Re: Railway	(MetroLink - E	stuary to C	harlemont via Dublin Airport) Order 2022 Case Reference Number NA29N.31472	24	
1	Letter introduction	1	Firstly, we are in favour of the broad aim of the Metrolink project to connect Dublin's city centre to the airport. However, as a resident living in the Dartmouth/Charlemont area, we wish to set out a number of observations for the Board regarding the proposal to locate the Terminus station at Charlemont-Dartmouth. Our family home is in the midst of the community where the Terminus station is proposed to be located. It is directly adjacent the proposed metro construction site, which is estimated to be in operation about us for nearly a decade. We live here with our four young children	Thank you for taking the time to make a submission and your overall endorsement of the MetroLink Project. We have reviewed your submission and responded to the observations made below.

Re: Railway (MetroLink - Estuary to Charlemont via Dublin Airport) Order 2022 Case Reference Number NA29N.314724						
2	Point 1		1. Charlemont is the incorrect strategic location for a Terminus hub and spoke system as it is too far out along the Luas Green Line spoke and would prejudice future options for integration of networks and services.	I'll do not agree that Charlemont is the incorrect location for an interchange with the Luas Green Line or that it prejudices future options for integration with the wider transport network for the reasons set out below. The Board is required to have regard to the likely consequences for proper planning and sustainable development in the area in which it proposed to carry out railway works (section 43(1) of the 2001 Act) and as such the following matters are relevant. The connection from St Stephens Green to Charlemont / Ranelagh is supported by the current Transport Strategy for Greater Dublin Are (2022-2042). The Transport Strategies were prepared by the National Transport Authority, scrutinised by the Joint Orieachtas Committee on Transport and approved by the Minister for Transport. It notes in section 12.3.2, "Charlemont offers the optimal location for Direachtas Committee on Transport and approved by the Minister for Transport. It notes in section 12.3.2, "Charlemont offers the optimal location for Direachta Committee on Transport and approved by the Minister for Transport. It notes in section 12.3.2, "Charlemont offers the optimal location for International Fortial Strategy is a supportable location for International Fortial Strategy is an appropriate location to facilitate are potential future metro extensions to serve the south west, south or south east of the city region should sufficient demand arise. The Transport Strategy is "a consideration material to the proper planning and sustainable development of the area areas in question. Development Plans are required to be consistent with the Transport Strategy. The Dublin City Development Plan 2022-2028 envisages the station at Charlemon in policy SMT2." To support the expeditions delivery of the Strategy and the support the integration of existing public transport indeas transport modes, serving the existing and future needs of the class of the cl

Re: Railway	Re: Railway (MetroLink - Estuary to Charlemont via Dublin Airport) Order 2022 Case Reference Number NA29N.314724						
3	Point 1	1	Point 1 continued - St. Stephens Green is the most appropriate location as it provides for interchange with bus, Luss and future DART underground. The project incorrectly dismisses 35 Stephens (Seen West as an appropriate terminal station. It only considers \$1. Stephens Green East and Charlemont. No Study has been completed by MTA/TI in spart of the entire Metholiac project on the optimal location for a City centre terminus, which strikes us as an incomprehensible omission of an obviously relevant and necessary study. It is difficult to see why there should be a metro stop on \$1. Stephens Green East, far away from Grafton Street, and also contradictorily why the LUAS interconnection cannot take place there if its location on the east is not otherwise a difficulty.

Re: Railway	(MetroLink - Es	stuary to C	harlemont via Dublin Airport) Order 2022 Case Reference Number NA29N.31472	24		
4	Point 2	1	2. Expensive Duplication of Rail infrastructure - The inclusion of an expensive and costly section between St. Stephens Green and Charlemont is strategically weak and duplicates the existing Luas Green Line services. NTA's cost estimate for this kim section at 6550M is an expensive unnecessary duplication and significant investment that deprives other parts of Dublin that are in immediate need of rail infrastructure to support housing and urban development. Bringing the terminus to Charlemont rules out the development of the metro to parts of the South city not covered by light rail. This is a very shortsighted development. Reeping the terminus at St. Stephens Green at least allows for the possibility of proper expansion.	The Board is not responsible for any decisions in relation to the funding the Project. It is solely responsible for assessing whether the Project is consistent with proper planning and sustainable development and that its effects on the environment are acceptable. The responsibility for funding the Project lies with the NTA, the Government and ultimately the Oireachtas. It has received all necessary approvals, including under the Public Spending Code for the making of a Railway Order. It will undergo further script way and approvals, including under the Public Spending Code, before it is funded. It is not appropriate for the Board to make findings in relation to value-formoney that are outside its statutory functions and would cut across those arrangements. Members of the public are entitled to make representations to their TDs in relation to the value-for-money of any element of the Project. In any event, TI do not agree with this statement for the reasons set out by response (2) above, noting that infrestructure is not being duplicated given the capacity of the Luas south from St. Stephen's Green is restricted due to on-street running. There is a limit to the potential of the Luas to provide additional capacity in the on-street non-segregated section of the Luas Green Line from Charlemont northwards through the city centre. The nature of this route and the fact that it currently crosses several road junctions (Adelaide Road, Harcourt Street / Hatch Street upper and Harcourt Street / St Stephen's Green south) limit the service to a maximum of 24 transper hour per direction. The projected demand for this section would require a higher frequency of up to 30 transper hour and this demand cannot be met with on-street systems (Luas / bus). The interchange between Luas and MetroLink proposed at Charlemont will provide the necessary capacity to address the demand on this section would require a higher frequency of up to 30 transper hour and this demand cannot be met with on-street systems (Luas / bus). The interch		
5	Point 3	2	3. The station box at Charlemont, as constructed in 2021/22 by the Developer Hines, does not have the benefit of planning permission and has not been part of the EIA undertaken for this project. Processing the current Railway Order application, which is reliant on these preliminary and now constructed works, is legally unsafe and contravenes the provisions of the EIA Directive. A considered legal opinion has been prepared on this important issue and has been submitted to An Bord Pleanala an as Appendix in the community submission and the contents thereof are adopted by us.	The MetroLink enabling works constructed as part of the Hines development was included in the planning application for the Hines Development and has the benefit of planning permission which was granted in April 2019.

Re: Railway	(MetroLink - Es	stuary to C	harlemont via Dublin Airport) Order 2022 Case Reference Number NA29N.31472	24
6	Point 4		4. The station box at Charlemont will result in only one possible future tie in with the Luas Green Line to the south, which would result in an option that was previously dismissed as part of the Tie-In study from March 2017. No alternatives to the station box at Charlemont were considered as it had been fixed through the design of the overhead thines Grand Parade commercial development. The implications of this new alignment is very significant on our wider community as it will involve top down construction that will only be possible when many houses on Manders Terrace, Oakley Road and Charleston road are demolished.	The station box at Charlemont allows for a future tie into the Luas Green Line should it be determined in the future that through running metro services to Sandyford is the required solution to address the public transport needs to the south of the city. It is incorrect to say that the current proposal is based on an option that was previously dismised as part of the March 2017 Green Line tie in study. The station design is in affect a modification to the preferred Green Line Tie Option 4B which was modified as result of the postponement of the upgrade of the Green Line to metro standard. The station box location was not fixed by the Charlemont Development. The preferred route for MetroLink was published in March 2019 following a comprehensive route options study. The preferred route was based on the emerging preferred rote for the scheme which included a station at Charlemont. The Charlemont Development to proceed whilst simultaneously ensuring there was an option available to construct a station at Charlemont. The Charlemont Development to proceed whilst simultaneously ensuring there was an option available to construct a station at Charlemont that avoided unnecessary demolition, took advantage of an available is the provided infrastructure that is integrated with planned development rather than necessitating later changes and retrospective adjustments to a new development or even possible demolition of the new development, whilst providing protected provision for the future extension of the scheme south, if required. It is also important to recognise that the station location at Charlemont is influenced by available vacant land and thus avoids unnecessary demolition. The submission seeks to portray the construction of the Metro Enabling Works as prejudicial to future decisions on proper planning and sustainable development of the area. It might is that the counterfactual would have in the proper planning and sustainable development of the area. The Board could have refused be evolopment at the time the la
7	Point 5	2	5. The Environmental Impact Assessment Report is inadequate in relation the description of development, alternatives, transport assessment, noise and the cumulative effects of the development on the Charlemont-Dartmouth Community. For a project of this size, scale, investment to date, it is inadequate to propose a Railway Order with so many important studies and analysis missing.	TII do not agree that the Environmental Impact Assessment is deficient, inadequate or missing information. The Railway Order application comprises a very detailed environmental impact assessment that has identified and assessed the potential environmental impacts of MetroLink and proposed mitigations for these impacts where necessary. TII would also draw attention to the detailed project description, construction phase description and operational phase description provided in EIAR Chapters 4 and 5 and 6, and EIAR Chapter 7 and associated appendices that present details of alternatives considered. EIAR Chapter 9 and appendices provides a detailed analysis of transport and traffic effects, and EIAR Chapters 13 Airborne Noise & Vibration, and 14 Groundborne Noise & Vibration provide a detailed assessment of potential noise and vibration effects, while Chapter 29 outlines the assessment of interactions between various environmental aspects, and Chapter 30 covers the cumulative impacts with other projects. This assessment is carried out for the full length of the alignment including relative to potential significant effects on the Charlemont-Dartmouth Community.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
: Railway	(MetroLink - E	stuary to C	harlemont via Dublin Airport) Order 2022 Case Reference Number NA29N.3147	724
				The EIAR presents a comprehensive and detailed assessment of both groundborne and airborne noise and vibration in Chapter 13 an of the EIAR. The assessments include predictive modelling in order to identify the potential impacts on all sensitive receptors during the construction phase and the operational phase.
				Noise and disturbance during construction:
				No profound impacts have been identified for residents and mitigation measures proposed will be effective at reducing the impacts of these properties and in general terms impacts will be associated with the construction phase only. Significant mitigation is proposed include 4m high noise barriers and further proposed mitigation in line with the Airborne and Groundborne Noise Mitigation Policy. Of implementation of these measures the residual impacts of airborne noise are predicted to be moderate.
				Chapter 14 of the EIAR assesses groundborne noise and vibration, with EIAR Appendix A14.5 Groundborne Noise and Vibration and Blasting Modelling Results presenting predicted groundborne noise and vibration levels during below ground construction. During TB passage the predicted level of groundborne noise will be above the 45 dB LASmax threshold for a number of receptors above the rur alignment, resulting in a significant impact on the building occupants during the relatively short 2-week duration of the TBM passage given location. The predicted vibration levels for TBM passage are well below human response thresholds during both day and night-periods.
				Unfortunately there are no effective methods are available to reduce groundborne noise from TBMs at source. The principal mitigatic measures aimed at minimising impacts are to give advance notice to residents of the timing of the TBM passage. In addition TII will act and consider applications for additional measures on a case-by case basis, in accordance with its Noise and Vibration Mitigation Police Appendix A14.6).
				Noise and disturbance during operation:
8	Point 6	2	6. The development would result in noise and disturbance during the construction and operational phases and would result in a loss of amenities for the area.	No residual noise impacts are identified at this location during operation. The calculated rail noise levels across the proposed Project not significant in terms of any widespread community disturbance and results in a not significant impact when added to the prevailin noise environment.
				Loss of amenity during construction:
				EIAR Chapter 11, Population & Land Use provides an assessment of effects on community amenity during construction and operation which relates to the interaction of impacts on air quality; visual amenity; traffic and transport; and noise and vibration.
				At this location during construction as outlined in Section 11.5.2 of Chapter 11, no impacts are identified on the retail sector or command social infrastructure (e.g. schools or hospitals). Any severance/disruption to transport will be limited by site mitigation measures as alternative routes, reducing impacts to not significant.
				Loss of amenity during operation:
				No significant residual negative impacts are anticipated on the Population and Land Use from the operation of the proposed Project, following the incorporation of the mitigation measures into the design of the proposed Project and implementation on an ongoing by throughout the lifecycle. The residual effects that will arise during operation will be permanent and positive as detailed in EIAR Chap

throughout the lifecycle. The residual effects that will arise during operation will be permanent and positive as detailed in EIAR Chapter 11, section 11.1.1.

Re: Railway	(MetroLink - E	stuary to C	harlemont via Dublin Airport) Order 2022 Case Reference Number NA29N.31472	24
				The MetroLink forms part of an integrated public transport network. The system is designed in an integrated manner so that people travelling from the area south of Dublin to access locations north of Charlemont, such as Dublin Airport, Mater, Swords etc. will utilise public transport to interchange with the MetroLink, or will walk or cycle to access their local station. The system is not designed to encourage people to drive to stations within the City and TII actively discourage people from doing so other than the Park & Ride station a Estuary. TII therefore do not agree with the observation that there will be a "huge volume of anticipated airport users from Dublin South and greater Dublin/Leinster that will come to Charlemont via car or taxi with luggage for onward destination to the airport" as this is not borne out by our transport analysis.
			Point 6 continued - The Traffic Study for the local Charlemont area is wholly inadequate as it omitted the modelling of the impact of Airport users coming to the only Dublin South Metrolink station at Charlemont. The Traffic Study uses a strategic, generalised regional model that does not take local factors into account.	The Transport Assessment for MetroLink includes for people travelling to/from Dublin Airport from all areas within the extents of the GD area, therefore it is incorrect to say "The Traffic Study for the local Charlemont area is wholly inadequate as it omitted the modelling of the impact of Airport users coming to the only Dublin South Metrolink station at Charlemont".
9	Point 6		Extract from observation 7) The EIA did not properly assess the impact of additional local traffic volumes, rather they used a generalised regional model that does not take local factors into account. A key local factor at a Terminus station in Charlemont that runs to the Airport is the huge volume of anticipated airport users from Dublin South and greater Dublin/Leinster that will come to Charlemont via car or taxi with baggage for onward destination to the airport. Grand Parade and the residential area around Charlemont-Dartmouth can not sustain the significant additional traffic volumes associated with this development.	The NTA's Eastern regional Model (ERM) incorporates a wide range of data sources, including demographic data, land use data, transportation network data, and travel survey data. The system is designed to model a variety of transportation modes, including private vehicles, public transit, walking, and cycling, and to simulate the interactions between these modes. The ERM model has been validated and calibrated using a range of localised data sources to ensure that the model can accurately represent the transport network, these include public transport and vehicle counts from the canal cordon counts. The outputs from the model have been combined with local survey data to undertake the more localised modelling, such as the pedestrian impact assessments, or the local traffic signals. This does not support the observations made "The Traffic Study uses a strategic, generalised regional model that does not take local factors into account." or "The EIA did not properly assess the impact of additional local traffic volumes, rather they used a generalised regional model that does not take local factors into account."

Regards the observation there will be a "huge volume of anticipated airport users from Dublin South and greater Dublin/Leinster that will come to Charlemont via car or taxi with luggage for onward destination to the airport. Grand Parade and the residential area around Charlemont-Dartmouth cannot sustain the significant additional traffic volumes associated with this development", this is covered by

Submission	No.		51		
Organisation Name or Name of Submitter			Conor and Lorraine Power		
Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
Re: Railway	(MetroLink - E	stuary to C	charlemont via Dublin Airport) Order 2022 Case Reference Number NA29N.3147	24	
10	Point 7	2	7. The development would have an adverse impact upon traffic during the construction and operational phase, and it has not been properly designed and there is poor integration with other modes of transport. Pedestrian movements in and around the station would be difficult. Grand parade is an already heavily congested orbital route.	The MetroLink is designed to form part of an integrated public transport network with Charlemont selected as the preferred interchange location in order to maximise the potential interchange with the existing Luas Green Line. In overall terms, Charlemont Station will provide for improvements to the public transport network resulting in decreases in private car usage/trips, increases in public transport usages and will facilitate walking and cycling to the station, without significantly impacting on the operation of the road network in the area. Construction Phase: EIAR Appendix A9.5 Scheme Traffic Management Plan presents the analysis undertaken to assess the impact of the traffic management measures on the local road network surrounding the proposed Charlemont Station during the construction phase. At the local level the following parameters have been used to assess impacts on general traffic and on pedestrians: • Increase in walking distance/quality of service for pedestrians (through removal of footpath, reduction of quality of service, removal of a pedestrian crossing or relocation of crossing by more than 100m); • Increase in driver delays at junctions; • Changes in traffic flows on surrounding streets; and, • Additional distance travelled due to diversions. The analysis undertaken at this location indicates that the increased volume of traffic on Grand Parade and Northbrook Road does not translate into any significant increase in driver delay. The largest increase in driver delay of 12 seconds is registered on the westbound approach on Grand Parade to the Ranelagh Road signalised junction. During the construction phase, pedestrians will experience a reduction in quality of pedestrian infrastructure and space. The construction site boundary will encroach upon footways in the local area, including the northern side of Dartmouth Road, and the southern side of Grand Parade. However, a temporary signalised crossing will be provided west of the Luas to maintain pedestrian access to and from the Stop. Wh

Re: Railway	(MetroLink - E	stuary to C	harlemont via Dublin Airport) Order 2022 Case Reference Number NA29N.31472	24
			(10) continued	Operational Phase: A microsimulation VisWalk model has been developed for the immediate area surrounding Charlemont Station during the operational phase. The model covers the full extent of the publicly accessible station area, including the immediate vicinity of the station entrance at street level, the Luas stop and nearby junctions at Charlemont Bridge. In order to accommodate the forecast demand from the proposed Charlemont Station, a new staircase with 2.4m stair width is proposed at the south east corner of Charlemont Luas stop. An elevator will also be provided at this location. Both are sized for MetroLink to Luas, and Luas to MetroLink passengrumbers. In addition, it is proposed that the pedestrian crossing on R111 Grand Parade will be repositioned to the front of the building being developed by Hines. With this infrastructure in place, the model indicates that the R111 Grand Parade will have an acceptable level of service overall, with some reductions in service seen at the pedestrian crossing where pedestrians are required to wait for a green phase at the signals. Overall, it is considered that the model displays an acceptable level of network performance. The proposed pedestrian crossing on Grand Parade will have minimal impact on the traffic flow along Grand Parade and can be programmed to operate in sync with the existing signalised junction at Grand Parade /Charlemont Street to maintain the flow of traffic movements. When the Project is operational, car mode share will decrease, with a reduction of up to approximately 830 car typs to and from the zones surrounding Charlemont Station over the 12hr period in 2065. In overall terms, the Charlemont Station will provide for improvements to the public transport network resulting in decreases in private car usage/frips. Increases in public transport usages and will facilitate walking and cycling to the station, without significantly impacting on the operation of the road network in the area. Furthermore, Til have deliberately designed the Station wi
11	Point 8	2	8. The development will have an obvious adverse impact upon our home and daily life and will also diminish property values as our house will be practically unsalable during the very disruptive construction at the Charlemont site phase estimated to last nearly a decade. As an adjacent house, there will be a long term and permanent adverse impact upon our home from the noise of the operating rail infrastructure, vents, PA systems, escalators and large traffic volumes- vehicular and pedestrian using the station 19 hours per day. The adverse impact also extends to the loss of amenity for the wider community changing our quiet residential neighbourhood into a noisy, busy, congested major transport hub. This residential neighbourhood is a very unsuitable location for a metro terminus and for one of the main construction sites to be used for the whole Metrolink project.	Response (8) above outlines the predicted environmental impacts with regards to noise and vibration, and amenity, while responses (9) and (10) summarise the assessed traffic and pedestrian impacts, noting that there are no predicted significant impacts when the proposed mitigation measures are implemented. TII would note that as explained by response (10) above that in overall terms Charlemont Station will provide for improvements to the public transport network resulting in decreases in private car usage/trips. TII do not agree that the development will have a long term and permanent negative affect. In fact there is evidence to suggest that property values will in fact increase in close proximity to public transport infrastructure and that local residents will greatly benefit from having a world class metro system providing access to the city centre, airport and north city at their door step. TII would also like to confirm that the site for the construction of the proposed Charlemont Station will not be used for the whole MetroLink project, but confined to the construction of the proposed station and intervention / evacuation tunnel south of the Station.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response		
Re: Railway	e: Railway (MetroLink - Estuary to Charlemont via Dublin Airport) Order 2022 Case Reference Number NA29N.314724					
13	Point 10	3	10. The substantial disruption that will be caused by noise and vibrations has not been properly or adequately assessed, and we refer in this regard to the Submission put in on behalf of us and our neighbours on Dartmouth Square West. The near decade long construction phase at the Charlemont site allows for significant works between 7 am - 7pm, with obvious significant disruption to our home life.	As set out in response (8) above, potential airborne noise impacts identified due to airborne noise & vibration are presented in Chapter 13. Proposed mitigation includes 4m high noise barriers, with 7m high barriers along the eastern boundary, and further proposed mitigation in line with the Airborne and Ground borne Noise Mitigation Policy at 10 & 11 Dartmouth Square. On the implementation of these measures the residual impacts are predicted to be moderate. Potential groundborne noise and vibration impacts are presented in Chapter 14, with a significant adverse impact identified for residents during the relatively short duration of TBM passage, as explained by response (8) above. As outlined in Transport Infrastructure Ireland (TII) Airborne and Groundborne Noise Mitigation Policy (Appendix A14.6) there is a process proposed whereby further mitigation measures including temporary relocation can be implemented at individual properties should this be merited The proposed working hours for the construction phase of the proposed Project (as per Section 5.2.4 of Chapter 5 of the EIAR) will be for all above ground works to progress Monday to Friday 07:00 to 19:00 and Saturday 07:00 to 13:00. There will additionally be a period of 24/7 working below ground to enable the construction of the sprayed concrete lined tunnel, with the associated above ground support activities enclosed within a sound insulated acoustic enclosure as discussed in Section 13.6.1.2.4 of the EIAR. As discussed in the response to point 8 and outlined in Section 11.5.2 of Chapter 11, no residual impacts in terms of loss of amenity are identified on the community or retail sector and social infrastructure (e.g. schools or hospitals).		
14	Requested Amendments	3	Requested amendment to An Bord Pleanala We request the following amendments: 1. Omit from the Railway Order the section from Tara Street Station to Charlemont Station and associated onward tunnel extension and intervention tunnel 2. Require the submission of a railway order for a section from Tara Street Station to St. Stephens Green which would effectively provide for a terminal hub station that can integrate with the Luas Green Line, multiple bus routes and future DART underground.	The above responses to the observations made explain why TII do not consider it is correct or appropriate that the MetroLink alignment south of the proposed Tara Station should be omitted, and also demonstrates why the proposed Charlemont Station has been selected by TII as the preferred interchange with the Luas Green Line A scheme which terminates at Tara Street would not be consistent with the Transport Strategy for Greater Dublin Area (2022-2042) and would be a material contravention of the Dublin City Development Plan 2022-2027. In addition any decision to terminate the scheme at Tara will significantly impact on the overall viability and benefits of scheme.
