- Figure 2: ADCO Dive locations.

## 1.0 Summary

The Archaeological Diving Company Ltd. (ADCO) was appointed by Jacobs civil engineering through Irish Archaeological Consultancy Ltd on behalf of Irish Water to carry out an underwater assessment of a series of marine geophysical survey anomalies that had been detected in survey commissioned by Irish Water for the marine outfall component of the Greater Dublin Drainage Scheme. Site work took place on 1-2 June 2016. The marine geophysical survey area is 80m wide and extends 4.1km offshore from Velvet Strand, in Burrow townland, Co. Dublin.

A total of 13 anomalies were considered in 6 locations. Dives were carried out in all 6 locations. No material of archaeological significance was observed.

The archaeological underwater assessment has added a new layer of information to the project area.

The impacts arising from the GDD project will require the cutting of a trench to insert the marine outfall pipe.

There is no archaeological reason why the proposed works should not proceed.

It is recommended that a competent, experienced and licence-eligible marine archaeologist is employed to monitor the marine works, to record and recover archaeological materials exposed as a result of the works.

The archaeologist should be assisted by the client, and should be provided with suitable offices and welfare facilities to support their work.

Any objects recovered during the construction phase will need to meet the requirements of the National Museum of Ireland, and resources will need to be provided for all temporary storage and conservation needs.

The recommendations outlined above are subject to the approval of the National Monuments Service, at the Department of Arts, Heritage, Regional, Rural and Gaeltacht Affairs.

## 2.0 INTRODUCTION

The Archaeological Diving Company Ltd. (ADCO) was appointed by Jacobs consultant engineers through Irish Archaeological Consultancy Ltd on behalf of Irish Water to carry out an underwater assessment of a series of marine geophysical survey anomalies that had been detected in survey work commissioned by Irish Water for the marine outfall component of the Greater Dublin Drainage Scheme.

Site work took place on 1-2 June 2016 under licence from the National Monuments Service at the then Department of Arts, Heritage and the Gaeltacht, 16D00151, 16R0076.

The marine geophysical survey area is 80m wide and extends 4.1km offshore from Velvet Strand, in Burrow townland, Co. Dublin. A total of 13 anomalies were considered in 6 locations. Dives were carried out in all 6 locations. No material of archaeological significance was observed.

## 3.0 LOCATION

The survey area extends approximately 4.1km long by 80m wide, from a point on the shoreline of Velvet Strand, off Burrow townland, Portmarnock. Co. Dublin (Figure 1).

A series of anomalies were observed in data sets acquired through marine geophysical survey commissioned for the project.<sup>1</sup> None of the anomalies were indicative of shipwreck or other archaeological indicators, and many of the anomalies were associated with the presence of a working platform (spud barge) immediately prior to the marine geophysical survey being carried out.

A small number of anomalies remained that could not be explained in this manner, and the dive inspections were commissioned to examine those anomalies, to assess further their archaeological risk (Table 1, Figure 2).

Table 1: List of locations for archaeological dive inspection to assess further the archaeological risk.

# 4.0 METHODOLOGY

ADCO presented an archaeological dive team on site to carry out the inspection work The following procedure was followed:

- 1) Dive support was provided by a RIB, operating from Dun Laoghaire Harbour and skippered by a third party, Oceandivers.
- 2) Project work was planned to take place over a two (2) day period.
- 3) The dive support vessel took position over the 6 dive locations using on-board GPS/DGPS.
- 4) Individual targets/anomalies were buoyed by dropping a weight line over the position coordinates.
- 5) Dive work proceeded to inspect each location.
- 6) The dive team operated Surface Supplied Diving Equipment in accordance with SI422 of 1981. A four-person team conducted the work, comprising Dive Supervisor, Dive Tender, Diver and Standby Diver.
- 7) The Diver descended the buoyed line and inspected the seabed. A circular search pattern was established at each location, reaching up to 50m out from the buoyed line.
- 8) Record was taken of all observations. Written record was recorded topside based on the diver's observations made during the dive. Visual record was made and, where suitable, recorded using a hand-held underwater camera. A hand-held metal detector was employed simultaneously.
- 9) Once ADCO was satisfied that all areas of the inspection area were fully inspected and recorded, site work concluded.

# 5.0 DIVE STRUCTURE

The four-person dive team comprised: Niall Brady (NB) diver, Rex Bangerter (RB) diver, Kyle McCoy (KMcC) diver, and Brian MacAllister as Dive Supervisor. Dan Lenehan served as diver tender. All personnel are competent and experienced in the survey work required and in interpreting marine deposits.

The work was completed on 01 and 02 June 2016. Weather conditions were very favourable on the first day, deteriorating slightly on the second day but full and uninterrupted access was possible in all six dive locations.

## 6.0 OBSERVATIONS

| in this location.<br>There was no anomaly observed at the bottom of the down-line. Water depth<br>underwater visibility was 2m.<br>A circular search commenced, extending to 40m from the down-line, and usin<br>search pattern to ensure full coverage of the search area.<br>The seabed surface comprises silt and sand, with a light rippled surface. | The seabed is flat and featureless and some sea life was observed, including starfish, a whelk and razor shells. There are no rises or hollows, and no features observed.   |                              |   |   |               |            |  |
|   |                              | did not detect any and                        | omalies here.   |               |            |  |

There is no feature in this location exposed on or above the seabed.

### Recommendation

No further work is required in this location prior to the construction phase. Archaeological monitoring of all seabed impacts is required during the construction phase.

## 6.3 Dive Location 3, anomalies ss15, ss22

| Date                 | Diver                      | Weather                                    | Sea State  | Time in        | Time Out |
|----------------------|----------------------------|--|--|----------------|----------|
| 01/06                | KMcC                       | Sunny, very good                           | Light chop   | 13:30          | 14:05    |
| Geophys              | sical surve                | y interpretation and                       | l side-scan sonar image                                      | 9              |          |
| off seabe<br>anomaly | ed. Probabl<br>rising 60cr | le rock or debris. 5m<br>n off the seabed. | a around, 1.4m long, 0.9n<br>from ss22, a <i>c</i> . 6m long | n high         |          |
| Dive Log             | g and inter                | pretation                                  |  |                |          |
| underwat             | ter visibility             | aly observed at the b<br>was 1-2m.         | ottom of the down-line. W                                    | ater depth was | s 20m,   |

A plastic fishing pot for whelk-fishing was observed within 3m of the downline.

A circular search commenced, extending to 30m from the down-line, and using a pendulum search-pattern to ensure full coverage of the search area.

The seabed surface comprises silt and sand, and was quite flat and featureless. The sediment is a soft- to medium density, permitting manual penetration to a depth of 10cm. The metal-detector did not detect any anomalies here.

There is no feature in this location exposed on or above the seabed, other than the fishing pot.

Recommendation

No further work is required in this location prior to the construction phase.

Archaeological monitoring of all seabed impacts is required during the construction phase.

# 6.7 Discussion

All six dive locations were inspected and examined comprehensively. There were no archaeological features observed. The dive inspections clarified the nature of the geophysical survey anomalies in Dive Locations 3, 5 and 6, and indicate the presence of modern fishing practice as the most likely explanation. The absence of clarification at Locations 1, 2 and 4 might reflect the dynamic nature of this gently sloping sandy

seabed, where one can expect shifting topography as a result of a season's weather patterns.

## 7.0 IMPACTS

The outfall pipe trench will be tunnelled across the foreshore to a point that lies between Borehole 1 and Borehole 2. One option is to continue tunnelling the pipe seawards to its offshore terminus. A second option is to dredge the pipe trench seawards from where the tunnelled limit ends between Boreholes 1 and 2.

Tunnelling is unlikely to create extensive impact on the surface levels of the foreshore and may therefore have a reduced impact from an archaeological perspective, but the risings could reveal material of interest and these should be inspected.

Dredging of the pipe trench will create high impact along the pipe trench route, extending out to the sides of the way leave. All such ground disturbance activities have the potential to reveal new archaeological material and will require archaeological monitoring.

# 8.0 **RECOMMENDATIONS**

The recommendations in this report refer only to the marine dredging works offshore and nearshore, and do not refer to the intertidal foreshore.

There is no archaeological reason why the proposed works should not proceed.

## 8.1 Pre-construction phase measures

No further archaeological mitigation is recommended prior to the construction phase commencing.

## 8.2 Construction phase measures

MONITORING. Seabed disturbance activities will be archaeologically monitored under licence from the DAHRRGA, with the proviso to resolve fully any archaeological material that occurs during such works. The archaeological monitoring will be conducted by a competent, experienced and licence-eligible marine archaeologist.

The archaeologist should be assisted by the client, and should be provided with suitable offices and welfare facilities to support their work.

## 8.3 **Project Management Measures**

All archaeological site work will be licensed by the DAHRRGA. Licence applications (Detection Device, Dive Survey, and Excavation) take a minimum of three working weeks to be processed, and sufficient lead time is required to ensure that such permits are in place before construction works commence.

THE TIME SCALE for the pre-construction and construction phases should be made available to the archaeologist, with information on where and when the various elements and ground disturbances and dredging will take place.

SUFFICIENT NOTICE. It is essential for the developer to give sufficient notice to the archaeologist/s in advance of the pre-construction and construction works commencing. This will allow for prompt arrival on site to undertake additional surveys and to monitor ground disturbances. As often happens, intervals may occur during the construction phase. In this case, it is also necessary to inform the archaeologist/s as to when ground disturbance works will recommence.

DISCOVERY OF ARCHAEOLOGICAL MATERIAL. In the event of archaeological features or material being uncovered during the construction phase, it is crucial that any machine work cease in the immediate area to allow the archaeologist/s to inspect any such material.

ARCHAEOLOGICAL MATERIAL. Once the presence of archaeologically significant material is established, full archaeological recording of such material is recommended. If it is not possible for the construction works to avoid the material, full excavation would be recommended. The extent and duration of excavation would be a matter for discussion between the client and the licensing authorities.

ARCHAEOLOGICAL TEAM. It is recommended that the core of a suitable archaeological team be on standby to deal with any such rescue excavation. This would be complimented in the event of a full excavation. Excavation work of marine sites must be done by archaeologists specialized in Marine and Underwater Archaeology. The archaeological team for marine works must include an archaeological dive team working within current Health and Safety regulations for Safety at Work, and specifically Safety in Industry (Diving Operations) Regulations, 1981: SI 422 of 1981, and 2010 SI (Draft), HSA Diving Standards 2010.

SECURE SITE OFFICES and facilities should be provided on or near those sites where excavation is required.

SECURE WET AND DRY STORAGE for artefacts recovered during the course of the monitoring and related work should be provided on or near those sites where excavation is required.

BUOYING of any such areas would be necessary once discovered and during excavation.

ADEQUATE FUNDS to cover excavation, post-excavation analysis, reporting and any testing or conservation work required should be made available.

MACHINERY TRAFFIC during construction must be restricted as to avoid any of the selected sites and their environs.

SPOIL should not be dumped on any of the selected sites or their environs.

The recommendations outlined above are subject to the approval of the National Monuments Service, at the Department of Arts, Heritage, Regional, Rural and Gaeltacht Affairs
