Joe Cronin Briarsfield Blackwoods Blackwood Lane Malahide Co Dublin K36 VK63

The Secretary, An Bord Pleanala, 64 Marlborough Street, Dublin 1, D01 V902

OBSERVATION. Case. Number 314485. Joe Cronin An Bord Pleanala Case No. PL06F 314485 Planning Authority Case Reference. F20A/0668 Location of Planned Development. Dublin Airport. An Objection.

Dear Sir/Madam,

The purpose of this submission is to object to the above for the reasons as set out below.

Excessive Noise

Acoustic Report Reflecting Reality.

Excessive noise especially at night is the principal reason for our objection. It would be detrimental to our health, disastrous for the quiet enjoyment of our property, (a right enshrined in law) and calamitous for our property values to allow unfettered flight operations at Dublin Airport. Please refer to the Attached Acoustic Survey Report produced by Mr. Karl Searson, CEng., MIEI., MIOSH., MIOA., ACIArb., conducted on the night of 11th and 12th July 2023 at my home, corresponding to the above address. Blackwoods is an estate of eleven dwelling houses inclusive of a neighbouring home on an adjacent site, all located at the intersection of the R124 and Blackwood Lane, Malahide. It lies a mere 270 meters from the centre line of the flightpath for runway 28R (the northern runway) and used by landing aircraft in a westerly direction. Please refer to attached illustrative graphic No 1.

External readings of up to 92 decibels SEL and internal readings of up to 70 decibels SEL were recorded in the bedroom of my home. A good median to take is External 86 decibels and internal 66 decibels. Readings that are excessive by any standards. This has been our plight since the opening of the new northern runway albeit intermittently, a fate which can only worsen over time. Meteorological conditions in Ireland dictate that due to prevailing winds, this could well be our experience 70% of the year dependent on operational decisions at Dublin Airport the control of which is purely in the hands of commercial interests. I drawyour attention to item 12 of Mr. Searson's report in which he concludes as follows,

"Even were the tests to have been conducted for potential "emergency" or "one-off operational conditions", the data, now to hand, means that *unless* and *until* significant upgrades/modifications to your home (and that of your immediate neighbours) are completed (thereafter being suitably commissioned, confirmed and maintained) these flight paths must not be availed of."

Aircraft Noise Competent Authority (ANCA)

The remit of ANCA was taken from Fingal County Councils Web Site.

In 2022, ANCA defined a Noise Abatement Objective (NAO) for Dublin Airport. An NAO is a policy for managing the effects of aircraft noise emissions on the surrounding communities and environment at an airport. It is a plan to ensure that any growth at the airport occurs in the most sustainable manner possible. The NAO for Dublin Airport was defined by ANCA to ensure that aircraft noise is considered as part of the sustainable development of the airport. It has a clear policy objective set against measurable criteria and outcomes.

The Legislative Backing for the above.

21 (1) The competent authority shall monitor—

- (a) compliance with noise mitigation measures and operating restrictions, and
- (b) the introduction of operating restrictions.
- (2) Subject to subsections (3) and (4), the competent authority shall, on or before each anniversary of the date of commencement of this section, review the effectiveness of the noise mitigation measures and operating restrictions (if any) on achieving the noise abatement objective.
- (3) (a) The airport authority, or a person upon whom there is a noise impact from the airport, may, by notice in writing given to the competent authority, request the competent authority to review the effectiveness of the noise mitigation measures and operating restrictions (if any) on achieving the noise abatement objective.
 - (b) The competent authority shall, as soon as is practicable after it receives a request under paragraph (a), respond in writing to the requester.

- (c) The competent authority may, at its discretion, comply with a request under paragraph (a).
- (4) Where the competent authority is of the opinion, following a review referred to in subsection (2) or (3), that the noise abatement objective is not being achieved, it shall take such action, whether under the Aircraft Noise Regulation or this Act, or both, as it is of the opinion will be effective towards achieving that objective.

Distortion of Reality

Operationally ANCA, stick very closely to their remit. They take no account of health, the environment or disturbance but rather take the position noise is an inevitable outcome in supporting the growth and expansion of Dublin Airport; they treat sustainability as a matter of conjecture. The only data reviewed by ANCA is that provided solely by the DAA and have rejected Mr. Searson's professional acoustic report provided here. This is all the more galling as they are still awaiting the DAA to provide figures for 2022. The legislative framework under which ANCA operate, (highlighted passage C above) provides them with complete discretion as to whether or not they will accept or study such material; to date they never have. Indeed, their only relevance to the neighbouring communities are the noise contour maps (Document 2 and 3 included with this submission) These contour maps are at variance with the reality of life as we experience it.

An incidence of excessive noise is just as the appendices to Mr. Searson's Report aptly describe, charting the severity and intensity of such noise. The purpose of the contour maps is to dilute and smear-out over time the level and intensity of noise as it happens. It is a deliberate act aimed to conceal that which has blighted our lives as we live it, excessive noise as it peaks and decays in actuality. If one is disturbed from one's sleep by excessive noise, it happens in the moment, not over a period of weeks and months. It is incredulous, bearing in mind the findings in Mr. Searson's report that ANCA an unelected body, can produce contour maps so detached from reality that Blackwoods is within the 40-44 Daytime contour and outside any contour on the Nighttime map. Our data has been collected exclusively from nighttime flights.

In the matter of ANCA's approach to its discretionary powers there is a point of law to be considered here. Yes, ANCA have legislation on their side affording them enormous leeway in what to accept and reject; it is solely at their discretion. However, the Doctrine of Reasonableness and Proportionality applies here as demonstrated in Meadows vs Minister for Justice, Equality & Law Reform, and the O'Keefe Principle. Succinctly, the decision maker must not flagrantly reject or disregard fundamental reason or common sense in reaching a decision.

They have done just that in rejecting Mr. Searson's report. Anca is part of the executive function of Fingal County Council (FCC) and whilst the ELECTED membership of FCC supports our view, the executive and ANCA do not; it is patently undemocratic. Is it because over €33,000,000 is collected annually in commercial rates from Dublin Airport?

ANCA's contour maps are not associated with any operatio nal limits eitherin noise level or aircraft volumes, a practise not seen in any other western societies. ANCA do not operate in a Reasonable or Proportionate Manner there bre the data they produce is biased. They are independent of the county council members and unelected.

Submission

For the reasons Stated Above

- Night Flights Between the Hours of 11pm and & 7am Should Be Prohibited.
- Adopt The World Health Organization Recommendation of 45 Decibels for All Flights.
- In the interests of allowing neighbouring communities gain an undisturbed night's sleep the 6am to 12pm operating extension shou ldnot be granted.

The Dublin Airport Authority (DAA), Trust & Conditionality

Passenger Cap of Thirty-Two Million

The Irish nation and more directly those communities that neighbour Dublin Airport must await the result of a legal dual between Fingal County Council and the DAA over the interpretation of a planning permission granted by An Bord Pleanala (ABP) regarding passenger capping.

It is a monstrous absurdity that state entities will spend hundreds of thousands of Euros in legal fees to determine what should be obvious to any reasonable human being. I am confident ABP knew exactly what they meant when they granted Planning Permission to the DAA

Breaking the 65 Night Flight Limit.

Numerous instances have been reported to the DAA by neighbouring communities, TD's. and County Councillors about the breaching of the sixty-five aircraft movements per night rule. As for myself, I can testify that in or around the period of the attached acoustic survey I counted over one hundred aircraft passing overhead.

Take-Off Flight Paths, Standard Instrument Departures (SID's)

ABP granted Planning Permission in 2007 to the DAA, for straight ahead (westerly) departures by aircraft taking off from the new north runway (28R/I0L). However, these were not implemented but instead the DAA instigated SIDs directing aircraft to turn sharply right and depart to the north, circle east and leave the mainland close to Rush. Residents having brought this to the attention of the DAA were informed these were the licenced departures granted by the Irish Aviation Authority (IAA). Furthermore, the DAA claim these headings were always meant to be the correct SID's for this runway, despite the contrary ABP planning permission.

Confusion now reigns supreme, in that nobody in the north county knew of this change in operational procedures and any houses that the DAA provided with sound insulation or directly purchased as sound insulation proved to be an insufficient remedy, were all in a westerly direction. The DAA are being less than candid. It is quite apparent the DAA are operating in an underhand and less than transparent manner, playing off a grant of planning permission from ABP to a grant of license from the IAA.

Just because one has a driver's license and a Ferrari it does not entitle one to drive it at 150 KPH on Irish roads.

Submission

For the reasons Stated Above,

Night Flights Should Not Be Permitted

Planning Permission should be refused.

Self-Regulation is No Regulation.

If Planning Permission is granted in part or in whole, it should only be done so under extremely strict conditions, accompanied by punitive penalties on default.

EPA, Fairness, Expert Opinion and Request for an Oral Hearing.

The Environmental Protection Agency (EPA)

The above body when contacted have refused to act in the matter of fuel emissions or excessive noise citing, they have no remit in aviation fuel partlets, it is a matter for the DAA. Regarding noise they suggest contacting ANCA, whist that body deny any environmental involvement stating their remit is purely Aircraft Operations.

Fairness.

The various communities neighbouring Dublin Airport are a disparate group and affected in diverse ways to a greater or lesser degree depending on location and distance from the airport. Some are affected by aircraft taking off and others landing aircraft, as is our case. Our requirements for information and consultation whilst having some commonalities differ in detail.

DAA's Application for Planning Permission

The application submitted by the DAA for Planning Permission was in excess of 550 pages of information, impossible for small communities like ours to absorb in the allotted five weeks and an impossibility to brief and appoint expert opinion.

Submission

For the reasons and information contained in all three parts of this document we request the Bord review its decision to not grant an Oral Hearing.

Due to the lack of candour from the DAA as demonstrated in the foregoing document and the obvious bias in ANCA's deliberations we request that should independent expert opinion be required in this assessment of Planning Permission ABP appoint its own.

Re: No 4, Blackwoods: Aircraft Noise Assessment, index of noted events.

YOUR REF: BG

Dear Mr. Glover,

I am setting out below details of the 101 *significant events* which were recorded at/in your home over the measurement period which commenced shortly after 15:00 hours on 11th July and terminated at 09:00 hours on 22nd July 2023. During this 127 hour-odd period specific attention was paid to night time events, night-time commencing at 23:00 hours and terminating at 07:00 hours the next morning. The specific events were proximate aircraft fly-by's which provoked excessive in-bedroom noise levels. You had been advised that certain "test periods" had been selected by DAA for new flight paths and the measurement sessions were intended to analyse the levels associated with these new night-time fly-by events.

An aircraft identification application - with acronym FR - was initially used to identify those in-bedroom noise signals which characterised "events", but that application left many events unidentified. A subsequent package, with acronym WT and available on the internet, was accessed. It proved useful in reviewing the flight passes with respect to Dublin Airport during the above-mentioned measurement period and traces of specific fly-paths were noted and compared to the gathered acoustical data. It proved possible to identify the flight identification number and aircraft type and time of passage (with respect to Blackwoods) and correlate such results with the time stamp of the fast-logged acoustical data. In this respect the primary time metric was that accompanying the highest in-bedroom fast level (defined below as LaFmax) and the corresponding flight, gauged from "inching" the incoming aircraft icon proximate to Blackwoods and noting the corresponding time, aircraft type and flight identification number. In all the 101 events noted, the maximum time difference between the fast logged (primary) acoustical data and the WT time display was 22 seconds. As the minimum interval between incoming flights was typically six times this interval, no significant error arises.

The acoustical data refers to both indoor and outdoor locations, the indoor location being in a bedroom with the window ajar for fresh air admission and the outdoor location being some 3,5m out from the façade of that bedroom, and at a height of 4m overground.

There are a number of acoustical metrics of interest, as follows:

- LAFmax: This is the noisiest portion of an event, assessed with the fast time constant and expressed in A-Weighted decibels, dB(A).
- Lasmax: This is the noisiest portion of an event, assessed with the slow time constant and expressed in A-Weighted decibels, dB(A).
- SEL: This is the total acoustical energy associated with a given event but normalised back to
 a 1-second time interval. It is expressed in A-Weighted decibels, dB(A). It is an acronym for
 "single event level" or, alternatively, "sound energy level".

Considerable data have been gathered and to present same in a coherent fashion I have prepared appendices showing the relevant data for each day and, additionally, tabulated the L_{AFmax} trace from outdoors and indoors directly under each other to enable the contours to be visualised. For each outdoor event provoking excessive in-bedroom levels, I have tabulated and included the above metrics. The primary time is the Brüel & Kjær time (B & K time).

I Report as follows:

1. The first series of data refers to the night-time profiles on 11th July 2023. There were six notable events, numbered accordingly, and I have tabulated the metrics, times and details in table 1A, below. I have also prepared and attached, as appendix 1, the Comparative fast trace, 23:29 – 00:00, 11th July 2023. This trace depicts the outdoor profile in the upper (1A) portion and, directly below, the corresponding provoked in-bedroom level (1B).

OUTDOORS - A INDOORS - B B & K time WT Flight Id. LAFmax SEL Lasmax Type SEL L_{ASmax} LAFmax B738 23:31:27 RYR2PC 85 76 73 65 56 55 61 2 23:33:38 EIN40W A320 86 81 77 67 59 GEC 8582 3 23:36:24 A321 85 77 75 66 59 57 4 23:39:24 EIN611 79 77 61 58 A320 86 66 5 23:47:02 RYR9M 85 58 B738 79 76 65 60 A320 EIN24K 87 79 77 67 60 58 6 23:50:43 23:57:57 SWR878C BCS3 83 62 53

TABLE 1: 6 noted events of 11th July, # 1 - #7.

The above table give a useful insight into the reduction in certain acoustic metrics going from outside to inside via a window ajar for ventilation (fresh air admission). While the SEL values have a significant effect on the 5-minute (or 15-minute) LAEQ level obtained, the maximum values (fast or slow) are subject to a numerical ceiling. This ceiling applies during night-time, from 23:00 to 07:00 hours, and, in the case of the LAFmax, the in-room level should not exceed 45 dB(A) and in the case of the LASmax, the level should not exceed (about) 42 dB(A).

Taking the two periods from the 23:00 hours until 23:30 (no significant events) and the following period from 23:30 until midnight (7 notable events as set out above), there are significant differences. Via the B&K Evaluator software the following results a have been established:

TABLE 2: 30-minute night-time comparisons, no events Vs 7 events

		(OUTDOORS -	- A	INDOORS - B			
Time (T)	Events?	L _{AeqT}	L _{AFmax}	LASmax	L _{AeqT}	L _{AFmax}	LASmax	
23:00 - 23:30	No	47	63	60	27	42	39	
23:30 - 00:00	Yes, 1 - 7	61	81	77	42	61	59	

There are good and reliable criteria for a bedroom, at night, with fresh air admission. The L_{AeqT} (sometimes called the decibel average) should not exceed 30 dB(A), and this should be maintained for the duration of the night. The first 30-minute test (no events) has all three metrics comfortably within their guideline values. Once the "events" occur (itemised and recorded as 1 to 7) those levels are *grossly* exceeded.

2. The next day (in a 24-hour sense) was 12th July. 32 night-time events were noted, and their combined result are set out in table 2 below:

TABLE 2: parts 1 & 2, 32 noted events of 12th July, #8 - #40.

Appendices 2, parts 1 and 2, show the indoor and outdoor traces. Considerable air traffic movements ensued from just after midnight (event #8) until 02:22 (event #39). A single event (#40) occurred at 04:25 - 04:27 hours.

- 3. The next few days until the early hours of 18th July passed without any **significant** night-time events occurring.
- 4. A single event occurred in the early hours of 18th July. There were other signature passes both before and after the particular event, but the in-room level associated therewith were all below the threshold L_{AFmax} level of 45 dB(A). Appendix 3 details the relevant combined trace, the results being set out in table 3 below

TABLE 3: Noted single event of 18th July.

7. The pattern of notable events carried on into the early hours of 21st July. A further 28 events were noted and analyzed. Appendix 5, divided into two parts, sets out the comparative Lafmax traces with the individual results being tabulated in table 5 below.

TABLE 5, parts 1& 2, 28 notable events of 21st July.

- 8. The above results and appendices indicate a clear and significant issue in respect of the given events. You have indicated that the DAA e-contacted you (and others) indicating that "tests" were being conducted.
- 9. From my interpretation of the WT trace, these events are all associated with incoming aircraft, at night, availing of the North Runway.
- 10. The crux of the night-time issues, in respect of the 101 events tabulated above, mean that each and every one of the above tests provoked in-bedroom noise levels well in excess of the published levels geared towards a good night's sleep. Furthermore, on the occasions when these tests were *not being conducted* proper and suitable levels were measured, post 23:00 hours, in your bedroom, the window ajar for fresh air admission.
- 11. These findings are applicable to your immediate neighbours, assuming they rely on natural ventilation for fresh air admission.
- 12. Even were the tests to have been conducted for potential "emergency" or "one-off operational conditions", the data, now to hand, means that *unless* and *until* significant upgrades/modifications to your home (and that of your immediate neighbours) are completed (thereafter being suitably commissioned, confirmed and maintained) these flight paths must not be availed of.

Yours sincerely,

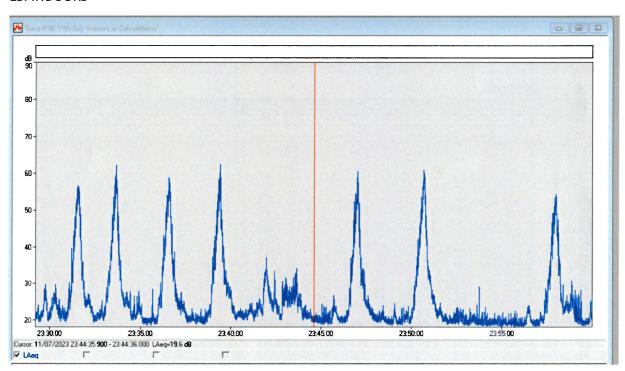

Karl Searson
Chartered Engineer.
