Submission No.			141	
Organisation Name or Name of Submitter			Jian Cheng and Family (residents - 164 Ballymun Road)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: Jian Cheng				
1	Observations/ Concerns	1	We absolutely oppose to the proposal of construction of Glasnevin Metro station within the Metro link project along the Ballymun Road, in particular about the plan to construct the underground metro directly under my house on 164 Ballymun Road, Dublin 9. 1. There will be major disruption on this end of Ballymun Road, the project will severely effect residents on the main road and we'll all face major issues with accessing our properties, traffic disruption, noise, vibration, dirt and dust to mention a few.	Thank you for your submission and for sharing your observations with regards to the MetroLink project to which we have responded below. We note your objection to Glasnevin Station but this is unsupported with any specific concerns for us to address as it is not adjacent to your property.
2	Observations/ Concerns	1	2. There is the Our Lady of Victories national school across road from my house, on normal days, the parents park their cars along footpath of both sides of the road during drop off and collection. The project will majorly disrupt these activities and create a major safety hazards for the parents, the children and the local residents.	As outlined in Chapter 9 of the EIAR, there will be additional traffic at Our Lady of Victories Schools during construction, however a Traffic Management Plan will be implemented to ensure that there are no significant impacts on students, parents and staff albeit with a restriction on the kerbside drop off.. All HGV movements will be managed in line with the measures with further details found in the Outline CEMP (Volume 5, Appendices, Chapter 5 (MetroLink Construction Phase) and Appendix A9.5, Section 2.5.2 to ensure that there are no accidents involving construction phase vehicles. These measures will include control of the movement of HGVs to and from the site during school drop off and pick up times. It should also be noted that during all phases of construction the pedestrian crossing between Our Lady of Victories church and the schools will be maintained to ensure safe access across the road. To minimise disruption, where practicable, construction work requiring short term disruption and road closures will be carried out when traffic volumes are lower, such as at night, at weekends and during school holidays (Section 9.7.1.2, EIAR Chapter 9). Appropriate traffic management and health and safety best practice will be adhered to during construction with public safety in mind with the pedestrian crossing maintained. These measures will cater to all vulnerable users including children. There will be a construction management team on-site for the duration of the Construction Phase who will ensure mitigation measures are implemented, and that construction impacts and nuisance are minimised. All construction work in connection with the proposed Project will be carried out in accordance with the CEMP (EIAR Appendix A5.1) and relevant health and safety legislation and best practice, with particular regard to: • Safety, Health and Welfare at Work Act, 2005; • Safety, Health and Welfare at Work (Construction) Regulations 2013; and • Other relevant Irish and EU safety legislation. As required by the Regulations, a Health and Safety Plan will be formulated which will address health and safety issues from the design stages through to completion of the construction and maintenance phases. The plan will be reviewed as the development progresses. A Project Supervisor Construction Stage will be appointed by TII and a Safety File prepared for the Construction Phase (Section 5.11, Chapter 5 (MetroLink Construction Phase)). Vulnerable road users such as pedestrians and cyclists will be prioritised for protection in the Scheme Traffic Management Plan. Temporary pathways will be installed where appropriate and provisions will be made to ensure access for the mobility impaired is maintained. For those who walk to Our Lady of Victories Schools the signalised pedestrian/toucan crossing outside of the front of the school will be retained during all works and will continue to allow safe access for pedestrians and vulnerable users. Cycle lanes will continue to be provided along the R108 (Section 9.6.1.2.4.3, Chapter 9 (Traffic & Transport)). The planning, testing and commissioning and operation of the proposed Project will be carried out in accordance with the Railway Safety Act 2005 and with consents and directions issued by the Commission for Railway Regulation under the Act. A safety management system and safety case will be in place for the operation of the proposed Project (Section 5.11, Chapter 5 (MetroLink Construction Phase)).

Submission No.			141	
Organisation Name or Name of Submitter			Jian Cheng and Family (residents - 164 Ballymun Road)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: Jian Cheng				
3	Observations/ Concerns	1	3. Then there is the relocation of all services (drainage, sewerage, electricity, water, gas) to the eastern side of Ballymun road before station construction even commences.	Prior to the enabling works and the main construction phase a Traffic Management Plan will be developed (Refer to Appendix A9.5 of the EIAR). The use of a traffic management plan is critical to the management of the services diversion phase and construction phase traffic and vulnerable road users such as cyclists and pedestrians. The contractor will be legally required to adhere to the requirements of the plan on a day by day basis and so any such measures will be implemented with a focus on managing traffic movements to ensure that there are no accidents. It should also be noted that as outlined in Table 9.64 in Chapter 9 of the EIAR, enabling works in this area will be undertaken such that one lane of general traffic and one bus lane in each direction will remain open. Dedicated cycle lanes will also be provided during the construction phase. Furthermore, as outlined in EIAR Appendix A9.5 section 2.5.2.2, construction vehicles will be controlled in terms of the hours of operation (i.e. construction traffic will be prohibited during periods of very heavy traffic and during school drop off and pick up periods). Additionally, there will be controls at the entrance and exits of sites for construction vehicles in order to ensure the safety of other road users.
4	Observations/ Concerns	1	4. The station construction itself will require 7-10 years duration with associated road closures and traffic gridlock, with no vehicle access to my own house.	Please refer to Response (3). Access will be maintained to your property during this period. The impacts of the works on traffic flow have been assessed and reported on in EIAR Chapter 9.
5	Observations/ Concerns	1	5. Furthermore, there is also the construction and excavation of the proposed shaft in the Albert college park, which is also a major project itself.	Albert College Park has also been considered in the EIAR and cumulative traffic impacts assessed together with wider environmental impacts of the proposed project. Refer to EIAR Chapter 9 for Traffic impacts and Chapters 1 to 31 for wider impacts of the works.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: Jian Cheng				
6	Observations/ Concerns	1	6. The construction will inevitably causing damage to our house as well as the long term structure effect on our property since the underground tunnel running directly underneath our house. Think about the noise, the vibration each time the metro passes through underneath.	A comprehensive Settlement Assessment has been undertaken to determine the potential impacts that construction of the proposed Project will have on sensitive receptors such as buildings and infrastructure from the advance of the TBM. The ground movement predictions and the building damage assessment methodology adopted for MetroLink is based on the approach adopted in most tunnel projects around the world, including London Crossrail and High Speed 2 in England. This is described in EIAR Section 5.4.11 (Ground Settlement Monitoring and Mitigation Works). The EIAR Appendix A 5.17 Building Damage Report, covers the assessed impacts of construction generated ground movements and settlement on property. Table 5.2 of this report shows that your property (AB07) has been assessed as falling within the 'Very Slight' category currently. The building risk categories shown in Table 4-4 of the aforementioned report are used to define the degree of building damage related to the Risk Category. There is no predicted structural impact due to tunnelling nor the subsequent operation of MetroLink. Noise and Vibration Chapter 14 presents the assessment of groundborne noise and vibration impacts for both construction and operation phases. EIAR Appendix A14.5 Groundborne Noise and Vibration and Blasting Modelling Results presents the predicted noise and vibration levels during TBM passage and railway operation for various sensitive receptors, including 164 Ballymun Road. The predicted level of groundborne noise during TBM passage is 49 dB LASmax, which is above the 45 dB LASmax threshold resulting in a significant impact on the building occupants during TBM passage. The predicted vibration for TBM Passage during the day and night are 0.255ms-1.75 (VDV day) and 0.214ms-1.75 (VDV night). Both of these values are lower than the VDV Threshold Levels of 1.0ms-1.75 (VDV day) and 0.5ms-1.75 (VDV night). These threshold levels have been established in relation to human response to vibration, and thresholds for building damage are much higher. As the predicted levels of vibration from TBM passage are below these thresholds then no impact from vibration during TBM passage is expected for this building. The predicted groundborne noise and vibration from mechanical excavation at Collins Avenue Station are also presented with groundborne noise predicted to be 29 dB LASmax, which is below the 40 dB LASmax threshold. The predicted vibration during mechanical excavation is 0.001 ms-1.75 V DV which is well below the VDV Threshold Levels of 0.8ms-1.75 VDV (day) and 0.4ms-1.75 VDV (night). There are therefore no adverse impacts predicted at this location during the mechanical excavation at Collins Avenue station. Unfortunately, there are no effective methods are available to reduce groundborne noise from TBMs at source. The principal mitigation measures aimed at minimising impacts are as follows: • Advance public consultation and stakeholder engagement can greatly reduce the significance of groundborne noise effects during construction, as building occupants would be prepared for the passage of the TBM and resultant elevated noise and vibration levels. • TII will accept and consider applications for additional measures on a case-by case basis, in accordance with its Noise and Vibration Mitigation Policy (see Appendix A14.6). During railway operation the predicted groundborne noise at 164 Ballymun Road is 31 dB LASmax, which is below the threshold level of 40 dB LASmax indicating no significant impact during railway operation. The predicted VDV (Vibration Dose Value is a parameter that combines the magnitude of vibration and the time for which it occurs) during railway operation is 0.006 ms-1.75 (VDV day) and 0.003ms-1.75 (VDV night). Both of these values are well below the VDV Threshold Levels of 0.8ms-1.75 (VDV day) and 0.4ms-1.75 (VDV night) indicating no significant impact for the building or for residents of this address.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: Jian Cheng				
7	Observations/ Concerns	1	We cannot tolerate the noise, pollution and vibration that will be caused during the construction directly outside and underneath my house.	Please refer to response item (6) above related to Groundborne Noise and Vibration. <u>Airborne Noise and Vibration</u> The assessment of airborne noise and vibration during the construction of Collins Avenue Station includes the consideration of a number of receptors on Ballymun Road. Table 13.59 of Chapter 13 presents the unmitigated potential significant airborne noise impacts, which includes receptors with predicted Moderate to Significant, and Significant to Very Significant impacts during some of the work phases. Measures to mitigate noise are discussed in Section 13.6.1 and include the provision of 4m high boundary hoarding around works at Collins Avenue compound. Following the implementation of noise mitigation measures the magnitude of impact at 164 Ballymun Road is reduced to "Not Significant" as indicated in Pages 39 to 45 of EIAR Appendix 13.7 Construction Phase modelling. The Contractor will be required to set out noise mitigation measures in their Construction Environmental Management Plan (CEMP), an outline of which is included in EIAR Appendix A5.1. Should an Enforceable Railway Order be granted, prior to the commencement of any construction works, a detailed noise assessment for each work site will be undertaken based on the most up to date information for each. There is no published statutory Irish guidance relating to the maximum permissible noise level that may be generated during the Construction Phase of a project. Local authorities normally control construction activities by imposing limits on the hours of operation and consider noise limits at their discretion. Additionally, the contractor undertaking the construction of the works will be required to take specific noise abatement measures to the extent required and comply with the recommendations of BS 5228-1 (BSI 2014a). The Transport Infrastructure Ireland (TII) Airborne Noise and Ground-borne Noise Mitigation Policy (Appendix A14.6 of EIAR Chapter 14) sets out the construction noise insulation and temporary rehousing measures to be implemented, if required. When the dust minimisation measures detailed in the mitigation section of EIAR Chapter 16 are implemented, fugitive emissions of dust or pollution from the site are not predicted to be significant and pose no nuisance, human health or ecological risk to nearby receptors. Thus, there will be no likely residual Construction Phase dust effects.
8	Observations/ Concerns	1	We are also deeply fearful of the safety of our house due to tunnel being constructed directly underneath our house, we are even more fearful of the safety on ourselves day in and day out during the construction period that will last well beyond the 7-10 years that was estimated for this part of the project. I cannot accept that my children to grow up during their most vulnerable times on a construction site for best part of their youth.	TII would like to reassure you that the impact on your house has been assessed and there are no structural safety issues due to either the construction or operation of MetroLink. TII intend to implement best practice with regard to the construction of MetroLink and a priority is to ensure the safety and security of all those impacted by the works. TII acknowledge that there is potential for significant environmental effects on the surrounding area to the proposed MetroLink station if not mitigated effectively. However, as detailed in relevant chapters of the EIAR, TII's assessment shows that it is possible to mitigate the potential impacts identified at this location during the construction period. Once the construction phase is completed, the location of a MetroLink station at Our Lady of Victories Church will provide significant positive benefits to the local community in terms of enhanced public transport provision, reduced traffic and the resultant improvements in the environment, with reduced noise and air quality pollution.

Submission No.			141	
Organisation Name or Name of Submitter			Jian Cheng and Family (residents - 164 Ballymun Road)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: Jian Cheng				
9	Observations/ Concerns	1	I am also deeply concerned in respect of hugely increased population footfall after the station being in place, in terms of anti-social behaviour etc. The local residents all firmly believe that the Metro Station should be redesigned and built within the Albert College Park instead of building a ventilation shaft.	TII are keen to point out that once the construction phase is completed the location of a MetroLink station here will provide significant positive benefits to the local community in terms of enhanced public transport provision, reduced traffic and the resultant improvements in the environment, with reduced noise and air quality pollution. As outlined in section 7.7.10.7 of Chapter 7 of the EIAR the assessment undertaken for the Emerging Preferred Route (EPR) identified a preferred route option including the proposed station location in front of Our Lady of Victories Church. This location for the station provides a number of advantages when compared to other options which are: (1) It allows the project to achieve a core project objective of providing public transport that is integrated in the existing and future proposed transport network, allowing as it does for interchange between bus routes both on Collins Avenue and on Glasnevin road. A station location further south at the northern section of Albert College Park would not allow for this interchange potential as there would be over 500m separating potential bus stop locations and the MetroLink station. (2) The proposed Collins Avenue station would have a significant catchment area and analysis undertaken leading to the EPR identified that this route option had the highest potential passenger numbers when compared with other route options. (3) During the construction phase, the location of a station within the frontage to Our Lady of Victories means that traffic disruption would be reduced when compared to the location of a station within the road corridor (partially or fully). Regarding anti-social behaviour, as presented in the EIAR Chapter 6, MetroLink Operations and Maintenance, one of the outcomes of the architectural and urban realm design is to discourage anti-social behaviour, for example through the attractive setting, use of public lighting, open sight-lines, and avoidance of areas where individuals and groups of people can hide. Subject to data protection impact assessment and compliance with the General Data Protection Regulation (GDPR) anti-social behaviour on the trains and within the stations will be observed through CCTV (Closed Circuit Television) and if required staff sent to manage the situation. The ACID (Access control and intrusion detection) system will also identify intruders trying to enter locations where unauthorised access is prohibited. The station will be designed with safety and security in mind and as a core design principle.
10	Observations/ Concerns	1	We as a family had been extremely stressful about the planning proposal, we believe the current planed project will make our lives a living nightmare, essentially making our current location an inhabitable environment. We are pleading with the authority to reject the current planning proposal and order TII to redesign their planning please.	Refer to response (8).

SUBMISSION TO AN BORD PLEANALA Railway (Metrolink-Estuary to Charlemont via Dublin Airport) Order 2022.				
1	Letter	1	I support the decision of government and the application to grant permission for a Railway Order to run from Estuary to the City Centre. Dublin City has long needed a rail link to Dublin Airport and this central objective of the application as my support.	Thank you for taking the time to make a submission and your overall endorsement of the MetroLink Project. We have reviewed your submission and responded to the observations made below.
2	Letter	1	One aspect of the proposal which I do not support and which I would ask An Bord Pleanala to refuse is the proposal to have a terminal at Charlemont. As you know, the government decision permitted the construction of a Metrolink from Estuary to Dublin City Centre. Charlemont is not Dublin City Centre. It is a residential area south of the canal and a mile south of the City Centre.	The Board is required to have regard to the likely consequences for proper planning and sustainable development in the area in which it is proposed to carry out railway works (section 43(1) of the 2001 Act) and as such the following matters are relevant. The connection from St Stephens Green to Charlemont / Ranelagh is supported by the current Transport Strategy for Greater Dublin Area (2022-2042). The Transport Strategies were was prepared by the National Transport Authority, scrutinised by the Joint Oireachtas Committee on Transport and approved by the Minister for Transport. It notes in section 12.3.2, "Charlemont offers the optimal location for the primary interchange with the Green Line in response to growing demand in the longer term and is an appropriate location to facilitate any potential future Metro extensions to serve the south west, south or south east of the city region should sufficient demand arise." The Transport Strategy is "a consideration material to the proper planning and sustainable development of the area or areas in question." Development Plans are required to be consistent with the Transport Strategy. The Dublin City Development Plan 2022-2028 envisages this station at Charlemon in policy SMT22 "To support the expeditious delivery of key sustainable transport projects so as to provide an integrated public transport network with efficient interchange between transport modes, serving the existing and future needs of the city and region and to support the integration of existing public transport infrastructure with other transport modes. In particular the following projects subject to environmental requirements and appropriate planning consents being obtained: ... MetroLink from Charlemont to Swords". It is not clear what Government decision is referred to in the submission, but the Preliminary Business Case approved by the Government in July 2022 included the station at Charlemont. Accordingly, the location of the Charlemont station was a strategic decision made at the highest levels of transport and land use planning and such is fully consistent with the proper planning and sustainable development of the area. The current Transport Strategy considers a range of options for the onward extension of MetroLink to meet the demand for travel over the period of the strategy. This TII do not agree that Charlemont is the incorrect location for an interchange with the Luas Green Line or that it prejudices future options for integration with the wider transport network for the reasons set out below. In the Emerging Preferred Route Report, Charlemont was identified as the last station prior to the tie-in to the Green Luas Line which was intended to be upgraded to Metro standard. as outlined in EIAR chatper 7, decision to terminate at Charlemont instead was driven by three factors: (a) the additional impacts that would be involved in upgrading the Luas south of Charlemont as a result of the proposed adoption of a high degree of automated operations (GoA4); (b) the development of alternatives to accommodate increased capacity on the Luas line south of Charlemont without that upgrade; and (c) Feedback received during the EPR non-statutory consultation.

Submission No.			142	
Organisation Name or Name of Submitter			Jim O'Callaghan TD	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
SUBMISSION TO AN BORD PLEANALA Railway (Metrolink-Estuary to Charlemont via Dublin Airport) Order 2022.				
				The proximity of the Metro to the Luas line at Charlemont provides for a positive customer experience for all users with short interchange distance and due to the proximity, clear wayfinding and high visibility of the interchange. The interchange arrangements at Charlemont provide for significantly better interchange arrangements compared to an alternative interchange at St Stephen's Green Station. Passengers wishing to interchange between Luas and Metro at an alternative St Stephen's Green terminus would face a 500m-walk along a route either through St Stephen's Green park or along the footpath north of the park, which adds significantly to the time for interchange and therefore the overall journey time for passengers and a less positive customer experience for all interchange users. This passenger experience would be reduced further for those with mobility or visual impairments as well as those travelling to/from the airport with luggage. The detailed analysis done for the Railway Order application further confirms that the section of MetroLink route between St Stephen's Green and Charlemont Stations contributes significantly to the overall benefits of the scheme. It serves a significant area of the south city of Dublin and offers enhanced access from the local area to the city centre and a direct connection to Dublin Airport. It serves key trip attractors including residential areas and offices / workplace locations, with high passenger boarding and alighting figures in the peak hours. During the morning peak, at Charlemont station the flows include 1,800 passengers alighting, 2,300 boarding and 1,229 passengers alighting, 2,276 boarding during the evening peak. The passenger numbers contribute significantly to the overall benefits of the scheme and the effect of these benefits outweigh the additional costs that are associated with the delivery and operation of the section from St Stephen's Green to Charlemont station. Further information is available in Chapter 7: Consideration of the Alternatives, section 7.7.8 MetroLink Southern Terminus Location. The location of the interchange at Charlemont does not preclude onward extension south. An interchange at Charlemont is supported by policy including the Dublin City Development Plan 2022 - 2028 and the Transport Strategy for the Greater Dublin Area. By extending MetroLink to Charlemont it provides for future proofing of the Green Line, bypassing the capacity constrained Luas on-street running section, and ensures potential future connectivity options are enabled, either to the Green Line or for extensions of the Metro. The Charlemont Station interchange provides for increased passenger utilisation of the MetroLink system, thereby increasing the benefits delivered by the Project, reflected by an improved Project Benefit Cost Ration (BCR). Accordingly, the location of the Charlemont station is supported by detailed project-level analysis and the strength of that location is reflected at the highest levels of transport and land use planning and such is fully consistent with the proper planning and sustainable development of the area. The current Transport Strategy considers a range of options for the onward extension of MetroLink to meet the demand for travel over the period of the strategy. This includes consideration of the need for the upgrade of the Luas Green Line to Metro with a Metro extension to Dublin south west, south or south east. Whilst the strategy envisages that further extensions will be delivered after 2042, MetroLink which terminates at Charlemont allows for the possible extension of the Metro in all any of the above directions.
3	Letter	1	I believe permission should not be granted for the Metro Station at Charlemont but instead the terminal should be in the City Centre at St. Stephen's Green. The reason I oppose the Metro going to Charlemont is because I believe Dublin City will require a Metrolink to the south-west of the City in the very near future. If the Metrolink goes to Charlemont then this, in effect, rules out the later development of that Metro towards the south-west of the City.	The reasons for why TII are proposing a station at Charlemont are covered by response (2) above, noting that a station at Charlemont does not preclude the later development of the Metro towards the south-west of the City. The proposed route alignment from Estuary to Charlemont is consistent and compliant with the GDA Transport Strategy 2022-2042 (published in January 2023) which states that the south city terminus at Charlemont offers the optimal location for interchange with the Green Line in response to growing demand in the longer term and is an appropriate location to facilitate any potential future Metro extensions to serve the south west, south or south east of the city region should sufficient demand arise.

Submission No.			142	
Organisation Name or Name of Submitter			Jim O'Callaghan TD	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
SUBMISSION TO AN BORD PLEANALA Railway (Metrolink-Estuary to Charlemont via Dublin Airport) Order 2022.				
4	Letter	1	I believe that the reason why TII has sought to terminate the Metrolink at Charlemont is in order to pre-determine any future extension of that line so that it runs along the green Luas line. This has already been rejected by government and the TII should not be permitted to bind the hands of any future government and decisions it may wish to make in respect of the extension of rail infrastructure in the City.	TII can confirm that there is no predetermined future extension of Metro and would refer to responses (2) and (3) above that explain the reasons why a station at Charlemont is proposed.
5	Letter	2	There are many areas in south-west Dublin that do not have any rail infrastructure such as Leonard's Corner, Portobello, Harold's Cross, Rathgar, Terenure, Templeogue and Walkinstown. An Bord Pleancila should recognise that it makes no planning sense for this Metrolink to terminate at Charlemont which is a quiet residential area south of the canal.	Please refer to responses (2) and (3) that explain the reasons why a station at Charlemont is proposed. Future plans for the extensions of the Metro south of Charlemont are outside of the scope of this Railway Order application.
6	Letter	2	The overall project objective for Metrolink as established by the NTA and TII is to provide "a sustainable...and accessible public transport service between Swords, Dublin Airport and Dublin City Centre". By seeking permission for the Metro to terminate at Charlemont, the TII is seeking to circumvent this aim and objective of the project.	TII disagree that the overall project objectives are not achieved by a proposed station at Charlemont. EIAR Chapter 3, Background to the MetroLink Project, explains how the proposed Project will provide significant benefits not only to those who choose to use it, but also to other transport network users, by generating a modal shift from private car use, thereby reducing the demand for road space and creating the opportunity for the road transport system to achieve optimum levels of efficiency and effectiveness. MetroLink is predicted to divert 6.8 million car trips per annum in the early years, growing to 12 million per annum by 2045. Subsequently, there will be strong modal shift along all sections of the alignment, Further, as outlined in Chapter 3, the proposed Project is part of an integrated transport network that also includes for BusConnects and DART+ which are all included under Project Ireland 2040. Together, these projects will result in a reliable, sustainable, affordable, integrated public transport network that will support the economy, help Ireland meet its climate change targets in line with Climate Action Plan 2023 and make Dublin a more liveable and sustainable city. Whilst MetroLink is a standalone project that is not dependent on any other projects for its delivery or effective operation, it is nonetheless a critical part of the proposed integrated transport network for the Greater Dublin Area. Finally, as noted by the above responses, the proposed route alignment from Estuary to Charlemont is consistent and compliant with the GDA Transport Strategy 2022-2042 (published in January 2023).

Submission No.			143	
Organisation Name or Name of Submitter			Johann Harty (resident - 3A Mobhi Road, Glasnevin)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: Intended application by NRA [operating as Transport Infrastructure Ireland] for Railway [MetroLink- Estuary to Charlemont via Dublin Airport] Order [2022]				
1	Letter	1	I have received an information pack from Transport Infrastructure Ireland (TII) in relation to their application for the above reference MetroLink. Their application includes the acquisition of Substratum land beneath our property. While I support the proposed MetroLink, I have concerns in relation to the potential structural damages that may occur to our property during the construction stage.	While acknowledging your support for the Project, TII thank you for your submission and for sharing your concerns with regards to the MetroLink project to which we have responded below. A comprehensive Settlement Assessment has been undertaken to determine the potential impacts that construction of the proposed Project will have on sensitive receptors such as buildings and infrastructure from the advance of the TBM. The ground movement predictions and the building damage assessment methodology adopted for MetroLink is based on the approach adopted in most tunnel projects around the world, including London Crossrail and High Speed 2 in England. This is described in EIAR Section 5.4.11 (Ground Settlement Monitoring and Mitigation Works). EIAR Appendix A5.17 Building Damage Report, covers the assessed impacts of construction generated ground movements and settlement on property. Section 5.2 of this report sets out the rationale for the assessment of properties similar to yours. The results of the assessment provided in Table 5.2 shows that your property (Ref B - 163), as one of the representative properties selected, has been assessed as falling within the 'Negligible ' category. The building risk categories shown in Table 4-4 of the aforementioned report are used to define the degree of building damage related to the Risk Category. According to this Table, the Negligible damage category refers to hairline cracks. As your property is within the negligible category no further assessment beyond the Phase 2a Building Damage Assessment is required. Appendix A5.17 Appendix C contains the predicted settlement contour drawings. Sheet 20 of 30, drawing ML1-JAI-EIA-Rout_XX-DR-T-21140 refers to the tunnel alignment relevant to your propoerty.
2	Letter	1	I would therefore request that TII indemnify us against and structural damage or any loss of Rental income that is caused as a direct result of this development being approved and going ahead.	The Property Owner Protection Scheme (POPS), committed to by TII, allows residential property owners to register with TII if their residential property is within thirty (30) metres of the edge of the MetroLink alignment or fifty (50) metres of station structures. The POPS comprises condition surveys of residential properties along the route of the proposed Project. The purpose of the condition surveys is to ascertain the condition of the properties before, during (if deemed necessary), and after the completion of the proposed Project to determine whether there has been any deterioration of any of the properties surveyed and whether same may be attributable to the proposed Project, and subsequently to recommend repairs as appropriate. Condition survey data gathered pre and post construction, and possibly during construction, will be used to assist the property owner and TII in swift and accurate verification of any property damage claims which may be received from property owners. The POPS is designed to cater for / address repair work which may be necessary for any damage (attributable to the proposed Project) to a qualifying residential property up to a threshold of €45,000. The POPS will be introduced by TII through public consultation and will be formally advised to eligible property owners by the Public Relations Department. Further information on POPS is available in Chapter 11 (Population & Land Use). Useful information can also be found in the MetroLink Frequently Asked Questions document which can be found online at: https://www.metrolink.ie/en/your-property/property-owners-protection-scheme/ , and this is where useful updates will be made available as the proposed Project progresses.

Submission No.			143	
Organisation Name or Name of Submitter			Johann Harty (resident - 3A Mobhi Road, Glasnevin)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: Intended application by NRA [operating as Transport Infrastructure Ireland] for Railway [MetroLink- Estuary to Charlemont via Dublin Airport] Order [2022]				
3	Letter	1	In the case of my wife's Healthcare business at 3a St. Mobhi Rd, any loss of income or disruption to her business as a direct result of this development been approved and going ahead I would request similar indemnity to be in place.	Please refer to response item (2) above related to POPS, however it is important to note that this scheme is only applicable to residential properties and not for commercial buildings. TII acknowledge your concerns regarding any potential impact on your wife's healthcare business. Your property is approximately 280m from the southern boundary of the proposed construction compound at Albert College Park and therefore the direct impact from the shaft construction activities will be negligible. Traffic management plans have been developed to minimise the impact of the Project on road users, and to maintain continual access to residential properties and businesses. A hierarchical approach has been adopted, with pedestrian, cyclist, public transport and commercial needs provision taking priority over private vehicles. Whilst increases in traffic flow and driver delay are expected, there are no proposed diversions for local movements at this location and therefore disruption will be minimised. In very sensitive areas, such as the City Centre, the designated access and pedestrian routes around the construction sites, particularly at and/or along the hoarding lines, must not be perceived as uninviting by pedestrians. The environment around the sites, therefore, will be designed to ensure that pedestrians and cyclists feel they are entering a safe and accessible environment. This will ensure that impact to businesses and shops adjacent to the works areas is minimised. See EIAR Chapter 11, Population and Land Use, section 11.6.1.2 detailing construction activity mitigations for the population in general including those for economic activity. The Construction Noise and Vibration Management Plan will set out a detailed analysis of each construction compound relating to noise levels, durations and number of properties impacted and the planned approach for managing same. Prior to any construction work commencing on any of the main work sites a detailed acoustic impact assessment will be undertaken which will involve a baseline noise study, model of the contractors final site layout, plant and equipment models, numbers and on-site location and the inclusion of all available on-site noise control measures
4	Letter	1	I am presently negotiating with potential purchasers for my property. I therefore do not want potential building works to compromise this sale.	MetroLink will necessitate construction/ building works, however once complete it is anticipated that MetroLink will enhance the value for business and private properties.
5	Letter	2	If TII are not willing to indemnify us against any structural damage, loss of income, loss of sale of property due to this development been approved or work commencing we therefore object to the project.	Please refer to response items (2) and (3) above related to POPS and compensation for loss of income, and response item (4) in relation to the sale of your property.

Submission No.			144	
Organisation Name or Name of Submitter			John A Ryan (3 Dartmouth Square West)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Railway (MetroLink-Estuary to Charlemont via Dublin Airport) Order 2022 Case reference Number NA29N.314724				
1	Letter - Introduction	1	Whilst I am broadly in favour of any well-thought-out transport infrastructure planning (such as the proposed MetroLink to connect the airport to the city centre), I have deep misgivings about the proposed plan and the competence of TII to execute this plan within budget and timescale. As a resident of a home very close to the proposed Charlemont terminus I feel that my views on this aspect of the plan are concrete rather than abstract.	It is regrettable that the submitter has such misgivings given TII's record in successful delivery of Road and Public transport projects.
2	Key Submission Points	1	1. Charlemont is the incorrect strategic location for a Terminus. The notion of locating a major rail terminus at a small, congested, residential street such as Dartmouth Road is plainly absurd. Dartmouth Road currently struggles with the current level of through traffic between Ranelagh and Leeson Street. The congestion that will be caused by thousands of passengers transiting the station every hour and connecting with other forms of transport will create enormous issues not only for those same passengers but for the entire community within the area.	TII do not agree that Charlemont is the incorrect location for an interchange with the Luas Green Line or that it prejudices future options for integration with the wider transport network for the reasons set out below. In the Emerging Preferred Route Report, Charlemont was identified as the last station prior to the tie-in to the Green Luas Line which was intended to be upgraded to Metro standard. as outlined in EIAR chapter 7, decision to terminate at Charlemont instead was driven by three factors: (a) the additional impacts that would be involved in upgrading the Luas south of Charlemont as a result of the proposed adoption of a high degree of automated operations (GoA4); (b) the development of alternatives to accommodate increased capacity on the Luas line south of Charlemont without that upgrade; and (c) Feedback received during the EPR non-statutory consultation. A station on St Stephen's Green West is not preferred for several reasons. If a station was placed on St Stephen's Green West, the alignment between the proposed Tara Station and a station on St Stephen's Green West would result in an undesirable horizontal reverse curve and an alignment greater than a 1000m long that would necessitate an intermediate intervention shaft located somewhere between these stations to comply with the MetroLink Fire Strategy. Additional construction would be required to provide such a facility, similar in size to the proposed Albert College Park Intervention shaft. This could feasibly be situated in the Trinity College Dublin sports grounds. TII note that it is Government policy to provide a station and interchange with the Luas Green Line at Charlemont, as set out by the GDA Transport Strategy 2022 – 2042. Should a station be placed on St Stephen's Green West, the alignment between a station located here and the proposed Charlemont Station would also result in an undesirable horizontal reverse curve and an alignment that is greater than 1000m long, and would thus again require an intervention shaft similar to the proposed Albert College Park Intervention shaft to be provided. This would be expected to result in significant demolition and redevelopment in an existing built-up area. In both cases, compared to the proposed alignment that runs much more directly between Tara, St Stephen's Green and Charlemont, the additional length of tunnel and the addition of two intervention shafts generated by locating a station on St Stephen's Green West is uneconomic in comparison. As a potential station location, St Stephen's Green West itself is a very constrained location due to the presence of buildings, Luas and St Stephen's Green Park. Maintaining the Luas operational during station construction would be complex and challenging with significant disruption expected, whilst the impacts on St Stephen's Green Park would be greater for a station in this location compared to the proposed location on St Stephen's Green East. This would be the result of; the likely need to place more of the station in the Park compared to the proposed station on St Stephen's Green East; it would impact an area of the Park that has greater amenity value than St Stephen's Green East due to the nearby Park entrance adjacent to the southern end of Grafton Street, and there would be a risk of impacting the existing Park lake.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Railway (MetroLink-Estuary to Charlemont via Dublin Airport) Order 2022 Case reference Number NA29N.314724				
				In summary, an alignment that links the proposed Tara, St Stephen's Green East and Charlemont stations is a more direct and economic alignment, does not require additional intervention infrastructure, avoids a complex engineering interface with the Luas Green Line, impacts the Park less and has less potential for disruption during the construction phase. The proximity of the metro to the Luas line at Charlemont provides for a positive customer experience for all users with short interchange distance and due to the proximity, clear wayfinding and high visibility of the interchange. The interchange arrangements at Charlemont provide for significantly better interchange arrangements compared to an alternative interchange at St Stephen's Green Station. The detailed analysis done for the Railway Order application further confirms that the section of MetroLink route between St Stephen's Green and Charlemont Stations contributes significantly to the overall benefits of the scheme. It serves a significant area of the south city of Dublin and offers enhanced access from the local area to the city centre and a direct connection to Dublin Airport. It serves key trip attractors including residential areas and offices / workplace locations, with high passenger boarding and alighting figures in the peak hours. During the morning peak, at Charlemont station the flows include 1,800 passengers alighting, 2,300 boarding and 1,229 passengers alighting, 2,276 boarding during the evening peak. The passenger numbers contribute significantly to the overall benefits of the scheme and the effect of these benefits outweigh the additional costs that are associated with the delivery and operation of the section from St Stephen's Green to Charlemont station. Further information is available in Chapter 7: Consideration of the Alternatives, section 7.7.8 MetroLink Southern Terminus Location. The location of the interchange at Charlemont does not preclude onward extension south. An interchange at Charlemont is supported by policy including the Dublin City Development Plan 2022 - 2028 and the Transport Strategy for the Greater Dublin Area.
				By extending MetroLink to Charlemont it provides for future proofing of the Green Line, bypassing the capacity constrained Luas on-street running section, and ensures potential future connectivity options are enabled, either to the Green Line or for extensions of the metro.The Charlemont Station interchange provides for increased passenger utilisation of the MetroLink system, thereby increasing the benefits delivered by the Project, reflected by an improved Project Benefit Cost Ration (BCR). Accordingly, the location of the Charlemont station is supported by detailed project-level analysis and the strength of that location is reflected at the highest levels of transport and land use planning and such is fully consistent with the proper planning and sustainable development of the area. The current Transport Strategy considers a range of options for the onward extension of MetroLink to meet the demand for travel over the period of the strategy. This includes consideration of the need for the upgrade of the Luas Green Line to metro with a metro extension to Dublin south west, south or south east. Whilst the strategy envisages that further extensions will be delivered after 2042, MetroLink which terminates at Charlemont allows for the possible extension of the metro in all any of the above directions. Traffic and Pedestrian Congestion TII have modelled the impact of the potential changes to traffic and pedestrian movements and this shows there will be no significant impacts and instead MetroLink will provide improvements to the transport network as explained below. Please refer to Chapter 9, Traffic and Transport, Appendix A9.2-B Traffic and Transport Assessment, Charlemont Station, summarised in section 7.

Submission No.			144	
Organisation Name or Name of Submitter			John A Ryan (3 Dartmouth Square West)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Railway (MetroLink-Estuary to Charlemont via Dublin Airport) Order 2022 Case reference Number NA29N.314724				
				The MetroLink is designed to form part of an integrated public transport network with Charlemont selected as the preferred interchange location in order to maximise the potential interchange with the existing Luas Green Line. In overall terms, Charlemont Station will provide for improvements to the public transport network resulting in decreases in private car usage/trips, increases in public transport usages and will facilitate walking and cycling to the station, without significantly impacting on the operation of the road network in the area. A microsimulation VisWalk model has been developed for the immediate area surrounding Charlemont Station during the operational phase. The model covers the full extent of the publicly accessible station area, including the immediate vicinity of the station entrance at street level, the Luas stop and nearby junctions at Charlemont Bridge. In order to accommodate the forecast demand from the proposed Charlemont Station, a new staircase with 2.4m stair width is proposed at the south east corner of Charlemont Luas stop. An elevator will also be provided at this location. Both are sized for MetroLink to Luas, and Luas to MetroLink passenger numbers. In addition, it is proposed that the pedestrian crossing on R111 Grand Parade will be repositioned to the front of the building being developed by Hines. With this infrastructure in place, the model indicates that the R111 Grand Parade will have an acceptable level of service overall, with some reductions in service seen at the pedestrian crossing where pedestrians are required to wait for a green phase at the signals. Overall, it is considered that the model displays an acceptable level of network performance. The proposed pedestrian crossing on Grand Parade will have minimal impact on the traffic flow along Grand Parade and can be programmed to operate in sync with the existing signalised junction at Grand Parade /Charlemont Street to maintain the flow of traffic movements. When the Project is operational, car mode share will decrease, with a reduction of up to approximately 830 car tips to and from the zones surrounding Charlemont Station over the 12hr period in 2065. In overall terms, the Charlemont Station will provide for improvements to the public transport network resulting in decreases in private car usage/trips, increases in public transport usages and will facilitate walking and cycling to the station, without significantly impacting on the operation of the road network in the area.
3	Key Submission Points	1	2. Using Charlemont as a terminus will prejudice the future evolution of the network. For reasons best known to themselves TII have always favoured continuing Metrolink along the Luas Green Line, a policy that implied the destruction and rebuild of some of the best rail infrastructure undertaken in this country. When it was pointed out to them that the depth of the tunnel under the main sewer made this impossible, they changed the plan to make Charlemont a terminus. This appears to be a stubborn refusal to face engineering reality, as well as a shocking indictment of their professional competence. It was a local resident who pointed out the existence of a deep sewer along the canal, something TII had missed in their plans.	For clarity, the decision not to progress along the Luas Green Line with MetroLink was not driven by the location of the sewer along Grand Canal and any adjustments to the vertical alignment to de-risk the impacts to the sewer. ALG: As noted in Response (1) the location of the Charlemont station was a strategic decision made at the highest levels of transport and land use planning and such is fully consistent with the proper planning and sustainable development of the area. It is provided for the in the Transport Strategies and Dublin City Development Plan 2022-2028. The proposed MetroLink alignment has not been extended south of Charlemont for the reasons set out by the GDA strategy , section 12.3.10, "The challenges associated with the upgrading of the Luas Green Line to a metro standard of service have led to the emergence of an alternative proposal which seeks to meet travel demand from south of Sandyford along a new light rail corridor which serves UCD post-2042. As such, the upgrading of the Green Line to metro standard is not being pursued as part of this strategy. Instead, for this strategy period, the capacity and frequency on the current Green Line from Sandyford northwards to the city centre will be incrementally increased through the provision of additional tram fleet and services and associated turnback arrangements to meet forecast passenger demand. The location of the interchange at Charlemont does not preclude onward extension south. An interchange at Charlemont is supported by policy including the Dublin City Development Plan 2022 - 2028 and the Transport Strategy for the Greater Dublin Area. By extending MetroLink to Charlemont it provides for future proofing of the Green Line, bypassing the capacity constrained Luas on-street running section, and ensures potential future connectivity options are enabled, either to the Green Line or for extensions of the Metro.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Railway (MetroLink-Estuary to Charlemont via Dublin Airport) Order 2022 Case reference Number NA29N.314724				
4	Key Submission Points	1	3. The budget of €650M for the section between St. Stephens Green and Charlemont is an enormous misuse of financial resources when one considers that there is already a perfectly good means of making that short journey - the Luas.	The Board is not responsible for any decisions in relation to the funding the Project. It is solely responsible for assessing whether the Project is consistent with proper planning and sustainable development and that its effects on the environment are acceptable. The responsibility for funding the Project lies with the NTA, the Government and ultimately the Oireachtas. It has received all necessary approvals, including under the Public Spending Code for the making of a Railway Order. It will undergo further scrutiny and approvals, including under the Public Spending Code, before it is funded. It is not appropriate for the Board to make findings in relation to value-for-money that are outside its statutory functions and would cut across those arrangements. Members of the public are entitled to make representations to their TDs in relation to the value-for-money of any element of the Project. In any event, TII do not agree with this statement for the reasons set out by response (2) above, noting that infrastructure is not being duplicated given the capacity of the Luas south from St. Stephen's Green is restricted due to on-street running. There is a limit to the potential of the Luas to provide additional capacity in the on-street non-segregated section of the Luas Green Line from Charlemont northwards through the city centre. The nature of this route and the fact that it currently crosses several road junctions (Adelaide Road, Harcourt Street / Hatch Street upper and Harcourt Street / St Stephen's Green south) limit the service to a maximum of 24 trams per hour per direction. The projected demand for this section would require a higher frequency of up to 30 trams per hour and this demand cannot be met with on-street systems (Luas / bus). The interchange between Luas and MetroLink proposed at Charlemont will provide the necessary capacity to address the demand on this corridor and reduce overall travel time for passengers There is also high passenger demand forecast for a Metrolink station at Charlemont, including from the Ranelagh area, which would be lost if St. Stephen's Green was the MetroLink southern interchange station. The additional fare revenues collected by the Charlemont Station interchange increase the benefits delivered by the Project, reflected by an improved Project Benefit Cost Ration (BCR). Further, to ensure that public investment delivers value for money, the Public Spending Code sets out requirements for the evaluation, planning and management of public investment. The preparation of a Business Case is a key element of meeting these requirements. The Public Spending Code requires that both the Preliminary Business Case and Final Business Case for public investment projects are published. In July 2022, the Government granted Approval in Principle to the NTA to enable the submission of a railway order application by TII to An Bord Pleanála in respect of the MetroLink project (Decision Gate 1). This approval was granted after the Preliminary Business Case (PBC) had undergone significant scrutiny and challenge by bodies that are independent of TII, including DoT and DPER review (including independent review by JASPERS and the Major Projects Advisory Group (MPAG)) of the PBC around timeline, costs and benefits that were updated to inform the Government decision.
5	Key Submission Points	2	4. NTA have failed to provide adequate impact studies in relation the proposed project and those that have been supplied have all the appearance of documents hurriedly put together. Witness the extension of the deadline for making submissions to ABP due to the 'inadvertent omission' of such key documents.	TII disagree with this assertion. A detailed, robust and comprehensive EIAR and supporting appendices has been prepared for the proposed Project, which has allowed TII to address all questions raised during the statutory consultation from the material provided within the EIAR and supporting documentation. With regards to the extension of deadline referred, when it was found that c.30 pages had been inadvertently omitted from a 12,000 page submission, it was right and proper to extend the submission deadline.
6	Key Submission Points	2	5. NTA's record in managing a project of this scale is highly questionable. As mentioned in 2) they had failed to note the presence of a major sewer along the Grand Canal. The €25 million spent on excavating and building a station box beneath the Mater Hospital which will now have to be simply written off is further evidence that incompetence.	TII had not "failed to note the presence of a major sewer". It is a normal part of project design development for amendments to be made as further information becomes available, in this case surveys were undertaken of the sewer, and thus the proposed alignment design and Charlemont Station has full regard to the location of the sewer along Grand Canal. A station box was not built previously at Mater, rather a section of wall was installed to future proof the possible construction of a station. A comprehensive alternatives/options assessment has been undertaken for this Project to ensure that it meets the objectives for this Project (not a previous one). This assessment, as presented in Chapter 7 of the EIAR identified an alternative route for the alignment that did not match the one proposed for "Old Metro North" and as a result it was not possible or desirable to utilise the section of retaining wall constructed at the time.

Railway (MetroLink-Estuary to Charlemont via Dublin Airport) Order 2022 Case reference Number NA29N.314724				
7	Requested amendment	2	Requested amendment to An Bord Pleanála We request the following amendments: 1. Omit from the Railway Order the section from Tara Street Station to Charlemont Station and associated onward tunnel extension and intervention tunnel 2. Require the submission of a railway order for a section from Tara Street Station to St. Stephens Green which would effectively provide for a terminal hub station that can integrate with the Luas Green Line, multiple bus routes and future DART underground.	The above responses to the observations made explain why TII do not consider it is correct or appropriate that the MetroLink alignment south of the proposed Tara Station should be omitted, and also demonstrates why the proposed Charlemont Station has been selected by TII as the preferred interchange with the Luas Green Line A scheme which terminates at Tara Street would not be consistent with the Transport Strategy for Greater Dublin Area (2022-2042). In addition any decision to terminate the scheme at Tara will significantly impact on the overall viability and benefits of scheme.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Metro Terminus Case Reference Number: NA29N 314724 January 7 th , 2023				
1	Letter	1	As owners of the property situated in 17 Dartmouth Square, we are writing regarding the proposed tunnel under our property. We are totally opposed to the metro running through and under our property, The power of the metro structure would destroy the integrity of our property, cause serious devaluation and have a gravely detrimental effect on our health.	Please refer to the TII response to your submission dated 21 November 2022 (No.146), and in particular TII response (1).
2	Letter	1	TII accepted at an earlier Metrolink Meeting that the proposed metro could run under Carroll's Building which is not a residential building. Dartmouth Square is in a conservation area and all the properties are listed and protected.	Please refer to the TII response to your submission dated 21 November 2022 (No.146), and in particular TII response (2).
3	Letter	1	We own 17 Dartmouth Square, house, gardens and access to the lane. We also own the ground rent in respect of these properties. We do not accept that the metro should run under our gardens, close to our home. Furthermore, there are no amenities in the vicinity, no bus stops, no coach stops. To attempt to introduce them would create chaos. Also, Luas does not connect and the new Luas lift fitted with 4 hand rails accommodates at best 2 people with a bag. Cars and taxis cannot stop on the canal without create a serious danger for motorists, cyclists and pedestrians.	Please refer to the TII response to your submission dated 21 November 2022 (No.146), and in particular TII response (3) and (4).
4	Letter	1	The logical location for the Metro Terminus is in St Stephen's Green where all the amenities, attractions, shopping and cultural activities are and where the metro lines can radiate further West. The impact of the metro under our property would be devastating for us, for our home and for the other residents of Dartmouth Square. It would be inappropriate and prejudicial to position the metro directly behind Dartmouth Square and disastrous to run the tunnel through our property . Terminus needs to be positioned in St Stephen's Green where it should be.	Please refer to the TII response to your submission dated 21 November 2022 (No.146), and in particular TII response (1) and (5).

Re: Metrolink Terminus Case Reference Number: NA29N.314724 November 21, 2022				
1	Letter	1	As owners of 17 Dartmouth Square, we are opposed to the acquisition of the land under our property, both in terms of the amount of building and disturbance it would create but also the vibrations of the power of the Metro structure which, in such proximity, would affect the integrity of our house and the neighbouring houses and would be a cause of devaluation.	TII understand the reasons for your concerns and would like to provide the assurance that the potential disturbance impact on your property as a result of the proximity of the proposed tunnel and station has been carefully assessed. This includes the impact of noise and vibrations from: the tunnel boring machine (TBM), mechanical excavation and blasting; construction generated ground movements leading to settlement and possible building and property movement; and the operation of MetroLink. All of which have been assessed and reported in the EIAR and are summarised below. With exception of a temporary disturbance when the TBM passess your property, TII are predicting a 'not significant' impact to the building occupants and your building, or risk to the integrity of your house. Regards devaluation, there is evidence to suggest that property values will in fact increase in close proximity to public transport infrastructure and that local residents will greatly benefit from having a world class Metro system providing access to the city centre, airport and north city at their door step. The benefits of the project for all communities along the MetroLink route are described in Chapter 3: Background to the MetroLink Project, section 3.4 MetroLink Response to Challenges. Construction Phase – Airborne Noise and Vibration EIAR Chapter 13 Airborne Noise and Vibration, Table 13.68 summarises the potential significant construction noise impacts from the construction of the proposed Charlemont Station, which includes receptor 29 for 17 Dartmouth Square. The predicted impact without additional noise mitigation is Significant to Very Significant during some of the work phases. Noise mitigation measures are detailed in section 13.6.1 and include for a proposed 4m high acoustic noise screen along the east, west and southern boundaries of the Charlemont construction compound, and a 7m high noise screen along the northern boundary. Surface activities to support sprayed concrete tunnel construction will be enclosed within an acoustically clad steel framed building to control airborne noise breakout to surrounding receptors. With these mitigations the construction impacts are reduced to below significant. Construction Phase – Groundborne Noise and Vibration EIAR Chapter 14 Groundborne Noise and Vibration, Appendix 14.5 presents the predicted groundborne noise and vibration levels during the construction phase of the project for 17 Dartmouth Square: • The predicted level of groundborne noise during TBM passage is 49 dB LASmax, which is above the 45 dB LASmax threshold resulting in a significant impact on the occupants of the building for the relatively short duration of TBM passage. • The predicted level of groundborne vibration during TBM passage is 0.254 ms-1.75 day and 0.214 ms-1.75 night, below the VDV (Vibration Dose Value is a parameter that combines the magnitude of vibration and the time for which it occurs) Threshold Level of 1.0 ms-1.75 day and 0.5 ms-1.75 night, resulting in a not significant impact on the building. • The predicted level of groundborne noise during mechanical excavation at Charlemont Station is 38 dB LASmax, which is below the 40 dB LASmax threshold resulting in a not significant impact on the occupants of the building. • The predicted level of groundborne vibration during mechanical excavation at Charlemont Station is 0.002 ms-1.75 day and 0.002 ms-1.75 night, well below the VDV Threshold Level of 0.8 ms-1.75 day and 0.4 ms-1.75 night, resulting in a not significant impact on the building. • The predicted level of vibration during blasting at Charlemont Station is 6.1mm/s PPV (Peak Particle Velocity), which is below the 8mm/s PPV threshold resulting in a not significant impact on the building. • The predicted level of air overpressure during blasting at Charlemont Station is 110.1dB, below the Threshold Level of 125dB, resulting in a not significant impact on the building. Unfortunately, there are no effective methods available to reduce groundborne noise or vibration from the TBM at source but noting that the duration of this impact will be temporary and of the order of up to two-weeks as the TBM passes. TII will undertake advanced consultation and stakeholder engagement to prepare people for the passing of the TBM and ensure the timing of these impacts are known.

Submission No.			146	
Organisation Name or Name of Submitter			John and Josiane Bullows	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Metrolink Terminus Case Reference Number: NA29N.314724 November 21, 2022				
			Response (1) continued.	TII's contractor(s) will prepare a Construction Noise and Vibration Management Plan (CNVMP) for the proposed Project as referred to in EIAR Appendix A5.1, Outline Construction Environmental Management Plan (CEMP). The CNVMP will be a live document and will include a full monitoring and auditing programme which will be agreed with the Local Authorities prior to the commencement of the Construction Phase, including predetermined monitoring trigger levels to ensure noise and vibration limits are not breached, noting that it is not possible to mitigate TBM groundborne noise and vibration at source. Table 6.2: Noise and Vibration Measures of the Outline CEMP outlines the monitoring programme requirements. The Transport Infrastructure Ireland (TII) Airborne Noise and Ground-borne Noise Mitigation Policy (Appendix A14.6 of EIAR Chapter 14) also sets out the construction noise insulation and temporary rehousing measures to be implemented where required. Construction Generated Ground Movements EIAR Appendix A 5.17 Building Damage Report, covers the assessed impacts of construction generated ground movements and settlement on your property and has been predicted to not exceed the 'Slight' category, an explanation for which can be found in Table 4-4 of the aforementioned report. The assessment work undertaken for the EIAR has determined that your property along with other similar neighbouring properties have been designated as "special" and hence a further Phase 3 refined assessment will be undertaken that will take account of final design and construction methodology details most likely utilising advanced numerical modelling techniques and further surveys of the building. The results of this refined assessment typically show that earlier assessments are conservative and overestimate the likely impact of construction generated ground movements. Monitoring instrumentation will also be installed to monitor the performance of the works and potential environmental impacts, including those discussed above to ensure that acceptable limits are not breached. TII would also draw attention to the fact that private properties within 50m of the station excavation, or 30m of the tunnel are eligible to subscribe to the Property Owners Protection Scheme (POPs). The Property Owners' Protection Scheme is in addition to the existing legal rights of property owners and is in place to provide a simple and prompt way of rectifying any damage caused under the project up to the ceiling of €45,000. If the sum should exceed this amount the normal claims process would be used with the insurance companies for TII and/or the contractor. Operational Noise and Vibration EIAR Chapters 13 and 14 present a comprehensive and detailed assessment of operational groundborne and airborne noise and vibration. No residual noise impacts are identified at this location during operation. The calculated rail noise levels across the proposed Project are not significant in terms of any widespread community disturbance and results in a not significant to slight impact when added to the prevailing noise environment.

Submission No.			146

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Metrolink Terminus Case Reference Number: NA29N.314724 November 21, 2022				
			Response (1) continued.	Chapter 13, sections 13.2.3.2 and 13.5.3.2.3 recognise that ventilation systems if not designed and mitigated effectively are potential noise sources. Section 13.6.2.3 outlines the detailed considerations that will be included in the design to ensure that the ventilation systems do not exceed limits as per BS 4142, including: • Reduction of induct flow rates; • Reduction of elements in the airflow; • In duct attenuators; • Orientation of grilles and louvres away from sensitive receptors; • Acoustic louvres; and • Anti-vibration mountings and couplings will be incorporated into the design to control vibration. Measures to mitigate noise from the use of public address systems is also detailed in Chapter 13 (sections 13.5.3.2.4 and 13.6.2.4). Best practice design principles will be employed to minimise noise breakout at the surface from these systems via escalators, lift shafts and stairwells. EIAR Chapter 14, Groundborne Noise and Vibration, Appendix 14.5 presents the predicted groundborne noise and vibration levels during the operation phase of the project for 17 Dartmouth Square: • The predicted level of groundborne noise during the railway operation is 21 dB LASmax, which is below the 40 dB LASmax threshold resulting in a not significant impact on the occupants of the building. • The predicted level of groundborne vibration during the railway operation is 0.001 ms-1.75 day and 0.00 ms-1.75 night, well below the VDV Threshold Level of 0.8 ms-1.75 day and 0.4 ms-1.75 night, resulting in a not significant impact on the building.
2	Letter	1	TII admitted at a Metrolink meeting that it was possible to position the proposed Metro under the Carroll's building. This would be a better solution for Dartmouth Square residents.	Though the possibility of locating the station beneath the Carolls building may have been discuss at one of the meetings with TII staff, TII confirm that it is not possible to locate the station beneath this building due to geometric constraints at this location.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Metrolink Terminus Case Reference Number: NA29N.314724 November 21, 2022				
3	Letter	1	By positioning the terminus centrally in St Stephen's Green, passengers can avail of other forms of transport such as luas, bus, coach, taxi and rail, in an area that can absorb future major transport activity on the scale of a Metrolink southside terminus.	TII do not agree that St Stephen's Green is a better interchange with the Luas Green Line than Charlemont for the reasons set out below. The Board is required to have regard to the likely consequences for proper planning and sustainable development in the area in which it is proposed to carry out railway works (section 43(1) of the 2001 Act) and as such the following matters are relevant. The connection from St Stephens Green to Charlemont / Ranelagh is supported by the current Transport Strategy for Greater Dublin Area (2022-2042). The Transport Strategies were was prepared by the National Transport Authority, scrutinised by the Joint Oireachtas Committee on Transport and approved by the Minister for Transport. It notes in section 12.3.2, "Charlemont offers the optimal location for the primary interchange with the Green Line in response to growing demand in the longer term and is an appropriate location to facilitate any potential future Metro extensions to serve the south west, south or south east of the city region should sufficient demand arise." The Transport Strategy is "a consideration material to the proper planning and sustainable development of the area or areas in question." Development Plans are required to be consistent with the Transport Strategy. The Dublin City Development Plan 2022-2028 envisages this station at Charlemon in policy SMT22 "To support the expeditious delivery of key sustainable transport projects so as to provide an integrated public transport network with efficient interchange between transport modes, serving the existing and future needs of the city and region and to support the integration of existing public transport infrastructure with other transport modes. In particular the following projects subject to environmental requirements and appropriate planning consents being obtained: ... MetroLink from Charlemont to Swords". Accordingly, the location of the Charlemont station was a strategic decision made at the highest levels of transport and land use planning and such is fully consistent with the proper planning and sustainable development of the area. The current Transport Strategy considers a range of options for the onward extension of MetroLink to meet the demand for travel over the period of the strategy. This includes consideration of the need for the upgrade of the Luas Green Line to Metro with a Metro extension to Dublin south west, south or south east. Whilst the strategy envisages that further extensions will be delivered after 2042, MetroLink which terminates at Charlemont allows for the possible extension of the Metro in all any of the above directions. The current Transport Strategy considers a range of options for the onward extension of MetroLink to meet the demand for travel over the period of the strategy. This includes consideration of the need for the upgrade of the Luas Green Line to Metro with a Metro extension to Dublin south west, south or south east. Whilst the strategy envisages that further extensions will be delivered after 2042, MetroLink which terminates at Charlemont allows for the possible extension of the Metro in all the above directions. The proximity of the Metro to the Luas line at Charlemont provides for a positive customer experience for all users with short interchange distance and due to the proximity, clear wayfinding and high visibility of the interchange. The interchange arrangements at Charlemont provide for significantly better interchange arrangements compared to an alternative interchange at St Stephen's Green Station. Passengers wishing to interchange between Luas and Metro at an alternative St Stephen's Green terminus would face a 500m-walk along a route either through St Stephen's Green park or along the footpath north of the park, which adds significantly to the time for interchange and therefore the overall journey time for passengers and a less positive customer experience for all interchange users. This passenger experience would be reduced further for those with mobility or visual impairments as well as those travelling to/from the airport with luggage. The detailed analysis done for the Railway Order application further confirms that the section of MetroLink route between St Stephen's Green and Charlemont Stations contributes significantly to the overall benefits of the scheme. It serves a significant area of the south city of Dublin and offers enhanced access from the local area to the city centre and a direct connection to Dublin Airport. It serves key trip attractors including residential areas and offices / workplace locations, with high passenger boarding and alighting figures in the peak hours. During the morning peak, at Charlemont station the flows include 1,800 passengers alighting, 2,300 boarding and 1,229 passengers alighting, 2,276 boarding during the evening peak. The passenger numbers contribute significantly to the overall benefits of the scheme and the effect of these benefits outweigh the additional costs that are associated with the delivery and operation of the section from St Stephen's Green to Charlemont station. . Further information is available in Chapter 7: Consideration of the Alternatives, section 7.7.8 MetroLink Southern Terminus Location.

Submission No.			146	
Organisation Name or Name of Submitter			John and Josiane Bullows	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Metrolink Terminus Case Reference Number: NA29N.314724 November 21, 2022				
			Response (3) continued.	The location of the interchange at Charlemont does not preclude onward extension south. An interchange at Charlemont is supported by policy including the Dublin City Development Plan 2022 - 2028 and the Transport Strategy for the Greater Dublin Area. As noted by the GDA Transport Strategy 2022-2042, section 12.3.2, "Charlemont offers the optimal location for the primary interchange with the Green Line in response to growing demand in the longer term and is an appropriate location to facilitate any potential future Metro extensions to serve the south west, south or south east of the city region should sufficient demand arise." By extending MetroLink to Charlemont it provides for future proofing of the Green Line, bypassing the capacity constrained Luas on-street running section, and ensures potential future connectivity options are enabled, either to the Green Line or for extensions of the Metro. The Charlemont Station interchange provides for increased passenger utilisation of the MetroLink system, thereby increasing the benefits delivered by the Project, reflected by an improved Project Benefit Cost Ration (BCR).
4	Letter	1	In Charlemont, there are no bus tops, coach stops or taxi ranks on the boundary roads and to introduce them, would be creating an unimaginable chaos, and Luas would not connect. The canal road is congested and blocked in the morning and evening. It would be dangerous for a car or a taxi to stop to drop or collect a passenger in the middle of the traffic. There is also very limited transport access to the location as it is defined from the East by the residential houses of Dartmouth Square and from the West by the very narrow residential Dartmouth Lane. To the South is Dartmouth Road which is also severely congested. This would become the point of entry for cars, buses, coaches and taxis and would have devastating consequences for the residents and also for Dublin traffic in general.	As noted in response (3), the location of the Charlemont station was a strategic decision made at the highest levels of transport and land use planning and such is fully consistent with the proper planning and sustainable development of the area. The terminus is consistent with the GDA Transport Strategy. TII would note that the observations made with regards traffic congestion is one of the reasons why MetroLink is such an important project for the Greater Dublin Area. The proposed Project will provide significant benefits not only to those who choose to use it, but also to other transport network users, by reducing the demand for road space and creating the opportunity for the road transport system to achieve optimum levels of efficiency and effectiveness. The system is designed in an integrated manner so that people travelling from the area south of Dublin to access locations north of Charlemont, such as Dublin Airport, Mater, Swords etc. will utilise public transport to interchange with the MetroLink or will walk or cycle to access their local station. The system is not designed to encourage people to drive to stations within the City and TII do not anticipate that there will be significant volumes of people driving to any stations, other than the Park & Ride station at Estuary. When the Project is operational, car mode share will decrease, with a reduction of up to approximately 830 car tips to and from the zones surrounding Charlemont Station over the 12hr period in 2065. In overall terms, the Charlemont Station will provide for improvements to the public transport network resulting in decreases in private car usage/trips, increases in public transport usages and will facilitate walking and cycling to the station, without significantly impacting on the operation of the road network in the area. Chapter 9: Traffic & transport, Appendix A9.2-B Traffic and Transport Assessment Charlemont Station, Section 6.1.2. refers. With regards to the observation that "Luas would not connect", a microsimulation VisWalk model has been developed for the immediate area surrounding Charlemont Station during the operational phase. The model covers the full extent of the publicly accessible station area, including the immediate vicinity of the station entrance at street level, the Luas stop and nearby junctions at Charlemont Bridge. In order to accommodate the forecast demand from the Project station, a new staircase with 2.4m stair width is proposed at the south east corner of Charlemont Luas stop. An elevator will also be provided at this location. Both have been sized for Metro to Luas, and Luas to Metro passenger numbers. TII would also note they have deliberately designed Charlemont Station with minimum set down space (with the exception of a drop-off on Grand Parade for persons of restricted mobility only) or room for taxi ranks so that it does not encourage the Station to be used as a terminus.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Metrolink Terminus Case Reference Number: NA29N.314724 November 21, 2022				
5	Letter	1	The logical location for the Metro link in St Stephen' s Green, in the city centre, where the amenities, attractions, shopping and cultural activities are.	Please refer to response (3) above.
6	Letter	1	The added cost of tunnelling and building a terminus in Charlemont cannot be justified as there are no advantages in building it there. On the opposite, one would face a minefield of traffic, human and environmental issues which would have to be reversed.	The Board is not responsible for any decisions in relation to the funding the Project. It is solely responsible for assessing whether the Project is consistent with proper planning and sustainable development and that its effects on the environment are acceptable. The responsibility for funding the Project lies with the NTA, the Government and ultimately the Oireachtas. It has received all necessary approvals, including under the Public Spending Code for the making of a Railway Order. It will undergo further scrutiny and approvals, including under the Public Spending Code, before it is funded. It is not appropriate for the Board to make findings in relation to value-for-money that are outside its statutory functions and would cut across those arrangements. Members of the public are entitled to make representations to their TDs in relation to the value-for-money of any element of the Project. In any event, TII do not agree with the statement "building a terminus in Charlemont cannot be justified" for the reasons set out by response (2) above, noting that infrastructure is not being duplicated given the capacity of the Luas south from St. Stephen's Green is restricted due to on-street running. There is a limit to the potential of the Luas to provide additional capacity in the on-street non-segregated section of the Luas Green Line from Charlemont northwards through the city centre. The nature of this route and the fact that it currently crosses several road junctions (Adelaide Road, Harcourt Street / Hatch Street upper and Harcourt Street / St Stephen's Green south) limit the service to a maximum of 24 trams per hour per direction. The projected demand for this section would require a higher frequency of up to 30 trams per hour and this demand cannot be met with on-street systems (Luas / bus). The interchange between Luas and MetroLink proposed at Charlemont will provide the necessary capacity to address the demand on this corridor and reduce overall travel time for passengers There is also high passenger demand forecast for a Metrolink station at Charlemont, including from the Ranelagh area, which would be lost if St. Stephen's Green was the MetroLink southern interchange station. The additional fare revenues collected by the Charlemont Station interchange increase the benefits delivered by the Project, reflected by an improved Project Benefit Cost Ration (BCR). Further, to ensure that public investment delivers value for money, the Public Spending Code sets out requirements for the evaluation, planning and management of public investment. The preparation of a Business Case is a key element of meeting these requirements. The Public Spending Code requires that both the Preliminary Business Case and Final Business Case for public investment projects are published. In July 2022, the Government granted Approval in Principle to the NTA to enable the submission of a railway order application by TII to An Bord Pleanála in respect of the MetroLink project (Decision Gate 1). This approval was granted after the Preliminary Business Case (PBC) had undergone significant scrutiny and challenge by bodies that are independent of TII, including DoT and DPER review (including independent review by JASPERS and the Major Projects Advisory Group (MPAG)) of the PBC around timeline, costs and benefits that were updated to inform the Government decision. TII would also note, for the reasons explained by response (4) above that the observation that traffic impacts are made worse is incorrect and contrary to one of the key objectives and benefits of the MetroLink Project. TII acknowledge there are human and environmental impacts, but TII have demonstrated these can be mitigated to acceptable levels.

Re: Metrolink Terminus Case Reference Number: NA29N.314724 November 21, 2022				
7	Letter	1	For all the reasons listed above and the impact it would have on a residential area and the environment, it would be inappropriate and prejudicial to position the Metro directly behind Dartmouth Square and build a Metro station with lifts and escalators at 1,5 m (5 feet) from our homes.	TII have carefully considered the submission and responded to the observations made. As reflected by the TII responses above to the observations raised, TII consider they have demonstrated why the proposed Charlemont Station has been selected by TII as the preferred interchange with the Luas Green Line.

Submission No.			148	
Organisation Name or Name of Submitter			John Bernard Reid (4 Bridge Court, City Gate, Saint Augustine Street, Christchurch, Dublin 8, D08R6PV)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Observation on the application for a Railway Order for Metrolink (Case reference NA29N.314724).				
1	Letter	1	I write in support of the application for a railway order for the Dublin (Estuary to Charlemont, via Dublin Airport) Metrolink. The proposed Metrolink constitutes an absolutely vital and necessary piece of national infrastructure.	Thank you for taking the time to make this submission and for your endorsement of the MetroLink Project.
2	Letter	2	Allowing the proposed Metrolink to reach the proposed Charlemont station on the South side of the city would allow the eventual (and necessary) extension of the line to the South and South West of the city and county. A Charlemont terminus would also allow for a potential future Metrolink extension or spur to Ireland's largest university, University College Dublin at Belfield. Despite its status as the country's largest third-level institution, UCD is currently not connected by even one direct railway link.	In accordance with your observation and as identified in EIAR Chapter 7, Consideration of Alternatives, the selection of Charlemont does not preclude any future connections to the south-west or south of the city. TII will maintain engagement with UCD and relevant stakeholders for future feasibility studies and route considerations for future phases of the Project. The GDA Transport Strategy 2022-2042 (as adopted in Jan 2023) section 12.3.8 Additional Luas Lines Post-2042, also states that the analysis undertaken for the Transport Strategy indicates that a number of corridors in the GDA will, in the longer term, generate travel demand above that which can be catered for by higher capacity bus systems and are likely to require upgrading to light rail in the period after 2042. The planning and design work associated with this longer term framework can commence during the strategy period. The Green Line Reconfiguration is proposed to provide a city centre line to Bray via UCD and Sandyford, however this is subject to the detailed appraisal, planning and design by the NTA, and is not within the remit of TII or An Bord Pleanála as regards this application.
3	Letter	2	The current absence of a direct railway link to Ireland's largest university is incongruent and unsustainable. Allowing the proposed Metrolink to reach Charlemont (as per the current railway order application) would lay the groundwork for eventually rectifying this anomaly for the good of students, residents and Ireland's international reputation.	Please refer to response (2) above.
4	Letter	3	The proposed 3,000 space multi-story Park and Ride car park facility at the proposed Estuary terminus should be approved, with the proposed car park capacity perhaps even increased in order to facilitate more than 3,000 car drivers to use the proposed Metrolink.	The Project has been designed to ensure maximum interchange with other modes of transport, specifically more sustainable modes of transport, such as walking, cycling and public transport to encourage a modal shift away from private vehicles and an overall reduction in car trips in Dublin. Chapter 9, Traffic and Transport details the operational impact of the Park & Ride facility on the surrounding road network, and whilst the strategic road network will experience an overall reduction in AADT and delays with increased use of public transport, the M1 and other local roads north of the Park & Ride facility see an increase in traffic flow due to people accessing the Park & Ride. Therefore, as outlined in EIAR Chapter 31, Summaries of the route wide mitigation and monitoring, item TT19, the use of the Park & Ride facility at Estuary Station will be monitored throughout the Operational Phase. Data on the origins and destinations of users and their trips will be monitored throughout the operation of the Park & Ride facility so that the operation of the Park & Ride facility can be optimised throughout the life of MetroLink.
5	Letter	3	In conclusion, I believe that it is in the national interest for the current Metrolink railway order application to be approved, in an expeditious manner and without delay. I would request that An Bord Pleanála would avoid the creation of unnecessary delays such as oral hearings, for example. MetroLink needs to be approved for construction whilst both the political will, and the money, is there to build it.	TII again thank you for your endorsement and support. TII as the Government Agency responsible for delivering MetroLink are committed to expediting the delivery of this transformative project should An Bord Pleanála chose to grant the Railway Order and in accordance with Government direction and any conditions that the Railway Order may include.

Submission No.			149	
Organisation Name or Name of Submitter			John Conway and Orlaith McCarthy (15 Dartmouth Square West)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Observation on a Startegic Infrastructure Development				
1	Letter introduction	3	Our names are John Conway and Orlaith McCarthy. We have been living at # 15 Dartmouth Square West for more than 40 years..... It is important to state at the outset that we are very much in favour of the Metrolink project to connect Dublin's city centre to our national airport and the broader objective of providing a modern and efficient public transport infrastructure for the people of Dublin. That is why we have a number of concerns that the current plan is not optimal and is wasteful of public money. We want to set out a number of observations for the Board regarding the proposal to locate the city centre Terminus station at Charlemont-Dartmouth. Our family home is in the midst of the community where the Terminus station is proposed to be located.	Thank you for taking the time to make a submission and your overall endorsement of the MetroLink Project. We have reviewed your submission and responded to the observations made below.
2	(a) Strategy & Policy Issues	4	1. Charlemont is NOT the correct strategic location for a Terminus hub and spoke system. It is too far out along the Luas Green Line spoke and would prejudice future options for integration of networks and services.	TII do not agree that Charlemont is the incorrect location for an interchange with the Luas Green Line or that it prejudices future options for integration with the wider transport network for the reasons set out below. The Board is required to have regard to the likely consequences for proper planning and sustainable development in the area in which it is proposed to carry out railway works (section 43(1) of the 2001 Act) and as such the following matters are relevant. The connection from St Stephens Green to Charlemont / Ranelagh is supported by the current Transport Strategy for Greater Dublin Area (2022-2042). The Transport Strategies were prepared by the National Transport Authority, scrutinised by the Joint Oireachtas Committee on Transport and approved by the Minister for Transport. It notes in section 12.3.2, "Charlemont offers the optimal location for the primary interchange with the Green Line in response to growing demand in the longer term and is an appropriate location to facilitate any potential future metro extensions to serve the south west, south or south east of the city region should sufficient demand arise." The Transport Strategy is "a consideration material to the proper planning and sustainable development of the area or areas in question." Development Plans are required to be consistent with the Transport Strategy. The Dublin City Development Plan 2022-2028 envisages this station at Charlemont in policy SMT22 "To support the expeditious delivery of key sustainable transport projects so as to provide an integrated public transport network with efficient interchange between transport modes, serving the existing and future needs of the city and region and to support the integration of existing public transport infrastructure with other transport modes. In particular the following projects subject to environmental requirements and appropriate planning consents being obtained: ... MetroLink from Charlemont to Swords". Accordingly, the location of the Charlemont station was a strategic decision made at the highest levels of transport and land use planning and such is fully consistent with the proper planning and sustainable development of the area. The current Transport Strategy considers a range of options for the onward extension of MetroLink to meet the demand for travel over the period of the strategy. This includes consideration of the need for the upgrade of the Luas Green Line to metro with a metro extension to Dublin south west, south or south east. Whilst the strategy envisages that further extensions will be delivered after 2042, MetroLink which terminates at Charlemont allows for the possible extension of the metro in all any of the above directions. The proximity of the metro to the Luas line at Charlemont provides for a positive customer experience for all users with short interchange distance and due to the proximity, clear wayfinding and high visibility of the interchange. The interchange arrangements at Charlemont provide for significantly better interchange arrangements compared to an interchange at St Stephen's Green Station.

Submission No.			149

Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
Observation on a Startegic Infrastructure Development					
				The detailed analysis done for the Railway Order application further confirms that the section of MetroLink route between St Stephen's Green and Charlemont Stations contributes significantly to the overall benefits of the scheme. It serves a significant area of the south city of Dublin and offers enhanced access from the local area to the city centre and a direct connection to Dublin Airport. It serves key trip attractors including residential areas and offices / workplace locations, with high passenger boarding and alighting figures in the peak hours. During the morning peak, at Charlemont station the flows include 1,800 passengers alighting, 2,300 boarding and 1,229 passengers alighting, 2,276 boarding during the evening peak. The passenger numbers contribute significantly to the overall benefits of the scheme and the effect of these benefits outweigh the additional costs that are associated with the delivery and operation of the section from St Stephen's Green to Charlemont station. The location of the interchange at Charlemont does not preclude onward extension south. An interchange at Charlemont is supported by policy including the Dublin City Development Plan 2022 - 2028 and the Transport Strategy for the Greater Dublin Area. By extending MetroLink to Charlemont it provides for future proofing of the Green Line, bypassing the capacity constrained Luas on-street running section, and ensures potential future connectivity options are enabled, either to the Green Line or for extensions of the metro. The Charlemont Station interchange provides for increased passenger utilisation of the MetroLink system, thereby increasing the benefits delivered by the Project, reflected by an improved Project Benefit Cost Ration (BCR).	
3	(a) Strategy & Policy Issues	4	1. (continued) St. Stephens Green is the most appropriate location for the Terminus as it provides for interchange with bus, Luas and future DART underground. The project incorrectly dismisses St. Stephens Green West as an appropriate terminal station. It only considers St. Stephens Green East and Charlemont. Furthermore, no study has been completed by NTA/TII as part of the entire Metrolink project on the optimal location for a city centre terminus.	TII do not agree that St Stephen's Green is the most appropriate interchange location for the reasons set out by response (2) above. It is not correct to say that the Project "only considers St. Stephens Green East and Charlemont." A number of route options were considered in the process of identifying the Emerging Preferred Route (EPR). These route options included potential station locations on St. Stephen's Green West. However these options were ruled out as it was not possible to design an alignment that would also provide a MetroLink interchange with DART at Tara Street Station. A station on St Stephen's Green West is not preferred for several reasons: If a station was placed on St Stephen's Green West, the alignment between the proposed Tara Station and a station on St Stephen's Green West would result in an undesirable horizontal reverse curve and an alignment greater than a 1000m long that would necessitate an intermediate intervention shaft located somewhere between these stations to comply with the MetroLink Fire Strategy. Additional construction would be required to provide such a facility, similar in size to the proposed Albert College Park Intervention shaft. This could feasibly be situated in the Trinity College Dublin sports grounds. TII note that it is Government policy to provide a station and interchange with the Luas Green Line at Charlemont, as set out by the GDA Transport Strategy 2022 – 2042. Should a station be placed on St Stephen's Green West, the alignment between a station located here and the proposed Charlemont Station would also result in an undesirable horizontal reverse curve and an alignment that is greater than 1000m long, and would thus again require an intervention shaft similar to the proposed Albert College Park Intervention shaft to be provided. This would be expected to result in significant demolition and redevelopment in an existing built-up area.	

Submission No.			149	
Organisation Name or Name of Submitter			John Conway and Orlaith McCarthy (15 Dartmouth Square West)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Observation on a Startegic Infrastructure Development				
				In both cases, compared to the proposed alignment that runs much more directly between Tara, St Stephen’s Green and Charlemont, the additional length of tunnel and the addition of two intervention shafts generated by locating a station on St Stephen’s Green West is uneconomic in comparison. As a potential station location, St Stephen’s Green West itself is a very constrained location due to the presence of buildings, Luas and St Stephen’s Green Park. Maintaining the Luas operational during station construction would be complex and challenging with significant disruption expected, whilst the impacts on St Stephen’s Green Park would be greater for a station in this location compared to the proposed location on St Stephen’s Green East. This would be the result of; the likely need to place more of the station in the Park compared to the proposed station on St Stephen’s Green East; it would impact an area of the Park that has greater amenity value than St Stephen’s Green East due to the nearby Park entrance adjacent to the southern end of Grafton Street, and there would be a risk of impacting the existing Park lake. In summary, an alignment that links the proposed Tara, St Stephen’s Green East and Charlemont stations is a more direct and economic alignment, does not require additional intervention infrastructure, avoids a complex engineering interface with the Luas Green Line, impacts the Park less and has less potential for disruption during the construction phase. As outlined by EIAR Chapter 3, Background to the MetroLink Project, one of the key objectives of the Project is the integration of it with the wider transport network that also includes for BusConnects and DART+ which are all included under Project Ireland 2040. Together, these projects will result in a reliable, sustainable, affordable, integrated public transport network that will support the economy, help Ireland meet its climate change targets in line with Climate Action Plan 2023 and make Dublin a more liveable and sustainable city. Arising from the decision to postpone the future upgrade of the Green Line to metro services, it is being argued that Charlemont station effectively becomes a terminus station in the short to medium term. In this regard, it is true to say that the Metrolink trains will terminate and turn back at Charlemont station, however the public transport service offering for passengers does not terminate, it transfers from Metrolink to LUAS as part of the integrated transport network. The terminus station for MetroLink is located at Estuary where all of the activities normally associated with a terminus take place. At this location the high capacity public transport offering terminates and the public transport offering transfers to a completely different mode, i.e. Bus. The environmental effects of the Metrolink terminus are accordingly assessed in the EIAR. Charlemont Station does not have the associated infrastructure and services associated with a terminus location and in fact has more in common with a “system turn back location”. Charlemont Station is located within an area of high public transport accessibility, linking with the Luas Green Line which offers reasonably similar levels of services and frequency for journeys to and from the south of Dublin. As such, public transport service offering is not considered to terminate, but transfers onto the similar service offered by the Luas Green Line, forming part of a transport corridor running from Cherrywood to Estuary. The associated environmental impacts for the turnback and station at Charlemont have been fully assessed in the EIAR. Charlemont station itself was chosen on the basis of its interchange potential with Luas, as well as local bus services, as outlined above. The section of the line between St Stephen’s Green and Charlemont generates considerable benefits for the scheme in terms of increased patronage. As noted in response item (2), during the morning peak, at Charlemont station the flows include 1,800 passengers alighting, 2,300 boarding and 1,229 passengers alighting, 2,276 boarding during the evening peak. The fact that the Charlemont Station is now being referred to and considered as a “terminus station” rather than an interchange station, does not increase the environmental impacts the station has on its local environment, in terms of passenger demand, airborne noise. vibration and other environmental effects.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Observation on a Startegic Infrastructure Development				
				If a decision was taken to terminate MetroLink at St Stephen's Green, significant changes would be required to the scheme. These would include design changes at St Stephen's Green station and provision of alternative turnback facilities immediately south of the station. The proposed route alignment from Estuary to Charlemont is consistent and compliant with the GDA Transport Strategy 2022-2042 (published in January 2023) in which states that the south city terminus at Charlemont offers the optimal location for interchange with the Green Line in response to growing demand in the longer term and is an appropriate location to facilitate any potential future metro extensions to serve the south west, south or south east of the city region should sufficient demand arise.

Observation on a Startegic Infrastructure Development				
4	(a) Strategy & Policy Issues	4	2. Expensive Duplication of Rail infrastructure - The inclusion of an expensive and costly section between St. Stephens Green and Charlemont is strategically weak and duplicates the existing Luas Green Line services. The NTA's cost estimate for this 1 km section at €650M is an expensive duplication and significant investment that deprives other parts of Dublin that are in immediate need of rail infrastructure to support housing and urban development.	The Board is not responsible for any decisions in relation to the funding the Project. It is solely responsible for assessing whether the Project is consistent with proper planning and sustainable development and that its effects on the environment are acceptable. The responsibility for funding the Project lies with the NTA, the Government and ultimately the Oireachtas. It has received all necessary approvals, including under the Public Spending Code for the making of a Railway Order. It will undergo further scrutiny and approvals, including under the Public Spending Code, before it is funded. It is not appropriate for the Board to make findings in relation to value-for-money that are outside its statutory functions and would cut across those arrangements. Members of the public are entitled to make representations to their TDs in relation to the value-for-money of any element of the Project. In any event, TII do not agree with this statement for the reasons set out by response (2) above, noting that infrastructure is not being duplicated given the capacity of the Luas south from St. Stephen's Green is restricted due to on-street running. There is a limit to the potential of the Luas to provide additional capacity in the on-street non-segregated section of the Luas Green Line from Charlemont northwards through the city centre. The nature of this route and the fact that it currently crosses several road junctions (Adelaide Road, Harcourt Street / Hatch Street upper and Harcourt Street / St Stephen's Green south) limit the service to a maximum of 24 trams per hour per direction. The projected demand for this section would require a higher frequency of up to 30 trams per hour and this demand cannot be met with on-street systems (Luas / bus). The interchange between Luas and MetroLink proposed at Charlemont will provide the necessary capacity to address the demand on this corridor and reduce overall travel time for passengers There is also high passenger demand forecast for a Metrolink station at Charlemont, including from the Ranelagh area, which would be lost if St. Stephen's Green was the MetroLink southern interchange station. The additional fare revenues collected by the Charlemont Station interchange increase the benefits delivered by the Project, reflected by an improved Project Benefit Cost Ration (BCR). Further, to ensure that public investment delivers value for money, the Public Spending Code sets out requirements for the evaluation, planning and management of public investment. The preparation of a Business Case is a key element of meeting these requirements. The Public Spending Code requires that both the Preliminary Business Case and Final Business Case for public investment projects are published. In July 2022, the Government granted Approval in Principle to the NTA to enable the submission of a railway order application by TII to An Bord Pleanála in respect of the MetroLink project (Decision Gate 1). This approval was granted after the Preliminary Business Case (PBC) had undergone significant scrutiny and challenge by bodies that are independent of TII, including DoT and DPER review (including independent review by JASPERS and the Major Projects Advisory Group (MPAG)) of the PBC around timeline, costs and benefits that were updated to inform the Government decision. With regards the observation that "Charlemont rules out the development of the metro to parts of the South city not covered by light rail", TII do not agree and would further note that the proposed route alignment from Estuary to Charlemont is consistent and compliant with the GDA Transport Strategy 2022-2042 (published in January 2023) which states that the south city terminus at Charlemont offers the optimal location for interchange with the Green Line in response to growing demand in the longer term and is an appropriate location to facilitate any potential future metro extensions to serve the south west, south or south east of the city region should sufficient demand arise.

5	(a) Strategy & Policy Issues	4	3. The station box at Charlemont, as constructed in 2021/22 by the Developer Hines, does not have the benefit of planning permission and has not been part of the EIA undertaken for this project. Processing the current Railway Order application, which is reliant on these preliminary and now constructed works, is legally unsafe and contravenes the provisions of the EIA Directive.	The MetroLink enabling works constructed as part of the Hines development was included in the planning application for the Hines Development and has the benefit of planning permission which was granted in April 2019.

Observation on a Startegic Infrastructure Development				
6	(a) Strategy & Policy Issues	4	4. The station box at Charlemont will result in only one possible future tie in with the Luas Green Line to the south, which would result in an option that was previously dismissed as part of the Tie-In study from March 2017. No alternatives to the station box at Charlemont were considered as it had been fixed through the design of the overhead Hines Grand Parade commercial development. The implications of this new alignment are very significant for our wider community as it will involve top-down construction that will only be possible when many houses on Manders Terrace, Oakley Road and Charleston Road are demolished.	The station box at Charlemont allows for a future tie into the Luas Green Line should it be determined in the future that through running metro services to Sandyford is the required solution to address the public transport needs to the south of the city. It is incorrect to say that the current proposal is based on an option that was previously dismissed as part of the March 2017 Green Line tie in study. The station design is in affect a modification to the preferred Green Line Tie Option 4B which was modified as result of the postponement of the upgrade of the Green Line to metro standard. The station box location was not fixed by the Charlemont Development. The preferred route for MetroLink was published in March 2019 following a comprehensive route options study. The preferred route was based on the emerging preferred route for the scheme which included a station at Charlemont. The Charlemont Metro Enabling Works were constructed to enable the Charlemont Development to proceed whilst simultaneously ensuring there was an option available to construct a station at Charlemont that avoided unnecessary demolition, took advantage of an available site, provided infrastructure that is integrated with planned development rather than necessitating later changes and retrospective adjustments to a new development or even possible demolition of the new development, whilst providing protected provision for the future extension of the scheme south, if required. It is also important to recognise that the station location at Charlemont is influenced by available vacant land and thus avoids unnecessary demolition. The submission seeks to portray the construction of the Metro Enabling Works as prejudicial to future decisions on proper planning and sustainable development of the area. It implies that the counterfactual would have had no effect on such decisions. That is not the case. There was a planning conflict between the EPR and the Grand Parade Development at the time the latter development was proposed. There was no resolution to that conflict that was free of implications for future decisions on the proper planning and sustainable development of the area. The Board could have refused permission for the Grand Parade Development, inevitably creating a underutilised and potentially vacant and idle site in a commercial hub location. The Board could have granted permission with no provision to facilitate a station at this location, resulting in a requirement for the railway order to provide for the demolition of a new office building. The Board's actual decision was reasonable and lawful in seeking to minimise the prejudice to an important office development and a critical piece of national infrastructure. It was also not particularly restrictive of future decisions in relation to the proper planning and sustainable development of the area. Of the three options open at the date of the Grand Parade planning application, two remain open: the Board can still require changes to the station design that require the demolition of the commercial building and it can grant an order that avoids demolition by using the Metro Enabling Works. It is agreed that the short-term implications for local residents will be significant as the scheme progresses through the construction stage, however the EIAR assesses the environmental impacts of the construction phase and commits to the implementation of appropriate mitigation measures that reduce the environmental impacts to not significant. The same is true of the operations phase for the project. TII will work closely with local residents to ensure the required mitigation measures are put in place. If in the future, the metro was extended south, this does not mean that inevitably open cut construction will be required or demolition of property will be necessary. In designing an extension, the promoter will seek to reduce the requirement for demolition by looking for tunnel launch sites at the southern extent of the scheme and, if one can be identified, driving the Tunnel Boring Machine northwards ultimately connecting into the existing tunnel. In that case, even if the new alignment were under the properties identified in the submission, the tunnel underneath them would be constructed by the Tunnel Boring Machine without the need for above ground works.

Observation on a Startegic Infrastructure Development				
7	(b) Neighbourhood & Community	4	The entire Dartmouth Square - North, South, East & West - is designated as an ACA and all of the dwellings are protected structures. We have been part of this community for more than 40 years and we have often remarked on the pride which all the neighbours take in the physical environment in which we live. We feel a responsibility to maintain and protect it and to hand it on to future generations of residents in as good or better condition as we received it.	TII recognise the importance of Dartmouth Square and its designated status as an Architectural Conservation Area (ACA). Mitigation measures for Architectural Heritage can be found in Table 26.66 of EIAR chapter 26 (Architectural Heritage). The only potential for direct impacts on the Architectural Heritage Areas (ACA) is related to the diversion of utilities on Dartmouth Square West. To minimise the impact on protected structures in Dartmouth Square such as historic granite steps, kerbing and lamp standards, works within the Dartmouth Square ACA will be overseen by the Project Conservation Architect (PCA) and carried out in accordance with a method statement prepared by PCA. This commitment is detailed in section 26.7.1 of Chapter 26 (Architectural Heritage). The impact on Architectural Heritage in Dartmouth Square has been assessed to decrease to slight following mitigation.
8	(b) Neighbourhood & Community	5	We note that in the Dublin City Development Plan 2022 - 2028 our houses are covered by the zoning objective Z2 - ‘to protect and / or improve the amenities of the residential conservation areas’. Clearly, the proposal to locate the city centre Terminus within such close proximity of our dwelling at # 15 Dartmouth Square West is blatantly inconsistent with this zoning objective.	TII do not agree that Charlemont Station is inconsistent with the zoning objective. The zoning under the Dublin City Development Plan 2022 - 2027 for the residential properties in question is "Z2 Residential Neighbourhoods (Conservation Areas)" with an objective to "protect them from unsuitable new developments or works that would have a negative impact on the amenity or architectural quality of the area (See Table 3.11 of the Planning Report). Further, Dublin City Development Plan supports the location of a station at Charlemont. As outlined in Section 4.5.18.6 of the Planning Report, the element of the project within the Z2 zoning area will affect a below ground area only and as such will not compromise the land use objective for the lands overhead. The majority of the proposed station and all above ground elements are located within the lands zoned Z5 with the objective “To provide for the creation and protection of enterprise and facilitate opportunities for employment creation”. The station has been designed so that it is integrated with the proposed redevelopment of this site by a third party development, and as such, demonstrates that the proposed Project is consistent with the zoning objective.

Observation on a Startegic Infrastructure Development				
9	(b) Neighbourhood & Community	5	The construction phase of 9+ years will place an intolerable burden on us residents in terms of noise, vibration, subsidence, and the work compound. But matters will not improve when construction is completed, and the terminus becomes operational. Indeed, the situation will get worse in terms of noise, vibration, subsidence risk and traffic congestion. We are both in our late 60s. This project is a life sentence for us. Our property will be unsaleable throughout the 9+years of the construction phase and the position will not improve in the operational phase. We have a particular worry about the structural damage that our property could suffer as a result of subsidence and vibrations during the construction phase as the tunnelling will be within very close proximity indeed to our dwelling (well less than 50 metres).	TII have carefully assessed the environmental impacts on your property, 15 Dartmouth Square West, including noise, vibration, construction generated ground movements (subsidence) and traffic, summarised below. No profound impacts are predicted, in line with the EIAR significance ratings. <u>Construction Noise and Vibration</u> Potential impacts identified due to airborne noise & vibration are presented in EIAR Chapter 13. Proposed mitigation includes 4m high noise barriers and further proposed mitigation in line with the Airborne and Groundborne Noise Mitigation Policy. On the implementation of these measures the residual impacts are predicted to be moderate. EIAR Appendix A14.5, Groundborne Noise and Vibration and Blasting Modelling Results, 14.4 Section AZ4 Northwood to Charlemont, presents the predicted vibration levels during TBM passage for various sensitive receptors. The predicted vibration presented in this section outlines the VDV (Vibration Dose Value is a parameter that combines the magnitude of vibration and the time for which it occurs) for TBM Passage during the day and night at 15 Dartmouth Square West are 0.249ms-1.75 (VDV day) and 0.21ms-1.75 (VDV night) respectively. Both of these values are lower than the VDV Threshold Levels of 1.0ms-1.75 (VDV day) and 0.5ms-1.75 (VDV night). Levels of vibration during mechanical excavation of Charlemont Station are predicted to be 0.004ms-1.75 and 0.003ms-1.75 for day and night-time respectively. The threshold levels have been set in relation to human response to vibration, and thresholds for building damage are much higher. As the predicted levels of vibration from TBM passage and mechanical excavation are below these thresholds then no impact is expected for the building or for residents of this address. Predictions of vibration during blasting at Charlemont Station have also been made. For 15 Dartmouth Square an exceedance vibration level of 11.2mm/s PPV (Peak Particle Velocity) is predicted compared to the threshold level for this building of 8mm/s resulting in a potential significant impact. As a result, mitigation measures will be implemented to reduce the risk to buildings as outlined in EIAR Chapter 14, Section 14.5.1.2. Mitigation measures to reduce the impact of blasting will include the preparation of specific blast design at each location, minimisation of the maximum instantaneous charge weight or alternatives to blasting. With the implementation of appropriate mitigation to reduce vibration from blasting the residual impact is expected to be reduced to not-significant. The predicted level of groundborne noise during TBM passage is 49 dB LASmax, which is above the 45 dB LASmax threshold, resulting in a significant impact on the occupants of this address for the relatively short 2-week duration of TBM passage. Unfortunately there are no effective methods available to reduce groundborne noise from TBMs at source and therefore the principal mitigation measure is advance public consultation to inform residents of the anticipated timing of the TBM passing to allow building occupants to prepare for the passage of the TBM and resultant elevated noise levels. In addition to the mitigation measures outlined above, the contractor(s) will prepare a Construction Noise and Vibration Management Plan (CNVMP) for the proposed Project, which will be a live document. There are no statutory standards in Ireland relating to noise and vibration limit values for construction works. The contractor(s) will work within the noise and vibration significance threshold levels identified in the EIAR for both airborne and groundborne noise and vibration and the limits contained in the Railway Order approval. Further details on the proposed mitigation measures can be found in section 6.2. of Appendix A5.1 Outline Construction Environmental Management Plan.

Observation on a Startegic Infrastructure Development				
				<u>Operational Noise and Vibration</u> - please refer to response (11) below. <u>Construction Generated Ground Movements (risk of subsidence)</u> The approach taken by TII for assessing the impact of construction generated ground movements reflects the industry standard three-phased ground movement impact assessment process that is undertaken on tunnelling and underground projects around the world, that includes Channel Tunnel Rail Link (CTRL), Dublin Port Tunnel, Crossrail and High Speed 2. EIAR Appendix A 5.17 Building Damage Report, covers the assessed impacts of construction generated ground movements and settlement and includes for the assessed impact on 15 Dartmouth Square West. EIAR Appendix 5.17 refers. The Phase 2 assessment of the damage for this building is "slight" (an explanation for which can be found in Table 4-4), please refer to building B-150 in table 5-2 of the appendix. As your property is a designated Protected Structure, it has been designated as "special", and hence a further Stage 3 refined assessment, despite the impact only being assessed as 'slight' will be undertaken that will take account of final design and construction methodology details most likely utilising advanced numerical modelling techniques and further surveys of the building. The results of this refined assessment typically show that earlier assessments are conservative and overestimate the likely impact of construction generated ground movements. Monitoring instrumentation will also be installed in the area to monitor the performance of the works and potential environmental impacts, including those discussed above to ensure that acceptable limits are not breached. The Property Owner Protection Scheme (POPS), committed to by TII, allows residential property owners to register with TII if their residential property is within thirty (30) metres of the edge of the MetroLink alignment or fifty (50) metres of station structures. The POPS comprises condition surveys of residential properties along the route of the proposed Project. The purpose of the condition surveys is to ascertain the condition of the properties before, during (if deemed necessary), and after the completion of the proposed Project to determine whether there has been any deterioration of any of the properties surveyed and whether same may be attributable to the proposed Project, and subsequently to recommend repairs as appropriate. Condition survey data gathered pre and post construction, and possibly during construction, will be used to assist the property owner and TII in swift and accurate verification of any property damage claims which may be received from property owners. The POPS is designed to cater for / address repair work which may be necessary for any damage (attributable to the proposed Project) to a qualifying residential property up to a threshold of €45,000. The POPS will be introduced by TII through public consultation and will be formally advised to eligible property owners by the Public Relations Department. Further information on POPS is available in Chapter 11 (Population & Land Use). Useful information can also be found in the MetroLink Frequently Asked Questions document which can be found online at: https://www.metrolink.ie/en/your-property/property-owners-protection-scheme/ , and this is where useful updates will be made available as the proposed Project progresses. TII also do not expect significant ground movement to continue long-term after excavation is completed. The monitoring referred to above will verify this.

Observation on a Startegic Infrastructure Development				
				<u>Traffic Congestion</u> - please refer to response (13) below Regards devaluation, there is evidence to suggest that property values will in fact increase in close proximity to public transport infrastructure and that local residents will greatly benefit from having a world class Metro system providing access to the city centre, airport and north city at their doorstep. The benefits of the project for all communities along the MetroLink route are described in Chapter 3: Background to the MetroLink Project, section 3.4 MetroLink Response to Challenges.
10	(b) Neighbourhood & Community	5	We have major worries about so many aspects of the Environmental Impact Assessments (EIA) which have been undertaken - or so often not been undertaken. We set out below some specific concerns. 5. The Environmental Impact Assessment is inadequate in relation the description of development, alternatives, transport assessment, noise and the cumulative effects of the development on the Charlemont-Dartmouth Community. For a project of this size, scale, and investment to date, it is inadequate to propose a Railway Order with so many important studies and analysis missing.	TII do not agree that the Environmental Impact Assessment is deficient, inadequate or missing information. The Railway Order application comprises a very detailed environmental impact assessment that has identified and assessed the potential environmental impacts of MetroLink and proposed mitigations for these impacts where necessary. TII would also draw attention to the detailed project description, construction phase description and operational phase description provided in EIAR Chapters 4 and 5 and 6, and EIAR Chapter 7 and associated appendices that present details of alternatives considered. EIAR Chapter 9 and appendices provides a detailed analysis of transport and traffic effects, and EIAR Chapters 13 Airborne Noise & Vibration, and 14 Groundborne Noise & Vibration provide a detailed assessment of potential noise and vibration effects, while Chapter 29 outlines the assessment of interactions between various environmental aspects, and Chapter 30 covers the cumulative impacts with other projects. This assessment is carried out for the full length of the alignment including relative to potential significant effects on the Charlemont-Dartmouth Community.

Observation on a Startegic Infrastructure Development				
11	(b) Neighbourhood & Community	5	6. The development would result in noise and disturbance during the construction and operational phases and would result in a loss of amenities for the area.	The EIAR presents a comprehensive and detailed assessment of both groundborne and airborne noise and vibration in Chapter 13 and 14 of the EIAR. The assessments include predictive modelling in order to identify the potential impacts on all sensitive receptors during both the construction phase and the operational phase. Noise and disturbance during construction: No profound impacts have been identified for residents and mitigation measures proposed will be effective at reducing the impacts on these properties and in general terms impacts will be associated with the construction phase only. Significant mitigation is proposed to include 4m high noise barriers and further proposed mitigation in line with the Airborne and Groundborne Noise Mitigation Policy. On the implementation of these measures the residual impacts of airborne noise are predicted to be moderate. Chapter 14 of the EIAR assesses groundborne noise and vibration, with EIAR Appendix A14.5 Groundborne Noise and Vibration and Blasting Modelling Results presenting predicted groundborne noise and vibration levels during below ground construction. During TBM passage the predicted level of groundborne noise will be above the 45 dB LASmax threshold for a number of receptors above the runnel alignment, resulting in a significant impact on the building occupants during the relatively short 2-week duration of the TBM passage at a given location. The predicted vibration levels for TBM passage are well below human response thresholds during both day and night-time periods. Unfortunately there are no effective methods are available to reduce groundborne noise from TBMs at source. The principal mitigation measures aimed at minimising impacts are to give advance notice to residents of the timing of the TBM passage. In addition TII will accept and consider applications for additional measures on a case-by case basis, in accordance with its Noise and Vibration Mitigation Policy (see Appendix A14.6). Noise and disturbance during operation: No residual noise impacts are identified at this location during operation. The calculated rail noise levels across the proposed Project are not significant in terms of any widespread community disturbance and results in a not significant impact when added to the prevailing noise environment. Loss of amenity during construction: EIAR Chapter 11, Population & Land Use provides an assessment of effects on community amenity during construction and operation, which relates to the interaction of impacts on air quality; visual amenity; traffic and transport; and noise and vibration. At this location during construction as outlined in Section 11.5.2 of Chapter 11, no impacts are identified on the retail sector or community and social infrastructure (e.g. schools or hospitals). Any severance/disruption to transport will be limited by site mitigation measures such as alternative routes, reducing impacts to not significant.

Submission No.			149	
Organisation Name or Name of Submitter			John Conway and Orlaith McCarthy (15 Dartmouth Square West)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Observation on a Startegic Infrastructure Development				
				Loss of amenity during operation: No significant residual negative impacts are anticipated on the Population and Land Use from the operation of the proposed Project, following the incorporation of the mitigation measures into the design of the proposed Project and implementation on an ongoing basis throughout the lifecycle. The residual effects that will arise during operation will be permanent and positive as detailed in EIAR Chapter 11, section 11.1.1. The zoning under the Dublin City Development Plan 2022 - 2027 for the residential properties in question is "Z2 Residential Neighbourhoods (Conservation Areas)" with an objective to "protect them from unsuitable new developments or works that would have a negative impact on the amenity or architectural quality of the area (See Table 3.11 of the submitted Planning Report). As outlined in Section 4.5.18.6 of the Planning Report, the element of the Project within the Z2 zoning area will affect a below ground area only and as such will not compromise the land use objective for the lands overhead. The majority of the proposed Charlemont Station and all above ground elements are located within the lands zoned Z5 with the objective "To provide for the creation and protection of enterprise and facilitate opportunities for employment creation". The Station has been designed so that it is integrated with the proposed redevelopment of this site by a third party development, and as such, demonstrates that the proposed Project is consistent with the zoning objective. The MetroLink station design does not result in any segregation of the area, with no surface barriers or walls proposed.
12	(b) Neighbourhood & Community	5	6. (continued) The Traffic Study for the local Charlemont area is wholly inadequate as it omitted the modelling of the impact of Airport users coming to the only Dublin South Metrolink station at Charlemont. The Traffic Study uses a strategic, generalised regional model that does not take local factors into account. Extract from observation 7) - The EIA did not properly assess the impact of additional local traffic volumes. Rather they used a generalised regional model that does not take local factors into account. A Terminus at Charlemont will attract a hinge volume of passengers travelling to and from the airport. They will come from Dublin South and the greater Dublin/Leinster area via car or taxi with baggage and baby buggies for onward destination to the airport. However, there is absolutely no space for set-down at Grand Parade or in the residential area around Charlemont-Dartmouth. This neighbourhood cannot sustain the significant additional traffic volumes associated with this development.	The MetroLink forms part of an integrated public transport network. The system is designed in an integrated manner so that people travelling from the area south of Dublin to access locations north of Charlemont, such as Dublin Airport, Mater, Swords etc. will utilise public transport to interchange with the MetroLink, or will walk or cycle to access their local station. The system is not designed to encourage people to drive to stations within the City and TII actively discourage people from doing so other than the Park & Ride station at Estuary. TII therefore do not agree with the observation that there will be a "huge volume of anticipated airport users from Dublin South and greater Dublin/Leinster that will come to Charlemont via car or taxi with luggage for onward destination to the airport" as this is not borne out by our transport analysis. The Transport Assessment for MetroLink includes for people travelling to/from Dublin Airport from all areas within the extents of the GDA area, therefore it is incorrect to say "The Traffic Study for the local Charlemont area is wholly inadequate as it omitted the modelling of the impact of Airport users coming to the only Dublin South Metrolink station at Charlemont". The NTA's Eastern regional Model (ERM) incorporates a wide range of data sources, including demographic data, land use data, transportation network data, and travel survey data. The system is designed to model a variety of transportation modes, including private vehicles, public transit, walking, and cycling, and to simulate the interactions between these modes. The ERM model has been validated and calibrated using a range of localised data sources to ensure that the model can accurately represent the transport network, these include public transport and vehicle counts from the canal cordon counts. The outputs from the model have been combined with local survey data to undertake the more localised modelling, such as the pedestrian impact assessments, or the local traffic signals. This does not support the observations made "The Traffic Study uses a strategic, generalised regional model that does not take local factors into account." or "The EIA did not properly assess the impact of additional local traffic volumes, rather they used a generalised regional model that does not take local factors into account." Regards the observation there will be a "huge volume of anticipated airport users from Dublin South and greater Dublin/Leinster that will come to Charlemont via car or taxi with luggage for onward destination to the airport. Grand Parade and the residential area around Charlemont-Dartmouth cannot sustain the significant additional traffic volumes associated with this development", this is covered by response (10) below.

Observation on a Startegic Infrastructure Development				
13	(b) Neighbourhood & Community	5	7. The development would have an adverse impact upon traffic during the construction and operational phase. The proposed Terminus provides very poor integration with other modes of transport. Pedestrian movements in and around the station would be very difficult. Grand Parade is an already heavily congested orbital route.	The MetroLink is designed to form part of an integrated public transport network with Charlemont selected as the preferred interchange location in order to maximise the potential interchange with the existing Luas Green Line. In overall terms, Charlemont Station will provide for improvements to the public transport network resulting in decreases in private car usage/trips, increases in public transport usages and will facilitate walking and cycling to the station, without significantly impacting on the operation of the road network in the area. Construction Phase: EIAR Appendix A9.5 Scheme Traffic Management Plan presents the analysis undertaken to assess the impact of the traffic management measures on the local road network surrounding the proposed Charlemont Station during the construction phase. At the local level the following parameters have been used to assess impacts on general traffic and on pedestrians: • Increase in walking distance/quality of service for pedestrians (through removal of footpath, reduction of quality of service, removal of a pedestrian crossing or relocation of crossing by more than 100m); • Increase in driver delays at junctions; • Changes in traffic flows on surrounding streets; and, • Additional distance travelled due to diversions. The analysis undertaken at this location indicates that the increased volume of traffic on Grand Parade and Northbrook Road does not translate into any significant increase in driver delay. The largest increase in driver delay of 12 seconds is registered on the westbound approach on Grand Parade to the Ranelagh Road signalised junction. During the construction phase, pedestrians will experience a reduction in quality of pedestrian infrastructure and space. The construction site boundary will encroach upon footways in the local area, including the northern side of Dartmouth Road, and the southern side of Grand Parade. However, a temporary signalised crossing will be provided west of the Luas to maintain pedestrian access to and from the Stop. Whilst there are partial closures on Dartmouth Road and Grand Parade, pedestrian movements will be maintained on appropriately sized footways through the area. Operational Phase: A microsimulation VisWalk model has been developed for the immediate area surrounding Charlemont Station during the operational phase. The model covers the full extent of the publicly accessible station area, including the immediate vicinity of the station entrance at street level, the Luas stop and nearby junctions at Charlemont Bridge. In order to accommodate the forecast demand from the proposed Charlemont Station, a new staircase with 2.4m stair width is proposed at the south east corner of Charlemont Luas stop. An elevator will also be provided at this location. Both are sized for MetroLink to Luas, and Luas to MetroLink passenger numbers.

Submission No.			149

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Observation on a Startegic Infrastructure Development				
				In addition, it is proposed that the pedestrian crossing on R111 Grand Parade will be repositioned to the front of the building being developed by Hines. With this infrastructure in place, the model indicates that the R111 Grand Parade will have an acceptable level of service overall, with some reductions in service seen at the pedestrian crossing where pedestrians are required to wait for a green phase at the signals. Overall, it is considered that the model displays an acceptable level of network performance. The proposed pedestrian crossing on Grand Parade will have minimal impact on the traffic flow along Grand Parade and can be programmed to operate in sync with the existing signalised junction at Grand Parade /Charlemont Street to maintain the flow of traffic movements. When the Project is operational, car mode share will decrease, with a reduction of up to approximately 830 car tips to and from the zones surrounding Charlemont Station over the 12hr period in 2065. In overall terms, the Charlemont Station will provide for improvements to the public transport network resulting in decreases in private car usage/trips, increases in public transport usages and will facilitate walking and cycling to the station, without significantly impacting on the operation of the road network in the area. Furthermore, TII have deliberately designed the Station with minimum set down space (with the exception of a drop-off on Grand Parade for persons of restricted mobility only) or room for taxi ranks so that it does not encourage the Station to be used as a terminus.
14	(b) Neighbourhood & Community	6	8. The development will have an adverse impact upon property values, particularly during the construction phase. For many houses in the area there will be a long term and permanent adverse impact upon property values from noise of the operating rail infrastructure, vents, tannoy systems, escalators and large traffic volumes - vehicular and pedestrian using the station 19 hours per day. The adverse impact also extends to the loss of amenity for the wider community changing a quiet residential neighbourhood into a noisy, busy, congested major transport hub.	Responses (9) and (11) above outline the predicted environmental impacts with regards to noise and vibration, and amenity, while responses (12) and (13) summarise the assessed traffic and pedestrian impacts. TII would note that as explained by response (13) above that in overall terms Charlemont Station will provide for improvements to the public transport network resulting in decreases in private car usage/trips. Regards devaluation, there is evidence to suggest that property values will in fact increase in close proximity to public transport infrastructure and that local residents will greatly benefit from having a world class Metro system providing access to the city centre, airport and north city at their doorstep. The benefits of the project for all communities along the MetroLink route are described in Chapter 3: Background to the MetroLink Project, section 3.4 MetroLink Response to Challenges.
15	Letter conclusion	6	We believe that the logical place for the city centre Terminus is in St Stephens Green. This location would effectively provide for a hub station that can integrate with the Luas Green Line and multiple bus routes. There is also ample space for taxi and private car set-down	Please refer to responses (2) and (3) above that explain the rationale for a proposed station at Charlemont.
16	Letter conclusion	6	Importantly, this solution saves public money in the short term while at the same time it leaves open a broader range of strategic options to extend the Metro in the future such as the South West corridor.	Please refer to responses (2) and (3) above explain the rationale for a proposed station at Charlemont, whilst noting that infrastructure is not being duplicated given the capacity of the Luas south from St. Stephen's Green is restricted due to on-street running, and that as noted by the GDA Transport Strategy 2022-2042, section 12.3.2, "Charlemont offers the optimal location for the primary interchange with the Green Line in response to growing demand in the longer term and is an appropriate location to facilitate any potential future metro extensions to serve the south west, south or south east of the city region should sufficient demand arise."

Letter: Case reference NA29n.314724				
1	Letter	3	I am writing in connection with the above case, i.e. Metrolink. This will be a very important addition to Dublin's public transport infrastructure. However, a major weakness is that it does not link with Connolly Station. This impacts negatively at three levels: • Interconnectivity • Construction • Operations	EIAR Chapter 7, Consideration of Alternatives, details the robust decision-making that has led to the preferred route chosen, including alternative alignments and station locations. The identification of a preferred route took account of the interchange capability of a location with other modes of transport, including the DART network. However, other criteria were also identified, such as potential trip demand, key trip attractors in the area, and directness of route (and subsequent impact on cost). While Connolly Station is an important station for Intercity and Dart services, it is located in the east of the city away from areas of high passenger demand for MetroLink services between the Dublin Airport and the City Centre. A MetroLink interchange located at Connolly Station would therefore negatively impact on potential trip demand, the directness of the route (increasing the cost of the project), and would not serve key attractors in the city centre. MetroLink connectivity with Connolly Station and its Intercity and Dart services is provided via the proposed new MetroLink station at Glasnevin, together with and interchange at Tara station.
2	Interconnectivity	3	Connolly is the most important railway station in the country, being the terminus for most mainline and Dublin commuter services (all of them if there is a link from Heuston in the future), as well as linking with both DART and LUAS. It is also adjacent to Busaras. Therefore, in terms of connectivity, it is the most important station to link the new service with. Interconnectivity is a key prerequisite of successful public transport and is regularly highlighted at Irish Government¹ and EU level². Including a station at Connolly would not eliminate the potential to include a station at Tara Street also.	The overall project objective of MetroLink, as established by TII and as outlined in the National Development Plan 2021-2030 (Government of Ireland, 2021) is 'to provide a sustainable, safe, efficient, integrated and accessible public transport service between Swords, Dublin Airport and Dublin City Centre'. While Connolly Station is an important station for Intercity and Dart services, it is located in the east of the city away from areas of high passenger demand for MetroLink services between the Dublin Airport and the City Centre. A MetroLink interchange located at Connolly Station would therefore negatively impact on potential trip demand, the directness of the route (increasing the cost of the project), and would not serve key attractors in the city centre. With the interchanges provided by Metrolink at both Tara and Glasnevin, the proposed route offers high levels of interchange with Dublin Airport, the Western Commuter Line (Maynooth Line), the South-Western Commuter Line (Kildare Line), DART network, Intercity Services, Luas Lines, Dublin Bus network and future BusConnects network, in line with the project's objective.

Letter: Case reference NA29n.314724				
3	Construction	3	Another important factor from a planning perspective is disruption during construction and the socioeconomic costs thereof. Urban transport developments, including metro infrastructure, are internationally recognised as generating largescale disruption during their construction phases. In this regard, Connolly has advantages over the proposed city centre stations (O' Connell Street and Tara Street) as follows: • There are two large surface carparks immediately to the east of Connolly station (see image overleaf), which could: - be utilised to accommodate Metrolink surface access and - greatly facilitate the construction of and tunnelling for Metrolink. If this were to be done, the material dug up could also be removed by rail, greatly reducing or eliminating road traffic disruption in the city centre during construction • Connolly is a better candidate for a city centre Metrolink station than Tara Street, because the latter is closer to the river. That means its station would have to be deeper, taking longer and costing more to construct and generating more dig spoil.	EIAR Chapter 5 (Construction Phase) Section 5.10.11 sets out the construction methods and activities anticipated in constructing the proposed Metrolink Tara station. While property and utility impacts have been identified, the Construction Phase for MetroLink is anticipated to last approximately 8 years, whereas the Operational Phase is anticipated to last for many years. As a result, the operational benefits of delivering the Project through the city centre, as opposed to serving Connolly Station, outweigh the short-term construction benefits, if any, that could be achieved by serving Connolly Station instead of O'Connell Street or Tara during this phase of the Project.
4	Operations	4	Operationally, Connolly has advantages over the proposed city centre stations, as follows: • A new metro station at Connolly could be linked by underground passageway to Busaras, effectively creating an intermodal public transport hub. • Being underground, a Metrolink station at Connolly would be unconstrained for space; underground capacity at Connolly could potentially cater for other services currently terminating at the station, relieving pressure on the surface. • Because a Connolly Metrolink station would not be as deep as a Tara Street Station, it would be quicker and more convenient to use. • Maintaining public safety at Connolly would be easier than at a station on O'Connell Street, as it would be contained within an existing station facility.	Please refer to the responses above that set out TII's rationale for providing an interchange at Tara rather than Connolly.

Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) Order 2022 Case Reference Number NA29N.314724				
1	Letter	1	Firstly, in general, I am in favour of the broad aim of the Metrolink project to connect Dublin's city centre to our national airport. However, as a resident living in the Dartmouth/Charlemont area, I wish to set out a number of observations for the Board regarding the proposal to locate the Terminus station at Charlemont-Dartmouth. My family home is in the midst of the community where the Terminus station is proposed to be located.	Thank you for taking the time to make a submission and your overall endorsement of the MetroLink Project with the exception of Charlemont Station. We have reviewed your submission and have responded to the observations made below.
2	Letter	1	I object to the proposed Metrolink Extension to Charlemont on the following grounds; 1 . Additional Cost. The requirement to interface with LUAS could be achieved at an earlier location eg Stephens' Green with adaptations that would save public funds of approximately 650 million Euro on this section project which duplicates existing rail infrastructure. This is especially relevant in the rising interest rate environment.	<u>Rationale for selecting Charlemont as the preferred interchange with the Luas Green line</u> While an interchange with the Luas Green Line could be achieved at St Stephen's Green, Charlemont has been chosen as the interchange for the reasons set out below. The Board is required to have regard to the likely consequences for proper planning and sustainable development in the area in which it is proposed to carry out railway works (section 43(1) of the 2001 Act) and as such the following matters are relevant. The connection from St Stephens Green to Charlemont / Ranelagh is supported by the current Transport Strategy for Greater Dublin Area (2022-2042). The Transport Strategies were prepared by the National Transport Authority, scrutinised by the Joint Oireachtas Committee on Transport and approved by the Minister for Transport. It notes in section 12.3.2, "Charlemont offers the optimal location for the primary interchange with the Green Line in response to growing demand in the longer term and is an appropriate location to facilitate any potential future metro extensions to serve the south west, south or south east of the city region should sufficient demand arise." The Transport Strategy is "a consideration material to the proper planning and sustainable development of the area or areas in question." Development Plans are required to be consistent with the Transport Strategy. The Dublin City Development Plan 2022-2028 envisages this station at Charlemont in policy SMT22 "To support the expeditious delivery of key sustainable transport projects so as to provide an integrated public transport network with efficient interchange between transport modes, serving the existing and future needs of the city and region and to support the integration of existing public transport infrastructure with other transport modes. In particular the following projects subject to environmental requirements and appropriate planning consents being obtained: ... MetroLink from Charlemont to Swords". Accordingly, the location of the Charlemont station was a strategic decision made at the highest levels of transport and land use planning and such is fully consistent with the proper planning and sustainable development of the area. The current Transport Strategy considers a range of options for the onward extension of MetroLink to meet the demand for travel over the period of the strategy. This includes consideration of the need for the upgrade of the Luas Green Line to metro with a metro extension to Dublin south west, south or south east. Whilst the strategy envisages that further extensions will be delivered after 2042, MetroLink which terminates at Charlemont allows for the possible extension of the metro in all any of the above directions. The proximity of the metro to the Luas line at Charlemont provides for a positive customer experience for all users with short interchange distance and due to the proximity, clear wayfinding and high visibility of the interchange. The interchange arrangements at Charlemont provide for significantly better interchange arrangements compared to an alternative interchange at St Stephen's Green Station. Passengers wishing to interchange between Luas and metro at an alternative St Stephen's Green terminus would face a 500m-walk along a route either through St Stephen's Green park or along the footpath north of the park, which adds significantly to the time for interchange and therefore the overall journey time for passengers and a less positive customer experience for all interchange users. This passenger experience would be reduced further for those with mobility or visual impairments as well as those travelling to/from the airport with luggage. The detailed analysis done for the Railway Order application further confirms that the section of MetroLink route between St Stephen's Green and Charlemont Stations contributes significantly to the overall benefits of the scheme. It serves a significant area of the south city of Dublin and offers enhanced access from the local area to the city centre and a direct connection to Dublin Airport. It serves key trip attractors including residential areas and offices / workplace locations, with high passenger boarding and alighting figures in the peak hours. During the morning peak, at Charlemont station the flows include 1,800 passengers alighting, 2,300 boarding and 1,229 passengers alighting, 2,276 boarding during the evening peak. The passenger numbers contribute significantly to the overall benefits of the scheme and the effect of these benefits outweigh the additional costs that are associated with the delivery and operation of the section from St Stephen's Green to Charlemont station. Further details are provided on Table 7-16 in Chapter 7: Consideration of the Alternatives, section 7.7.8. MetroLink Southern Terminus Location.

Submission No.			151

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) Order 2022 Case Reference Number NA29N.314724				
			Response (2) continued.	The location of the interchange at Charlemont does not preclude onward extension south. An interchange at Charlemont is supported by policy including the Dublin City Development Plan 2022 - 2028 and the Transport Strategy for the Greater Dublin Area. By extending MetroLink to Charlemont it provides for future proofing of the Green Line, bypassing the capacity constrained Luas on-street running section, and ensures potential future connectivity options are enabled, either to the Green Line or for extensions of the metro. The Charlemont Station interchange provides for increased passenger utilisation of the MetroLink system, thereby increasing the benefits delivered by the Project, reflected by an improved Project Benefit Cost Ration (BCR). Duplication of Existing Infrastructure The Board is not responsible for any decisions in relation to the funding the Project. It is solely responsible for assessing whether the Project is consistent with proper planning and sustainable development and that its effects on the environment are acceptable. The responsibility for funding the Project lies with the NTA, the Government and ultimately the Oireachtas. It has received all necessary approvals, including under the Public Spending Code for the making of a Railway Order. It will undergo further scrutiny and approvals, including under the Public Spending Code, before it is funded. It is not appropriate for the Board to make findings in relation to value-for-money that are outside its statutory functions and would cut across those arrangements. Members of the public are entitled to make representations to their TDs in relation to the value-for-money of any element of the Project. In any case, TII do not agree with the duplication of rail infrastructure observation for the reasons set out by the above, noting that infrastructure is not being duplicated given the capacity of the Luas south from St. Stephen's Green is restricted due to on-street running. There is a limit to the potential of the Luas to provide additional capacity in the on-street non-segregated section of the Luas Green Line from Charlemont northwards through the city centre. The nature of this route and the fact that it currently crosses several road junctions (Adelaide Road, Harcourt Street / Hatch Street upper and Harcourt Street / St Stephen's Green south) limit the service to a maximum of 24 trams per hour per direction. The projected demand for this section would require a higher frequency of up to 30 trams per hour and this demand cannot be met with on-street systems (Luas / bus). The interchange between Luas and MetroLink proposed at Charlemont will provide the necessary capacity to address the demand on this corridor and reduce overall travel time for passengers There is also high passenger demand forecast for a Metrolink station at Charlemont, including from the Ranelagh area, which would be lost if St. Stephen's Green was the MetroLink southern interchange station. The additional fare revenues collected by the Charlemont Station interchange increase the benefits delivered by the Project, reflected by an improved Project Benefit Cost Ration (BCR). Further, to ensure that public investment delivers value for money, the Public Spending Code sets out requirements for the evaluation, planning and management of public investment. The preparation of a Business Case is a key element of meeting these requirements. The Public Spending Code requires that both the Preliminary Business Case and Final Business Case for public investment projects are published. In July 2022, the Government granted Approval in Principle to the NTA to enable the submission of a railway order application by TII to An Bord Pleanála in respect of the MetroLink project (Decision Gate 1). This approval was granted after the Preliminary Business Case (PBC) had undergone significant scrutiny and challenge by bodies that are independent of TII, including DoT and DPER review (including independent review by JASPERS and the Major Projects Advisory Group (MPAG)) of the PBC around timeline, costs and benefits that were updated to inform the Government decision.
3	Letter	1	2. Future Strategic Planning. A future south city Metro extension will need to be flexible in terms of transport and population demographics. A terminus at Charlemont restricts other direction options, and is strategically weak, whereas an earlier terminus retains future options.	TII do not agree with the observation that the selection of Charlemont is "strategically weak" or constrains future options for extending the metro if deemed required. The preferred location of the MetroLink interchange with the Luas Green Line has been selected for the reasons set out by response (2) above. This includes the consideration of possible future onward extension of the metro. The proposed Charlemont Station allows for a future tie into the Luas Green Line should it be determined in the future that through running metro services to Sandyford is the required solution to address the public transport needs to the south of the city.

Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) Order 2022 Case Reference Number NA29N.314724				
4	Letter	1	3. Unsuitability of the area. The Charlemont area and surrounding roads are historic Victorian residential areas with limited scope for increased transport interfacing, footfall and required amenities. The character of the many protected structure dwellings are at risk. Noise and disturbance during construction will result in loss of amenities for the area and an adverse impact upon traffic.	TII have assessed the impact on traffic and pedestrians, noise during construction and amenity. A summary of this assessment is provided below which indicates there will not be a significant impact and that the character of the dwellings will not be impacted. <u>Assessed Traffic and Pedestrian Impacts</u> In overall terms, Charlemont Station will provide for improvements to the public transport network resulting in decreases in private car usage/trips, increases in public transport usages and will facilitate walking and cycling to the station, without significantly impacting on the operation of the road network in the area. Construction Phase EIAR Appendix A9.5 Scheme Traffic Management Plan presents the analysis undertaken to assess the impact of the traffic management measures on the local road network surrounding the proposed Charlemont Station during the construction phase. At the local level the following parameters have been used to assess impacts on general traffic and on pedestrians: • Increase in walking distance/quality of service for pedestrians (through removal of footpath, reduction of quality of service, removal of a pedestrian crossing or relocation of crossing by more than 100m); • Increase in driver delays at junctions; • Changes in traffic flows on surrounding streets; and, • Additional distance travelled due to diversions. The analysis undertaken at this location indicates that the increased volume of traffic on Grand Parade and Northbrook Road does not translate into any significant increase in driver delay. The largest increase in driver delay of 12 seconds is registered on the westbound approach on Grand Parade to the Ranelagh Road signalised junction. During the construction phase, pedestrians will experience a reduction in quality of pedestrian infrastructure and space. The construction site boundary will encroach upon footways in the local area, including the northern side of Dartmouth Road, and the southern side of Grand Parade. However, a temporary signalised crossing will be provided west of the Luas to maintain pedestrian access to and from the Stop. Whilst there are partial closures on Dartmouth Road and Grand Parade, pedestrian movements will be maintained on appropriately sized footways through the area. Operational Phase A microsimulation VisWalk model has been developed for the immediate area surrounding Charlemont Station during the operational phase. The model covers the full extent of the publicly accessible station area, including the immediate vicinity of the station entrance at street level, the Luas stop and nearby junctions at Charlemont Bridge. In order to accommodate the forecast demand from the proposed Charlemont Station, a new staircase with 2.4m stair width is proposed at the south east corner of Charlemont Luas stop. An elevator will also be provided at this location. Both are sized for MetroLink to Luas, and Luas to MetroLink passenger numbers. In addition, it is proposed that the pedestrian crossing on R111 Grand Parade will be repositioned to the front of the building being developed by Hines. With this infrastructure in place, the model indicates that the R111 Grand Parade will have an acceptable level of service overall, with some reductions in service seen at the pedestrian crossing where pedestrians are required to wait for a green phase at the signals. Overall, it is considered that the model displays an acceptable level of network performance. The proposed pedestrian crossing on Grand Parade will have minimal impact on the traffic flow along Grand Parade and can be programmed to operate in sync with the existing signalised junction at Grand Parade /Charlemont Street to maintain the flow of traffic movements. When the Project is operational, car mode share will decrease, with a reduction of up to approximately 830 car tips to and from the zones surrounding Charlemont Station over the 12hr period in 2065. In overall terms, the Charlemont Station will provide for improvements to the public transport network resulting in decreases in private car usage/trips, increases in public transport usages and will facilitate walking and cycling to the station, without significantly impacting on the operation of the road network in the area. Furthermore, TII have deliberately designed the Station with minimum set down space (with the exception of a drop-off on Grand Parade for persons of restricted mobility only) or room for taxi ranks so that it does not encourage the Station to be used as a terminus.

Submission No.			151	
Organisation Name or Name of Submitter			John Loughrey	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) Order 2022 Case Reference Number NA29N.314724				
			Response (4) continued.	<u>Noise and Disturbance During Construction</u> The EIAR presents a comprehensive and detailed assessment of both groundborne and airborne noise and vibration in Chapter 13 and 14 of the EIAR. The assessments include for predictive modelling in order to identify the potential impacts on all sensitive receptors during the construction phase. No profound impacts have been identified for residents and mitigation measures proposed will be effective at reducing the impacts on these properties. Significant mitigation is proposed to include 4m high noise barriers and further proposed mitigation in line with the Airborne and Groundborne Noise Mitigation Policy. On the implementation of these measures the residual impacts are predicted to be moderate. However, as outlined in Transport Infrastructure Ireland (TII) Airborne and Groundborne Noise Mitigation Policy (Appendix A14.6) there is a process in place whereby further mitigation measures can be implemented at individual properties should this be merited. <u>Loss of Amenity During Construction</u> EIAR Chapter 11, Population & Land Use provides an assessment of effects on community amenity during construction and operation, which relates to the interaction of impacts on air quality; visual amenity; traffic and transport; and noise and vibration. At this location during construction as outlined in Section 11.5.2 of Chapter 11, no impacts are identified on the retail sector or community and social infrastructure (e.g. schools or hospitals). Any severance/disruption to transport will be limited by site mitigation measures such as alternative routes reducing impacts to not significant.
5	Letter	2	4. Environmental impact The environmental impact assessment of the project in relation to transport, noise, alternatives and cumulative impact on the Charlemont-Dartmouth community is inadequate for a project of this scale.	TII do not agree that the Environmental Impact Assessment is inadequate. The Railway Order application comprises a very detailed environmental impact assessment that has identified and assessed the potential environmental impacts of MetroLink and proposed mitigations for these impacts where necessary. TII would also draw attention to the detailed project description, construction phase description and operational phase description provided in EIAR Chapters 4 and 5 and 6, and EIAR Chapter 7 and associated appendices that present details of alternatives considered. EIAR Chapter 9 and appendices provides a detailed analysis of transport and traffic effects, and EIAR Chapters 13 Airborne Noise & Vibration, and 14 Groundborne Noise & Vibration provide a detailed assessment of potential noise and vibration effects, while Chapter 29 outlines the assessment of interactions between various environmental aspects, and Chapter 30 covers the cumulative impacts with other projects. This assessment is carried out for the full length of the alignment including relative to potential significant effects on the Charlemont-Dartmouth Community.
6	Letter	2	5. Station Box. The station box at Gharlemont, constructed in 2020/21 by Hines does not have the benefit of planning permission and therefore the current railway order application which relies on this already constructed work, is legally unsafe.	The MetroLink enabling works constructed as part of the Hines development was included in the planning application for the Hines Development and has the benefit of planning permission which was granted in April 2019.
7	Letter	2	I request the following amendments: Omit from the Railway Order the section from Tara Street Station to Gharlemont Station and associated onward tunnel extension and intervention tunnel. Require the submission of a railway order for a section from Tara Street Station to St. Stephens Green which would effectively provide for a terminal hub station that can integrate with the LuasGreen Line, multiple bus routes and future DART underground.	The above responses to the observations made explain why TII do not consider it is correct or appropriate that the MetroLink alignment south of the proposed Tara Station should be omitted, and also demonstrates why the proposed Charlemont Station has been selected by TII as the preferred interchange with the Luas Green Line A scheme which terminates at Tara Street would not be consistent with the Transport Strategy for Greater Dublin Area (2022-2042). In addition any decision to terminate the scheme at Tara will significantly impact on the overall viability and benefits of scheme.

Submission No.			152		
Organisation Name or Name of Submitter			John McGreevy (Clonaloney, 223 Mount Prospect Avenue, Clontarf, Dublin 3)		
Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
Letter Re: NA29N.314724 Estuary through Swords, Dublin Airport, Ballymun, Glasnevin and City Centre to Charlemont, Co. Dublin (MetroLink)					
1	Paragraph 2 Fig. 1 Fig. 2	1, 2, 3	On behalf of John McGreevy of Clonaloney, 223 Mount Prospect Ave, Clontarf, Dublin 3, D03 DX04, we wish to make the following observation... request that the parcel of Mr McGreevy's land, highlighted in pink on the enclosed plans, is not acquired by the railway/TII for the purposes of accommodating a relocated telecommunications mast. The parcel of land, which extends to approximately 1750sqm, is situated to the immediate north-east of the proposed Fosterstown Station and is included within land take ref: ML1T-A2.	The relocation of utilities along the route of the proposed alignment are an essential part of the MetroLink project. This site has been identified as an appropriate place in the local vicinity to where the existing telecommunications mast can be relocated to, helping to lessen the visual impact and allowing unimpeded construction access for the station area itself. So whilst the mast itself is not a direct part of the MetroLink project, the relocation of same is essential to facilitate the MetroLink alignment.	
2	Paragraph 3 Fig. 2	1, 3	On behalf of John McGreevy of Clonaloney, 223 Mount Prospect Ave, Clontarf, Dublin 3, D03 DX04, we wish to make the following observation... The landowner is generally supportive of the Metrolink, but he has concerns that the proposed land acquisition on his land exceeds the requirements to accommodate the tracks and station.	TII notes your concern in relation to land-take requirements. The land-take at this location is required to facilitate the construction of the rail alignment retaining structure, Fosterstown Station along with the creation of the associated station access, access to the respondents land, relocation of utilities and landscaping proposals around the station and the alignment. TII would like to highlight that we have taken your concerns seriously and have actively engaged in previous discussions to address them. As a result of this engagement, we have already taken measures to reduce the land-take where possible. See also response number (1) above.	

Submission No.			153	
Organisation Name or Name of Submitter			John Neary and Kathleen White (11 Cambridge Terrace, Dartmouth Square)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Railway (Metrolink - Estuary to Charlemont via Dublin Airport) Order 2022 Case Reference Number NA29N.314724				
1	Letter introduction	1	Both 11 Cambridge Terrace (which is a protected structure forming part of the Dartmouth Square Architectural Conservation Area) and 35 Dartmouth Road are located in the residential area proposed as the location of the Terminus for the Metrolink project. It is clear that during the construction phase, which is expected to last 9 years, our property at 35 Dartmouth Road will be uninhabitable and our access to and enjoyment of our home at 11 Cambridge Terrace will be severely compromised. During the operation phase the noise, vibration, light, traffic and influx of people using the station will significantly impact on our quality of life and the value of our properties. We are fully supportive of the Charlemont and Dartmouth Community Group Metrolink submission as well as the submission made on behalf of the Residents of Dartmouth Road. We wish to highlight the following key observations for the Board regarding the proposal to locate the Terminus station at Charlemont.	We have reviewed your submission and responded below to each of the observations raised, that includes the assessed noise, vibration, traffic and pedestrian impacts, and where necessary, the proposed mitigations for both the construction and operational phases of the Project. TII understand your particular concerns regards the proximity of 35 Dartmouth Road to the construction of the proposed Charlemont Station, and while TII are of the view that the construction environmental impacts can be mitigated, relocation is an available option during peak construction. TII are available to discuss this option if that is something the property owner would like to explore and consider. Transport Infrastructure Ireland (TII) Airborne and Groundborne Noise Mitigation Policy (EIAR Chapter 14, Appendix A14.6) there is a process in place whereby further mitigation measures, including temporary relocation, can be implemented at individual properties should this be merited. Regards light, we have not identified a particular observation with regards to this matter. During the construction phase, lighting will be designed to ensure that artificial light emitted from the construction compound does not cause a nuisance to residents. Lighting will be positioned and directed so as not to intrude unnecessarily on adjacent properties. For further information on site lighting, see section 5.12.9 of Chapter 5 and EIAR Appendix A5.18 (Site Lighting Plan). Regards lighting during the operational phase, EIAR Chapter 4, Description of the MetroLink Project, section 4.12.8.3 explains the lighting class (and therefore the light level and uniformity targets) for each area to be lit, and has been selected using BS5489-1:2020 with account made for the local ambient lighting and environmental zones. The following measures will be undertaken to ensure the quality of life of residents will not be effected by station lighting: • LED lights will be used instead of traditional lights to control light spill, in compliance with the Institute of Lighting Profession 'GN01 Guidance Notes for the Reduction of Obtrusive Light' document; • The use of luminaires will ensure that zero upward light is emitted; and • Lighting will be adjusted depending on a stations setting for example lighting columns on highways will be 12m high but lighting columns in or near residential areas will be 8m high. TII also confirm they have reviewed and responded to all other submissions made.
2	Key Observations	1	1. Despite the fact that our property at 35 Dartmouth Road will be one of the houses most impacted during the construction phase, we have received no direct communication from Metrolink about how our property will be protected. Specifically: a. We understand that it is the subject of a substratum CPO. However, we have not been received any communication in this regard. b. The property has not been identified in the Book of Reference.	No. 35 was under construction at the time referencing was carried out and would note the property lies within the land owned by 11 Cambridge Terrace who were referenced. 35 Dartmouth Road is a new mews residence to the rear of 11 Cambridge Terrace. The owner of 11 Cambridge Terrace was served the notice and the submission on page 15 notes the owner of 35 Dartmouth Road as one and the same. The new build was completed in Q4 2022 and remains part of the garden to the rear of 11 Cambridge Terrace until separately registered. A letter seeking confirmation of title pertaining to 11 Cambridge Terrace was issued on 02/02/2022, in the full knowledge that TII understood that a dwelling was currently being constructed to the rear of 11 Cambridge Terrace. A Mr John Neary responded on 09/02/2022 confirming ownership of 11 Cambridge Terrace and referring to the new dwelling being currently being constructed at the rear of 11 Cambridge Terrace. - At the time of the RO Application there was no change/new Folio to Land Registry boundary information to 11 Cambridge Terrace, therefore no transfer (of part) to new owners. - At the time of the RO Application there was no update to Registry of Deeds title, therefore no transfer (of part) to new owners. - At the time of the RO Application there was no update to The Property Price Register, therefore no indication of a sale. Accordingly, there was no new data/evidence at the time, and the understanding would have been the property (i.e. the new dwelling known as 35 Dartmouth Road) was not completed/sold prior to September 2022, at the time of the RO Application. It has not been alleged by the observer that the facts are different, but this may be clarified at oral hearing. From a Land Referencing perspective, TII could not done anything further to establish possible ownership/tenancy on a new build which was possibly not completed prior to the MetroLink RO. This will be subject of legal submissions at oral hearing in due course.

Submission No.			153	
Organisation Name or Name of Submitter			John Neary and Kathleen White (11 Cambridge Terrace, Dartmouth Square)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Railway (Metrolink - Estuary to Charlemont via Dublin Airport) Order 2022 Case Reference Number NA29N.314724				
3	Key Observations	1	c. We have not received any specific information about the provision of mitigating measures for noise, access, dust and dirt, etc.	(c) For the reason explained in response (2) above, no direct mailing of information was carried out to No.35 Dartmouth Road. The EIAR and associated appendices presents the proposed mitigation measures for the Project. Chapter 13 and Chapter 14 of the EIAR identifies the required mitigation measures for noise and vibration associated with the Project, and Chapter 16 provides mitigation measures associated with dust. Further detail on mitigation measures are provided in Appendix A5.1 Construction Environmental Management Plan (CEMP) and Appendix A16.4 Dust Management Plan. In summary: <u>Construction Noise and Vibration</u> Potential impacts identified due to airborne noise and vibration are presented in EIAR Chapter 13. Noise mitigation proposed for works at Charlemont Station are summarised in Section 13.6.1 of the EIAR and include for boundary hoarding around the working area, including a 4m high hoarding at the southern boundary. In addition, the above ground support works for below ground sprayed concrete tunnelling works will be enclosed within an acoustically clad steel framed building to control noise breakout to surrounding receptors. On the implementation of these measures the residual impacts at the adjacent 34 Dartmouth Road, and therefore comparable for 35 Dartmouth Road, are predicted to be Moderate to Significant. EIAR Appendix A14.5, Groundborne Noise and Vibration and Blasting Modelling Results, 14.4 Section AZ4 Northwood to Charlemont presents the predicted vibration levels during TBM passage for various sensitive receptors and outlines the predicted VDV (Vibration Dose Value is a parameter that combines the magnitude of vibration and the time for which it occurs) for TBM Passage during the day and night at the adjacent 34 Dartmouth Road are 0.251ms-1.75 (VDV day) and 0.211ms-1.75 (VDV night) respectively. Both of these values are lower than the VDV Threshold Levels of 1.0ms-1.75 (VDV day) and 0.5ms-1.75 (VDV night). Levels of vibration during mechanical excavation of Charlemont Station are predicted to be 0.003ms-1.75 and 0.003ms-1.75 for day and night-time respectively. The threshold levels have been set in relation to human response to vibration, and thresholds for building damage are much higher. As the predicted levels of vibration from TBM passage and mechanical excavation are below these thresholds, no impact is predicted for either the building or for residents of this address. Predictions of vibration during blasting at Charlemont Station have also been made. For 34 Dartmouth Road an exceedance vibration level of 9.3mm/s PPV (Peak Particle Velocity) is predicted compared to the threshold level for this building of 8mm/s resulting in a potential significant impact. As a result, mitigation measures will be implemented to reduce the risk to buildings as outlined in EIAR Chapter 14, Section 14.5.1.2, including measures to reduce the impact of blasting through the preparation of specific blast design at each location, minimisation of the maximum instantaneous charge weight or alternatives to blasting. With the implementation of appropriate mitigation to reduce vibration from blasting the residual impact is predicted to be reduced to not-significant. The predicted level of groundborne noise during TBM passage is 48 dB LASmax at 34 Dartmouth Road, which is above the 45 dB LASmax threshold, resulting in a significant impact on the occupants of this address for the relatively short 2-week duration of the TBM passage. Unfortunately there are no effective methods available to reduce groundborne noise from TBMs at source and therefore the principal mitigation measure is advance consultation and engagement to inform residents of the timing of the TBM passing to allow building occupants to prepare for the temporary elevated noise levels. As outlined in Transport Infrastructure Ireland (TII) Airborne and Groundborne Noise Mitigation Policy (Appendix A14.6) there is a process in place whereby further mitigation measures, including temporary relocation, can be implemented at individual properties should this be merited. <u>Operational Noise and Vibration</u> EIAR Chapters 13 and 14 present a comprehensive and detailed assessment of operational airborne and groundborne noise and vibration. No residual noise impacts are identified at this location during operation. The calculated rail noise levels across the proposed Project are not significant in terms of any widespread community disturbance and result in a not significant to slight impact when added to the prevailing noise environment. EIAR Chapter 13, sections 13.2.3.2 and 13.5.3.2.3 recognise that ventilation systems if not designed and mitigated effectively are potential noise sources. Section 13.6.2.3 outlines the detailed considerations that will be included in the design to ensure that the ventilation systems do not exceed limits as per BS 4142, including: • Reduction of induct flow rates; • Reduction of elements in the airflow; • In duct attenuators; • Orientation of grilles and louvres away from sensitive receptors; • Acoustic louvres; and • Anti-vibration mountings and couplings will be incorporated into the design to control vibration. Measures to mitigate noise from the use of public address systems is also detailed in Chapter 13 (sections 13.5.3.2.4 and 13.6.2.4). Best practice design principles will be employed to minimise noise breakout at the surface from these systems via escalators, lift shafts and stairwells. <u>Access</u> During construction, pedestrian access will be maintained to the property. Once the station is operational, as outlined by EIAR Chapter 9 Traffic and Transport, with mitigation measures implemented there will be a residual long term slight impact on pedestrians as a result of there being more pedestrians in the area. However the use of existing footpaths will be at "acceptable comfort levels". There will be no other residual impacts in the operational phase related to traffic or transport. (also see responses (16) and (17) below).

Submission No.			153	
Organisation Name or Name of Submitter			John Neary and Kathleen White (11 Cambridge Terrace, Dartmouth Square)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Railway (Metrolink - Estuary to Charlemont via Dublin Airport) Order 2022 Case Reference Number NA29N.314724				
			Response (3) continued.	<u>Dust / Air Quality Construction Phase</u> EIAR Chapter 16, Air Quality, section 16.6 Mitigation Measures. The potential risk from dust emissions has been reviewed for the most important activities and each of the construction areas. Before commencing relevant works, an Air Quality Management Plan will be prepared and submitted for approval to the planning authority. The plan will take account of all relevant dust and emissions applicable to the circumstances of the relevant site, based on the local authority requirements and industry best practices. The plan will be developed by the contractor and for each worksite shall include: - An inventory and timetable of activities which may give rise to emissions or dust; - Alert levels; - Alert system to be used (including notification process); - Details of control measures; - Details of dust monitoring arrangements, including the location of sensitive receptors, monitoring locations, and monitoring equipment to be used; and - Details of the air quality reporting requirements. In order to ensure that no dust nuisance occurs, a series of measures will be implemented, as detailed in Appendix A16.4. In summary, the measures will include: - Material handling systems and site stockpiling of materials designed and laid out to minimise exposure to wind. Water misting or sprays will be used as required if particularly dusty activities are necessary during dry or windy periods; - Any blasting will be completed by specialised contractors with a specific blasting dust management plan; and - Hoarding will be provided around the construction compounds. Strict dust prevention will be in place at all times to minimise any potential emissions and these procedures will be strictly monitored and assessed. In the event of dust nuisance occurring outside the site boundary, movements of materials likely to raise dust will be curtailed and satisfactory procedures implemented to rectify the problem before the resumption of construction operations. Consistent implementation of good dust minimisation practices will ensure that the impact from construction dust is Long-Term, Localised, Reversible and not significant when considered with respect to the Environmental Protection Agency (EPA) description of effects (EPA 2022). <u>Dust / Air Quality - Operational Phase</u> As noted by EIAR Section 16.6.2 Operational Phase, all ambient air pollutants will remain in compliance with the ambient air quality standards and the proposed Project has negligible impacts at all modelled receptors, and therefore no specific operational phase mitigation measures are required.
4	Key Observations	1	d. We have not received any assurances about compensation in the event of damage to the house as a result of construction work or subsidence even though the excavation of the tunnel driving at 30 metres deep will be located a mere 2 metres from the front elevation of the property.	The impacts of construction generated ground movements on 35 Dartmouth Road have been assessed. The approach taken by TII for assessing the impact of construction generated ground movements reflects the industry standard three-phased ground movement impact assessment process that is undertaken on tunnelling and underground projects around the world, that includes Channel Tunnel Rail Link (CTRL), Dublin Port Tunnel, Crossrail and High Speed 2. EIAR Appendix A 5.17 Building Damage Report, covers the assessed impacts of construction generated ground movements and settlement and includes for the assessed impact on 35 Dartmouth Road. The Phase 2 assessment of the assessed impact on a representative building adjacent to No. 35 is "slight" (an explanation for which can be found in Table 4-4), please refer to representative building B-151 in table 5-2 of the appendix. Given that your property is a new build, the impacts described above are likely to be less. As your property is in close proximity to the station box excavation, the assessment work undertaken for the EIAR has determined that your property along with other similar neighbouring properties have been designated as "special" (please refer to section 4 Subsidence Damage Assessment Methodology of Appendix A5.17). Consequently, the property will be subject to a further Phase 3 refined assessment (despite the impact only being assessed as 'slight') to take account of final design and construction methodology details. The Phase 3 assessment will most likely utilising advanced numerical modelling techniques and further surveys of the building. The results of this refined assessment typically show that earlier assessments are conservative and overestimate the likely impact of construction generated ground movements. Monitoring instrumentation will also be installed in the area to monitor the performance of the works and potential environmental impacts, including ground movements to ensure that acceptable limits, determined as part of the Phase 3 assessment, are not breached. TII would also draw attention to the fact that private properties within 50m of the station excavation, or 30m of the tunnel are eligible to subscribe to the Property Owners Protection Scheme (POPs). The Property Owners' Protection Scheme is in addition to the existing legal rights of property owners and is in place to provide a simple and prompt way of rectifying any damage caused under the project up to the ceiling of €45,000. If the sum should exceed this amount the normal claims process would be used with the insurance companies for TII and/or the contractor.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Railway (Metrolink - Estuary to Charlemont via Dublin Airport) Order 2022 Case Reference Number NA29N.314724				
5	Key Observations	1	e. We have not received any information about the provision of relocation expenses, including security and maintenance of our empty house, in the expected event that our lives become intolerable or unsafe during the construction period.	As noted by the responses to this submission, the environmental impacts when they are mitigated are considered to be within acceptable levels with the exception of an approximate 2 week period when the TBM passes generating groundborne noise, and construction airborne noise that could be Moderate to Significant (see response (3) above). TII also confirm that no works will be undertaken that are unsafe. As outlined in Transport Infrastructure Ireland (TII) Airborne and Groundborne Noise Mitigation Policy (Appendix A14.6) there is a process in place whereby further mitigation measures can be implemented at individual properties should this be merited. TII also confirm that while of the view that the construction environmental impacts can be mitigated, relocation is an available option during peak construction. TII are available to discuss this option if that is something the property owner would like to explore and consider.
6	Key Observations	1	f. During the operation phase we note that there has been no assessment of the noise and air emissions from the proposed overtrack ventilation system to be located directly opposite 35 Dartmouth Road.	TII can confirm that the EIAR has considered noise and air emissions from the station ventilation system. Please refer to response (3) above, Operational Noise and Vibration, and Dust / Air Quality - Operational Phase.
7	Key Observations	1	g. The proposal to locate a pedestrian crossing directly outside the house will make it impossible for our car to access the electric car charging point located in the courtyard of the house. This is not acceptable.	The location of pedestrian crossings have been chosen to ensure that there are no permanent restrictions to property access. At this location, the pedestrian crossing is designed to ensure that it will not restrict access to your property TII will meet with you to ensure arrangements are in place to ensure access to your electric charging point can be maintained.
8	Letter - Point 2	2	2. The current proposal will essentially turn a quiet residential street, which is covered by Objective Z2 zoning: to protect and/or improve the amenities of residential conservation areas, into the forecourt of a busy Terminus Station. It is noted that all mature trees on the street will be lost as a result of the development and no replacements are proposed.	As outlined by response (3) above, no residual noise impacts are identified at this location during the operational phase. The zoning under the Dublin City Development Plan 2022 - 2027 for the residential properties in question is "Z2 Residential Neighbourhoods (Conservation Areas)" with an objective to "protect them from unsuitable new developments or works that would have a negative impact on the amenity or architectural quality of the area (See Table 3.11 of the Planning Report). As outlined in Section 4.5.18.6 of the Planning Report the element of the Project within the Z2 zoning area will affect a below ground area only and as such will not compromise the land use objective for the lands overhead. The majority of the proposed station and all above ground elements are located within the lands zoned Z5 with the objective "To provide for the creation and protection of enterprise and facilitate opportunities for employment creation". The station has been designed so that it is integrated with the proposed redevelopment of this site by a third party development, and as such, demonstrates that the proposed Project is consistent with the zoning objective. Chapter 9 Traffic and Transport outlines that after mitigation measures have been implemented there will be a residual long term slight impact on pedestrians as there will be more pedestrians in the area. However the use of existing footpaths will be at "acceptable comfort levels". There will be no other residual impacts either in the operational phase related to traffic or transport. In addition, no significant residual negative impacts are anticipated on the Population and Land Use from the operation of the proposed Project as outlined in Chapter 11 Population and Land use. Following the incorporation of the mitigation measures into the design of the proposed Project and implementation on an ongoing basis throughout the lifecycle, the residual effects that will arise during operation will be permanent and positive. As a result, it is not considered that the proposed development compromises the requirements of the Dublin City Development Plan 2022 – 2027. It is regrettable there will be a loss of three street trees at this location that need to be felled to facilitate the construction of the proposed station. However TII would note that the impact of tree loss is considered in Chapter 15: Biodiversity section 15.8.1. Habitat Loss, with replanting proposed in the landscape design to compensate for habitat loss by providing new areas for trees. The landscape plan includes for the planting of 3,444 individual trees which will be organised in small copses, lines of trees and within woodland habitats. The planting of these new trees will compensate for the loss and will not result in significant negative residual effect on trees at any geographic scale.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Railway (Metrolink - Estuary to Charlemont via Dublin Airport) Order 2022 Case Reference Number NA29N.314724				
9	Letter - Point 3	2	3. Charlemont is the incorrect strategic location for a Terminus hub and spoke system as it is too far out along the Luas Green Line spoke and would prejudice future options for integration of networks and services.	TII do not agree that Charlemont is the incorrect location for an interchange with the Luas Green Line or that it prejudices future options for integration with the wider transport network for the reasons set out below. In the Emerging Preferred Route Report, Charlemont was identified as the last station prior to the tie-in to the Green Luas Line which was intended to be upgraded to Metro standard. as outlined in EIAR chatper 7, decision to terminate at Charlemont instead was driven by three factors: (a) the additional impacts that would be involved in upgrading the Luas south of Charlemont as a result of the proposed adoption of a high degree of automated operations (GoA4); (b) the development of alternatives to accommodate increased capacity on the Luas line south of Charlemont without that upgrade; and (c) Feedback received during the EPR non-statutory consultation. St Stephen's Green West was not considered a feasible terminus location as an alignment that links the proposed Tara and St Stephen's Green west would have an undesirable horizontal reverse curve and an alignment greater than a 1000m long that would necessitate an intermediate intervention shaft located somewhere between these stations to comply with the MetroLink Fire Strategy. St Stephens Green West would also require a complex engineering interface with the Luas Green Line, significantly greater impacts on the Park and has greater potential for disruption during the construction phase. The proximity of the metro to the Luas line at Charlemont provides for a positive customer experience for all users with short interchange distance and due to the proximity, clear wayfinding and high visibility of the interchange. The interchange arrangements at Charlemont provide for significantly better interchange arrangements compared to an alternative interchange at St Stephen's Green Station. Passengers wishing to interchange between Luas and metro at an alternative St Stephen's Green terminus would face a 500m-walk along a route either through St Stephen's Green park or along the footpath north of the park, which adds significantly to the time for interchange and therefore the overall journey time for passengers and a less positive customer experience for all interchange users. This passenger experience would be reduced further for those with mobility or visual impairments as well as those travelling to/from the airport with luggage. The detailed analysis done for the Railway Order application further confirms that the section of MetroLink route between St Stephen's Green and Charlemont Stations contributes significantly to the overall benefits of the scheme. It serves a significant area of the south city of Dublin and offers enhanced access from the local area to the city centre and a direct connection to Dublin Airport. It serves key trip attractors including residential areas and offices / workplace locations, with high passenger boarding and alighting figures in the peak hours. During the morning peak, at Charlemont station the flows include 1,800 passengers alighting, 2,300 boarding and 1,229 passengers alighting, 2,276 boarding during the evening peak. The passenger numbers contribute significantly to the overall benefits of the scheme and the effect of these benefits outweigh the additional costs that are associated with the delivery and operation of the section from St Stephen's Green to Charlemont station. Further information is available in Chapter 7: Consideration of the Alternatives, section 7.7.8 MetroLink Southern Terminus Location. The location of the interchange at Charlemont does not preclude onward extension south. An interchange at Charlemont is supported by policy including the Dublin City Development Plan 2022 - 2028 and the Transport Strategy for the Greater Dublin Area. By extending MetroLink to Charlemont it provides for future proofing of the Green Line, bypassing the capacity constrained Luas on-street running section, and ensures potential future connectivity options are enabled, either to the Green Line or for extensions of the metro. The Charlemont Station interchange provides for increased passenger utilisation of the MetroLink system, thereby increasing the benefits delivered by the Project, reflected by an improved Project Benefit Cost Ration (BCR). The connection from St Stephens Green to Charlemont / Ranelagh is supported by the current Transport Strategy for Greater Dublin Area (2022-2042). The Transport Strategy was prepared by the National Transport Authority, scrutinised by the Joint Oireachtas Committee on Transport and approved by the Minister for Transport. It notes in section 12.3.2, "Charlemont offers the optimal location for the primary interchange with the Green Line in response to growing demand in the longer term and is an appropriate location to facilitate any potential future metro extensions to serve the south west, south or south east of the city region should sufficient demand arise." Under the Planning and Development Act 2000, the Transport Strategy is "a consideration material to the proper planning and sustainable development of the area or areas in question." Development Plans are required to be consistent with the Transport Strategy. The Dublin City Development Plan 2022-2028 envisages this station at Charlemont in policy SMT22 "To support the expeditious delivery of key sustainable transport projects so as to provide an integrated public transport network with efficient interchange between transport modes, serving the existing and future needs of the city and region and to support the integration of existing public transport infrastructure with other transport modes. In particular the following projects subject to environmental requirements and appropriate planning consents being obtained: ... MetroLink from Charlemont to Swords". Accordingly, the location of the Charlemont station is supported by detailed project-level analysis and the strength of that location is reflected at the highest levels of transport and land use planning and such is fully consistent with the proper planning and sustainable development of the area. The current Transport Strategy considers a range of options for the onward extension of MetroLink to meet the demand for travel over the period of the strategy. This includes consideration of the need for the upgrade of the Luas Green Line to metro with a metro extension to Dublin south west, south or south east. Whilst the strategy envisages that further extensions will be delivered after 2042, MetroLink which terminates at Charlemont allows for the possible extension of the metro in all any of the above directions.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Railway (Metrolink - Estuary to Charlemont via Dublin Airport) Order 2022 Case Reference Number NA29N.314724				
10	Letter - Point 3 (continued)	3	St. Stephens Green is the most appropriate location as it provides for interchange with bus, Luas and future DART underground. The project incorrectly dismisses St. Stephens Green West as an appropriate terminal station. It only considers St. Stephens Green East and Charlemont. Furthermore, no Study has been completed by NTA/TII as part of the entire Metrolink project on the optimal location for a City centre terminus.	TII do not agree that St Stephen's Green is the most appropriate interchange location for the reasons set out by response (9) above. It is not correct to say that the Project "only considers St. Stephens Green East and Charlemont." A number of route options were considered in the process of identifying the Emerging Preferred Route (EPR). These route options included potential station locations on St. Stephen's Green West. However these options were ruled out as it was not possible to design an alignment that would also provide a MetroLink interchange with DART at Tara Street Station without the requirement for an additional intervention shaft and poor reverse curve. As outlined by EIAR Chapter 3, Background to the MetroLink Project, one of the key objectives of the Project is the integration of it with the wider transport network that also includes for BusConnects and DART+ which are all included under Project Ireland 2040 and the GDA Transport Strategy 2022-2042 (section 12.3.2). Together, these projects will result in a reliable, sustainable, affordable, integrated public transport network that will support the economy, help Ireland meet its climate change targets in line with Climate Action Plan 2021 and make Dublin a more liveable and sustainable city. It is being argued that Charlemont station effectively becomes a terminus station in the short to medium term. In this regard, it is true to say that the Metrolink trains will terminate and turn back at Charlemont station, however the public transport service offering for passengers does not terminate, it transfers from Metrolink to LUAS as part of the integrated transport network. The terminus station for MetroLink is located at Estuary where all of the activities normally associated with a terminus (train sideways, car parking etc) take place. At this location the high capacity public transport offering terminates and the public transport offering transfers to a completely different mode, i.e. Bus and car . The environmental effect of the Metrolink terminus are accordingly assessed in the EIAR. Charlemont Station does not have the associated infrastructure and services associated with a terminus location and in fact has more in common with a "system turn back location". Charlemont Station is located within an area of high public transport accessibility, linking with the Luas Green Line which offers reasonably similar levels of services and frequency for journeys to and from the south of Dublin. As such, public transport service offering is not considered to terminate, but transfers onto the similar service offered by the Luas Green Line, forming part of a transport corridor running from Cherrywood to Estuary. The associated environmental impacts for the turnback and station at Charlemont have been fully assessed in the EIAR. Charlemont station itself was chosen on the basis of its interchange potential with Luas, as well as local bus services, as outlined above. The section of the line between St Stephen's Green and Charlemont generates considerable benefits for the scheme in terms of increased patronage. Operationally, the Station will see people moving quickly in and out of the area, noting that it will act as an interchange, and has been deliberately designed with minimum set down space or room for taxis so that it does not encourage the Station to be used as a terminus. All operational environmental impacts are mitigated so they are not significant, while the impact on amenity will be permanent and positive. The proposed route alignment from Estuary to Charlemont is consistent and compliant with the GDA Transport Strategy 2022-2042 (published in January 2023) in which states that the south city terminus at Charlemont offers the optimal location for interchange with the Green Line in response to growing demand in the longer term and is an appropriate location to facilitate any potential future metro extensions to serve the south west, south or south east of the city region should sufficient demand arise.

Submission No.			153	
Organisation Name or Name of Submitter			John Neary and Kathleen White (11 Cambridge Terrace, Dartmouth Square)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Railway (Metrolink - Estuary to Charlemont via Dublin Airport) Order 2022 Case Reference Number NA29N.314724				
11	Letter - Point 4	2	4. Expensive Duplication of Rail infrastructure - The inclusion of an expensive and costly section between St. Stephens Green and Charlemont is strategically weak and duplicates the existing Luas Green Line services. NTA's cost estimate for this 1km section at €650M is an expensive duplication and significant investment that deprives other parts of Dublin that are in immediate need of rail infrastructure to support housing and urban development.	The Board is not responsible for any decisions in relation to the funding the Project. It is solely responsible for assessing whether the Project is consistent with proper planning and sustainable development and that its effects on the environment are acceptable. The responsibility for funding the Project lies with the NTA, the Government and ultimately the Oireachtas. It has received all necessary approvals, including under the Public Spending Code for the making of a Railway Order. It will undergo further scrutiny and approvals, including under the Public Spending Code, before it is funded. It is not appropriate for the Board to make findings in relation to value-for-money that are outside its statutory functions and would cut across those arrangements. Members of the public are entitled to make representations to their TDs in relation to the value-for-money of any element of the Project. In any case, TII do not agree with this statement for the reasons set out by response (2) above, noting that infrastructure is not being duplicated given the capacity of the Luas south from St. Stephen's Green is restricted due to on-street running. There is a limit to the potential of the Luas to provide additional capacity in the on-street non-segregated section of the Luas Green Line from Charlemont northwards through the city centre. The nature of this route and the fact that it currently crosses several road junctions (Adelaide Road, Harcourt Street / Hatch Street upper and Harcourt Street / St Stephen's Green south) limit the service to a maximum of 24 trams per hour per direction. The projected demand for this section would require a higher frequency of up to 30 trams per hour and this demand cannot be met with on-street systems (Luas / bus). The interchange between Luas and MetroLink proposed at Charlemont will provide the necessary capacity to address the demand on this corridor and reduce overall travel time for passengers. There is also high passenger demand forecast for a Metrolink station at Charlemont, including from the Ranelagh area, which would be lost if St. Stephen's Green was the MetroLink southern interchange station. The additional fare revenues collected by the Charlemont Station interchange increase the benefits delivered by the Project, reflected by an improved Project Benefit Cost Ratio (BCR). Further, to ensure that public investment delivers value for money, the Public Spending Code sets out requirements for the evaluation, planning and management of public investment. The preparation of a Business Case is a key element of meeting these requirements. The Public Spending Code requires that both the Preliminary Business Case and Final Business Case for public investment projects are published. In July 2022, the Government granted Approval in Principle to the NTA to enable the submission of a railway order application by TII to An Bord Pleanála in respect of the MetroLink project (Decision Gate 1). This approval was granted after the Preliminary Business Case (PBC) had undergone significant scrutiny and challenge by bodies that are independent of TII, including DoT and DPER review (including independent review by JASPERS and the Major Projects Advisory Group (MPAG)) of the PBC around timeline, costs and benefits that were updated to inform the Government decision.
12	Letter - Point 5	2	5. The station box at Charlemont, as constructed in 2021/22 by the Developer Hines, does not have the benefit of planning permission and has not been part of the EIA undertaken for this project. Processing the current Railway Order application, which is reliant on these preliminary and now constructed works, is legally unsafe and contravenes the provisions of the EIA Directive.	The MetroLink enabling works constructed as part of the Hines development was included in the planning application for the Hines Development and has the benefit of planning permission which was granted in April 2019.

Submission No.			153

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Railway (Metrolink - Estuary to Charlemont via Dublin Airport) Order 2022 Case Reference Number NA29N.314724				
13	Letter - Point 6	3	6. The station box at Charlemont will result in only one possible future tie in with the Luas Green Line to the south, which would result in an option that was previously dismissed as part of the Tie-In study from March 2017. No alternatives to the station box at Charlemont were considered as it had been fixed through the design of the overhead Hines Grand Parade commercial development. The implications of this new alignment is very significant on our wider community as it will involve top down construction that will only be possible when many houses on Manders Terrace, Oakley Road and Charleston road are demolished.	The station box at Charlemont allows for a future tie into the Luas Green Line should it be determined in the future that through running metro services to Sandyford is the required solution to address the public transport needs to the south of the city. It is incorrect to say that the current proposal is based on an option that was previously dismissed as part of the March 2017 Green Line tie in study. The station design is in affect a modification to the preferred Green Line Tie Option 4B which was modified as result of the decision not to proceed with the upgrade of the Green Line to metro standard. The station box location was not fixed by the Charlemont Development. The preferred route for MetroLink was published in March 2019 following a comprehensive route options study. The preferred route was based on the emerging preferred route for the scheme which included a station at Charlemont. The Charlemont Metro Enabling Works were constructed to enable the Charlemont Development to proceed whilst simultaneously ensuring there was an option available to construct a station at Charlemont that avoided unnecessary demolition, took advantage of an available site, provided infrastructure that is integrated with planned development rather than necessitating later changes and retrospective adjustments to a new development or even possible demolition of the new development, whilst providing protected provision for the future extension of the scheme south, if required. It is also important to recognise that the station location at Charlemont is influenced by available vacant land and thus avoids unnecessary demolition. The submission seeks to portray the construction of the Metro Enabling Works as prejudicial to future decisions on proper planning and sustainable development of the area. It implies that the counterfactual would have had no effect on such decisions. That is not the case. There was a planning conflict between the EPR and the Grand Parade Development at the time the latter development was proposed. There was no resolution to that conflict that was free of implications for future decisions on the proper planning and sustainable development of the area. The Board could have refused permission for the Grand Parade Development, inevitably creating a underutilised and potentially vacant and idle site in a commercial hub location. The Board could have granted permission with no provision to facilitate a station at this location, resulting in a requirement for the railway order to provide for the demolition of a new office building. The Board's actual decision was reasonable and lawful in seeking to minimise the prejudice to an important office development and a critical piece of national infrastructure. It was also not particularly restrictive of future decisions in relation to the proper planning and sustainable development of the area. Of the three options open at the date of the Grand Parade planning application, two remain open: the Board can still require changes to the station design that require the demolition of the commercial building and it can grant an order that avoids demolition by using the Metro Enabling Works. It is agreed that the short-term implications for local residents will be significant as the scheme progresses through the construction stage, however the EIAR assesses the environmental impacts of the construction phase and commits to the implementation of appropriate mitigation measures that reduce the environmental impacts to not significant. The same is true of the operations phase for the project. TII will work closely with local residents to ensure the required mitigation measures are put in place. If in the future, the metro was extended south, this does not mean that inevitably open cut construction will be required or demolition of property will be necessary. In designing an extension, the promoter will seek to reduce the requirement for demolition by looking for tunnel launch sites at the southern extent of the scheme and, if one can be identified, driving the Tunnel Boring Machine northwards ultimately connecting into the existing tunnel. In that case, even if the new alignment were under the properties identified in the submission, the tunnel underneath them would be constructed by the Tunnel Boring Machine without the need for above ground works.
14	Letter - Point 7	2	7. The Environmental Impact Assessment is inadequate in relation the description of development, alternatives, transport assessment, noise and the cumulative effects of the development on the Charlemont-Dartmouth Community. For a project of this size, scale, investment to date, it is inadequate to propose a Railway Order with so many important studies and analysis missing.	TII do not agree that the Environmental Impact Assessment is deficient, inadequate or missing information. The Railway Order application comprises a very detailed environmental impact assessment that has identified and assessed the potential environmental impacts of MetroLink and proposed mitigations for these impacts where necessary. TII would also draw attention to the detailed project description, construction phase description and operational phase description provided in EIAR Chapters 4 and 5 and 6, and EIAR Chapter 7 and associated appendices that present details of alternatives considered. EIAR Chapter 9 and appendices provides a detailed analysis of transport and traffic effects, and EIAR Chapters 13 Airborne Noise & Vibration, and 14 Groundborne Noise & Vibration provide a detailed assessment of potential noise and vibration effects, while Chapter 29 outlines the assessment of interactions between various environmental aspects, and Chapter 30 covers the cumulative impacts with other projects. This assessment is carried out for the full length of the alignment including relative to potential significant effects on the Charlemont-Dartmouth Community.

Re: Railway (Metrolink - Estuary to Charlemont via Dublin Airport) Order 2022 Case Reference Number NA29N.314724				
15	Letter - Point 8	3	The development would result in noise and disturbance during the construction and operational phases and would result in a loss of amenities for the area.	For noise and vibration assessed impacts please refer to response (3) above. Loss of amenity during operation: No significant residual negative impacts are anticipated on the Population and Land Use from the operation of the proposed Project, following the incorporation of the mitigation measures into the design of the proposed Project and implementation on an ongoing basis throughout the lifecycle. The residual effects that will arise during operation will be permanent and positive as detailed in EIAR Chapter 11, section 11.1.1. Response (8) above explains why TII consider the proposed station complies with the zoning defined by the Dublin City Development Plan 2022 - 2027. The Station has been designed so that it is integrated with the proposed redevelopment of this site by a third party development, and as such, demonstrates that the proposed Project is consistent with the zoning objective. The MetroLink station design does not result in any segregation of the area, with no surface barriers or walls proposed.
16	Letter - Point 8 (continued)	3	The Traffic Study for the local Charlemont area is wholly inadequate as it omitted the modelling of the impact of Airport users coming to the only Dublin South Metrolink station at Charlemont. The Traffic Study uses a strategic, generalised regional model that does not take local factors into account. Extract from observation 9) - The EIA did not properly assess the impact of additional local traffic volumes, rather they used a generalised regional model that does not take local factors into account. A key local factor at a Terminus station in Charlemont that runs to the Airport is the huge volume of anticipated airport users from Dublin South and greater Dublin/Leinster that will come to Charlemont via car or taxi with baggage for onward destination to the airport. Grand Parade and the residential area around Charlemont-Dartmouth can not sustain the significant additional traffic volumes associated with this development.	The MetroLink forms part of an integrated public transport network. The system is designed in an integrated manner so that people travelling from the area south of Dublin to access locations north of Charlemont, such as Dublin Airport, Mater, Swords etc. will utilise public transport to interchange with the MetroLink, or will walk or cycle to access their local station. The system is not designed to encourage people to drive to stations within the City and TII actively discourage people from doing so other than the Park & Ride station at Estuary. TII therefore do not agree with the observation that there will be a "huge volume of anticipated airport users from Dublin South and greater Dublin/Leinster that will come to Charlemont via car or taxi with luggage for onward destination to the airport" as this is not borne out by our transport analysis. The Transport Assessment for MetroLink includes for people travelling to/from Dublin Airport from all areas within the extents of the GDA area, therefore it is incorrect to say "The Traffic Study for the local Charlemont area is wholly inadequate as it omitted the modelling of the impact of Airport users coming to the only Dublin South Metrolink station at Charlemont". The NTA's Eastern regional Model (ERM) incorporates a wide range of data sources, including demographic data, land use data, transportation network data, and travel survey data. The system is designed to model a variety of transportation modes, including private vehicles, public transit, walking, and cycling, and to simulate the interactions between these modes. The ERM model has been validated and calibrated using a range of localised data sources to ensure that the model can accurately represent the transport network, these include public transport and vehicle counts from the canal cordon counts. The outputs from the model have been combined with local survey data to undertake the more localised modelling, such as the pedestrian impact assessments, or the local traffic signals. This does not support the observations made "The Traffic Study uses a strategic, generalised regional model that does not take local factors into account." or "The EIA did not properly assess the impact of additional local traffic volumes, rather they used a generalised regional model that does not take local factors into account." Regards the observation there will be a "huge volume of anticipated airport users from Dublin South and greater Dublin/Leinster that will come to Charlemont via car or taxi with luggage for onward destination to the airport. Grand Parade and the residential area around Charlemont-Dartmouth cannot sustain the significant additional traffic volumes associated with this development", this is covered by response (17) below.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Railway (Metrolink - Estuary to Charlemont via Dublin Airport) Order 2022 Case Reference Number NA29N.314724				
17	Letter - Point 9	3	9. The development would have an adverse impact upon traffic during the construction and operational phase, and it has not been properly designed and there is poor integration with other modes of transport. Pedestrian movements in and around the station would be difficult. Grand parade is an already heavily congested orbital route.	Metrolink is designed to form part of an integrated public transport network with Charlemont selected as the preferred interchange location in order to maximise the potential interchange with the existing Luas Green Line. In overall terms, Charlemont Station will provide for improvements to the public transport network resulting in decreases in private car usage/trips, increases in public transport usages and will facilitate walking and cycling to the station, without significantly impacting on the operation of the road network in the area. Construction Phase: EIAR Appendix A9.5 Scheme Traffic Management Plan presents the analysis undertaken to assess the impact of the traffic management measures on the local road network surrounding the proposed Charlemont Station during the construction phase. At the local level the following parameters have been used to assess impacts on general traffic and on pedestrians: • Increase in walking distance/quality of service for pedestrians (through removal of footpath, reduction of quality of service, removal of a pedestrian crossing or relocation of crossing by more than 100m); • Increase in driver delays at junctions; • Changes in traffic flows on surrounding streets; and, • Additional distance travelled due to diversions. The analysis undertaken at this location indicates that the increased volume of traffic on Grand Parade and Northbrook Road does not translate into any significant increase in driver delay. The largest increase in driver delay of 12 seconds is registered on the westbound approach on Grand Parade to the Ranelagh Road signalised junction. During the construction phase, pedestrians will experience a reduction in quality of pedestrian infrastructure and space. The construction site boundary will encroach upon footways in the local area, including the northern side of Dartmouth Road, and the southern side of Grand Parade. However, a temporary signalised crossing will be provided west of the Luas to maintain pedestrian access to and from the Stop. Whilst there are partial closures on Dartmouth Road and Grand Parade, pedestrian movements will be maintained on appropriately sized footways through the area. Operational Phase: A microsimulation VisWalk model has been developed for the immediate area surrounding Charlemont Station during the operational phase. The model covers the full extent of the publicly accessible station area, including the immediate vicinity of the station entrance at street level, the Luas stop and nearby junctions at Charlemont Bridge. In order to accommodate the forecast demand from the proposed Charlemont Station, a new staircase with 2.4m stair width is proposed at the south east corner of Charlemont Luas stop. An elevator will also be provided at this location. Both are sized for MetroLink to Luas, and Luas to MetroLink passenger numbers. In addition, it is proposed that the pedestrian crossing on R111 Grand Parade will be repositioned to the front of the building being developed by Hines. With this infrastructure in place, the model indicates that the R111 Grand Parade will have an acceptable level of service overall, with some reductions in service seen at the pedestrian crossing where pedestrians are required to wait for a green phase at the signals. Overall, it is considered that the model displays an acceptable level of network performance. The proposed pedestrian crossing on Grand Parade will have minimal impact on the traffic flow along Grand Parade and can be programmed to operate in sync with the existing signalised junction at Grand Parade /Charlemont Street to maintain the flow of traffic movements. When the Project is operational, car mode share will decrease, with a reduction of up to approximately 830 car tips to and from the zones surrounding Charlemont Station over the 12hr period in 2065. In overall terms, the Charlemont Station will provide for improvements to the public transport network resulting in decreases in private car usage/trips, increases in public transport usages and will facilitate walking and cycling to the station, without significantly impacting on the operation of the road network in the area. Furthermore, TII have deliberately designed the Station with minimum set down space (with the exception of a drop-off on Grand Parade for persons of restricted mobility only) or room for taxi ranks so that it does not encourage the Station to be used for a significant volume of car or taxi trips.

Organisation Name or Name of Submitter			John Neary and Kathleen White (11 Cambridge Terrace, Dartmouth Square)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Railway (Metrolink - Estuary to Charlemont via Dublin Airport) Order 2022 Case Reference Number NA29N.314724				
18	Letter - Point 10	4	10. The development will have an adverse impact upon property values, particularly during the construction phase. For many houses in the area there will be a long term and permanent adverse impact upon property values from noise of the operating rail infrastructure, vents, tannoy systems, escalators and large traffic volumes - vehicular and pedestrian using the station 19 hours per day. The adverse impact also extends to the loss of amenity for the wider community changing a quiet residential neighbourhood into a noisy, busy, congested major transport hub.	Response (3) above outlines the predicted environmental impacts with regards to noise and vibration, and amenity, while responses (16) and (17) summarise the assessed traffic and pedestrian impacts. TII would note that as explained by response (17) above that in overall terms Charlemont Station will provide for improvements to the public transport network resulting in decreases in private car usage/trips. TII do not agree that the development will have a long term and permanent negative affect. In fact there is evidence to suggest that property values will in fact increase in close proximity to public transport infrastructure and that local residents will greatly benefit from having a world class metro system providing access to the city centre, airport and north city at their door step. The benefits of the project for all communities along the MetroLink route are described in Chapter 3: Background to the MetroLink Project, section 3.4 MetroLink Response to Challenges.
19	Requested Amendments	4	Requested amendment to An Bord Pleanala We request the following amendments: 1. Omit from the Railway Order the section from Tara Street Station to Charlemont Station and associated onward tunnel extension and intervention tunnel 2. Require the submission of a railway order for a section from Tara Street Station to St. Stephens Green which would effectively provide for a terminal hub station that can integrate with the Luas Green Line, multiple bus routes and future DART underground. 3. If the construction of a station at Charlemont is permitted, require the provision of adequate mitigation measures to protect the owners of residential properties significantly affected during the construction and operational phases. 4. If the construction of a station at Charlemont is permitted, require the relocation of the proposed pedestrian crossing directly outside No 35 Dartmouth Road.	The above responses to the observations made explain why TII do not consider it is correct or appropriate that the MetroLink alignment south of the proposed Tara Station should be omitted, and also demonstrates why the proposed Charlemont Station has been selected by TII as the preferred interchange with the Luas Green Line A scheme which terminates at Tara Street would not be consistent with the Transport Strategy for Greater Dublin Area (2022-2042). In addition any decision to terminate the scheme at Tara will significantly impact on the overall viability and benefits of scheme. TII have also outlined how the potential construction and operational environmental impacts will be mitigated, but as confirmed by response (5) above, TII are available to discuss with the property owner the option to relocate during the peak construction. Regards the proposed pedestrian crossing outside No 35 Dartmouth Road, as noted by response (7) above, TII propose to meet with you to ensure that an arrangement can be arrived at that ensures you can charge your car.

Letter Re: Submission in Relation to Metrolink (Ref: ABP-302010-18) and Proposed Mater Station					
1	Station design	1 and 2	The railings, gates, some of the statues and plinth walls enclosing the park at the corner of Eccles Street and Berkeley Road, are protected structures which I understand will be stored and reinstated according to the details provided in the Railway Order and accompanying documentation. However, the photomontages illustrating the ex post reinstatement of the park show a vastly changed area, with a hard landscaped 'plaza' replacing much of the soft landscaping, a voluminous (excessively tall and long) station entrance and canopy blocking views of the Mater Hospital from Berkeley Road, and a number of ancillary buildings which are not in keeping with the architectural surroundings. Such development would be highly deleterious to the visual amenity and architectural heritage of valuable local streetscape. I therefore request the following changes to the station design to protect and enhance the visual and recreational amenity of the area: • Serious consideration should be given to a reduction in the size of the above-ground Mater Station in both height and length, and/or consideration of an alternative location parallel to St Joseph's Church (on the east of Four Masters' Park) with entrances/exits via Eccles St and Berkeley Road.	TII believe the commissioning of internationally renowned architect Nicholas Grimshaw and Partners, has delivered a contemporary station design which is appropriate for a state of the art metro system such as MetroLink. Appropriately, significant emphasis is placed on the public spaces. Where feasible, the station concourse is a soaring space illuminated from above with natural light. Dublin's rich architectural heritage has been respected, but not copied in a pastiche imitation. In accordance with best conservation principles, as set out in the ICOMOS Venice Charter of 1964, the stations are architecturally distinguishable so as not to falsify the existing historic context. Reference and due respect to that context is made through the choice of high quality and appropriate materials and the scale of the interventions. At Mater station, the canopy entrance evokes the scale of park structures. The aesthetic values of all eras, including our own, have cultural validity, and therefore the brick is used in a contemporary way reflecting contemporary aesthetic idioms derived from 21st century technology. TII believe the current station and surface level designs greatly enhance the public realm at all locations along the MetroLink route. There is a unifying commonality in the design of all stations, providing a consistent and coherent architectural language, which assists with orientation and wayfinding, and contributes a new architectural lexicon to the cultural iconography of the city. The station architecture is integrated in the park in a sympathetic fashion with the skylights being framed by planting and providing circulation routes through the park. Existing monuments and protected railings will be relocated within the park. Large mature trees will be placed so as to provide balance and create space within the park. The landscape design itself will be created on top of the station box and sufficient depths and infrastructure are provided for in order to integrate the landscape design. There will be one entrance to Mater Station, situated at the northwest corner of the park and close to the Mater Hospital access, which is conveniently located to walk to Mater Hospital, St. Joseph's Church and Berkeley Road. The station location will also connect with bus services to and from Dublin City Centre with bus stops on Berkeley Road. A change in location for the station and creation of additional station entrances/exits would have a major impact on the design of the station in terms of utilities, traffic and construction, in a very space-constrained location.	
2	Station design	2	• The removal of 50 mature trees from this relatively small area is excessive, unnecessary, at odds with Government climate action and biodiversity policy, and would represent a significant environmental and visual amenity loss to the local area. The Planning Report states that “<i>tree planting will ... be relatively immature and will not enclose the Park or contribute much to the definition of the two adjoining streets for at least a period of approximately 7-10 years</i>”. In light of this, proper consideration should be given to protecting existing mature trees where possible, as well as reinstating mature trees that must be felled with mature specimens.	TII recognise the impact that the Proposed Project will have on Four Masters Park, particularly during construction. EIAR Chapter 27 (The Landscape) details the impact on the landscape and visual amenity of the stations during both the construction and when the station is operational. On completion of the station box, the existing Four Master Park and its surface features will be substantially reinstated with the visual amenity of the area largely restored, much to its existing condition and improved in respect of the shared space to the front of the original hospital building, the refinement of the park layout and the tree and plant species selection. Over the initial period after completion of the construction, the maturity and ambience created by the existing trees cannot be matched. However, as the new trees mature, this too will return with views along the adjacent streets and into the Park, much as they were. The restoration of the open green park space within the triangle of buildings along with the proposed amendments to the original Mater Hospital section of Eccles Street, will again impart the tranquil qualities of the existing condition. Overall, the predicted effects on the visual environment and on visual amenity when the station is operational will, in the longer term be significant and positive.	

Submission No.			154		
Organisation Name or Name of Submitter			Jonathan Healy (22 Geraldine Street, Phibsborough)		
Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
Letter Re: Submission in Relation to Metrolink (Ref: ABP-302010-18) and Proposed Mater Station					
3	Station design - alternatives	2	Local residents, including myself, do not wish to see the Four Masters' Park becoming a hard landscaped 'plaza'. Thus, consideration should be given to the use of more soft landscaping of the reinstated park (including shrubbery, gravel pathways, etc.) to better recreate the feel, design and visual configuration of the current park.	Please refer to response item (1) in relation to the architectural design of Mater Station. TII recognise that Four Masters Park has very important heritage and architectural connotations, and as such the Mater Station urban realm design principles for restoration of the Park at completion are based on the following: * Realignment of the Four Masters Memorial; * Rearranging the footpath to provide enough pedestrian space for the main entrance; * Reinstatement with enhanced planting of the Four Masters Park and its existing railings; and * Replacement of existing trees. The construction of Mater Station in the Four Masters Park will affect the park itself, both Eccles Street and Berkeley Road, and St Joseph's Church, requiring stringent environmental management measures during construction and restoration of the urban realm. Design changes that were introduced to reduce impacts on heritage include the following: prior to the construction phase the railings, gates, plinth walls, Healing hands sculpture and Celtic cross at Four Masters Park (RPS, Reference 737) will be removed, stored carefully and reinstated following the completion of construction of the proposed Mater Station. Please refer to response item (4) below for more information related to the provisions of Park reinstatement following the completion of the construction of the Mater Station box.	
4	Station design - alternatives	2	Ancillary station buildings containing lifts, ventilation shafts, etc., should be redesigned aesthetically, in keeping with the local environment, and with a view to minimising visual intrusion.	Please refer to response item (1) and (3) in relation to the architectural design and proposed landscaping at Mater Station. As detailed in Chapter 26 (Architectural Heritage), following the completion of the construction of the station box, the Park will be reinstated on the surface to a shape and form similar to the existing Park with updated planting, including new trees along each side of the triangle. To ensure the protection of architectural heritage throughout the alignment, a Project Conservation Architect has been engaged to oversee the implementation of the Project. A specialist Heritage Works Contractor will also be appointed to remove, store and conserve the architectural heritage constraints identified at Four Masters Park during the construction phase, to ensure they are protected for reinstatement as part of the completion of the station. Please refer to section 26.7 Mitigation Measures and Residual Impacts, of Chapter 26. The railings and gates, the Four Masters Cross and the sculpture will all be reinstated to a slightly amended alignment and locations to facilitate ventilation grilles, air intake shafts, fire access lift, emergency escape stairs and the main entrance to the station. The existing garden and grotto adjoining and within the grounds of St Joseph's Church will also be reinstated on the existing footprint and in similar style to the Four Masters Park proposals with proposed trees. This allows the accommodation of the introduced elements of the station which will now be expressed at surface level. It also ties in with the axial elements related to the original Mater building and which will be expressed in the proposed shared surface at its front. Please refer to section 26.5.4.8 Mater, from Chapter 26.	
5	Station design	2	The excessive use of bollards around the station entrance should be avoided, as these detract from the visual amenity and will undoubtedly become damaged. Consideration should be given instead to greener alternatives - such as a row of trees and shrubs - as well as the use of the existing cast-iron railings to form a protective frontage for the station if this is desired.	The use of bollards for the purpose of security at station entrances is a feature common across the majority of the proposed city centre deep stations, particularly where space for other methods is limited. The commonality of approach aligns with the Architectural, Urban Realm, and Landscaping Design Principles set out in Section 4.7 of Chapter 4: Description of the MetroLink Project. Please refer to response item (4) above related to the provisions of Park reinstatement following the completion of the construction of the Mater Station box.	
6	Station design	2	All of the historical, protected cast-iron railings and other features of Four Masters' Park should be reinstated.	Please refer to response item (4) in relation to the reinstatement of architectural heritage features at Mater Station.	

Submission No.			154	
Organisation Name or Name of Submitter			Jonathan Healy (22 Geraldine Street, Phibsborough)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: Submission in Relation to Metrolink (Ref: ABP-302010-18) and Proposed Mater Station				
7	Station design	2	Station skylights should be flush with the ground rather than raised, as the current design is visually intrusive.	Please refer to response item (1, 2, 4) above related to the design and construction of the Mater Station box.
8	Station design	2	There should be ample seating, planting and paths within the reinstated park.	Please refer to response items (2, 4) above related to the provisions of Park reinstatement following the completion of the construction of the Mater Station box.
9	Construction phase	2	With regard to issues that may arise during the construction phase, a number of matters have not been adequately addressed in the Railway Order, Environmental Impact Assessment, Appropriate Assessment, Planning Report or related documents: Parking for local residents is limited on the streets adjacent to the Mater site running off Berkeley Road (DCC Zone 2: “To protect and/or improve the amenities of residential conservation areas”). As residents of Victorian housing without the facility of driveways or garages and therefore reliant on zoned residential disc parking, for which residents pay an annual charge, it would be an egregious impact on the local community should construction workers and Metrolink contractors use these limited parking spaces, especially given the lengthy duration of the project. Consideration should be given to a ‘park and ride service’ for construction workers, or some alternative to the use of private vehicles to commute to the Mater site.	Construction Staff Parking As noted in A5.1 Outline Construction Environmental Management Plan (CEMP) section 5.14 Worker Access, all construction staff and workforce will be encouraged to make their way to site and home from site by public transport, by project specific transport (e.g. minibuses), by bicycle or on foot. Limited parking spaces will be provided for vehicles required for the construction activity and for employees. The nominated contractor(s) may provide a transfer pick-up and drop off service from suitable public transport hubs. As part of the preparation for the construction phase the appointed contractor for the works at Mater Station will prepare a detailed CEMP that will include plans to mitigate construction parking locally with the preparation of the Construction Mobility Plan, part of the CEMP documentation to be submitted for Dublin City Council approval prior to works commencing at Mater. Construction Phase - Impact on local parking Parking availability during the construction phase at the proposed Mater Station is covered in Chapter 9 (Traffic and Transport) of the EIAR, section 9.6.1.2.4.5, Parking and Loading Construction Impact Assessment, with particular detail provided in EIAR Appendix A9.5 Scheme Traffic Management Plan, section 7.7: There will be slight impacts for loading and parking during the Enabling Works associated with Mater Station. This loss of parking will at its peak be approximately 7 parking spaces, however generally only one or two spaces will be lost through the phasing of the work. During Phase 1 of the Main Works, the Pay and Display parking spaces along the eastern side of Berkeley Road will be removed, resulting in the removal of 12 on-street parking spaces. Approximately 5 on-street Pay and Display and Resident Permit parking spaces will be removed from the western side of Berkeley Road. A temporary location for the taxi rank will be agreed with DCC. During Phase 2 and 3 of the Main Works at Mater Station, the Pay and Display parking spaces along the eastern side of Berkeley Road will be removed. This will result in the removal of 12 on-street parking spaces. On the west side of Berkeley Road, five on-street Pay and Display and Resident Permit parking spaces will be removed as well as a loading bay that will be relocated. A summary of Mitigation Measures in Construction Phase are presented in Table 9.147 of the EIAR Chapter 9 (Traffic & Transport). The mitigation measure for Berkeley Road for general traffic, parking and loading is to monitor if closures are required at all stages of the construction phase, or if spaces can be reinstated temporarily throughout the works. Operational Phase - Impact on local parking Once MetroLink is operational, to accommodate the station entrance, the current footways and traffic lanes on Eccles Street will be realigned as part of the proposed Project. The realignment of Eccles Street, and the widening of the footway on Berkeley Road will result in the loss of on-street parking at both locations. Approximately 20 on-street parking spaces will be lost on Eccles Street, while approximately 14 spaces will be lost on Berkeley Road, due to the provision of a signalised crossing in proximity to the Station entrance. While there will be a loss of commercial and residential parking and loading infrastructure as a result of the proposed Project, the modal shift from road to public transport when the proposed Project is in place will reduce the overall demand on parking and loading facilities, thus reducing the severity of the impact. For more information, please refer to Chapter 9: Traffic and Transport, Appendix A9.2-I, Traffic and Transport Assessment Mater Station.

Submission No.			154	
Organisation Name or Name of Submitter			Jonathan Healy (22 Geraldine Street, Phibsborough)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: Submission in Relation to Metrolink (Ref: ABP-302010-18) and Proposed Mater Station				
10	Construction phase	3	• Residents like myself are very concerned about access to their homes during the construction phase. It is not clear from the project documentation how residents will be able to continue to access their homes, how traffic from Berkeley Road will be re-directed, the impacts of any redirections, including traffic, noise, pollution, etc. A detailed traffic management system, in consultation with local residents, should be put in place as a condition of proper planning.	Chapter 5 of the EIAR, MetroLink Construction Phase, explains that traffic management plans for the construction phase of the Project have been developed to minimise the impact on road users, and to maintain access to businesses and other premises. Prior to implementation, all traffic management measures will be agreed with Dublin City Council and where relevant, consultation with An Garda Síochána and other statutory stakeholders will be undertaken. The design of traffic management measures and highways works around the proposed Mater Station is based on achieving the key objective of maintaining continual access to all properties during the works. Where necessary, a safe alternative route will be provided for pedestrians and vulnerable road users, such as children, and persons with restricted mobility, to maintain pedestrian access to premises. Where detour routes are required, these will be kept as short as possible and detour signage will be clear and easy to understand. All construction sites will be designed to be as unobtrusive as possible. The EIAR Appendix 9.5, Scheme Traffic Management Plan provides details of the Traffic Management Plans for the construction phases at Mater Station. As detailed, during the Enabling Works there will be no diversions or road closures that will impact local access in the vicinity of Mater Station. Temporary shuttle signals will be introduced on Berkeley Road which will lead to slight traffic delays of approximately 20 seconds. During the Main Works, general traffic will not be able to access Eccles Street from the Berkeley Road direction (with the exception of emergency vehicles), however movements on Eccles Street will be maintained via the N1. This will result in a moderate redistribution of traffic, leading to delays of approximately 30 seconds. Mitigation measures to reduce noise from construction traffic are limited to restricting speed limits, maintaining road surfaces and ensuring all vehicles are properly maintained. In addition, any coverings on construction vehicles will be securely fastened before leaving site to avoid excessive 'rattling'. As detailed in Chapter 16 (Air Quality), the modelling of road traffic for impacts on human and ecological receptors has found no significant impacts that require mitigation measures with respect to the modelling of emissions. However, some mitigation measures can be put in place to minimise emissions: * Implement a policy which prevents idling of vehicles both on and off-site including HGV holding sites; * Construction Phase traffic should be monitored to ensure construction vehicles are using the designated haul routes; * Additional vehicular traffic will be managed through the CEMP and Temporary Traffic Management Plans for the proposed Project and stations as per Chapter 9 (Traffic and Transport); * Efficient scheduling of deliveries to minimise number of deliveries required, and in turn their emissions; and, * Construction vehicles should conform to the current EU emissions standards and where reasonably practicable, their emissions should meet upcoming standards prior to the legal requirement date for the new standard. This will ensure emissions are minimised. As detailed in Appendix A5.1 Outline CEMP, a Project Construction Traffic Forum will be established for local stakeholders to address any concerns regarding construction traffic.

Submission No.			154	
Organisation Name or Name of Submitter			Jonathan Healy (22 Geraldine Street, Phibsborough)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: Submission in Relation to Metrolink (Ref: ABP-302010-18) and Proposed Mater Station				
11	Construction phase	3	It is not clear from the documentation how construction-related noise and airborne pollution and dirt will be minimised. Air pollution levels are widely documented to be already high in the area. A pollution mitigation plan must be produced and conveyed to residents.	<u>Airborne and Groundborne Noise and Vibration</u> In order to manage and mitigate airborne noise, the Contractor will be required to set this out in their Construction Environmental Management Plan (CEMP), for consolation and approval by Dublin City Council, an outline of which is included in EIAR Appendix A5.1. The setting of Construction Noise Thresholds (CNT’s) limits used in the EIAR for this Railway Order, are based on the requirements of BS 5228-1 (BSI 2014a), with details provided in Chapter 13, section 13.2.6.1.3. Should the Railway Order be granted the Construction Noise Threshold (CNT's) limits as listed in the EIAR will be mandated to the contractors and enshrined in the Railway Order. Before commencing works, a detailed noise assessment for each work site will be undertaken based on the most up to date information for each site and the contractors will then need to provide best practice mitigation to reduce the impacts. If the Contractor is unable to reduce the impacts sufficiently, with residual levels remaining such that widespread community disturbance or interference with sleep is likely to occur, then TII will consider whether the provision of further Noise Insulation (NI) or Temporary Rehousing (TRH) would be appropriate at locations where eligibility for either has been established. The Transport Infrastructure Ireland (TII) Airborne Noise and Ground-borne Noise Mitigation Policy (Appendix A14.6 of EIAR Chapter 14) sets out the construction noise insulation and temporary rehousing measures to be implemented where required. Regarding the noise and vibration from TBM Passage, as presented in the EIAR Chapter 14 (Groundborne Noise and Vibration), none of the construction activities proposed for MetroLink will have potential to meet the thresholds levels of vibration for buildings damage, with the exception of blasting. For some of the buildings located above or in close proximity of the tunnel, the noise level from TBM Passage will be above the 45 dB threshold level, resulting in a significant impact on the residents for the limited duration during TBM passage. Unfortunately, there are no effective methods available to reduce groundborne noise or vibration from TBMs at source, but noting that the duration of this impact will be in the order of up to two weeks as the TBM passes. TII will liaise with the residents to ensure the timing of these impacts are known. <u>Air Quality</u> EIAR Chapter 16, Air Quality, assesses the likely effects of the Project on Air Quality during the construction phase with mitigation measures proposed where required. Air Quality during the construction phase will be impacted by traffic and dust emissions resulting from construction activities at the Mater Station site from Earthworks, Construction and Trackout (Maximum Daily HGV Movements). Section 16.5.2.6, Regional Air Quality Assessment – Construction Phase Southern Peak Scenario, has assessed traffic emissions pre-mitigation as being overall Neutral, Not Significant and short-term. Table 16.44 presents a summary of predicted dust emission magnitudes from the main construction sites, the results for the Mater Station site being: - Earthworks - Large; - Construction - Small; - Trackout – Large; This has resulted in defining the site-specific mitigation level as High and thus mitigation will be required. A detailed list of Dust Mitigation Best Practice Measures for each construction activity is presented in Appendix 16.4 Dust Management Plan. Before commencing relevant works, an Air Quality Management Plan will be prepared and submitted for approval to Dublin City Council. The plan will include all appropriate dust and emissions mitigation measures applicable to the circumstances of the relevant site, based on the local authority requirements and industry best practices. A plan will be developed by the contractor for each worksite, including Mater. Strict dust prevention will be in place at all times to minimise any potential emissions and these procedures will be strictly monitored and assessed. In the event of dust nuisance occurring outside the site boundary, movements of materials likely to raise dust will be curtailed and satisfactory procedures implemented to rectify the problem before the resumption of construction operations.

Submission No.			154

Letter Re: Submission in Relation to Metrolink (Ref: ABP-302010-18) and Proposed Mater Station				
12	Construction phase	3	Hours of operation on this site need to be clearly defined and communicated to residents. To minimise disruption to residents, there should be no work performed at weekends, and on weekdays before 8am or after 6pm in the interests of planning and residential amenity.	As detailed in the EIAR Chapter 5, MetroLink Construction Phase, the programme for the construction of the proposed Project has been optimised to minimise the duration of the Construction Phase in order to lessen the duration of potential environment impacts, while ensuring that the areas surrounding the work sites remain operational and functional. Work will run concurrently at all MetroLink site locations to ensure the Project is delivered in an effective and timely manner. Once a contractor has been appointed, TII will seek to further optimise the programme with a view to reducing the overall duration of works at the proposed Mater Station. TII will consult with the stakeholders on any such proposals received from the contractor. Section 5.2.4 of Chapter 5: MetroLink Construction Phase of the EIAR sets out the proposed working hours across the project, with those proposed at Mater Station also listed in Table 5.5. The MetroLink construction duration of 105 weeks at Mater Station, listed in diagram 5.4 is based on these proposed working hours. Standard 5.5 day shift patterns are proposed during the main station construction activities at Mater Station, but move to 24 hour 7 day working at the later stages of the programme for the following activities: TBM Traverse across the station; Mechanical, Electrical and Plumbing (MEP) and station fitout all within the completed station structure. During 24 hour, 7 day working, deliveries to site will be limited to standard hours. Any requirements for occasional night-time activates outside of standards hours, such as: Traffic management, abnormal deliveries, concrete pours etc will be agreed with Dublin City Council having due consideration for local residents.
13	Construction phase	3	Regarding day-to-day construction-related impacts, including noise, vibration and other impacts from tunnelling, construction, debris removal, etc., it is important that a Metrolink project liaison officer be appointed who can offer to meet with each resident and business-owner in the Berkeley Road area including the residential streets adjacent to the Mater site, namely Geraldine St, O'Connell Ave, Sarsfield St, Saint Vincent St North and Goldsmith St.	Further to the RO application, TII intends to establish a minimum of 3 local community liaisons offices along the MetroLink Route. It is proposed to locate these offices in the city centre, Glasnevin and Swords Areas. The offices will be established at least 3 months prior to the commencement of Major Infrastructure works. As noted in Appendix A5.1 Outline CEMP, TII and the contractor(s) will take all reasonable steps to engage with stakeholders in the local community, especially those who may be affected by the construction works including residents, businesses, community resources and specific vulnerable groups. The contractor(s) will be responsible for putting in place a Stakeholder Communications Plan which will be developed by the contractor as part of the CEMP (EIAR Appendix A5.1) before any work can commence. Prior to the submission to DCC for approval, the Stakeholder Engagement Plan will be developed under and endorsed by a designated community liaison officer appointed by TII. The purpose of this plan will be to provide a two-way mechanism for members of the public to communicate with a designated member of the contractor(s)'s staff and for the contractor(s) to communicate important information on various aspects of the proposed Project to the general public. Further details are provided within 5.12.4 Construction Phase Sustainability, CC2: Community and Engagement.
14	Community engagement	3	Finally, in terms of community engagement, it is vital that greater clarity and local community consultation be prioritised as a project objective. There is a general lack of clarity around the responsibilities of the scheme contractor in terms of communication and consultation with the local community over the course of the project. This also includes the proper demarcation of responsibilities between the Scheme Contractor, TII and Dublin City Council. I also observe a lack of specificity with regard to the scheme contractor's formal obligations to the local community (e.g. monitoring air emissions, dirt, noise and vibration, cleaning, traffic management, reinstatement of the Four Masters' Park, etc.). The restoration and rejuvenation of the area after the development of the Mater Station is vital to the proposal being acceptable to the local community.	TII have undertaken extensive consultation across the route of MetroLink and has listened carefully to the concerns of stakeholders and the community, as documented by EIAR Chapter 8. In preparation for the Railway Order application TII have also undertaken a detailed and an extensive Environmental Impact Assessment that identifies and addresses environmental concerns as evidenced by the submitted EIAR, including proposed mitigations to reduce environmental impacts. The EIAR Appendix 5.1 sets out the outline CEMP that is based on the assessment outcomes of the EIAR which subject to Railway Order approval will condition the scheme appointed contractors to meet the performance requirements and conditions set by the Railway Order. Please refer to response item (13) above in relation to TII's commitment to engagement during the construction phase.

Submission No.			154	
Organisation Name or Name of Submitter			Jonathan Healy (22 Geraldine Street, Phibsborough)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: Submission in Relation to Metrolink (Ref: ABP-302010-18) and Proposed Mater Station				
15	Community engagement	3	It is recommended that in order to ensure that the local community impacted by the Mater Station remain 'on board' and supportive of the project, a Mater Station Liaison Group be established which would comprise of TII officials, local representatives (Councillors) and representatives of the local Residents' Associations (Berkeley Road and District 7). This Group should be responsible for dealing with day-to-day construction-related issues such as those referred to in this submission, working with the local community to minimise adverse impacts and agreeing solutions to same, as well as provision of additional information to the local community.	Please refer to response item (13) above in relation to community liaison officers.
16	Community engagement	3	Given the scale of upheaval in the area, and duration of the project, I believe that it should be a condition of planning that TII make provision for a Community Fund for the benefit of the local area (i.e. funding for improvements to the visual amenity and liveability of the local area, traffic calming, greening, etc.). This will be particularly critical in the context of the reinstatement of the Four Masters' Park and the substantial impact to Berkeley Road residents and businesses.	TII will work with established Community Groups through the local community liaison officers along the route to identify projects at local level that would involve the Community in the delivery of MetroLink and its legacy. Such projects could include: - A local school learning programme. - Enhancement of community amenity within agreed funding limits. - Engagement with final landscape and finishing options, including aspects of biodiversity. TII are willing to explore mechanisms for investing in local initiatives to support affected communities during the works, such initiatives will be subject to funding being made available.

Submission No.			155	
Organisation Name or Name of Submitter			Juliana and Joe Boland and Family	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
RE: Case Ref. NA29N.314724 Railway (Metrolink - Estuary to Charlemont Via Dublin Airport) Order (2022) Observations/Arguments re potential Compulsory Purchase Order of Properties on the proposed Metrolink route in Swords area submitted by: Juliana and Joe Boland and family				
1	Letter	2	This is the second Railway Order which we as a business and family have been directly subjected to. The original Metro north proposed routes published by the RPA in 2006 and further changes to proposed routes published in 2008 at which time the RPA applied for a railway order to An Bord Pleanála. During this period we had various communications with the RPA as to potential CPO of part and or whole of both our family home and business premises which lie east and west respectively of the R132 between the Coachmans roundabout and what is now known as Boroimhe/Airside Junction, Swords, Co Dublin. The Oral hearings took place in 2009 and 2010, which I (Juliana Boland) personally attended at the Gresham Hotel, Croke Park and finally in the offices of An Bord Pleanála. My concerns about the project led me to attend at least two thirds of the Oral Hearing, even on days which did not directly relate to our own properties. The Oral Hearings were suspended in 2009 by An Bord Pleanála requiring further detailed submissions to be made by RPA re environmental impact statement and various engineering tests to be carried out as opposed to relying on previously published reports by others not related to nor contracted by the RPA to carry out such investigations. In October 2011 a Railway Order was granted after revised submissions had to be made with regards to the end point of the route to cease at Estuary as opposed to further North on the R132 in the vicinity of Blakes Cross, with a completion date of 10 years, if memory recollects correctly. Only for the then Minister for Transport Leo Varadkar to announce a month later that the Metro North project was been indefinitely deferred. In 2015 the government of the day announced that the Metro North would now go ahead potentially opening in 2027, with an application for extension of the Railway Order having to be made. 2018 revised plans extending Metrolink from St Stephens Green to Charlemont were announced this section alone at an estimated then cost of €3 billion euro. In 2021 with no works commencing and Eamon Ryan stating that it was never likely to be achievable by 2027, (on RTE 26/9/21) John Kilraine on RTE news 9/11/21 announced that the Metrolink would be postponed for ten years meaning the Order was now nullified as it would not commence never mind be completed within the time frame of the Order. Finally in 2022 a new Railway Order application was submitted	TII are aware of the frustrations experienced by you due to the ongoing arising from the Railway Order Applications for Metro North and MetroLink. TII are committed to implementing the MetroLink project upon receipt of an Enforceable Railway Order.
2	Letter	3	Throughout the above time period from 2006 to present money has been spent as if it were going out of fashion with regards to the Metro proposal. Even during the Covid Pandemic ground works were carried out in Swords in November 2020 when it was feasibly possible that the government and TII were aware that the existing Order would not be adhered to. This money may have been spent more wisely reopening disused existing railway lines and stations around the county and thereby servicing the county as a whole as opposed to simply Dublin benefitting yet again. The Kishoge, West Dublin train station built in 2009 approx. cost in excess of €6 million is still not operational and required a refurbishment at an estimated cost in excess of €3 million. Does the wastage ever end ?	Ground investigation works carried out in November 2020 were not related to the old Metro North Railway Order but rather were required for the updated design of the current MetroLink proposals. The other schemes mentioned are outside TII scope.
3	Letter	3	As hopefully you can appreciate from the above our lives have been put on hold literally living in oblivion since 2008 a period of 14 years due to will it won't it go ahead. We have had brief periods where it has been 'shelved' when we started to plan again for our lives only for these to be dashed by talks of the Metro. Will we be here in another 10 years submitting another Observation for a new Metrolink Railway Order application ?	TII are aware of the frustrations experienced by you due to the ongoing arising from the Railway Order Applications for Metro North and MetroLink. TII are committed to implementing the MetroLink project upon receipt of an Enforceable Railway Order.
4	Letter	3	We are not only potentially losing our family home but also our family business. Whilst we have had several meetings and communications with the Property Acquisition Dept of TII (Michael Horan) and previously Rory O'Connor of the RPA, these are simply general what may possibly happen conversations and nothing concrete.	Please see response to item (5) below
5	Letter	4	Although we had from the beginning been reluctant to agree to moving we were always painfully aware that we may end up been subject to a CPO and with that in mind we have kept our eyes open for appropriate premises to relocate to. This was done by generally window shopping by viewing estate agent's premises, reading the Property sections and gaining contacts in the industry who are aware of the type of properties we would be interested in all the ways people normally seek out a property. Very few ticking all or at least most of the boxes, have come on the market in the 14 year period, bearing in mind location and similar property type. There have in fact only been three properties which we would have contemplated moving to. In early 2022 one particular property was brought to our attention, so much so that with the impending new Railway Order to be submitted we contacted TII's Michael Horan to discuss the possibilities of coming to a settlement at that time for TII to purchase our properties. However as Michael noted during our meetings no financial recompense could be agreed and paid at that time, in fact this would not be possible until a Business Plan was agreed by the Government and an actual Railway Order obtained. Even then there is no guarantee of when this would actually happen. In the meantime we are expected to look for suitable properties only for them to be unavailable by the time any financial settlement is obtained. An unrealistic position to put anyone in.	TII understands and acknowledges the importance for residential property owners and businesses to plan their affairs with as much notice as possible. As part of the Land Acquisition Strategy, TII has introduced a discretionary scheme for residential property owners to encourage early engagement. Our intention is to enter into a pre-agreement with residents who are subject to compulsory acquisition to agree terms to acquire which will accelerate the acquisition process following an enforceable Railway Order and avoid protracted negotiations. Where businesses are to be displaced an agency service will be established to support the search for suitable alternative accommodation. Following approval to the Railway Order, confirmation of funding, TII will use reasonable endeavours to make arrangements to provide business with a longer period in which to relocate, commensurate with the co-ordinated progress of the MetroLink works. In both cases compensation will be paid in accordance with the compensation code. Please refer to metrolink_cpoguideline_final_september-2022
6	Letter	4	Under CPO guidance a property is valued at Average Market Value. Any property or good has two values one which a purchaser is prepared to pay and one which a willing seller is prepared to accept, the AMV does not reflect this and is wholly unfair to property owners who are subjected to a CPO.	The principles of compulsory purchase are to seek to place affected parties in no better or worse position than prior to the acquisition of their property interest. Compensation is paid in accordance with the compensation code and assessed depending upon individual circumstances. The main heads of claim are (i) market value which is the estimated amount for which an asset should sell on a valuation date between a willing buyer and willing seller in an arm's length transaction (ii) disturbance costs (iii) professional fees and cost of reinvestment where relevant.

Submission No.			156	
Organisation Name or Name of Submitter			Justin Marden (Australia)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
RE: APPLICATION FOR METROLINK NA29N.314724				
1	Letter	1	I was referenced in the An Bord Pleanála's Planning Inspectors report for Metro North In relation to St Stephens Green and its environs. Please see below and attached the grounds of observation and evidence of support. Much of the research and design development I did prior to the Metro North application advocated for a lower visual, environmental impacts and higher cultural and social returns results including: 1) Metro Entrances in shopfronts in O'Connell St in lieu of significant negative visual impact in heritage streetscapes. 2) Elevators in St Stephens Green to reduce significant negative visual impact in heritage streetscapes and the national moment.	TII wish to thank you for your submission and has provided response to your concerns in the items below.
2	Letter	1	The new project Metrolink "borrows some of these ideas" but still has a long way to meet the standards of International best practice. We believe the scheme needs more development and changes/upgrades to meet its full potential. The concept architects work is linked in the newspaper below. https://www.theage.com.au/national/victoria/southern-cross-is-grim-grimy-and-depressing-melbourne-deserves-better-20220628-p5ax8x.html	TII disagree and believe the commissioning of internationally renowned architect Nicholas Grimshaw and Partners, has delivered a contemporary station design which is appropriate for a state of the art metro system such as MetroLink. TII believe the current station and surface level designs greatly enhance the public realm at all locations along the MetroLink route. There is a unifying commonality in the design of all stations, providing a consistent and coherent architectural language, which assists with orientation and wayfinding, and contributes a new architectural lexicon to the cultural iconography of the city.
3	List	2	We would request that An Bord Pleanála formally request in writing prior to and await submission of reports which will be made public and accessible prior to any oral hearing/decisions that addresses the issues below: [PRESCRIBED BODIES] The ministers for [Tourism, Culture, Arts, Gaeltacht, Arts, Sport and Media] & [Environment, Climate and Communications] & [Public Procurement] conduct an internal comprehensive independent multi-criteria assessment written report separately in relation to alternatives of: listed below : <i>[See following items where these points are listed]</i> Any such report should quantify in numbers alternative cultural impacts, tourism impacts, art impacts, Gaeltacht impacts local and international.	TII does not have any comment to make in relation to the observers requests to ABP for reports by prescribed bodies and the Ministers of Government Departments Chapter 11 (Population) details the associated impacts on community and social infrastructure, with Chapter 25 presenting the impacts to Cultural Heritage. Chapter 03 (Background to the MetroLink Project) details the need for the Project, and how it will address challenges such as quality international connectivity. Tourists will be able to arrive at Dublin Airport and then access the rest of the rail network efficiently and effectively, confident in the time their journey will take and when they will arrive. By increasing the accessibility of Dublin and enhancing regional connectivity across Ireland, the Project will contribute to increased accessibility of the arts and cultural activities which often take place within Dublin City Centre. By facilitating improved rail connectivity to the rest of Ireland through interchanges provided at Glasnevin and Tara Street, there will be improved accessibility to Gaeltacht areas (e.g. Donegal, Mayo, Galway, Kerry , Cork, Meath and Waterford). As show in the images in Chapter 04 (Description of the MetroLink Project), signs will display the station names in both English and as Gaeilge.
4	List	2	Request for an independent multi-criteria assessment written report separately in relation to alternatives of: i) Selected colour coded stations. (St Stephens Green / Green - National Monument). Request for an independent multi-criteria assessment written report separately in relation to alternatives of: ii) A station foyer that references the Pantheon, Rome.	TII does not have any comment to make in relation to the observers requests to ABP for independent multi criteria assessment i), ii) Design principals for the project, including station design, are described in EIAR Chapter 4 (Description of the MetroLink Project), section 4.7. The project will deliver a robust and authentic design with a strong metropolitan identity, unique and sympathetic to Dublin. Dublin's rich architectural heritage has been respected, but not copied in a pastiche imitation. In accordance with best conservation principles, as set out in the ICOMOS Venice Charter of 1964, the stations are architecturally distinguishable so as not to falsify the existing historic context. Reference and due respect to that context is made through the choice of high quality and appropriate materials and the scale of the interventions. For example at Mater station, the canopy entrance evokes the scale of park structures. At St Stephen's Green, the materials of the ventilation structures are chosen to respect the surrounding 18th century Georgian brick architecture. The aesthetic values of all eras, including our own, have cultural validity, and therefore the brick is used in a contemporary way reflecting contemporary aesthetic idioms derived from 21st century technology.

Organisation Name or Name of Submitter			Justin Marden (Australia)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
RE: APPLICATION FOR METROLINK NA29N.314724				
5	List	2	Request for independent multi-criteria assessment written report separately in relation to alternatives of: iii) How green Connemara Marble/Surfaces might play a role to offset commercial designs with local cultural values in the realm of National Monuments. Request for independent multi-criteria assessment written report separately in relation to alternatives of: iv) A metro station alternative based on the form of the Book of Kells to offset the negative visual and cultural impact of automatic platform doors and commercial design.	TII does not have any comment to make in relation to the observers requests to ABP for independent multi criteria assessments. iii), iv) National Monuments have been identified in EIAR Chapter 25 (Archaeology and Cultural Heritage) and potential impacts from the proposed scheme on their settings are discussed in Chapter 27 (The Landscape) of the EIAR. As detailed in Chapter 27 (The Landscape) the underground station at St. Stephen's Green will include new above-ground elements which need to be incorporated within the reconstructed public realm and park, however the automatic platform doors will be located underground, causing no visual impact on the surface level. To mitigate visual and cultural impacts at St Stephen's green, the railings, statues, bollards, lamp standards and other park features that have to be removed prior to construction will be conserved and reinstated following completion of construction and all hard and soft landscaping will be reinstated. New structures will be designed to cause minimal visual impact on the Park and all final landscaping, conservation and reinstatement requirements will be agreed in direct consultation with the MHLGH/OPW and the TII Project Archaeologist and Project Conservation Architect. The Contractor appointed for the Operation Phase of the proposed Project will be required to keep all stations and their associated infrastructure well maintained and clean and to replace any failed planting above the station box.
6	List	2	Request for independent multi-criteria assessment written report separately in relation to alternatives of: v) The impact an international design competition, innovation partnerships would have on the project under European Procurement Law and Public Procurement Procedures and why this has not yet been progressed if they are claiming to get the best cultural/social/design/transport/tourism/environmental outcomes and why heritage entrances have not been considered in lieu of generic commercial design solutions Request for independent multi-criteria assessment written report separately in relation to alternatives of: vi) The impact of funding some companies involved in the project previously been in a consortium of nuclear weapons management in the UK and the extent to which nuclear power may fund/power this project from France with the Celtic Interconnector. https://www.reuters.com/article/uk-britain-atomicweapons-contract-idUSKBN27IOT5	TII does not have any comment to make in relation to the observers requests to ABP for independent multi criteria assessment v) Please refer to response item (4) summarising the design principles for the proposed Project, and response item (5) above in relation to the measures taken at St Stephen's Green to reduce the visual impact of the station. vi) Chapter 04 (Description of the MetroLink Project) details the proposed MetroLink Grid Connections and Power Systems. Electrical power will be provided from the national grid (Electricity Supply Board Networks Ltd - ESNB) at 110kV alternating current, which will feed two high voltage bulk connection (multi-purpose connection) substations, which will be Gas Insulation Switchgear transmission power substations. The new electrical substations will be constructed at the Dublin Airport North Portal and at the Dardistown Depot. These connections will be sought through a separate planning application by ESNB, but the environmental effects are assessed as part of the proposed Project in the EIAR in Chapter 10 (Human Health), Chapter 11(Population & Land Use), Chapter 12 (Electromagnetic Compatibility and Stray Current), Chapter 13 (Airborne Noise & Vibration), Chapter 15 (Biodiversity), Chapter 17 (Climate), Chapter 18 (Hydrology), Chapter 19 (Hydrogeology), Chapter 21 (Land Take), Chapter 22 (Infrastructure and Utilities), Chapter 24 (Materials & Waste Management), Chapter 25 (Archaeology & Cultural Heritage), Chapter 27 (Landscape & Visual) and Chapter 28 (Risk of Major Accidents & Disasters).

Submission No.			156	
Organisation Name or Name of Submitter			Justin Marden (Australia)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
RE: APPLICATION FOR METROLINK NA29N.314724				
7	List	2	Request for an independent multi-criteria assessment written report separately in relation to alternatives of: vii) Provide the m3 of concrete, steel, earth moved, and total embodied energy to construct and operate, maintain the project including the financing costs and how these will contribute to carbon expenditure and how many litres of petrol this could buy. Request for an independent multi-criteria assessment written report separately in relation to alternatives of: viii) Provide a fixed relationship value estimate of 1 euro to carbon/mega joules/energy/Litre of petrol in the project. Request for an independent multi-criteria assessment written report separately in relation to alternatives of: ix) The negative impact of not formally allowing Dublin Bus drivers first preference to drive or operate the new transport impacting negatively on their jobs and future/economy.	TII does not have any comment to make in relation to the observers requests to ABP for independent multi criteria assessment vii), viii) EIAR Chapter 17 (Climate) presents the proposed Project's carbon emissions during both the construction and operational phase. During the construction phase the embodied carbon assessment includes for construction materials such as concrete or steel, excavations, waste, transportation of materials and waste, power usage and water usage. Full details are available in Section 17.5.2.1 of the EIAR. As calculated using the TII Carbon Tool (v2.1) the proposed Project will result in total Construction Phase GHG emissions of 1,017KT CO2eq over the 9.25 year period, equivalent to an annualised total of 0.32% of Ireland's non-ETS 2030 target. Over the predicted 60-year lifespan the annualised emissions due to the initial Construction Phase and ongoing maintenance of the Proposed Project will reach at most 0.044% of Ireland's non-ETS 2020 emissions target, or 0.24% of the 2030 transport sector carbon budget. In order to minimise, control and mitigate carbon emissions, monitoring and reporting of the embodied carbon in the Construction Phase will be conducted. The aim of the monitoring will be to see further ways to minimise climate impacts. Monitoring will include contractual obligations, in line with the most recent Climate Action Plan and sectoral targets. Commitments to monitor GHG emissions during the construction phase will also be secured through the outline Construction Environmental Management Plan (CEMP) (Appendix A5.1). Monitoring will include; embodied carbon of construction materials, water usage, power and fuel usage and waste generation (including reuse and recycling rates). A Waste Management Plan for Construction and Demolition Waste will also be implemented. Section 17.5.3.5 discusses the embodied carbon of the rolling stock during the operational phase. The rolling stock is not yet final however once the rolling stock is finalised an Environmental Product Declaration (EPD) will be prepared for the exact specification. As this is currently not available for the proposed Project as the rolling stock has not been finalised, an EPD published in 2019 for rolling stock that is utilised on a similar Metro project (Sydney Metro Northwest) has been sourced to give a likely estimate of the embodied carbon of the rolling stock. The main components of the rolling stock are metallic materials and electronic and electrical equipment which allow a high recyclability (95.2%) potential. The Sydney Metro Northwest EPD for rolling stock had upstream and core emissions of 0.3447gCO2e per passenger km. With future improvements in technology, energy efficiency and sustainable practices the proposed Project aims to future reduce the rolling stock embodied carbon. Additionally, a whole -life Carbon Management Plan will be implemented to inform the detailed design, build and operation of MetroLink. During the operational phase, there will be GHG emission reductions through the displacement of existing car journeys. Metro trips typically emit seven times less CO2 than the current equivalent car journey. ix) TII to comment on impact on Dublin Bus drivers Chapter 03 (background to the MetroLink Project) details that the proposed Project will help to stimulate economic activity, encourage innovation and growth in Ireland's national skills base. The scale and complexity of the Project will support approximately 4,3000 direct construction jobs for each year of construction, as well as further indirect related jobs. The operations and maintenance will require over 300 permanent skilled jobs. In addition, the proposed Project is anticipated to generate agglomeration impact benefits for existing and new businesses, facilitated by increased accessibility of labour and reduced journey times.
8	List	2	Request for an independent multi-criteria assessment written report separately in relation to alternatives of: x) I believe the design standard of the stations/public realm is average at this point of time and could be upgraded for minimal costs for a multi-billion-dollar project.	TII does not have any comment to make in relation to the observers requests to ABP for independent multi criteria assessments]. Please refer to response item (4) summarising the design principles for the proposed Project.
9	List	2	Request for an independent multi-criteria assessment written report separately in relation to alternatives of: xi) The fare structure of the project.	TII does not have any comment to make in relation to the observers requests to ABP for independent multi criteria assessments]. As detailed in Chapter 06 (MetroLink Operations and Maintenance), the Project will have an automatic fare collection system compatible with an integrated ticketing scheme with other public transport offerings in the Greater Dublin Area. The fare structure for MetroLink is a mater for the National Transport Authority and does not form part of the railway order application for MetroLink.

Submission No.			156	
Organisation Name or Name of Submitter			Justin Marden (Australia)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
RE: APPLICATION FOR METROLINK NA29N.314724				
10	List	2	Request for an independent multi-criteria assessment written report separately in relation to alternatives of: xii) Under Irish Procurement practice only architects with a "Royal" are allowed to design important major projects based on historical events. This is discrimination.	TII does not have any comment to make in relation to the observers requests to ABP for independent multi criteria assessments.
11	Letter	2 and 3	There are other ways to measure the value of architecture too, such as social value, which is especially relevant for public, civic and commercial buildings. You can find the RIBA Social Value Toolkit from the UK here. In Australia, Deloitte used both social value and financial measures to quantify the contribution of the Sydney Opera House to NSW. The Deloitte report - first published in 2013 and updated in 2018 - found that: "The social asset value of the Opera House has increased to \$6.2 billion since FY13. Visitation has also increased by 33% to 10.9 million, while the economic contribution of the Opera House rose by 44% to \$1.2 billion since FY13 ."	Please refer to Chapter 26 for details of the assessment of the impact on Architectural Heritage. The appraisal method for the assessments of impacts follows the guidance in Guidelines on the Information to be Contained in EIARs (EPA 2022), and Guidelines for the Assessment of Architectural Heritage Impacts of National Road Schemes (NRA, 2005). An overview of the approach is presented in Chapter 02 (Methodology used in Preparation of the EIAR. The approach involves identifying the value of an architectural constraint, assessing the magnitude of the impact of the proposed Project on the constraint during the Construction and Operational Phases, and then assessing the significance of the effect on the integrity of the constraint. Each of the buildings and other structures that are identified within the study area is evaluated in accordance with its legal protection status. Where a structure is included in more than one protection status, it is assigned to whichever category has the higher evaluation.
12	Letter point 2	3	The 2014 Directive states inspector that there is a requirement for a description of the reasonable alternatives studied by the developer which are relevant to the project and its specific characteristics. https://www.youtube.com/watch?v=24g9H5D2zt0	Chapter 7 (Consideration of Alternatives) of the EIAR provides a detailed assessment of alternative proposals to MetroLink, such as the consideration of alternative transports, route alignments and station locations, in line with the Directive 2014/52/EU. The chapter has also been prepared in accordance with the Guidelines on the Information to be contained in Environmental Impact Assessment Reports (EPA 2022). The chapter describes the main alternatives considered at all stages of the MetroLink project development in order to clearly outline: * The robust decision-making process that has led to the proposed Project; * How environmental analysis was integrated into the proposed Project development from the earliest stages of the proposed Project; * The main reasons, environmental and otherwise, for choosing the proposed Project or the specific element of the proposed Project from the reasonable alternatives; and, * The likely evolution of the current state of the environment without implementation of the Project.
13	Letter point 2	3	Given that I raised many of these issues prior to and after the Metro North Application, during consultations, development plans and directly to ministers and in public where are the reasonable alternatives studied found in this application which is of International Significance in areas and environs of national monuments? At present I don't believe the application meets the high standards and objectives of the National Planning Framework highly enough without small and reasonable upgrades/innovation partnerships for a project of international significance under European law. Metrolink should be Irish.	MetroLink has been designed and assessed against all relevant polices at all levels, from European, through national and regional policy down to the local level. The policy context against which the project is considered and assessed is set out in the Planning Report and the EIAR that accompanies the Railway Order. The selection of the route of the project has been subject to a full consideration of alternatives as set out in the EIAR Chapter 07, as noted in response item (12) above.
14	Letter point 2	3	Will the applicant/inspector consider the issues raised in this submission or Article 26 Arbitration to resolve these issues and progress forward. Or will discrimination based on protected grounds under nationality/national origin be raised against the applicant on the employment equality acts.	TII have no comment to make in relation to whether the inspector should consider the MetroLink Railway Order Application is any-way discriminatory.

Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) Order 2022. Case Reference Number NA29N.314724. 22/11/22				
1	Letter	1	1. Living in the midst of this tightly compacted residential community, I consider the proposed development totally unsuitable as a location for a major Terminus hub. Strategically, the Charlemont / Darthmouth location is too far from Dublin city centre and it would be an unnecessary expense and duplication of the existing Green Line services.	While TII agree the Charlemont site is constrained, a Station design has been developed that fits and works within this constrained site, and is adequately sized for projected passenger numbers. Responses (4) and (5) below cover TII's assessment of potential environmental impacts resulting from the construction and operation of the MetroLink Charlemont Station, noting that no significant residual impacts are predicted. TII do not agree that “Strategically, the Charlemont / Dartmouth location is too far from Dublin city centre” for the reasons set out below. The Board is required to have regard to the likely consequences for proper planning and sustainable development in the area in which it is proposed to carry out railway works (section 43(1) of the 2001 Act) and as such the following matters are relevant. The connection from St Stephens Green to Charlemont / Ranelagh is supported by the current Transport Strategy for Greater Dublin Area (2022-2042). The Transport Strategies were prepared by the National Transport Authority, scrutinised by the Joint Oireachtas Committee on Transport and approved by the Minister for Transport. It notes in section 12.3.2, "Charlemont offers the optimal location for the primary interchange with the Green Line in response to growing demand in the longer term and is an appropriate location to facilitate any potential future metro extensions to serve the south west, south or south east of the city region should sufficient demand arise." The Transport Strategy is “a consideration material to the proper planning and sustainable development of the area or areas in question.” Development Plans are required to be consistent with the Transport Strategy. The Dublin City Development Plan 2022-2028 envisages this station at Charlemont in policy SMT22 “To support the expeditious delivery of key sustainable transport projects so as to provide an integrated public transport network with efficient interchange between transport modes, serving the existing and future needs of the city and region and to support the integration of existing public transport infrastructure with other transport modes. In particular the following projects subject to environmental requirements and appropriate planning consents being obtained: ... MetroLink from Charlemont to Swords”. Accordingly, the location of the Charlemont station was a strategic decision made at the highest levels of transport and land use planning and such is fully consistent with the proper planning and sustainable development of the area. The current Transport Strategy considers a range of options for the onward extension of MetroLink to meet the demand for travel over the period of the strategy. This includes consideration of the need for the upgrade of the Luas Green Line to metro with a metro extension to Dublin south west, south or south east. Whilst the strategy envisages that further extensions will be delivered after 2042, MetroLink which terminates at Charlemont allows for the possible extension of the metro in all any of the above directions. The proximity of the metro to the Luas line at Charlemont provides for a positive customer experience for all users with short interchange distance and due to the proximity, clear wayfinding and high visibility of the interchange. The interchange arrangements at Charlemont provide for significantly better interchange arrangements compared to an interchange at St Stephen's Green Station. The detailed analysis done for the Railway Order application further confirms that the section of MetroLink route between St Stephen's Green and Charlemont Stations contributes significantly to the overall benefits of the scheme. It serves a significant area of the south city of Dublin and offers enhanced access from the local area to the city centre and a direct connection to Dublin Airport. It serves key trip attractors including residential areas and offices / workplace locations, with high passenger boarding and alighting figures in the peak hours. During the morning peak, at Charlemont station the flows include 1,800 passengers alighting, 2,300 boarding and 1,229 passengers alighting, 2,276 boarding during the evening peak. The passenger numbers contribute significantly to the overall benefits of the scheme and the effect of these benefits outweigh the additional costs that are associated with the delivery and operation of the section from St Stephen's Green to Charlemont station. The location of the interchange at Charlemont does not preclude onward extension south. An interchange at Charlemont is supported by policy including the Dublin City Development Plan 2022 - 2028 and the Transport Strategy for the Greater Dublin Area. By extending MetroLink to Charlemont it provides for future proofing of the Green Line, bypassing the capacity constrained Luas on-street running section, and ensures potential future connectivity options are enabled, either to the Green Line or for extensions of the metro. The Charlemont Station interchange provides for increased passenger utilisation of the MetroLink system, thereby increasing the benefits delivered by the Project, reflected by an improved Project Benefit Cost Ration (BCR). It is true to say that the Metrolink trains will terminate and turn back at Charlemont station, However, Charlemont Station does not have the associated infrastructure and services associated with a terminus location and in fact has more in common with a “system turn back location”. Charlemont Station is located within an area of high public transport accessibility, linking with the Luas Green Line which offers reasonably similar levels of services and frequency for journeys to and from the south of Dublin. As such, public transport service offering is not considered to terminate, but transfers onto the similar service offered by the Luas Green Line, forming part of a transport corridor running from Cherrywood to Estuary. The associated environmental impacts for the turnback and station at Charlemont have been fully assessed in the EIAR. Additionally, there is a strong level of interchange offered throughout the corridor at locations such as Glasnevin, O’Connell Street, Tara Street and St Stephen's Green, where many journeys on the MetroLink will ‘terminate’.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) Order 2022. Case Reference Number NA29N.314724. 22/11/22				
			Response (1) continues.	The terminus station for MetroLink is located at Estuary where all of the activities normally associated with a terminus take place. Regards your observation “it would be an unnecessary expense and duplication of the existing Green Line services.” The Board is not responsible for any decisions in relation to the funding the Project. It is solely responsible for assessing whether the Project is consistent with proper planning and sustainable development and that its effects on the environment are acceptable. The responsibility for funding the Project lies with the NTA, the Government and ultimately the Oireachtas. It has received all necessary approvals, including under the Public Spending Code for the making of a Railway Order. It will undergo further scrutiny and approvals, including under the Public Spending Code, before it is funded. It is not appropriate for the Board to make findings in relation to value-for-money that are outside its statutory functions and would cut across those arrangements. Members of the public are entitled to make representations to their TDs in relation to the value-for-money of any element of the Project. In any case,TII do not agree with this statement for the reasons set out above, noting that infrastructure is not being duplicated given the capacity of the Luas south from St. Stephen's Green is restricted due to on-street running. There is a limit to the potential of the Luas to provide additional capacity in the on-street non-segregated section of the Luas Green Line from Charlemont northwards through the city centre. The nature of this route and the fact that it currently crosses several road junctions (Adelaide Road, Harcourt Street / Hatch Street upper and Harcourt Street / St Stephen's Green south) limit the service to a maximum of 24 trams per hour per direction. The projected demand for this section would require a higher frequency of up to 30 trams per hour and this demand cannot be met with on-street systems (Luas / bus). The interchange between Luas and MetroLink proposed at Charlemont will provide the necessary capacity to address the demand on this corridor and reduce overall travel time for passengers There is also high passenger demand forecast for a Metrolink station at Charlemont, including from the Ranelagh area, which would be lost if St. Stephen's Green was the MetroLink southern interchange station. The additional fare revenues collected by the Charlemont Station interchange increase the benefits delivered by the Project, reflected by an improved Project Benefit Cost Ration (BCR). Further, to ensure that public investment delivers value for money, the Public Spending Code sets out requirements for the evaluation, planning and management of public investment. The preparation of a Business Case is a key element of meeting these requirements. The Public Spending Code requires that both the Preliminary Business Case and Final Business Case for public investment projects are published. In July 2022, the Government granted Approval in Principle to the NTA to enable the submission of a railway order application by TII to An Bord Pleanála in respect of the MetroLink project (Decision Gate 1). This approval was granted after the Preliminary Business Case (PBC) had undergone significant scrutiny and challenge by bodies that are independent of TII, including DoT and DPER review (including independent review by JASPERS and the Major Projects Advisory Group (MPAG)) of the PBC around timeline, costs and benefits that were updated to inform the Government decision.
2	Letter	1	Instead, why not locate such a major terminus at Stephen's Green where there would be more suitable integration of networks and services and a better location for interchange with bus, Luas and future Dart underground?	TII do not agree that St Stephen's Green is the most appropriate interchange location for the reasons set out by response (1) above. A number of route options were considered in the process of identifying the Emerging Preferred Route (EPR). These route options included potential station locations on St. Stephen's Green West. Route alignments from St. Stephen's Green West that would also provide an interchange with DART at Tara Street Station would require an intervention shaft between these locations and would also need an undesirable horizontal reverse curve and so are not favoured. Integration with other public transport projects is a key project objective as outlined by EIAR Chapter 3. Such projects include BusConnects and DART+ which are all included under Project Ireland 2040. Together, these projects will result in a reliable, sustainable, affordable, integrated public transport network that will support the economy, help Ireland meet its climate change targets in line with Climate Action Plan 2021 and make Dublin a more liveable and sustainable city. Charlemont station itself was chosen on the basis of its interchange potential with Luas, as well as local bus services, as outlined above. The section of the line between St Stephen's Green and Charlemont generates considerable benefits for the scheme in terms of increased patronage. The fact that the Charlemont Station is now being referred to and considered as a “terminus station” rather than an interchange station, does not increase the environmental impacts the station has on its local environment, in terms of passenger demand, airborne noise. vibration and other environmental effects.
3	Letter	2	2. The Station Box constructed at Charlemont 2021/22 by Hines does not have planning permission. Hence, processing the current Railway Order application which is reliant on the now constructed works is legally unsafe and contravenes the provisions of the Environmental Impact Assessment Directive.	The MetroLink enabling works constructed as part of the Hines development was included in the planning application for the Hines Development and has the benefit of planning permission which was granted in April 2019.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) Order 2022. Case Reference Number NA29N.314724. 22/11/22				
4	Letter	2	3. As it is, there is an enormous volume of traffic in the Charlemont area. As proposed, a Terminus station servicing trains running to the airport and elsewhere 24/7 would greatly exacerbate existing traffic flow in such a confined area and increasingly endanger health and safety and further compromise existing problems. Grand Parade and the residential areas around Charlemont / Dartmouth could not possibly sustain the significant additional traffic volumes running to and from the airport.	The MetroLink is designed to form part of an integrated public transport network with Charlemont selected as the preferred interchange location in order to maximise the potential interchange with the existing Luas Green Line. The system is designed in an integrated manner so that people travelling from the area south of Dublin to access locations north of Charlemont, such as Dublin Airport, Mater, Swords etc. will utilise public transport to interchange with the MetroLink, or will walk or cycle to access their local station. The system is not designed to encourage people to drive to stations within the City and TII actively discourage people from doing so other than the Park & Ride station at Estuary. In overall terms, Charlemont Station will provide for improvements to the public transport network resulting in decreases in private car usage/trips, increases in public transport usages and will facilitate walking and cycling to the station, without significantly impacting on the operation of the road network in the area. TII therefore do not agree with the observation "Grand Parade and the residential areas around Charlemont / Dartmouth could not possibly sustain the significant additional traffic volumes running to and from the airport." as this is not borne out by our transport analysis. TII have assessed the impact on the traffic network for both the construction and operational phases of the Project: Construction Phase: EIAR Appendix A9.5 Scheme Traffic Management Plan presents the analysis undertaken to assess the impact of the traffic management measures on the local road network surrounding the proposed Charlemont Station during the construction phase. At the local level the following parameters have been used to assess impacts on general traffic and on pedestrians: • Increase in walking distance/quality of service for pedestrians (through removal of footpath, reduction of quality of service, removal of a pedestrian crossing or relocation of crossing by more than 100m); • Increase in driver delays at junctions; • Changes in traffic flows on surrounding streets; and, • Additional distance travelled due to diversions. The analysis undertaken at this location indicates that the increased volume of traffic on Grand Parade and Northbrook Road does not translate into any significant increase in driver delay. The largest increase in driver delay of 12 seconds is registered on the westbound approach on Grand Parade to the Ranelagh Road signalised junction. During the construction phase, pedestrians will experience a reduction in quality of pedestrian infrastructure and space. The construction site boundary will encroach upon footways in the local area, including the northern side of Dartmouth Road, and the southern side of Grand Parade. However, a temporary signalised crossing will be provided west of the Luas to maintain pedestrian access to and from the Stop. Whilst there are partial closures on Dartmouth Road and Grand Parade, pedestrian movements will be maintained on appropriately sized footways through the area. Operational Phase: A microsimulation VisWalk model has been developed for the immediate area surrounding Charlemont Station during the operational phase. The model covers the full extent of the publicly accessible station area, including the immediate vicinity of the station entrance at street level, the Luas stop and nearby junctions at Charlemont Bridge. In order to accommodate the forecast demand from the proposed Charlemont Station, a new staircase with 2.4m stair width is proposed at the south east corner of Charlemont Luas stop. An elevator will also be provided at this location. Both are sized for MetroLink to Luas, and Luas to MetroLink passenger numbers. In addition, it is proposed that the pedestrian crossing on R111 Grand Parade will be repositioned to the front of the building being developed by Hines. With this infrastructure in place, the model indicates that the R111 Grand Parade will have an acceptable level of service overall, with some reductions in service seen at the pedestrian crossing where pedestrians are required to wait for a green phase at the signals. Overall, it is considered that the model displays an acceptable level of network performance. The proposed pedestrian crossing on Grand Parade will have minimal impact on the traffic flow along Grand Parade and can be programmed to operate in sync with the existing signalised junction at Grand Parade /Charlemont Street to maintain the flow of traffic movements. When the Project is operational, car mode share will decrease, with a reduction of up to approximately 830 car tips to and from the zones surrounding Charlemont Station over the 12hr period in 2065. In overall terms, the Charlemont Station will provide for improvements to the public transport network resulting in decreases in private car usage/trips, increases in public transport usages and will facilitate walking and cycling to the station, without significantly impacting on the operation of the road network in the area. Furthermore, TII have deliberately designed the Station with minimum set down space (with the exception of a drop-off on Grand Parade for persons of restricted mobility only) or room for taxi ranks so that it does not encourage the Station to be used as a terminus.

Submission No.			159

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) Order 2022. Case Reference Number NA29N.314724. 22/11/22				
5	Letter	2	4. The proposed development will continue to have an adverse impact on the health of individuals in this heavily populated area. The noise and disturbance experienced already the residents takes its toll from this enterprise (boring machines etc). A continuation of this and the long-term and permanent impact of noise-operating machinery, vehicular use, tannoy systems etc will change a quiet residential neighbourhood into a noisy, busy, congested and major, unhealthy transport hub.	TII recognise and are cognisant of the risk of adverse environmental impacts and have therefore carefully assessed these impacts, as documented by the EIAR and summarised below, which concludes there are no significant residual impacts. The EIAR presents a comprehensive and detailed assessment of both groundborne and airborne noise and vibration in Chapter 13 and 14 of the EIAR. The assessments include for predictive modelling in order to identify the potential impacts on all sensitive receptors during both the construction phase and the operational phase. Noise and disturbance during construction: No profound impacts have been identified for residents and mitigation measures proposed will be effective at reducing the impacts on these properties and in general terms impacts will be associated with the construction phase only. Significant mitigation is proposed to include 4m high noise barriers and further proposed mitigation in line with the Airborne and Groundborne Noise Mitigation Policy. On the implementation of these measures the residual impacts are predicted to be moderate. However, as outlined in Transport Infrastructure Ireland (TII) Airborne and Groundborne Noise Mitigation Policy (Appendix A14.6) there is a process in place whereby further mitigation measures can be implemented at individual properties should this be merited. Noise and disturbance during operation: No residual noise impacts are identified at this location during operation. The calculated rail noise levels across the proposed Project are not significant in terms of any widespread community disturbance and results in a not significant to slight impact when added to the prevailing noise environment. Chapter 13, sections 13.2.3.2 and 13.5.3.2.3 recognise that ventilation systems if not designed and mitigated effectively are potential noise sources. Section 13.6.2.3 outlines the detailed considerations that will be included in the design to ensure that the ventilation systems do not exceed limits as per BS 4142, including: • Reduction of induct flow rates; • Reduction of elements in the airflow; • In duct attenuators; • Orientation of grilles and louvres away from sensitive receptors; • Acoustic louvres; and • Anti-vibration mountings and couplings will be incorporated into the design to control vibration. Measures to mitigate noise from the use of public address systems is also detailed in Chapter 13 (sections 13.5.3.2.4 and 13.6.2.4). Best practice design principles will be employed to minimise noise breakout at the surface from these systems via escalators, lift shafts and stairwells. Loss of amenity during construction: EIAR Chapter 11, Population & Land Use provides an assessment of effects on community amenity during construction and operation, which relates to the interaction of impacts on air quality; visual amenity; traffic and transport; and noise and vibration. At this location during construction as outlined in Section 11.5.2 of Chapter 11, no impacts are identified on the retail sector or community and social infrastructure (e.g. schools or hospitals). Any severance/disruption to transport will be limited by site mitigation measures such as alternative routes reducing impacts to not significant. Loss of amenity during operation: No significant residual negative impacts are anticipated on the Population and Land Use from the operation of the proposed Project, following the incorporation of the mitigation measures into the design of the proposed Project and implementation on an ongoing basis throughout the lifecycle. The residual effects that will arise during operation will be permanent and positive as detailed in EIAR Chapter 11, section 11.1.1. The zoning under the Dublin City Development Plan 2022 - 2027 for the residential properties in question is "Z2 Residential Neighbourhoods (Conservation Areas)" with an objective to "protect them from unsuitable new developments or works that would have a negative impact on the amenity or architectural quality of the area (See Table 3.11 of the submitted Planning Report). As outlined in Section 4.5.18.6 of the Planning Report, the element of the Project within the Z2 zoning area will affect a below ground area only and as such will not compromise the land use objective for the lands overhead. The majority of the proposed Charlemont Station and all above ground elements are located within the lands zoned Z5 with the objective "To provide for the creation and protection of enterprise and facilitate opportunities for employment creation". The Station has been designed so that it is integrated with the proposed redevelopment of this site by a third party development, and as such, demonstrates that the proposed Project is consistent with the zoning objective. The MetroLink station design does not result in any segregation of the area, with no surface barriers or walls proposed.

Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) Order 2022. Case Reference Number NA29N.314724. 22/11/22					
6	Letter	3	We request the following amendments:- 1. Omit from the Railway Order the section from Tara Street Station to Charlemont Station and associated onward tunnel extension and intervention tunnel. 2. Require the submission of a Railway Order for a section from Tara Street Station to St Stephens Green which would effectively provide for a terminal hub station that can integrate with the Luas Green Line, multiple bus routes and future DART underground.	The above responses to the observations made explain why TII do not consider it is correct or appropriate that the MetroLink alignment south of the proposed Tara Station should be omitted, and also demonstrates why the proposed Charlemont Station has been selected by TII as the preferred interchange with the Luas Green Line A scheme which terminates at Tara Street would not be consistent with the Transport Strategy for Greater Dublin Area (2022-2042). In addition any decision to terminate the scheme at Tara will significantly impact on the overall viability and benefits of scheme.

Re: Case reference NA29N.314724, Description: Railway (Metrolink Estuary to Charlemont via Dublin Airport) Order [2022]					
1	Letter - introduction	1	While I welcome the idea of a new metro for Dublin, especially from the Airport to the city centre, I do have concerns about the line after it reaches the city centre and continues south using the already existing Luas Green line. I outline some of these below. As a regular user of the Dublin City Council Markievicz sport and leisure centre I would like to make some observations on the proposed Metrolink Line particularly in relation to the section of the line at the Tara Street station.	TII wish to thank you for your submission and stated support for the delivery of MetroLink. Chapter 07 (Consideration of Alternatives) details the decision-making process that has led to the development of the proposed Project, including the route alignment and station locations. A station at Tara Street provides good interchange opportunities, serves important key trip attractors in the study area with high potential passenger trips. This option also takes a direct and short route through areas of high demand in the centre of the study area. As Dublin's public transport network grows through the implementation of higher capacity bus routes, more frequent heavy rail services and coverage, and the expansion of the light rail network it is critically important that to achieve the full benefits and capitalise on these investments that they are integrated fully where appropriate to attain "the network effect". High quality interchanges can significantly broaden the transport offer for their catchment and add to the appeal and attractiveness of sustainable transport by ensuring that people can easily change services to access a wider range of places by these modes, and each scheme should be designed to ensure that these are as seamless as possible. Please refer to response (7) which details the alternative options that were considered for this location, and outlines the reasons why this location (involving demolition) was ultimately identified as the preferred option.	
2	1. Loss of amenity	1	The Markievicz sport and leisure centre is a publicly owned facility managed by Dublin City Council. The pool and gym are used by people of all ages from all over the city as well as by visitors to Dublin. The pool is extensively used by schools and other groups for swimming lessons, by older people for exercise, by city centre workers. The health and wellness benefits that this facility provides cannot be overstated. This planning application envisages the complete demolition of the Markievicz centre without proposing any alternative in the city centre. I note from the railway drawings that the statue of Countess Markievicz is to be removed and stored for safe keeping while the works are being undertaken and then returned to its site. One wonders what Countess Markievicz would have to say about the destruction of the centre.	Mitigation for the loss of the Markievicz leisure centre is not addressed as part of the RO proposal and ABP is being asked to consent MetroLink acknowledging that this is a significant, unmitigated adverse impact on population and land use. However, Dublin City Council's functions include "the provision (both indoor and outdoor) of playing fields, athletic tracks, swimming pools and other bathing places, sports centres, gymnasia and other facilities and the holding of sporting events." TII will also continue to work with DCC in relation to the development of an alternative sports and recreational facility to replace the Markievicz leisure centre and intends to fund the alternative. However, TII does not have control over that development, which is part of DCC's function to provide public sport and recreational facilities in its function area. DCC may or may not be in a position to deliver it in parallel with the MetroLink project. Accordingly, the Board should assess the MetroLink project on the basis that the alternative may not be available. The impact would then be significant, but nonetheless one that would not outweigh the strategic scale long term benefits that MetroLink will deliver.	
3	2. Environmental impact	1	The area around Pearse street, Trinity College, Tara Street and Townsend Street is already an environmentally hostile one for pedestrians and cyclists. It will become even more so if this section of the metro is completed. There is no green infrastructure, pedestrian spaces or traffic calming proposed in the Metrolink plan. In addition, the complete demolition of a fully functioning sports centre and 78 apartments in good condition that were built twenty years ago comes with its own embodied carbon cost.	TII disagree with the statement that the area will become more hostile once the Tara Street Station is in place. As detailed in Chapter 04 (Description of the MetroLink Project), as part of the station and urban realm design, Luke Street will be converted into a shared space for cyclists and pedestrians, including provision of a two-way cycle track between its junctions with Poolbeg Street and George's Quay. Poolbeg Street will be reduced to one lane to accommodate more space for pedestrians and cyclists, and reduced space for general traffic. This newly created public realm will consist of outdoor seating and scope for ephemeral events, with the possibility of retro-fitting the adjacent rail arches to provide retail or food and beverage opportunities. High quality natural stone paving, seating used as directional wayfinding and space-making devices and large mature tree planting are used to create open space and enhance green infrastructure within the city centre. EIAR Chapter 17 (Climate) presents the proposed Project's carbon emissions during both the construction and operational phase. During the construction phase the embodied carbon assessment includes for construction materials such as concrete or steel, excavations, waste, transportation of materials and waste, power usage and water usage. Full details are available in Section 17.5.2.1 of the EIAR. As calculated using the TII Carbon Tool (v2.1) the proposed Project will result in total Construction Phase GHG emissions of 1,017KT CO2eq over the 9.25 year period, equivalent to an annualised total of 0.32% of Ireland's non-ETS 2030 target. Over the predicted 60-year lifespan the annualised emissions due to the initial Construction Phase and ongoing maintenance of the Proposed Project will reach at most 0.044% of Ireland's non-ETS 2020 emissions target, or 0.24% of the 2030 transport sector carbon budget. Section 7.5.2.1 Construction Phase Carbon Calculations refers. In order to minimise, control and mitigate carbon emissions, monitoring and reporting of the embodied carbon in the Construction Phase will be conducted, as set out in section 17.6.1 Construction Phase. The aim of the monitoring will be to see further ways to minimise climate impacts. Monitoring will include contractual obligations, in line with the most recent Climate Action Plan and sectoral targets. Commitments to monitor GHG emissions during the construction phase will also be secured through the outline CEMP (Appendix A5.1). Monitoring will include; embodied carbon of construction materials, water usage, power and fuel usage and waste generation (including reuse and recycling rates). A Waste Management Plan for Construction and Demolition Waste will also be implemented.	
4	3. Damage to community	1	In relation to quality of life in Dublin the demolition proposed at this site is one more example of loss of community space for residents, workers, and visitors in the city centre. No alternatives are proposed in this plan.	As noted in response item (7) below, the proposed option does not preclude future adjacent or oversite development following the demolition of the College Gate apartments and the Markievicz Leisure Centre. Please refer to response item (3) above in relation to the creation of a public plaza at this location as part of the proposed Project.	

Submission No.			160	
Organisation Name or Name of Submitter			Kathleen Shields (21 Palmerston Place, Broadstone)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
5	4. Demolition of housing during a housing emergency	2	It is proposed to demolish seventy-eight housing units during a major and unprecedented housing and construction crisis. There are more than seventy-eight residents living above the sports centre. Where are these residents to live and how are they to find new homes?	TII acknowledge the concerns you have around the demolition of College Gate. Mitigation for the loss of the College Gate apartments is being addressed as part of the Project with the support of Dublin City Council. In particular, TII, in consultation with DCC, will support rehousing and provide compensation for the loss of the residential units. By way of support, as noted in Chapter 21 (Land Take), section 21.6.1.2 Compensation for Compulsory Purchase, TII will offer compensation to property owners for land that is deemed to be acquired land in accordance with the general compulsory purchase code. Compensation will be provided through the Compulsory Purchase Order (CPO) process. In recognition of the impact on residential cases where properties are to be acquired and given the unique circumstances surrounding the proposed impacts to College Gate apartment complex, TII will engage the services of a property advisory company to engage directly with property owners. Property owners will be invited to participate in a Discretionary Scheme. The Discretionary Scheme will offer property owners the opportunity to negotiate and reach a 'Pre-Agreement' on both a baseline residential unit price and other matters of compensation that an owner would normally be entitled to under the compensation stage. This will provide the parties with as much certainty as possible at this early stage.
6	5. Economic loss	2	Metrolink have stated that they can sell the land above the completed metro line and once the underground Tara station is built. This financial consideration purely benefits Metrolink at a cost to others. In a broader sense this area of Dublin will become a non-economically viable dead zone with no commercial or cultural attractions whatsoever, reduced footfall and loss of amenity to the remaining residents in the greater TCD and Pearse street vicinity.	Please refer to response item (3) above in relation to the creation of a public plaza at this location as part of the proposed Project. As noted in Chapter 3 (Background to the MetroLink Project), MetroLink will provide a high-quality urban environment at station locations that will benefit the community as a whole by enhancing the urban realm directly and also by encouraging further high quality development which will stimulate the local economy. This will provide an opportunity for the development of a sustainable high quality urban environment along the alignment of the proposed Project. The business case for MetroLink, approved by Government in 2022, did not include for any benefit arising from the sale of lands above the station. TII have no plans for development of lands above the station. Should such a development take place an financial benefit will accrue to the State.
7	6. Alternatives - metro construction in other cities	2	While it might be financially expedient for Metrolink to acquire land, demolish the existing buildings and then sell it off again, it is not necessary to do so. In other cities (e.g. Paris) metros have been constructed underground without impacting on the buildings above.	Chapter 07 (Consideration of Alternatives) details the decision-making process that has led to the development of the proposed Project, including the route alignment and station locations. Appendix A7.2 Tara Street Station Report presents in detail the various options that were considered by TII for this location. Concerns had been raised during the public consultation on the Emerging Preferred Route (EPR) regarding the demolition required for the station in the location proposed, and concerns were again raised during the consultation on the Preferred Route. A number of alternative station locations were considered to try and address these concerns. Option 0 is the proposed station location, with a further 11 options assessed. Three options as submitted by College Gate residents, with the station relocated either to the north or south of the EPR proposed location, have been reviewed in detail. In addition, other options developed through the Preferred Route design process including a mined option and realignment of the route to the east of Tara Street Station have also been reviewed. All were assessed against the EPR proposed station location (Option 0) as a base case, adjusted to suit the single bore and reduced station box length. The various options were taken through a Multi Criteria Analysis to compare aspects of each different option. Assessment of options considered the viability of the rail alignment, the quality/ease of interchange with Tara DART Station (a key requirement given that this will be one of the busiest stations on MetroLink with high passenger interchange with the DART), demolition/construction impacts (including minimising impacts on the existing DART infrastructure/operations), other environmental and planning issues, including traffic and utility impacts, and urban integration, health and safety issues, and potential construction costs. A mined station option at Tara was considered as a solution to avoid the demolition of the College Gate building. The option comprises the construction of two deep shafts either side and immediately adjacent to the College Gate apartments to provide construction access for mining the tunnel under College Gate apartments and to subsequently provide permanent access, ventilation and back of house facilities for the operation of the station. It was established that 24 hour working would be the only realistically feasible approach to construct the cavern. Therefore, the nature of the work, drill and blast with mechanical excavation, would generate a level of groundborne noise and vibration would mean it would not be possible to inhabit the College Gate apartment block due to the disturbance caused, leading to a relocation of residents for a minimum of two years. However, there are possible risks that could extend the duration further, and therefore this option has a similar impact on College Gate residents as the cut and cover preferred option. TII consider that when balanced against the significant direct construction cost increase compared to the preferred cut and cover option, that demolition and redevelopment of the area around the site of the proposed Tara Station as part of the wider integrated development and regeneration of the site provides a better option. The mined option economically performs worse with a much greater risk allowance required compared to the preferred cut and cover option, and the preferred proposed cut and cover station provides a higher quality operational station that is consistent with the MetroLink architectural vision and operational and maintenance strategy. This assessment has identified that for a number of reasons including constructability, cost, and retention of a good interchange facility, that Option 0, including demolition of College Gate and Markiewicz Centre, remains the preferred station location: * This location retains a good interchange facility with Tara DART Station; * It reduces risk to the overall construction programme; * It offers cheaper overall construction cost; * It retains opportunity for future adjacent development by others; * Mitigation for the loss of the College Gate apartments is being addressed as part of the Project with the support of DCC. In particular, TII, in consultation with DCC, will support rehousing and provide compensation for the loss of the residential units; * Mitigation for the loss of the Markievicz leisure centre is not addressed as part of the RO proposal and ABP is being asked to consent MetroLink acknowledging that this is a significant, unmitigated adverse impact on population and land use. However, Dublin City Council's functions include "the provision (both indoor and outdoor) of playing fields, athletic tracks, swimming pools and other bathing places, sports centres, gymnasia and other facilities and the holding of sporting events." TII understands that Dublin City Council is investigating whether it is feasible to provide a facility at Sean Moore Park, Irishtown

8	7. Lack of consultation with stakeholders	2	The public consultation process was not respected and from the very beginning Transport Infrastructure Ireland were determined that this section of the city would have to be demolished without considering or proposing alternatives.	TII disagree that the public consultation process was not respected. Chapter 08 (Consultation) (specifically section 8.3.5.5) details the consultation that has taken place with residential property/landowners and residents associations. The Project Team is acutely aware of the potential impacts of the proposed Project to residential property/landowners (and residents associations) in particular, and as a result, ongoing engagement and negotiation was undertaken to allow these stakeholders time to consider the proposals. Significant consultations took place with all owners of properties and lands which are affected by the proposed Project. In cases where properties or land is acquired to facilitate the construction of MetroLink, the discussions were of a sensitive nature and required one-to-one meetings. Appendix A8.19 notes that 5 meetings were held with Townsend Street DCC tenants throughout 2019. In preparing the application for Railway Order, the Project Team has consulted with the public and stakeholders in accordance with the following legislative, best practice and planning practice requirements in line with the Aarhus Convention, Consolidated EIA Directive Requirements and requirements of national law. Please refer to response item (7) above in relation to the alternatives considered for Tara Street Station, and the reasons for the identification of the proposed location as the preferred option.

Re: Railway (MetroLink-Estuary to Charlemont via Dublin Airport) Order 2022. Case Reference Number NA29N.314724 23 rd Nov 2022				
1	Letter	1	Firstly, in general, I am in favour of the broad aim of the Metrolink project to connect Dublin's city centre to our national airport. However, as a resident living in the Dartmouth/Charlemont area, I wish to set out a number of observations for the Board regarding the proposal to locate the terminus station at Charlemont-Dartmouth. My family home is in the midst of the community where the Terminus station is proposed to be located.	Thank you for taking the time to make a submission and your overall endorsement of the MetroLink Project with the exception of Charlemont Station. We have reviewed your submission and responded to the observations made below.

Submission No.			161	
Organisation Name or Name of Submitter			Kevin Muaghan	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
2	Letter	1	1. Charlemont is the incorrect strategic location for a Terminus hub and spoke system as it is too far out along the Luas Green Line spoke and would prejudice future options for integration of networks and services.	TII do not agree that Charlemont is the incorrect location for an interchange with the Luas Green Line or that it prejudices future options for integration with the wider transport network for the reasons set out below. The Board is required to have regard to the likely consequences for proper planning and sustainable development in the area in which it is proposed to carry out railway works (section 43(1) of the 2001 Act) and as such the following matters are relevant. The connection from St Stephens Green to Charlemont / Ranelagh is supported by the current Transport Strategy for Greater Dublin Area (2022-2042). The Transport Strategies were prepared by the National Transport Authority, scrutinised by the Joint Oireachtas Committee on Transport and approved by the Minister for Transport. It notes in section 12.3.2, "Charlemont offers the optimal location for the primary interchange with the Green Line in response to growing demand in the longer term and is an appropriate location to facilitate any potential future metro extensions to serve the south west, south or south east of the city region should sufficient demand arise." The Transport Strategy is "a consideration material to the proper planning and sustainable development of the area or areas in question." Development Plans are required to be consistent with the Transport Strategy. The Dublin City Development Plan 2022-2028 envisages this station at Charlemont in policy SMT22 "To support the expeditious delivery of key sustainable transport projects so as to provide an integrated public transport network with efficient interchange between transport modes, serving the existing and future needs of the city and region and to support the integration of existing public transport infrastructure with other transport modes. In particular the following projects subject to environmental requirements and appropriate planning consents being obtained: ... MetroLink from Charlemont to Swords". Accordingly, the location of the Charlemont station was a strategic decision made at the highest levels of transport and land use planning and as such is fully consistent with the proper planning and sustainable development of the area. The current Transport Strategy considers a range of options for the onward extension of MetroLink to meet the demand for travel over the period of the strategy. This includes consideration of the need for the upgrade of the Luas Green Line to metro with a metro extension to Dublin south west, south or south east. Whilst the strategy envisages that further extensions will be delivered after 2042, MetroLink which terminates at Charlemont allows for the possible extension of the metro in any of the above directions. The proximity of the metro to the Luas line at Charlemont provides for a positive customer experience for all users with short interchange distance and due to the proximity, clear wayfinding and high visibility of the interchange. The interchange arrangements at Charlemont provide for significantly better interchange arrangements compared to an alternative interchange at St Stephen's Green Station. Passengers wishing to interchange between Luas and metro at an alternative St Stephen's Green terminus would face a 500m-walk along a route either through St Stephen's Green park or along the footpath north of the park, which adds significantly to the time for interchange and therefore the overall journey time for passengers and a less positive customer experience for all interchange users. This passenger experience would be reduced further for those with mobility or visual impairments as well as those travelling to/from the airport with luggage. The detailed analysis done for the Railway Order application further confirms that the section of MetroLink route between St Stephen's Green and Charlemont Stations contributes significantly to the overall benefits of the scheme. It serves a significant area of the south city of Dublin and offers enhanced access from the local area to the city centre and a direct connect on to Dublin Airport. It serves key trip attractors including residential areas and offices / workplace locations, with high passenger boarding and alighting figures in the peak hours. During the morning peak, at Charlemont station the flows include 1,800 passengers alighting, 2,300 boarding and 1,229 passengers alighting, 2,276 boarding during the evening peak. The passenger numbers contribute significantly to the overall benefits of the scheme and the effect of these benefits outweigh the additional costs that are associated with the delivery and operation of the section from St Stephen's Green to Charlemont station. Further information is available in Chapter 7: Consideration of the Alternatives, section 7.7.8 MetroLink Southern Terminus Location. The location of the interchange at Charlemont does not preclude onward extension south. An interchange at Charlemont is supported by policy including the Dublin City Development Plan 2022 - 2028 and the Transport Strategy for the Greater Dublin Area. By extending MetroLink to Charlemont it provides for future proofing of the Green Line, bypassing the capacity constrained Luas on-street running section, and ensures potential future connectivity options are enabled, either to the Green Line or for extensions of the metro. The Charlemont Station interchange provides for increased passenger utilisation of the MetroLink system, thereby increasing the benefits delivered by the Project, reflected by an improved Project Benefit Cost Ration (BCR).

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
3	Letter	1	St. Stephens Green is the most appropriate location as it provides for interchange with bus, Luas and future DART underground. The project incorrectly dismisses St. Stephens Green West as an appropriate terminal station. It only considers St. Stephens Green East and Charlemont. Furthermore, no comprehensive study or investigation has been completed by NTA/TII as part of the entire Metrolink project on the optimal location for a city-centre terminus.	TII do not agree that St Stephen's Green is the most appropriate interchange location for the reasons set out by response (2) above. It is not correct to say that the Project "only considers St. Stephens Green East and Charlemont." A number of route options were considered in the process of identifying the Emerging Preferred Route (EPR). These route options included potential station locations on St. Stephen's Green West. However these options were ruled out as it was not possible to design an appropriate alignment that would also provide a MetroLink interchange with DART at Tara Street Station. An alignment between St. Stephen's Green West and Tara would require an intervention shaft to be located between these locations. As outlined by EIAR Chapter 3, Background to the MetroLink Project, one of the key objectives of the Project is the integration of it with the wider transport network that also includes for BusConnects and DART+ which are all included under Project Ireland 2040 and the GDA Transport Strategy 2022-2042 (section 12.3.2). Together, these projects will result in a reliable, sustainable, affordable, integrated public transport network that will support the economy, help Ireland meet its climate change targets in line with Climate Action Plan 2021 and make Dublin a more liveable and sustainable city. Arising from the decision to postpone the future upgrade of the Green Line to metro services, it is being argued that Charlemont station effectively becomes a terminus station in the short to medium term. In this regard, it is true to say that the Metrolink trains will terminate and turn back at Charlemont station, however the public transport service offering for passengers does not terminate, it transfers from Metrolink to LUAS as part of the integrated transport network. The terminus station for MetroLink is located at Estuary where all of the activities normally associated with a terminus (train sideways, car-parking etc) take place. At this location the high capacity public transport offering terminates and the public transport offering transfers to a completely different mode, i.e. Bus or car . The environmental effect of the Metrolink terminus are accordingly assessed in the EIAR. Charlemont Station does not have the associated infrastructure and services associated with a terminus location and in fact has more in common with a "system turn back location". Charlemont Station is located within an area of high public transport accessibility, linking with the Luas Green Line which offers reasonably similar levels of services and frequency for journeys to and from the south of Dublin. As such, public transport service offering is not considered to terminate, but transfers onto the similar service offered by the Luas Green Line, forming part of a transport corridor running from Cherrywood to Estuary. The associated environmental impacts for the turnback and station at Charlemont have been fully assessed in the EIAR. Charlemont station itself was chosen on the basis of its interchange potential with Luas, as well as local bus services, as outlined above. The section of the line between St Stephen's Green and Charlemont generates considerable benefits for the scheme in terms of increased patronage as detailed in response item (2) above. Operationally, the Station will see people moving quickly in and out of the area, noting that it will act as an interchange, and has been deliberately designed with minimum set down space or room for taxis so that it does not encourage the Station to be used as a terminus. All operational environmental impacts are mitigated so they are not significant, while the impact on amenity will be permanent and positive. The proposed route alignment from Estuary to Charlemont is consistent and compliant with the GDA Transport Strategy 2022-2042 (published in January 2023) in which states that the south city terminus at Charlemont offers the optimal location for interchange with the Green Line in response to growing demand in the longer term and is an appropriate location to facilitate any potential future metro extensions to serve the south west, south or south east of the city region should sufficient demand arise.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
4	Letter	1	2. Expensive Duplication of Rail infrastructure: - The inclusion of an expensive and costly section between St. Stephens Green and Charlemont is strategically weak and duplicates the existing Luas Green Line services. NTA's cost estimate for this 1km section at €650M is a duplication and enormous outlay that represents very poor value-for-money, and deprives other parts of Dublin that are in immediate need of rail infrastructure to support urgently required housing and urban development.	The Board is not responsible for any decisions in relation to the funding the Project. It is solely responsible for assessing whether the Project is consistent with proper planning and sustainable development and that its effects on the environment are acceptable. The responsibility for funding the Project lies with the NTA, the Government and ultimately the Oireachtas. It has received all necessary approvals, including under the Public Spending Code for the making of a Railway Order. It will undergo further scrutiny and approvals, including under the Public Spending Code, before it is funded. It is not appropriate for the Board to make findings in relation to value-for-money that are outside its statutory functions and would cut across those arrangements. Members of the public are entitled to make representations to their TDs in relation to the value-for-money of any element of the Project. In any case, TII do not agree with this statement for the reasons set out by response (2) above, noting that infrastructure is not being duplicated given the capacity of the Luas south from St. Stephen's Green is restricted due to on-street running. There is a limit to the potential of the Luas to provide additional capacity in the on-street non-segregated section of the Luas Green Line from Charlemont northwards through the city centre. The nature of this route and the fact that it currently crosses several road junctions (Adelaide Road, Harcourt Street / Hatch Street upper and Harcourt Street / St Stephen's Green south) limit the service to a maximum of 24 trams per hour per direction. The projected demand for this section would require a higher frequency of up to 30 trams per hour and this demand cannot be met with on-street systems (Luas / bus). The interchange between Luas and MetroLink proposed at Charlemont will provide the necessary capacity to address the demand on this corridor and reduce overall travel time for passengers There is also high passenger demand forecast for a Metrolink station at Charlemont, including from the Ranelagh area, which would be lost if St. Stephen's Green was the MetroLink southern interchange station. The additional fare revenues collected by the Charlemont Station interchange increase the benefits delivered by the Project, reflected by an improved Project Benefit Cost Ration (BCR). Further, to ensure that public investment delivers value for money, the Public Spending Code sets out requirements for the evaluation, planning and management of public investment. The preparation of a Business Case is a key element of meeting these requirements. The Public Spending Code requires that both the Preliminary Business Case and Final Business Case for public investment projects are published. In July 2022, the Government granted Approval in Principle to the NTA to enable the submission of a railway order application by TII to An Bord Pleanála in respect of the MetroLink project (Decision Gate 1). This approval was granted after the Preliminary Business Case (PBC) had undergone significant scrutiny and challenge by bodies that are independent of TII, including DoT and DPER review (including independent review by JASPERS and the Major Projects Advisory Group (MPAG)) of the PBC around timeline, costs and benefits that were updated to inform the Government decision.
5	Letter	1	3. The station box at Charlemont, as constructed in 2021/22 by the developer Hines, does not have the benefit of planning permission and has not been part of the EIA undertaken for this project. Processing the current Railway Order application, which is reliant on these preliminary and now constructed works, is legally unsafe and contravenes the provisions of the EIA Directive.	The MetroLink enabling works constructed as part of the Hines development was included in the planning application for the Hines Development and has the benefit of planning permission which was granted in April 2019.

Submission No.			161

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
6	Letter	1	4. The station box at Charlemont will result in only one possible future tie in with the Luas Green Line to the south, which would result in an option that was previously dismissed as part of the Tie-In study from March 2017. No alternatives to the station box at Charlemont were considered as it had been fixed through the design of the overhead Hines Grand Parade commercial development. The implications of this new alignment are very negative for the local community as they will inevitably involve top-down construction that will only be possible when many houses on Manders Terrace, Oakley Road and Charleston Road are demolished.	"The station box at Charlemont allows for a future tie into the Luas Green Line should it be determined in the future that through running metro services to Sandyford is the required solution to address the public transport needs to the south of the city. It is incorrect to say that the current proposal is based on an option that was previously dismissed as part of the March 2017 Green Line tie in study. The station design is in affect a modification to the preferred Green Line Tie Option 4B which was modified as result of the decision not to proceed with the upgrade of the Green Line to metro standard. The station box location was not fixed by the Charlemont Development. The preferred route for MetroLink was published in March 2019 following a comprehensive route options study. The preferred route was based on the emerging preferred route for the scheme which included a station at Charlemont. The Charlemont Metro Enabling Works were constructed to enable the Charlemont Development to proceed whilst simultaneously ensuring there was an option available to construct a station at Charlemont that avoided unnecessary demolition, took advantage of an available site, provided infrastructure that is integrated with planned development rather than necessitating later changes and retrospective adjustments to a new development or even possible demolition of the new development, whilst providing protected provision for the future extension of the scheme south, if required. It is also important to recognise that the station location at Charlemont is influenced by available vacant land and thus avoids unnecessary demolition. The submission seeks to portray the construction of the Metro Enabling Works as prejudicial to future decisions on proper planning and sustainable development of the area. It implies that the counterfactual would have had no effect on such decisions. That is not the case. There was a planning conflict between the EPR and the Grand Parade Development at the time the latter development was proposed. There was no resolution to that conflict that was free of implications for future decisions on the proper planning and sustainable development of the area. The Board could have refused permission for the Grand Parade Development, inevitably creating a underutilised and potentially vacant and idle site in a commercial hub location. The Board could have granted permission with no provision to facilitate a station at this location, resulting in a requirement for the railway order to provide for the demolition of a new office building. The Board's actual decision was reasonable and lawful in seeking to minimise the prejudice to an important office development and a critical piece of national infrastructure. It was also not particularly restrictive of future decisions in relation to the proper planning and sustainable development of the area. Of the three options open at the date of the Grand Parade planning application, two remain open: the Board can still require changes to the station design that require the demolition of the commercial building and it can grant an order that avoids demolition by using the Metro Enabling Works. It is agreed that the short-term implications for local residents will be significant as the scheme progresses through the construction stage, however the EIAR assesses the environmental impacts of the construction phase and commits to the implementation of appropriate mitigation measures that reduce the environmental impacts to not significant. The same is true of the operations phase for the project. TII will work closely with local residents to ensure the required mitigation measures are put in place. If in the future, the metro was extended south, this does not mean that inevitably open cut construction will be required or demolition of property will be necessary. In designing an extension, the promoter will seek to reduce the requirement for demolition by looking for tunnel launch sites at the southern extent of the scheme and, if one can be identified, driving the Tunnel Boring Machine northwards ultimately connecting into the existing tunnel. In that case, even if the new alignment were under the properties identified in the submission, the tunnel underneath them would be constructed by the Tunnel Boring Machine without the need for above ground works.
7	Letter	2	5. The Environmental Impact Assessment is deficient in relation the description of development, alternatives, transport assessment, noise and the cumulative effects of the development on the Charlemont-Dartmouth Community. For a project of this size, scale, investment to date, it is inadequate to propose a Railway Order with so many important studies and analysis missing.	TII do not agree that the Environmental Impact Assessment is deficient, inadequate or missing information. The Railway Order application comprises a very detailed environmental impact assessment that has identified and assessed the potential environmental impacts of MetroLink and proposed mitigations for these impacts where necessary. TII would also draw attention to the detailed project description, construction phase description and operational phase description provided in EIAR Chapters 4 and 5 and 6, and EIAR Chapter 7 and associated appendices that present details of alternatives considered. EIAR Chapter 9 and appendices provides a detailed analysis of transport and traffic effects, and EIAR Chapters 13 Airborne Noise & Vibration, and 14 Groundborne Noise & Vibration provide a detailed assessment of potential noise and vibration effects, while Chapter 29 outlines the assessment of interactions between various environmental aspects, and Chapter 30 covers the cumulative impacts with other projects. This assessment is carried out for the full length of the alignment including relative to potential significant effects on the Charlemont-Dartmouth Community.

Submission No.			161	
Organisation Name or Name of Submitter			Kevin Muaghan	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
8	Letter	2	6. The development would result in noise and disturbance during the construction and operational phases and would result in a loss of amenities for the area.	The EIAR presents a comprehensive and detailed assessment of both groundborne and airborne noise and vibration in Chapter 13 and 14 of the EIAR. The assessments include for predictive modelling in order to identify the potential impacts on all sensitive receptors during both the construction phase and the operational phase. Noise and disturbance during construction: No profound impacts have been identified for residents and mitigation measures proposed will be effective at reducing the impacts on these properties and in general terms impacts will be associated with the construction phase only. Significant mitigation is proposed to include 4m high noise barriers and further proposed mitigation in line with the Airborne and Groundborne Noise Mitigation Policy. On the implementation of these measures the residual impacts are predicted to be moderate. However, as outlined in Transport Infrastructure Ireland (TII) Airborne and Groundborne Noise Mitigation Policy (Appendix A14.6) there is a process in place whereby further mitigation measures can be implemented at individual properties should this be merited. Noise and disturbance during operation: No residual noise impacts are identified at this location during operation. The calculated rail noise levels across the proposed Project are not significant in terms of any widespread community disturbance and results in a not significant to slight impact when added to the prevailing noise environment. Loss of amenity during construction: EIAR Chapter 11, Population & Land Use provides an assessment of effects on community amenity during construction and operation, which relates to the interaction of impacts on air quality; visual amenity; traffic and transport; and noise and vibration. At this location during construction as outlined in Section 11.5.2 of Chapter 11, no impacts are identified on the retail sector or community and social infrastructure (e.g. schools or hospitals). Any severance/disruption to transport will be limited by site mitigation measures such as alternative routes reducing impacts to not significant. Loss of amenity during operation: No significant residual negative impacts are anticipated on the Population and Land Use from the operation of the proposed Project, following the incorporation of the mitigation measures into the design of the proposed Project and implementation on an ongoing basis throughout the lifecycle. The residual effects that will arise during operation will be permanent and positive as detailed in EIAR Chapter 11, section 11.1.1. The zoning under the Dublin City Development Plan 2022 - 2027 for the residential properties in question is "Z2 Residential Neighbourhoods (Conservation Areas)" with an objective to "protect them from unsuitable new developments or works that would have a negative impact on the amenity or architectural quality of the area (See Table 3.11 of the submitted Planning Report). As outlined in Section 4.5.18.6 of the Planning Report, the element of the Project within the Z2 zoning area will affect a below ground area only and as such will not compromise the land use objective for the lands overhead. The majority of the proposed Charlemont Station and all above ground elements are located within the lands zoned Z6 with the objective "To provide for the creation and protection of enterprise and facilitate opportunities for employment creation". The Station has been designed so that it is integrated with the proposed redevelopment of this site by a third party development, and as such, demonstrates that the proposed Project is consistent with the zoning objective. The MetroLink station design does not result in any segregation of the area, with no surface barriers or walls proposed. See below in relation to the submission that the Traffic Study for Charlemont is inadequate because it omitted the impact of airport users from south Dublin travelling to this location.

Submission No.			161	
Organisation Name or Name of Submitter			Kevin Muaghan	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
9	Letter	2	The Traffic Study for the local Charlemont area is wholly inadequate as it omitted the modelling of the impact of Airport users coming to the only Dublin South Metrolink station at Charlemont. The Traffic Study uses a strategic, generalised regional model that does not take local factors into account. Extract from observation 7) - The EIA did not properly assess the impact of additional local traffic volumes, rather they used a generalised regional model that does not take local factors into account. A key local factor at a Terminus station in Charlemont that runs to the Airport is the huge volume of anticipated airport users from Dublin South and greater Dublin/Leinster that will come to Charlemont via car or taxi with luggage for onward destination to the airport. Grand Parade and the residential area around Charlemont-Dartmouth cannot sustain the significant additional traffic volumes associated with this development.	The MetroLink forms part of an integrated public transport network. The system is designed in an integrated manner so that people travelling from the area south of Dublin to access locations north of Charlemont, such as Dublin Airport, Mater, Swords etc. will utilise public transport to interchange with the MetroLink, or will walk or cycle to access their local station. The system is not designed to encourage people to drive to stations within the City and TII actively discourage people from doing so other than the Park & Ride station at Estuary. TII therefore do not agree with the observation that there will be a “huge volume of anticipated airport users from Dublin South and greater Dublin/Leinster that will come to Charlemont via car or taxi with luggage for onward destination to the airport” as this is not borne out by our transport analysis. The Transport Assessment for MetroLink includes for people travelling to/from Dublin Airport from all areas within the extents of the GDA area, therefore it is incorrect to say “The Traffic Study for the local Charlemont area is wholly inadequate as it omitted the modelling of the impact of Airport users coming to the only Dublin South Metrolink station at Charlemont”. The NTA's Eastern regional Model (ERM) incorporates a wide range of data sources, including demographic data, land use data, transportation network data, and travel survey data. The system is designed to model a variety of transportation modes, including private vehicles, public transit, walking, and cycling, and to simulate the interactions between these modes. The ERM model has been validated and calibrated using a range of localised data sources to ensure that the model can accurately represent the transport network, these include public transport and vehicle counts from the canal cordon counts. The outputs from the model have been combined with local survey data to undertake the more localised modelling, such as the pedestrian impact assessments, or the local traffic signals. This does not support the observations made “The Traffic Study uses a strategic, generalised regional model that does not take local factors into account.” or “The EIA did not properly assess the impact of additional local traffic volumes, rather they used a generalised regional model that does not take local factors into account.” Regards the observation there will be a “huge volume of anticipated airport users from Dublin South and greater Dublin/Leinster that will come to Charlemont via car or taxi with luggage for onward destination to the airport. Grand Parade and the residential area around Charlemont-Dartmouth cannot sustain the significant additional traffic volumes associated with this development”, this is covered by response (10) below.

Submission No.			161	
Organisation Name or Name of Submitter			Kevin Muaghan	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
10	Letter	2	7. The development would have an adverse impact upon traffic during the construction and operational phase, and it has not been properly designed and there is poor integration with other modes of transport. Pedestrian movements in and around the station would be difficult. Grand Parade is an already heavily congested orbital route.	The MetroLink is designed to form part of an integrated public transport network with Charlemont selected as the preferred interchange location in order to maximise the potential interchange with the existing Luas Green Line. In overall terms, Charlemont Station will provide for improvements to the public transport network resulting in decreases in private car usage/trips, increases in public transport usages and will facilitate walking and cycling to the station, without significantly impacting on the operation of the road network in the area. Construction Phase: EIAR Appendix A9.5 Scheme Traffic Management Plan presents the analysis undertaken to assess the impact of the traffic management measures on the local road network surrounding the proposed Charlemont Station during the construction phase. At the local level the following parameters have been used to assess impacts on general traffic and on pedestrians: • Increase in walking distance/quality of service for pedestrians (through removal of footpath, reduction of quality of service, removal of a pedestrian crossing or relocation of crossing by more than 100m); • Increase in driver delays at junctions; • Changes in traffic flows on surrounding streets; and, • Additional distance travelled due to diversions. The analysis undertaken at this location indicates that the increased volume of traffic on Grand Parade and Northbrook Road does not translate into any significant increase in driver delay. The largest increase in driver delay of 12 seconds is registered on the westbound approach on Grand Parade to the Ranelagh Road signalised junction. During the construction phase, pedestrians will experience a reduction in quality of pedestrian infrastructure and space. The construction site boundary will encroach upon footways in the local area, including the northern side of Dartmouth Road, and the southern side of Grand Parade. However, a temporary signalised crossing will be provided west of the Luas to maintain pedestrian access to and from the Stop. Whilst there are partial closures on Dartmouth Road and Grand Parade, pedestrian movements will be maintained on appropriately sized footways through the area. Operational Phase: A microsimulation VisWalk model has been developed for the immediate area surrounding Charlemont Station during the operational phase. The model covers the full extent of the publicly accessible station area, including the immediate vicinity of the station entrance at street level, the Luas stop and nearby junctions at Charlemont Bridge. In order to accommodate the forecast demand from the proposed Charlemont Station, a new staircase with 2.4m stair width is proposed at the south east corner of Charlemont Luas stop. An elevator will also be provided at this location. Both are sized for MetroLink to Luas, and Luas to MetroLink passenger numbers. In addition, it is proposed that the pedestrian crossing on R111 Grand Parade will be repositioned to the front of the building being developed by Hines. With this infrastructure in place, the model indicates that the R111 Grand Parade will have an acceptable level of service overall, with some reductions in service seen at the pedestrian crossing where pedestrians are required to wait for a green phase at the signals. Overall, it is considered that the model displays an acceptable level of network performance. The proposed pedestrian crossing on Grand Parade will have minimal impact on the traffic flow along Grand Parade and can be programmed to operate in sync with the existing signalised junction at Grand Parade /Charlemont Street to maintain the flow of traffic movements. When the Project is operational, car mode share will decrease, with a reduction of up to approximately 830 car tips to and from the zones surrounding Charlemont Station over the 12hr period in 2065. In overall terms, the Charlemont Station will provide for improvements to the public transport network resulting in decreases in private car usage/trips, increases in public transport usages and will facilitate walking and cycling to the station, without significantly impacting on the operation of the road network in the area. Furthermore, TII have deliberately designed the Station with minimum set down space (with the exception of a drop-off on Grand Parade for persons of restricted mobility only) or room for taxi ranks so that it does not encourage the Station to be used for a significant volume of car or taxi trips.

Submission No.			161	
Organisation Name or Name of Submitter			Kevin Muaghan	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
11	Letter	2	8. The development will have an adverse impact upon property values, particularly during the construction phase. For many houses in the area there will be a long term and permanent adverse impact upon property values from noise of the operating rail infrastructure, vents, operational noise and signals, escalators, and large traffic volumes - vehicular and pedestrian using the station 19 hours per day. The adverse impact also extends to the loss of amenity for the wider community changing a residential neighbourhood into a noisy, busy, congested major transport hub.	Response (8) above outlines the predicted environmental impacts with regards to noise and vibration, and amenity, while responses (9) and (10) summarise the assessed traffic and pedestrian impacts. TII would note that as explained by response (10) above that in overall terms Charlemont Station will provide for improvements to the public transport network resulting in decreases in private car usage/trips. TII do not agree that the development will have a long term and permanent negative affect. In fact there is evidence to suggest that property values will in fact increase in close proximity to public transport infrastructure and that local residents will greatly benefit from having a world class metro system providing access to the city centre, airport and north city at their door step.
12	Letter	2	Accordingly, we are requesting the following amendments of An Bord Pleanála: 1. Omit from the Railway Order the section from Tara Street Station to Charlemont Station and associated onward tunnel extension and intervention tunnel. 2. Require the submission of a Railway Order for a section from Tara Street Station to St Stephens Green which would effectively provide for a terminal hub station that can integrate with the Luas Green Line, multiple bus routes and future DART underground. 3. Halt any current construction at Charlemont until the stationbox (as constructed in 2021/22 by the Developer Hines) has received the benefit of full planning permission. Currently, it does not have the benefit of planning permission and has been constructed illegally.	TII respond as follows: 1. "The above responses to the observations made explain why TII do not consider it is correct or appropriate that the MetroLink alignment south of the proposed Tara Station should be omitted, and also demonstrates why the proposed Charlemont Station has been selected by TII as the preferred interchange with the Luas Green Line 2. A scheme which terminates at Tara Street would not be consistent with the Transport Strategy for Greater Dublin Area (2022-2042) and would be a material contravention of the Dublin City Development Plan 2022-2027. In addition any decision to terminate the scheme at Tara will significantly impact on the overall viability and benefits of scheme. " 3. The MetroLink enabling works constructed as part of the Hines development was included in the planning application for the Hines Development and has the benefit of planning permission which was granted in April 2019.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
Letter Re: Application by Transport Infrastructure Ireland (TII) to An Bord Pleanála for the Railway (MetroLink Estuary to Charlemont via Dublin Airport) Order 2022					
1	1	1	While very supportive of the scheme overall, and its objectives as detailed in the application we would like to comment on certain details of the proposals, which raise concerns for us. Before doing so, we would like to take the opportunity of acknowledging and complimenting TII on its stakeholder engagement, and in particular its engagement of an independent engineering expert, RINA Consulting, to support residential stakeholders likely to be affected by the MetroLink works, which not only upholds the letter, but also the spirit of applicable Irish and EU law.	TII wish to thank you for your submission and your stated support for the delivery of MetroLink.	
2	"Albert College Park: Intervention Shaft- Protection and Preservation of the Park and Scale of Design Footprint"	1	Albert College Park is an essential community resource and everything possible should be done to fully protect and preserve it. Ideally, the MetroLink Project would not impact the Park in any way, and certainly not in any permanent way (as seems to be the approach to parks and green spaces, where emergency shafts are employed, in other underground systems, for example, the newly constructed Elizabeth Line in London). It seems however, based on the current Metrolink proposals and the applicable recommended standards that an Intervention Shaft (IS) is required between the Collins Avenue and Griffith Park Stations as they are more than one kilometre apart. Based on this approach, Albert College Park (ACP) would appear to represent the optimal location for such an Intervention Shaft (IS). (Just to note that whatever about an IS it is clear that the placement of a Metrolink Station within the ACP, were this to be proposed, would be a disaster for the continued functioning of the park and would very severely impact on its amenity).	The RO does not include a proposal for a station to be located in Albert College Park. As stated, Albert College Park has been assessed as the optimum location for the ventilation shaft as noted within Chapter 7, Section 7.7.11.1.	
3	Albert College Park: Intervention Shaft- Protection and Preservation of the Park and Scale of Design Footprint	1,2	In our view the size and scale of the design of the Intervention Shaft (IS) proposed in the Albert College Park (ACP) will negatively impact not only the visual but the general amenity of the park by reducing the area of the park that is available for walking, and sports etc. We would therefore ask that an alternative to the current IS design, that would reduce its overall footprint, be fully considered. From some preliminary discussions with experts we understand that a suitable and effective IS could possibly be devised which would reduce its footprint using the kind of approach employed in the London Underground e.g. the new Elizabeth Line and Italian underground systems (see the red and yellow markings on the extract from the TII drawing of the IS attached - which illustrates in broad outline what the redesign and considerably reduced footprint of the IS might involve).	The design for the ACP Intervention Shaft has been developed having regard to the operational requirements, submissions received and detailed discussions with Dublin Fire Brigade and other stakeholders with regard to the site layout. The landscaping has been developed to mitigate any visual impact. Overall, MetroLink is taking a small proportion of the park with the walkways and the football pitches will be reinstated on completion of construction. The EIAR Chapter 27, Landscape & Visual and Chapter 15, Biodiversity set out the assessment of the potential impacts at Albert College Park and the proposed mitigation, while Appendix A8.18 details the engagement that has taken place with Dublin Fire Brigade. TII will work with the subsequent detailed designer to provide optimisation if feasible such that residual impacts are mitigated so far as is reasonable practicable.	
4	Albert College Park: Intervention Shaft- Protection and Preservation of the Park and Scale of Design Footprint	2	Key issues to be considered here are: -reducing the number of parking places and placing the ones that remain onto a grass verge at the edge of the Ballymun Road as a new emergency vehicle only layby, - moving the Air Intake/Exhaust Ventilation structure to the main building structure for the stairs and lift: while it would make that building a little larger it would significantly reduce the 'technical footprint' of the site overall (as long as the equipment rooms below ground as currently designed remain as is and perhaps are grassed over).	Please refer to response item (3) above in relation to the design and sizing of the Intervention Shaft at Albert College Park. As set out within the EIAR Chapter 4 section 4.17.5, a one way system for entry from and exit to the R108 has been provided for Dublin Fire Brigade, alongside required parking space for vehicles by the intervention shaft, both following discussions with Dublin Fire Brigade regarding their requirements. Further details are provided on slide 84 of 89 on RO Submission: Structures Details Book 3 of 3 Other Line wide Structures Fingal County Council and Dublin City Council. The reasoning supporting the proposed location, layout and operation of the Emergency Shaft at Albert College Park is detailed within Appendix A8.16.	
5	Albert College Park: Intervention Shaft- Protection and Preservation of the Park and Scale of Design Footprint	2	Another issue to be examined in terms of reducing the footprint of the IS might be to limit it to a shaft head and the subsurface buildings with a clear paved road from the revised IS to the main road in a straight line. That would omit the parking area in particular and having both an access and an exit road). This would be done on the basis of the Ballymun Road being closed in the event of an emergency, which we understand would be a recognised approach successfully used in the London Underground system.	Please refer to responses (3,4) above in relation to the required space for emergency vehicles, following consultation with Dublin Fire Brigade.	

Submission No.			162	
Organisation Name or Name of Submitter			Kieran Smyth and Margaret McDonnell and others (121 Ballymun Road)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
6	Albert College Park: Intervention Shaft- Protection and Preservation of the Park and Scale of Design Footprint	2	While these are technical matters which would require detailed expert consideration we have seen no convincing analysis and rationale from TII for the proposed scale of the IS footprint in the ACP. We would ask that An Bord Pleanála as a preliminary matter in advance of the finalisation of the Railway Order require TII to give further consideration, in consultation with other relevant bodies, with a view to reducing the design of the IS in the ACP to the minimum necessary for a suitable and effective IS in order to better protect the amenity of the ACP.	Please refer to responses (2, 3 and 4) above in relation to the rationale for the location and size of the ACP Intervention Shaft, which takes cognisance of the requirements set out by Dublin Fire Brigade and the feedback from public consultations. TII will work with the subsequent detailed designer to provide optimisation, if feasible, such that residual impacts are mitigated so far as is reasonable practicable.
7	Albert College Park Intervention Shaft - Construction Issues	2,3	We would ask that very careful consideration be given to the Metrolink application, and in particular the Environmental Impact Assessment undertaken, to ensure that the proposals adequately protect the amenity of the houses and other premises in the environs of the ACP, during the construction phase of the IS and that the inevitable disruption from the construction of the IS is kept to a minimum. We would seek in this context that in the event of the Metrolink being approved by An Bord Pleanála that such approval be subject to specific conditions to ensure: That the noise and vibration as a result of the construction works (including blasting for shaft sinking and tunnelling) is kept to within tightly prescribed limits and monitored on an ongoing basis with a staffed 24 hour contact telephone line available should any issue of concern arise;	Chapter 13 (Airborne Noise and Vibration) and Chapter 14 (Groundborne Noise & Vibration) of the EIAR outline the baseline noise and vibration levels and proposed mitigation measures. Appendix A5.1 Outline CEMP notes that in addition to the noise and vibration mitigation measures proposed, the contractor(s) will prepare a Construction Noise and Vibration Management Plan (CNVMP) for the proposed Project which will be a live document. There are no statutory standards in Ireland relating to noise and vibration limit values for construction works. The contractor(s) will work within the noise and vibration significance threshold levels identified in the EIAR (as per British Standards) for both airborne and groundborne noise and vibration and the limits contained in the Railway Order approval. The outline CEMP, Section 3.3.1 notes that TII and the contractor(s) will take all reasonable steps to engage with stakeholders in the local community, especially those who may be affected by the construction works including residents, businesses, community resources and specific vulnerable groups. The contractor will also be responsible for putting in place a Stakeholder Communications Plan which will be developed under the consent of a designated Public Liaison Officer (or equivalent officer) appointed by TII. This plan will provide a two-way mechanism for members of the public to communicate with a designated member of the contractor(s)'s staff and for the contractor(s) to communicate important information on various aspects of the proposed Project to the general public.
8	Albert College Park Intervention Shaft - Construction Issues	3	That the proposed Construction Community Relations Officer have an adequate and dedicated support team in place to liaise in a timely and comprehensive way in order to update residents on a regular basis of developments and to deal with any issues or problems that may arise;	For the tunnel boring, Appendix A5.1 Outline CEMP states that TII will establish a website to provide information on the forecast and actual passage of the tunnel boring machine. The contractor(s) will distribute leaflets to properties and affected parties, giving such notice along the tunnelling alignment, along with details of the first point of contact for any queries. Notifications will detail the estimated duration of the works, the working hours and the nature of the works. All notifications will include a local helpline number, as detailed in response item (7) above.
9	Albert College Park Intervention Shaft - Construction Issues	3	The design of the Shaft Ventilation system be such as to minimise any noise or vibration arising in order to protect the amenity of the area;	The requirements for the selection and attenuation of the Albert College Park Intervention Shaft ventilation systems, will be based on background noise level at the nearest and most exposed NSLs to each fixed item of plant and determined for day and night-time periods, with the methodology described in the EIAR Chapter 13, Section 13.2.5.2.4. All baseline noise values will be confirmed prior to the design and selection of the operational plant items with requisite attenuation determined after the updated baseline noise surveys. Suitable noise attenuation will be provided for the intermittent fan operation and will be developed at detailed design to ensure best practical means and equipment are employed. As presented in the EIAR Chapter 13, Section 13.6.2.3, the following will be considered when designing the equipment: - Selection of low noise rated equipment; - Reduction of induct flow rates; - Reduction of elements in the airflow; - In duct attenuators; - Orientation of grilles and louvres away from sensitive receptors; - Acoustic louvres; and - Anti-vibration mountings and couplings will be incorporated into the design to control vibration."

Submission No.			162		
Organisation Name or Name of Submitter			Kieran Smyth and Margaret McDonnell and others (121 Ballymun Road)		
Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
10	Albert College Park Intervention Shaft - Construction Issues	3	That the use of lorries and other vehicles to transport materials and staff to and from the IS in the ACP be minimised insofar as possible and in particular that out of hours working especially between 8pm and 7am (and at weekends) be avoided or at the very least severely restricted with a requirement to keep residents apprised in advance of any such planned out of hours working;	As detailed in the EIAR Chapter 5, MetroLink Construction Phase, the programme for the construction of the proposed Project has been optimised to minimise the duration of the Construction Phase in order to lessen the duration of potential environment impacts, while ensuring that the areas surrounding the work sites remain operational and functional. Work will run concurrently at all MetroLink site locations to ensure the Project is delivered in an effective and timely manner. EIAR Chapter 5, and Appendix A9.5 Scheme Traffic Management Plan details the impact of the temporary traffic management measures and associated construction traffic. As the Intervention Shaft is wholly located within the Albert College Park, there are no temporary traffic management measures associated with the main construction of this site required on the adjacent R108, causing no impact to road users. As shown in Appendix A5.7 Construction Vehicles, Plant and Equipment, there will be between 30 to 80 vehicle movements per day associated with the Intervention Shaft, however much of the works will see daily vehicle movements lower than this range. Vehicle movements will generally be limited to standard working hours as defined in Table 5.3 in section 5.2.4 of EIAR Chapter 5 which is as follows: - Monday to Friday 07:00hrs to 19:00hrs - Saturday 07:00hrs to 13:00hrs	
11	Albert College Park Intervention Shaft - Construction Issues	3	That appropriate traffic management plans be employed, including ones that take full account of the Bus Connects Ballymun/Finglas to City Centre proposals, in the event these are approved by An Bord Pleanála and proceed. (Just to note that it is understood that it is proposed that work on Metrolink and Bus Connects Ballymun/Finglas will be undertaken at the same time);	Please refer to response (10) in relation to the temporary traffic management measures associated with the Albert College Park Intervention Shaft. Chapter 5 of the EIAR, MetroLink Construction Phase, explains that traffic management plans for the construction phase of the Project have been developed to minimise the impact on road users, and to maintain access to businesses and other premises. Prior to implementation, all traffic management measures will be agreed with the relevant local authority (FCC or DCC) and where relevant, consultation with An Garda Síochána and other statutory stakeholders will be undertaken. The design of traffic management measures and highways works is based on achieving the key objective of maintaining continual access to all properties during the works. As noted in Appendix A9.5 Scheme Traffic Management Plan, the 2028 Do Minimum model scenario used for the local and strategic impact assessments during the construction phase consists of a 2028 base network with the addition of the measures included within the R132 Connectivity Study and the proposed BusConnects infrastructure design changes. Therefore, the traffic assessment of both the baseline, construction and operational phases is on the basis that BusConnects infrastructure and network redesign are in place prior to the construction of MetroLink.	

Submission No.			162	
Organisation Name or Name of Submitter			Kieran Smyth and Margaret McDonnell and others (121 Ballymun Road)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
12	Albert College Park Intervention Shaft - Construction Issues	3	That satisfactory and appropriate mitigation strategies are employed to ensure that any risks, such as that of local flooding and rodent displacement (from construction work) are fully addressed.	The risk of flooding is minimal and the EIAR includes for provision to manage the risk. Table 18.16 of EIAR Chapter 18, Hydrology provides a summary of the construction and compound sites along the full route together with the planned discharge point (surface water/storm sewer) and the estimated daily rate of discharge to that receiving feature. Including Albert College Park, none of the planned construction or compound sites are located immediately within areas designated as Flood Zone A or B, in accordance with the OPW 'Planning System and Flood Risk Management Guidelines' (November 2009). The management of flood risk during construction is detailed in Chapter 18 (Hydrology, Section 18.6.1.3) and in the outline CEMP (Appendix 5.1). Any local drainage impacted will be diverted to suit such that flood risk is managed. In order to manage and mitigate all environmental risk at Albert College Park, and as part of the preparation for the construction phase, the appointed Contractor for these works will be required to set out their proposals in the Construction Environmental Management Plan (CEMP), an outline of which is included in EIAR Appendix A5.1. The Contractors CEMP will include a Construction Flood Protection Plan, with minimum requirements set out in EIAR Appendix A5.1, Table 6.4 Water Measures. As noted in Chapter 10, Section 10.5.1.10, with regard to rodent displacement, as is standard practice vermin control will be implemented on all MetroLink sites. While rodents will be temporarily displaced as a result of initial construction activities, there is nothing in the Construction Phase which would lead to an increase in the number of rodents. It could be argued that with the rodent control policies in place, there will be a reduction in the level of rodents and the subsequent risk. Because there will be no increase in vermin numbers and more likely a decrease because of vermin control measures there will be no increase in vermin transmitted disease over and no significant adverse effect on human health.
13	Collins Avenue Station and Tunnelling- Construction Issues	3	We would ask that very careful consideration be given to the Metrolink application, and in particular the Environmental Impact Assessment undertaken, to ensure that the proposals adequately protect the amenity of the houses and other premises in the environs, during the construction phase, of the Collins Avenue Station and the Tunnelling work and in particular that the inevitable disruption during the construction phase is kept to a minimum. We would ask that in the event of An Bord Pleanála approving the Metrolink application that it be done subject to detailed conditions along similar lines to those proposed for the IS in the ACPIS - Construction Issues section above.	Minimising environmental impact on the local community is fundamental to the approach that TII will take and this is documented throughout the EIAR. As detailed in EIAR Chapter 5, MetroLink Construction Phase, the programme for the construction of the proposed Project has been optimised to minimise the duration of the Construction Phase in order to lessen the duration of potential environment impacts, while ensuring that the areas surrounding the work sites remain operational and functional. Work will run concurrently at all MetroLink site locations to ensure the Project is delivered in an effective and timely manner. Potential impacts associated with the construction phase activities of the proposed Project on the residences and businesses are addressed in for example : Chapter 11 (Population & Land Use), Chapter 13 (Airborne Noise & Vibration), Chapter 14 (Groundborne Noise & Vibration), Chapter 9 (Traffic & Transport), and Chapter 16 (Air Quality). Measures to mitigate and monitor these impacts as a result of construction activity across the proposed Project are detailed in Chapter 5 (MetroLink Construction Phase) and summarised in Chapter 31 (Summaries of the Route Wide Mitigation & Monitoring Proposed). Additionally, the appointed contractor will prepare detailed design and construction methodologies in the form of a detailed Construction Environmental Management Plan (CEMP) to ensure all environmental impacts are managed and mitigated in accordance with the EIAR and Railway Order, assuming an Enforceable Railway Order is granted. The detailed CEMP(s) will be provided to DCC for consultation in advance of any construction works on site. An Outline CEMP is included in Appendix A5.1 of the EIAR that will be developed further by the appointed contractors. Monitoring instrumentation will also be used throughout the works to monitor potential environmental impacts, including those discussed above to ensure that acceptable limits are not breached.
14	Property Owners Protection Scheme (POPS)	3,4	We would like to welcome the proposal by TII for a POPS scheme. However, we have some concerns about some of the details of the scheme, including that the system put in place by TII for compensation awards for damage to houses arising as a result of the Metrolink's construction, is a streamlined one, that allows for the prompt payment of such awards. -Given the rate of inflation, and in particular building inflation, we are concerned that the proposed limit of Euro 45,000, non inclusive of VAT, for an individual award may not adequately cover the cost of damage to houses as a result of Metrolink's construction in light of the fact that such occurrences may only come to pass over ten years from now (assuming that the Metrolink gets the required approvals and proceeds as planned). TII should be required to commit to increasing the maximum level of award at least in line with building or general inflation, whichever is the higher. As an additional safeguard it should also be required to obtain expert advice on the adequacy of the maximum quantum of award to ensure house owners are fully compensated for damage arising as a result of the Metrolink works, in respect of the time the scheme becomes operational, and to act on that advice. Interested parties should be able to make submissions for consideration by the expert concerned within this context.	TII believe the current limit of 45,000 is appropriate but do recognise the impact of inflation on the number. TII commit to reviewing the appropriate of the figure taking account of forecasted inflation, on receipt of an enforceable railway order for the scheme. Furthermore it should be noted that participation in the POPS does not impede a property owner's standard legal rights and so should this POPS threshold be exceeded, the property owner may seek redress through standard legal means.

Submission No.		162		
Organisation Name or Name of Submitter		Kieran Smyth and Margaret McDonnell and others (121 Ballymun Road)		
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
15	Property Owners Protection Scheme (POPS)	4	Furthermore, we are concerned that the proposed time limit of one year from the end of the Metrolink construction phase for awards to be valid under the scheme is too short as the consequence of problems, such as ground settlement, may not be identified within such a short timescale. The normal statutory time limits, were such a matter to be taken to court, should apply.	TII believe the proposed time limit is appropriate
16	Property Owners Protection Scheme (POPS)	4	Residents in addition to opting for one of the three TII contracted experts should be able to choose to use their own expert and be compensated up to an agreed set maximum amount.	To avail of the scheme residents must use one one of the survey companies from the panel of survey companies listed in the POPs scheme.
17	Property Owners Protection Scheme (POPS)	4	A dispute resolution process for any disputes arising under the POPS scheme should be put in place. Indeed, a dispute resolution process should be in place for all significant impacts arising from the Metrolink project construction and operational phases, which should encompass a comprehensive complaints' procedure.	Clause 26 of the draft Railway Order sets out an arbitration process in relation to any dispute arising between TII and any other party in relation to the execution of the authorised works or the exercise by TII of the powers granted by this Order. Furthermore, in the event the property owner disputes the findings of any survey carried out by the panel surveyor (on foot of the POPS), Engineer's Ireland shall be instructed to appoint an independent expert to adjudicate over the matter. The decision of the Independent Expert from Engineer's Ireland will be binding upon TII, however the property owner shall not be bound by the decision.
18	Property Owners Protection Scheme (POPS)	4	The above changes should be made to the POPS in advance of the start of the Metrolink construction phase and made a specific condition of any approval by An Bord Pleanála for the Project to proceed.	Please see above responses.
19	Other Issues	4,5	We welcome the fact that TII has committed to discussing the issue of the implications for home insurance arising from the construction of the Metrolink with a view to protecting the interests of the stakeholders concerned and look forward to full updates and consultation on these ongoing discussions. We also welcome the commitment of TII to a programme of public engagement, during the operational phase, to provide, inter alia, information on measures to manage anti-social behaviour. We think the issue of crime and anti-social behaviour is a key one for communities. Much more detail and engagement is needed on these issues not just during the operational phase but also in advance of and during the construction phase. The use of closed circuit television, employment of dedicated security personnel by TII and multi-agency forums with the full participation of residents' groups, Gardai, local authorities etc are all key issues to be considered. Failure to address such issues satisfactorily will negatively impact communities, and indeed, the positive reputation and "brand" that the Metrolink Project should have.	TII to comment on implications for home insurance and consultations on this. Construction Phase As detailed in Chapter 05 (MetroLink Construction Phase), there will be a construction security team on site. The primary function of the site's security team will be to ensure that no unauthorised entry to site occurs. There will be fencing around the sites to minimise the risk of vandalism and unauthorised access. This process will be made easier by all operatives possessing an ID card. ID cards will only be issued to operatives that have attended the site induction and (if relevant) a medical examination. CCTV and alarm systems will be installed where required. Security will also undertake regular inspections of the boundary to the compound. TII will continue to liaise with An Gardai and DFB to ensure provisions are suitable and sufficient. Operational Phase One of the outcomes of the architectural and urban realm design is to discourage anti-social behaviour in the operational phase, for example through the attractive setting, use of public lighting, open sight-lines, and avoidance of areas where individuals and groups of people can hide. Vandalism and anti-social behaviour on the trains and within the stations will be observed through CCTV (Closed Circuit Television) and if required staff sent to manage the situation. (ALG: refer back to relevant section of EIAR/application documents) The ACID (Access control and intrusion detection) system will also identify intruders trying to enter locations where unauthorised access is prohibited. It will also cover the platform doors to the track (surface and retained cut stations) and to the tunnel (underground stations); entrances to technical rooms, the station incident rooms, and stations (outside operational hours); access to the mainline tracks; entrances to facilities at Dardistown depot (test racks, workshops, garages, OCC (Operational Control Centre), technical rooms, storage areas, offices, and emergency doors); the back-up OCC: electricity sub-stations; tunnel portals; shafts and ventilation shafts and emergency doors. ACID will be integrated with the telephone system, CCTV, SCADA (Supervisory Control and Data Acquisition), Fire Alarm System and the Central Clock System. Subject to a Data Protection Impact Assessment and compliance with the General Data Protection Regulation, there will be a single CCTV system and a single ACID system serving all stations, tunnels, substations, and depot, and managed from Dardistown Depot. The final detailed design will be agreed with An Gardai, DFB and DCC to ensure compliance.

Submission No.			163	
Organisation Name or Name of Submitter			Knocklyon Network CLG (1) - Idrone Avenue, Knocklyon, Dublin 16	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Case reference: NA29N.314724: Estuary through Swords, Dublin Airport, Ballymun, Glasnevin and City Centre to Charlemont, Co. Dublin				
1	Letter - introduction	2	Knocklyon Network CIG is a Community Organisation that represents the Community of Knocklyon and parts of Rathfarnham, Firhouse, Templeogue. We have a Community Facebook page with over 1000 followers. We work to improve and support all aspects of making our Community a better place to live.	TII wish to thank you for taking the time to prepare a submission, and have provided responses to your concerns below.
2	Statement	2	Our submission wholly relates to that portion of the proposed Metro Link beyond the station located at St Stephen's Green East. For the avoidance of any doubt, we are fully supportive of the project from Estuary to St Stephen's Green, which we consider is long overdue. We strongly support Metro South West Group and their campaign to bring Metrolink to the Transport deprived area of South West Dublin. Much of the arguments in our Submission are given in greater detail by the MSWG submission.	TII appreciates the submission and the statement of support for the delivery of MetroLink. Please refer to the responses below and to the Metro South West Group Response Register (189) for further details.
3	Submission	2 and 3	We submit that Bord Pleanála should defer the authorisation of the section of Metrolink beyond the St Stephen's Green station, other than to create a turning section similar in length to that which is currently proposed for Manders Terrace. Reasons as follows: 1 . Failure to consider an alternative routing of the terminus notably towards Rathmines We would submit that the Rathmines or Portobello area would be a far more suitable location for a terminus but TII has wholly failed to consider this. This became relevant once the destination for a southern terminus was to be in or in the vicinity of the south inner city, rather than Sandyford. Rathmines Road under Bus Connects will have four 'A' services and a number 80, 81 and 82 with an aggregate frequency of 33 per hour peak time in each direction. A terminus for MetroLink in Rathmines or Portobello would offer superb bus connectivity and would connect much of the south west city. There was an obvious possibility of using Cathal Brugha Barracks in Rathmines as a terminus with its wide-open spaces and possible site for Tunnel Boring Machine which could then be re-directed to South West Dublin. The barracks is currently under review for future development under Land Development Agency for housing, and commercial buildings, suitable for a major terminus and connection to the South West Dublin.	TII do not agree that the Project should not continue past St. Stephen's Green for the reasons set out below. The connection from St Stephens Green to Charlemont / Ranelagh is supported by the previous Transport Strategy for Greater Dublin Area (2016-2035) and the current Transport Strategy for Greater Dublin Area (2022-2042). The latter considers a range of options for the onward extension of MetroLink to meet the demand for travel over the period of the strategy. This includes consideration of the need for the upgrade of the Luas Green Line to metro with a metro extension to Dublin south west, south or south east. Whilst the strategy envisages that further extensions will be delivered after 2042, MetroLink which terminates at Charlemont allows for the possible extension of the metro in all the above directions. The proximity of the MetroLink to the Luas line at Charlemont provides for a positive customer experience for all users with short interchange distance and due to the proximity, clear wayfinding and high visibility of the interchange. The interchange arrangements at Charlemont provide for significantly better interchange arrangements compared to an interchange at St Stephen's Green Station. Passengers wishing to interchange between Luas and metro at the St Stephen's Green terminus would face a 500m-walk along a route either through St Stephen's Green park or along the footpath north of the park, which adds significantly to the time for interchange and therefore the overall journey time for passengers and a less positive customer experience for all interchange users. This passenger experience would be reduced further for those with mobility or visual impairments as well as those travelling to/from the airport with luggage. The section of MetroLink route between St Stephen's Green and Charlemont Stations contributes significantly to the overall benefits of the scheme. It serves a significant area of the south city of Dublin and offers enhanced access from the local area to the city centre and a direct connection to Dublin Airport. It serves key trip attractors including residential areas and offices / workplace locations, with high passenger boarding and alighting figures in the peak hours. During the morning peak, at Charlemont station the flows include 1,800 passengers alighting, 2,300 boarding and 1,229 passengers alighting, 2,276 boarding during the evening peak. The passenger numbers contribute significantly to the overall benefits of the scheme and the effect of these benefits outweigh the additional costs that are associated with the delivery and operation of the section from St Stephen's Green to Charlemont station. This is detailed in Chapter 7 (Consideration of Alternatives, section 7.7.8). The location of the interchange at Charlemont does not preclude onward extension south to areas such as Rathmines. An interchange at Charlemont is supported by policy including the Dublin City Development Plan 2022 - 2028 and the Transport Strategy for the Greater Dublin Area. As noted by the GDA Transport Strategy 2022-2042, section 12.3.2, "Charlemont offers the optimal location for the primary interchange with the Green Line in response to growing demand in the longer term and is an appropriate location to facilitate any potential future metro extensions to serve the south west, south or south east of the city region should sufficient demand arise." By extending MetroLink to Charlemont it provides for future proofing of the Green Line, bypassing the capacity constrained Luas on-street running section, and ensures potential future connectivity options are enabled, either to the Green Line or for extensions of the metro. The Charlemont Station interchange provides for increased passenger utilisation of the MetroLink system, thereby increasing the benefits delivered by the Project, reflected by an improved Project Benefit Cost Ration (BCR).

Submission No.			163		
Organisation Name or Name of Submitter			Knocklyon Network CLG (1) - Idrone Avenue, Knocklyon, Dublin 16		
Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
4	Submission	3	2. Feasibility Study from City Centre to Knocklyon We note that in the context of the preparation of the Greater Dublin Area Transport Plan 2022-2042, the National Transport Authority did a feasibility study entitled Metro to Knocklyon. This study was severely flawed, and the criterion given to Jacob's International were bound to produce a negative result. We would request that a proper/comprehensive feasibility study be done to assess the options for the south west city. Any route decided upon would be more feasible from Stephen's Green than Charlemont. We do not believe that any progress can be made in assessing the alternative option unless a proper assessment of metro to the south west city is done. This study could be carried out while Metrolink continues to be built from Estuary. It will be unlikely to reach city centre before 2025.	Please refer to response item (2) above in relation to continuation of the Project to Charlemont. As noted, the selection of Charlemont Station does not preclude onward extensions to the south or south-west of the city. Any feasibility studies undertaken as part of future phases of the study will be subject to the planning, design and appraisal of the NTA. The Metro to Knocklyon Feasibility Study is not part of the submitted Railway Order.	
5	Submission	3	3 Limitations of Charlemont terminus for radial extensions onwards to south city It would seem, that the longer-term intent is, that the MetroLink line be extended into the south city area. There are statements on this by various persons including NTA senior executives and the Minister. There are three alternatives posed: a. south west city towards Tallaght, b. continuing the existing Luas line or c. heading south east towards UCD and Sandyford. In various statements both from Government and NTA , it would seem that options b and c are no longer under consideration for Metro. This been the case it would seem appropriate to look for a suitable terminus for option c. We believe that if the tunnel is bored as far as Manders Terrace, this seriously compromises the ability for an extension to serve important communities. In particular we find it difficult to see how MetroLink could be extended to include relatively inner-city suburbs such as Portobello, Rathmines, and Harold's Cross. MSWG have requested NTA through the Minister to give details of what suburbs could be served from a continuation of Manders Terrace to the South West. The NTA have not responded to this request of over a year. We would submit that proper planning requires a proper evaluation of the options for extension and <i>that it is not consistent with proper planning to permit a station at Charlemont which would compromise the options.</i>	Please refer to response item (2) above in relation to continuation of the Project to Charlemont. As noted, the selection of Charlemont Station as the last station on the alignment does not preclude onward extensions to the south, south-east or south-west of the city. Any decisions for extensions to MetroLink south from Charlemont would be based on future demand requirements. Any such extensions if identified as necessary would be subject to full alternatives assessment prior to identifying a preferred route that would be submitted to An Bord Pleanála for a Railway Order.	
6	Submission	4	4. Environmental Issues From Data collected by Metro South West Group, there is no doubt that the long-term plan for Dublin's environmental health must include substantial investment in Metro systems. There is a lack of belief in the public that buses and Bus Connects will be sufficient to meet the demands for public transport as proposed by NTA/TII. A Metro system, operated on electricity generated by Renewable Energy Resources is among the lowest carbon footprint. See Our World in Data Table. This is the obvious solution for the growing needs for Transport in South West Dublin. The benefits increase year on year as the occupancy increases year on year as was found with Luas. CSO Transport Survey of 2019 found the following conclusions. Almost half (48.5%) of respondents aged 18 years and over never use bus services, while one quarter (24.8%) use it less than monthly. One in every sixteen (6.3%) persons use the bus services very frequently, at least 5 times a week. Persons aged 18 to 24 years use the bus services most frequently - 36% of females and 33.6% of males in this age group use the bus services at least 5 times a week. At an overall level, one in twenty of over 18-year-olds (4.7%) use the bus 3 to 4 times a week, and 8.5% use it less frequently, 1 to 2 times a week.	Please refer to response item (2) above in relation to the continuation of the Project to Charlemont. As noted, the selection of Charlemont Station does not preclude onward extensions to the south or south-west. As noted by the GDA Transport Strategy 2022-2042, section 12.3.2, "Charlemont offers the optimal location for the primary interchange with the Green Line in response to growing demand in the longer term and is an appropriate location to facilitate any potential future metro extensions to serve the south west, south or south east of the city region should sufficient demand arise.' Bus Connects and MetroLink are both part of a comprehensive network of public transport interventions identified in the GDA Transport Strategy 2022-2042 that will reduce GHG emissions due to the predicted modal shift away from private car usage in response to these interventions. The GDA strategy is based on detailed and comprehensive modelling of future public transport demands across the Greater Dublin Area (GDA) and on this basis the proposed public transport provision has been designed to meet demand covering the period 2022 - 2042. However, it should be noted that this will be reviewed for future plans and that future predicted public transport demands will be assessed to identify potential future extensions to MetroLink.	
7	4 Environmental Issues	4 and 5	Green House Gas (GHG) Emissions are a major contributor to global climate change, which will increase the number and severity of extreme weather events in the region. In the United States, the biggest source of GHG emissions is from transportation. Every trip taken with Metro and not a car reduces the region's carbon footprint. On average, traveling by Metro results in 46% less GHG emissions per mile than driving in a single-occupancy vehicle. The transport sector emitted 12.0 million tons (Mt) CO2 in 2021 and accounted for 34.0% of Ireland's total energy emissions. Transport remained the most carbon intensive demand sector, with 95.5% of transport energy demand coming from fossil fuels. Rebounding from 2020 COVID-related travel restrictions, energy demand for transport increased by 8.3% in 2021, and was a significant driver of the overall increase in Ireland's energy-related emission this year.	Please refer to response item (6) above.	

Submission No.			163		
Organisation Name or Name of Submitter			Knocklyon Network CLG (1) - Idrone Avenue, Knocklyon, Dublin 16		
Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
8	4 Environmental Issues	5	Private car use is by far the largest transport sub-sector, and accounts for 43.0% of all transport energy demand. Energy demand by private cars is 67% greater than the combined demand of both heavy goods and light goods commercial vehicles on Irish roads. These numbers highlight the urgent need to reduce the climate impact of private car use by increasing the number of journeys we make by foot, by bicycle, and on public transport, while simultaneously replacing petrol and diesel cars with EVs. Provisional data from the first 6-months of 2022 indicates that demand for petrol is up by 27%, compared to the same period in 2021, and the demand for diesel is up by 15%, as consumption of both fossil fuels return to pre-COVID levels. Cars account for 65% of Dublin's transport emissions. <i>Source SEAI Report on Transport Energy consumption.</i>	Please refer to response item (6) above.	
9	4 Environmental Issues	6	In addition to the socioeconomic benefits such as reduction in travel time, travel cost, accident rate, per capita vehicle ownership etc., the ability of metro system towards substantial reduction in per capita pollution emission is considered as one of the major benefits. However, if the benefits offered by the metro system such as reduced traffic congestion, GHG emissions, accident rates, savings in travel time and cost, safety and comfort are assessed and quantified collectively, the metro projects could become the most cost-effective projects than the other public transport project alternatives. These details from the 2016 Census Data, CSO highlight our over dependence on the car. In Conclusion we see a Metro to South West Dublin originating at Stephen's Green as the answer to not only Public Transport needs in South West Dublin, but the only Environmentally satisfactory answer to reducing Green House Gases and encouraging a Modal shift from Private cars to Public Transport.	Please refer to response item (6) above.	
10	Submission	6	5 Poor access to Charlemont from Rathmines Road The original Metro North project, which was approved for a Railway Order by An Bord Pleanála, had the metro station on the western (College of Surgeons) side of St Stephens Green, where the interchange between the Green Line and metro would be swift. Charlemont would be unsuitable for an interchange between MetroLink and the Green Luas line. Figure 7.1 shows the vertical separation that would occur were the Luas /metro interchange to be located in Charlemont. Figure 7.2 shows that the first manoeuvre for incoming Luas passengers (many with luggage and/or disabilities) would be to cross the Luas line (looking both ways to avoid being mown down by an incoming or outgoing Luas). Would this be a safe manoeuvre to require, for example, from children?	TII do not agree that Charlemont is an unsuitable interchange between MetroLink and the Luas Green Line. Please refer to response item (2) in relation to the suitability of the interchange at Charlemont. As noted, the interchange arrangements at Charlemont provide for significantly better interchange arrangements compared to an interchange at St. Stephen's Green. Please refer to response item (11) below in relation to the anticipated pedestrian comfort levels at the interchange. Wayfinding will be appropriately signed to ensure safe movements for all users.	
11	5 Poor access to Charlemont from Rathmines Road.	7	 The second manoeuvre would require passengers to descend 3 flights of stairs in the open. It could be expected that there would be considerable congestion on these stairs and many passengers would be moving slowly and add to the congestion. The third manoeuvre would be a walk in the open towards the entrance to the proposed metro station. This is a station that lies alongside and above a canal and a major traffic route. The fourth manoeuvre - descending to the metro platform - is shown in Figure 7.3. The complexity and safety issues surrounding Charlemont make it unsuitable as an interchange.	Please refer to response item (10) in relation to the interchange arrangements at Charlemont Station. As outlined in Chapter 09 (Traffic and Transport), a microsimulation VisWalk model has been developed for the immediate area surrounding Charlemont Station during the operational phase. The model covers the full extent of the publicly accessible station area, including the immediate vicinity of the station entrance at street level, the Luas stop and nearby junctions at Charlemont Bridge. In order to accommodate the forecast demand from the proposed Charlemont Station, a new staircase with 2.4m stair width is proposed at the south east corner of Charlemont Luas stop. An elevator will also be provided at this location. Both are sized for MetroLink to Luas, and Luas to MetroLink passenger numbers. In addition, it is proposed that the pedestrian crossing on R111 Grand Parade will be repositioned to the front of the building being developed by Hines. With this infrastructure in place, the model indicates that the R111 Grand Parade will have an acceptable level of service overall, with some reductions in service seen at the pedestrian crossing where pedestrians are required to wait for a green phase at the signals. Overall, it is considered that the model displays an acceptable level of network performance.	
12	Submission	9	7 (6) Lack of adequate public service in outer suburbs In Knocklyon and the surrounding suburbs we are over dependent on the car for transport. Surveys found that over 74% of the population travel in a car daily. We are faced with large increase in population and cars as the county is expected to increase in population by over 50,000 in the coming 10 years. This added to the existing 350000 living in the triangle between the two Luas lines adds to congestion, pollution, time wasted in traffic, further dependence on the car. NTA proposals for Bus Connects are entirely inadequate and will not encourage a modal switch to public transport. There proposal in the latest Greater Dublin Area Transport Strategy Review is to look at possibility of three additional Luas lines, but in 2042. In addition, we have planning permission by SDCC to build an Interpretive Centre for the Dublin Mountains in the Knocklyon Area. This is proposed to bring 300000 visitors a year to the area. A metro station with a shuttle bus would solve this increase if suitably planned, as the roads certainly will be unable to accommodate these numbers.	Please refer to response items (2, 6) above in relation to the potential for future extensions to MetroLink. As noted, the selection of Charlemont Station does not preclude onward extensions to the south or south-west. As noted by the GDA Transport Strategy 2022-2042, section 12.3.2, "Charlemont offers the optimal location for the primary interchange with the Green Line in response to growing demand in the longer term and is an appropriate location to facilitate any potential future metro extensions to serve the south west, south or south east of the city region should sufficient demand arise."	

Submission No.			163

Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
13	6 Lack of adequate public service in outer suburbs	9	The rush hour congestion in mornings and evenings is getting worse as all available land is filled with new and necessary apartment blocks. The lack of any time consistency in public transport. The increase in pinch points for traffic on routes. Public transport is not attractive. At present the population sees only more cars as their only option for travel.	Please refer to response item (2) above in relation to the continuation of the Project to Charlemont. As noted, the selection of Charlemont Station does not preclude onward extensions to the south or south-west. As noted by the GDA Transport Strategy 2022-2042, section 12.3.2, "Charlemont offers the optimal location for the primary interchange with the Green Line in response to growing demand in the longer term and is an appropriate location to facilitate any potential future metro extensions to serve the south west, south or south east of the city region should sufficient demand arise.'	
14	6 Lack of adequate public service in outer suburbs	9	"What had the outside reviewers have to say about continuing to Charlemont/Manders Terrace?" <i>Jaspers: "Regarding the project's scope and design several technical aspects appear to make the project expensive: in particular the inclusion of the connection to Ranelagh/Charlemont. The connection to Ranelagh could feasibly be deferred until there is clarity on the future of the Green Line (subject to an improved understanding of how this could physically be delivered in a scenario with Metro operational) ."</i> Major Projects Advisory Group: "<i>The rationale for extending the preferred scheme to Charlemont is noted by JASPERS as "strategically weak" given the additional costs involved and the duplication of the LUAS Green Line which also provide a public transport service to the areas of the city centre in question "</i>.	TII do not agree with this statement for the reasons set out by response (2) above, noting that infrastructure is not being duplicated given the capacity of the Luas south from St. Stephen's Green is restricted due to on-street running. There is a limit to the potential of the Luas to provide additional capacity in the on-street non-segregated section of the Luas Green Line from Charlemont northwards through the city centre. The nature of this route and the fact that it currently crosses several road junctions (Adelaide Road, Harcourt Street / Hatch Street upper and Harcourt Street / St Stephen's Green south) limit the service to a maximum of 24 trams per hour per direction. The projected demand for this section would require a higher frequency of up to 30 trams per hour and this demand cannot be met with on-street systems (Luas / bus). The interchange between Luas and MetroLink proposed at Charlemont will provide the necessary capacity to address the demand on this corridor and reduce overall travel time for passengers There is also high passenger demand forecast for a Metrolink station at Charlemont, including from the Ranelagh area, which would be lost if St. Stephen's Green was the MetroLink southern interchange station. The additional fare revenues collected by the Charlemont Station interchange increase the benefits delivered by the Project, reflected by an improved Project Benefit Cost Ration (BCR). Further, to ensure that public investment delivers value for money, the Public Spending Code sets out requirements for the evaluation, planning and management of public investment. The preparation of a Business Case is a key element of meeting these requirements. The Public Spending Code requires that both the Preliminary Business Case and Final Business Case for public investment projects are published. In July 2022, the Government granted Approval in Principle to the NTA to enable the submission of a railway order application by TII to An Bord Pleanála in respect of the MetroLink project (Decision Gate 1). This approval was granted after the Preliminary Business Case (PBC) had undergone significant scrutiny and challenge by bodies that are independent of TII, including DoT and DPER review (including independent review by JASPERS and the Major Projects Advisory Group (MPAG)) of the PBC around timeline, costs and benefits that were updated to inform the Government decision.	
15	Conclusions	10	We suggest the following three conclusions. • Metro is necessary for Dublin South West. • Metrolink proceed as soon as possible from Estuary to Stephens Green. • A proper Feasibility study be undertaken in the next year to see the most suitable route for continuation of Metrolink when it reaches Stephens Green.	Please refer to response item (2) above in relation to the continuation of the Project to Charlemont. As noted, the selection of Charlemont Station does not preclude onward extensions to the south or south-west. As noted by the GDA Transport Strategy 2022-2042, section 12.3.2, "Charlemont offers the optimal location for the primary interchange with the Green Line in response to growing demand in the longer term and is an appropriate location to facilitate any potential future metro extensions to serve the south west, south or south east of the city region should sufficient demand arise.' Any feasibility studies undertaken as part of future phases of the study will be subject to the planning, design and appraisal of the NTA.

RE: "RAILWAY (METROLINK - ESTUARY TO CHARLEMONT VIA DUBLIN AIRPORT) ORDER 2022" - ABP REF. NA29N.314724, AREA 306 - ST. STEPHEN'S GREEN				
1	Cover Letter	1,11	The main concern in terms of the Shelbourne Hotel relates primarily to the potential impacts of MetroLink on the ongoing and successful operation of the Shelbourne Hotel during the construction phase of the MetroLink Project. Our Client is seeking to ensure that the construction of MetroLink Project will be undertaken with minimal disruption to the renowned historic Shelbourne Hotel and its guests and visitors.	TII have reviewed your submission and noted your concerns/observations which are responded to below. TII confirm that your property has been included in the assessment of potential construction and operational impacts of the MetroLink Project. The EIAR fully details all impacts to the Shelbourne Hotel during construction and operational phases of the MetroLink. TII will however ensure that all impacts are minimised so far as is reasonably practical.
2	Cover Letter	1,11	It is also incumbent on the TII to ensure that any potential direct or indirect adverse impacts in respect of noise, vibration or pedestrian and vehicular accessibility to the hotel during the construction and operational phase of MetroLink Project is appropriately mitigated through design.	The EIAR fully details the impacts of both the Construction and Operational Phases and proposes appropriate mitigations. Mitigations will be implemented throughout the design and construction phase. Included below is a summary of the impacts and mitigations provided for but reference should also be made to the Outline Construction Environmental Management Plan (CEMP) in EIAR Appendix A5.1. Noise and Vibration Regarding potential direct or indirect adverse impacts in respect of noise and vibration, please refer to Item 5 below. In order to mitigate noise and vibration the CEMP has been prepared and is included as Appendix A5.1. This is a working document that will be updated by the contractor prior to commencement of construction and regularly as the project progresses. Table 6.2 of the CEMP outlines the noise and vibration measures proposed during construction phase of MetroLink Project. Pedestrian and vehicular accessibility Pedestrian and Vehicular access to the Shelbourne is unaffected throughout the main works construction and during the enabling works periods any utility diversion work will be managed to minimise any short term disruption. The construction site does not alter during the main works phase. Only short term, slight negative impacts to traffic flow on St Stephens Green East are noted in the EIAR Chapter 9 (Traffic & Transport). Mitigation measures during the Construction Phase of the proposed Project will be managed through the Outline Construction Environmental Management Plan (CEMP) and Temporary Traffic Management (TTM) Plans for the proposed Project and stations. The contractor(s) are required to implement the measures outlined in Table 6.1 of the Outline CEMP in relation to traffic and transportation during construction. The Traffic Management proposals have been developed to minimise construction impacts on pedestrians, cyclists and on the operation of bus services based on the principles of the road user hierarchy. During operational phase, it is anticipated that, overall, the proposed Project will provide for improvements to the public transport network, resulting in decreases in car usage/trips, increases in public transport usages, and will facilitate walking and cycling to the stations, without significantly impacting on the operation of the networks in the area. The proximity of the station to your hotel will benefit the Shelbourne Hotel hugely in the operational phase.
3	Cover Letter	1	Our Client has made a significant investment in the external and internal conservation, repair and refurbishment of the Shelbourne Hotel in recent years to ensure that it remains an iconic City destination. It would be totally unacceptable to our Client that potential impacts arising during the construction or operational phases of the MetroLink Project would undermine the investment expended to date to ensure that the historic architectural quality of the building is maintained in excellent order and that the best quality experience is delivered to the hotel's local and international guests.	TII recognise the importance of the building and have included for this in the environmental impact assessments, including EIAR Architectural Heritage. [Section 26.4.4.14.2 specifically notes the Shelbourne Hotel building in this Historical Background section of the study area] Further Section 26.5.4.13.2 and 3 note that there will be no impacts on architectural heritage in this section of the study area (where the Shelbourne Hotel is located) during the Construction and Operational phases respectively. The impact of ground movement is discussed below in response (5).
4	Land Use Zoning	3	Significant investment has been made by the current owner in the conservation, repair and refurbishment of the Shelbourne Hotel as an iconic heritage and visitor destination in the City, in accordance with the aforementioned zoning objectives for this site. Our Client is anxious to ensure that this investment in the Shelbourne Hotel as a successful going concern and local historic landmark is not undermined by the MetroLink Project works or operation.	Refer to Response 3.

Submission No.			165

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
5	Protected Structure	4	The potential significant impact of any proposed MetroLink works on the Shelbourne Hotel (historic building and use) and its setting as a protected structure will need to be taken into account in terms of the construction and operational phases of the MetroLink Project.	The potential construction and operational impacts on the Shelbourne Hotel have been assessed within the EIAR. Potential impacts on the Shelbourne Hotel buildings and its use could arise due to settlement, air emissions and dust, airborne and groundborne noise and vibration. The main potential construction and operational impacts are summarised below while the EIAR chapters fully details all impacts during construction and operational phases of the MetroLink Project. 1. Settlement EIAR Appendix A 5.17, Building Damage Report, covers the assessed impacts of construction generated ground movements and settlement on properties. Table 5-2 outlines the results of the Phase 2a Building Damage Assessment conducted on representative buildings along the proposed tunnel alignment, including for Shelbourne Hotel (building reference B-12 and B-13). Table 5-2 shows that assessments to date indicate that the buildings fall into the "Negligible" damage category. As Protected Structures, the Shelbourne buildings are designated as 'special buildings' which means they will be taken forward for a Phase 3 Assessment that will be undertaken by the main works contractor at the detailed design stage of the Project. This is despite the negligible damage predicted. This further assessment will pick up on the building's condition close to the time when the building will be impacted. A detailed survey will be carried out as part of the Phase 3 assessment to provide the necessary additional information to inform this detailed analysis of how the individual elements of the building would be affected by the predicted ground movements. The results of this refined assessment typically show that earlier assessments are conservative and overestimate the likely impact of construction generated ground movements. 2. Airborne Noise and Vibration EIAR Chapter 13 (Airborne Noise and Vibration) assesses the impact of the MetroLink Project arising from Airborne Noise during the Construction Phase and Operational Phase. The assessment of airborne noise from above ground construction activities at nearby St. Stephen's Green Station is presented in section 13.5.2.6 AZ4: Northwood to Charlemont of EIAR Chapter 13. Full calculated results for this work area, including for Shelbourne Hotel, are included in EIAR Appendix A13.7. The airborne noise levels at Shelbourne Hotel are predicted to be between 62 - 68 dB LAeq,T depending on the sequence of construction activity, which are below the construction noise threshold level of 75 dB LAeq,T., resulting in a "not significant" impact on the building operation during the Metrolink construction phase. Once operational, the Metrolink will be in tunnel within Northwood to Charlemont section of the proposed Project. The primary operational noise sources in this section relate to station and ventilation tunnel systems. For the ventilation systems, during the detailed design phase, the operational noise level from each surface grill will be calculated to the nearest sensitive area to each and specific attenuation designed for each system to not exceed the relevant design criteria for each location (in line with BS4142). 3. Groundborne Noise and Vibration Chapter 14 (Groundborne Noise & Vibration) of the EIAR assesses the impact of the MetroLink Project arising from Groundborne Noise and Vibration during the Construction Phase and Operational Phase. The Shelbourne Hotel was assessed for potential groundborne noise and vibration impacts from the construction works (mechanical excavation, blasting, and TBM Passage) and railway operation. The predicted groundborne noise and vibration results for the Shelbourne Hotel are summarised in the EIAR Chapter 14, Table 14.29 (Groundborne Noise during TBM Passage), Table 14.31 (Groundborne Noise during Mechanical Excavation), Table 14.32 (Vibration during TBM Passage), Table 14.33 (Vibration during Construction Mechanical Excavation), Table 14.34 (Blasting Vibration Levels), Table 14.35 (Blasting Air Overpressure Levels), Table 14.44 (Groundborne Noise during Railway Operation), Table 14.45 (Groundborne Vibration during Railway Operation). The full suites of groundborne noise and vibration results are presented in Table 14.4 (Section AZ4) of EIAR Appendix 14.5. According to the assessment calculations, the noise and vibration levels during construction and operational phases will be below the threshold limits (please refer to EIAR Chapter 14.3.1.4 Sensitive Receptors AZ4 Northwood to Charlemont, Table 14.18 for threshold limits applicable to The Shelbourne Hotel) resulting in "no significant" impact on buildings operation, except for TBM Passage where the noise value of 47 dB will be above the threshold limit of 45dB, resulting a "significant" impact on the buildings operation for the limited duration (a maximum of 2 weeks) during TBM passage.

Submission No.			165	
Organisation Name or Name of Submitter			KW Real Estate ICAV (represented by Stephen Little & Associates)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
			Response (5) continued.	3. Air Quality Air quality impact was assessed in the EIAR Chapter 16 Air Quality. According to the assessment, following mitigation measures, the likely effects of the emissions from the proposed Project construction, are considered overall Neutral, Not Significant and Medium-Term and fugitive emissions of dust from the site are not predicted to be significant and pose no nuisance, human health or ecological risk to nearby receptors. During Metrolink operation, overall, considering the likely effect of emissions from the Operational Phase of the proposed Project, the likely effects are considered overall Neutral, Not Significant and Long-Term. In conclusion, according to the above mentioned there will be no predicted significant impacts on Shelbourne Hotel operation due to settlement, noise and vibration and air quality, except for the noise generated during TBM Passage which will be of limited duration. Unfortunately, there are no effective methods available to reduce groundborne noise or vibration from TBMs at source but note that the duration of this impact will be in the order of up to two weeks as the TBM passes. TII will liaise with Shelbourne Hotel to ensure the timing of these impacts are known.
6	Conservation Area	4	Again, the potential significant impact of any proposed MetroLink Project works on the Shelbourne Hotel (historic building and use) and its setting as a protected structure in a designated 'Conservation Area', will need to be taken into account in terms of the construction and operational phases of the MetroLink Railway Order application .	Please see responses (5) above and (11) below.
7	Noise & Vibration	8	On review of the mitigation measures set out in the EIAR, noise insulation and temporary re-housing is proposed for all sensitive receptors. The mitigation measures do not differentiate between a residential or a hotel use for example. While the tunnel boring may be temporary as it passes in proximity and beneath the Shelbourne Hotel the 'residual impacts' as set out in the EIAR are naturally a concern for our Client. The mitigation measures set out in the EIAR do not appear to differentiate between the types of sensitive receptors along the MetroLink line. Our Client would have significant concerns in relation to the practical application of the proposed mitigation measures in the context of the Shelbourne Hotel.	Unfortunately, there are no effective methods are available to reduce groundborne noise from TBMs at source. The principal mitigation measures aimed at minimising impacts from groundborne noise are as follows: • Advance public consultation and stakeholder engagement can greatly reduce the significance of groundborne noise effects during construction, as building occupants would be prepared for the passage of the TBM and resultant elevated noise and vibration levels. It is important however to note that the advancement of the Tunnel Boring Machine will be for a very short duration over a matter of days and that the noise will be imperceptible to most guests. TII and their contractors will engage with the Shelbourne Hotel regarding the potential impacts of these works and the proposed programme for the same once this information is available.
8	Noise & Vibration	8	Secondary glazing would not be appropriate on the Shelbourne Hotel given that it is a Protected Structure. Such works are likely to significantly detract from the character of the building even in a temporary scenario. Furthermore, such mitigation measures may not be implementable due to the potential impact on the historic protected fabric of the building.	This point is noted, but for clarity please note that secondary glazing is neither proposed nor required at this location.
9	Noise & Vibration	8	Temporary Rehousing is not considered feasible for a hotel of such significance in Dublin City centre. Even if it were, rehousing guests / visitors would have a significant impact on the operation of the Shelbourne Hotel.	Please see response to 7 above.
10	Noise & Vibration	8	Our Client is a Key Stakeholder and early engagement with both TII and future Contractor is requested to ensure the short to medium term operation of the Shelbourne Hotel is not unduly impacted by noise and vibration during the construction phase of the MetroLink Project.	TII will engage with the Shelbourne Hotel as required both in advance of the works likely to impact and throughout the construction phase.

Submission No.			165

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
11	Conservation / Architectural Heritage	8,9	The Architectural Heritages Chapter of the EIAR submitted with the Draft Railway Order identifies that there will be a significant indirect impact on the Protected Structures on the northern side of St. Stephens Green (which include the Shelbourne Hotel). It is acknowledged that the 'setting' in the context of the Protected Structures on the northern side of St- Stephens Green (which include the Shelbourne Hotel) will be reinstated. In this instance it is proposed to re- Instatement of protected railing and new tree planting within the northwestern corner of St.Stephens Green. It is incumbent on TII o ensure that during the construction phase of the MetroLink Project at St. Stephen's Green East that the operation of the Construction Compound does not have any adverse impacts on the operation of the Shelbourne Hotel. This would include orderly management of the compound to ensure it remains well maintained and does not detract from the setting of the Shelbourne Hotel whilst present. Our Client is a Key Stakeholder and early engagement with both TII and future Contractor is requested to ensure the setting of the Shelbourne Hotel in architectural heritage terms is not substantial undermined during the construction phase of the MetroLink Project.	According to the assessment, during Construction Phase, an indirect impact on the building will occur due to the presence of the construction site directly in front of the protected structure. On completion of the works the impact will be not significant. This is an indirect impact due to the works to St Stephen's Green. TII can confirm that the protected railing will be reinstated and new trees will be planted as stated. TII will ensure that the site is hoarded and maintained to a standard in keeping with the setting.
12	Traffic	9	The results of the junction modelling set out in EIAR indicate that the main impact of the traffic management measures at St. Stephen's Green station will occur in the Weekday AM Peak Hour. The closure of Hume Street and subsequent diversion via Pembroke Street and Leeson Street (See Figure 6) will impact on the flow of traffic generally in the area.	Correct. For context only slight negative short term impacts are assessed on St Stephens Green East.
13	Parking & Loading	10	During the construction phase St. Stephen Green East will have a temporary layout which may in turn impact on the road layout on St. Stephens Green North once a detailed Construction Management Plan is put in place by the Contractor. The Draft Railway Order sets out in relation to parking and loading area impacts that: "Parking and Loading Impact Temporary management measures have been developed to minimise the impact on parking and loading. Site specific mitigation measures will be developed through consultation with stakeholders, including local authorities, residents and business owners. These impacts should be monitored throughout the Construction Phase to assess if any disrupted bays can be reinstated." Our Client is a Key Stakeholder and early engagement with both TII and future Contractor is requested to ensure that the operation of the Shelbourne Hotel is not impacted by any temporary traffic arrangements implemented during the construction phase of the MetroLink Project. Any amendments to the road layout on the junction of St. Stephens Green North and St. Stephen Green East are likely to have an impact on the operation of the Shelbourne Hotel. This needs to be fully considered prior to the commencements of works of the MetroLink Project at this location.	The traffic management arrangements developed in conjunction with DCC and the NTA are included within the EIAR and have been modelled. The arrangements will not impact upon the operation of the Shelbourne Hotel. TII note your observation and although temporary traffic impacts and arrangements have been fully considered in the EIAR, we nonetheless welcome continued engagement with Shelbourne Hotel with regards to your concerns related to temporary traffic arrangements.
14	Air Quality & Dust	10	The Draft Railway Order sets out that an Air Quality Management Plan shall be prepared and submitted for approval to the relevant Planning Authority. The EIAR describes the impact on air quality during the construction phase as short to medium term, negative, localised and not significant. Our Client is a Key Stakeholder and early engagement with both TII and future Contractor is requested to ensure that the operation of the Shelbourne Hotel is not impacted by dust or air quality arising from the construction phase of the MetroLink Project.	Please refer to response (5) above. Air Quality will be managed to minimise all impacts with details of the proposed mitigations contained in the CEMP.

Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) order 2022 Case Reference Number NA29N.314724				
1	Letter - Introductio	1	We live at 11 Dartmouth Square West.... Firstly, in general, we are in favour of the broad aim of the Metrolink project to connect Dublin's city centre to our national airport. However, as a resident living in the Dartmouth/Charlemont area, we wish to set out a number of observations for the Board regarding the proposal to locate the Terminus station at Charlemont-Dartmouth. Our family home is in the midst of the community where the Terminus station is proposed to be located; and further, the application makes provision for part of our property to become the subject of a Compulsory Purchase Order. We respectfully ask that you consider the following points in making your decision on the Application.	Thank you for taking the time to make a submission and your overall endorsement of the MetroLink Project. We have reviewed your submission and responded to the observations made below.

Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) order 2022 Case Reference Number NA29N.314724				
2	Letter - Point 1	1	1. Charlemont Is the incorrect strategic location for a Terminus hub and spoke system as it is too far out along the Luas Green Line spoke and would prejudice future options for integration of networks and services.	TII have carefully considered where the best location is for a southern interchange with MetroLink, and for the reasons set out below, the preferred location is a station at Charlemont. The Board is required to have regard to the likely consequences for proper planning and sustainable development in the area in which it is proposed to carry out railway works (section 43(1) of the 2001 Act) and as such the following matters are relevant. The connection from St Stephens Green to Charlemont / Ranelagh is supported by the previous Transport Strategy for Greater Dublin Area (2016-2035) and the current Transport Strategy for Greater Dublin Area (2022-2042). The Transport Strategies were prepared by the National Transport Authority, scrutinised by the Joint Oireachtas Committee on Transport and approved by the Minister for Transport. It notes in section 12.3.2, "Charlemont offers the optimal location for the primary interchange with the Green Line in response to growing demand in the longer term and is an appropriate location to facilitate any potential future metro extensions to serve the south west, south or south east of the city region should sufficient demand arise." The Transport Strategy is "a consideration material to the proper planning and sustainable development of the area or areas in question." Development Plans are required to be consistent with the Transport Strategy. The Dublin City Development Plan 2022-2028 envisages this station at Charlemont in policy SMT22 "To support the expeditious delivery of key sustainable transport projects so as to provide an integrated public transport network with efficient interchange between transport modes, serving the existing and future needs of the city and region and to support the integration of existing public transport infrastructure with other transport modes. In particular the following projects subject to environmental requirements and appropriate planning consents being obtained: ... MetroLink from Charlemont to Swords". Accordingly, the location of the Charlemont station was a strategic decision made at the highest levels of transport and land use planning and such is fully consistent with the proper planning and sustainable development of the area. The current Transport Strategy considers a range of options for the onward extension of MetroLink to meet the demand for travel over the period of the strategy. This includes consideration of the need for the upgrade of the Luas Green Line to metro with a metro extension to Dublin south west, south or south east. Whilst the strategy envisages that further extensions will be delivered after 2042, MetroLink which terminates at Charlemont allows for the possible extension of the metro in all the above directions. The proximity of the metro to the Luas line at Charlemont provides for a positive customer experience for all users with short interchange distance and due to the proximity, clear wayfinding and high visibility of the interchange. The interchange arrangements at Charlemont provide for significantly better interchange arrangements compared to an interchange at St Stephen's Green Station. The detailed analysis done for the Railway Order further confirms that the section of MetroLink route between St Stephen's Green and Charlemont Stations contributes significantly to the overall benefits of the scheme. It serves a significant area of the south city of Dublin and offers enhanced access from the local area to the city centre and a direct connection to Dublin Airport. It serves key trip attractors including residential areas and offices / workplace locations, with high passenger boarding and alighting figures in the peak hours. During the morning peak, at Charlemont station the flows include 1,800 passengers alighting, 2,300 boarding and 1,229 passengers alighting, 2,276 boarding during the evening peak. The passenger numbers contribute significantly to the overall benefits of the scheme and the effect of these benefits outweigh the additional costs that are associated with the delivery and operation of the section from St Stephen's Green to Charlemont station. By extending MetroLink to Charlemont it provides for future proofing of the Green Line, bypassing the capacity constrained Luas on-street running section, and ensures potential future connectivity options are enabled, either to the Green Line or for extensions of the metro. The Charlemont Station interchange provides for increased passenger utilisation of the MetroLink system, thereby increasing the benefits delivered by the Project, reflected by an improved Project Benefit Cost Ration (BCR).

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) order 2022 Case Reference Number NA29N.314724				
3	Station Location	2	1. (continued) St. Stephens Green is the most appropriate location as it provides for interchange with bus, Luas and future DART underground. The project incorrectly dismisses St. Stephens Green West as an appropriate terminal station. It only considers St. Stephens Green East and Charlemont. Furthermore, no Study has been completed by NTA/TII as part of the entire Metrolink project on the optimal location for a City centre terminus. If St. Stephen's Green were to be designated as the hub, there would be the opportunity for an integrated underground commercial development which could be privately funded as part of the project.	"TII do not agree that St Stephen's Green is the most appropriate interchange location for the reasons set out by response (2) above. It is not correct to say that the Project ""only considers St. Stephens Green East and Charlemont."" A number of route options were considered in the process of identifying the Emerging Preferred Route (EPR). Route alignments from St. Stephen's Green West that would also provide an interchange with DART at Tara Street Station would require an intervention shaft between these locations and would also need an undesirable horizontal reverse curve and so are not favoured. As outlined by EIAR Chapter 3, Background to the MetroLink Project, one of the key objectives of the Project is the integration of it with the wider transport network that also includes for BusConnects and DART+ which are all included under Project Ireland 2040 and the GDA Transport Strategy 2022-2042 (section 12.3.2). Together, these projects will result in a reliable, sustainable, affordable, integrated public transport network that will support the economy, help Ireland meet its climate change targets in line with Climate Action Plan 2021 and make Dublin a more liveable and sustainable city. The submission is being argued argues that Charlemont station effectively becomes a terminus station in the short to medium term. The implication is that the activities normally associated with a terminus are incompatible with the proper planning and sustainable development of this location, in particular, travel to and from the location by car at the start and end of journeys. In this regard, it is true to say that the Metrolink trains will terminate and turn back at Charlemont station, However, Charlemont Station does not have the associated infrastructure and services associated with a terminus location and in fact has more in common with a "system turn back location". Charlemont Station is located within an area of high public transport accessibility, linking with the Luas Green Line which offers reasonably similar levels of services and frequency for journeys to and from the south of Dublin. As such, public transport service offering is not considered to terminate, but transfers onto the similar service offered by the Luas Green Line, forming part of a transport corridor running from Cherrywood to Estuary. The associated environmental impacts for the turnback and station at Charlemont have been fully assessed in the EIAR. Additionally, there is a strong level of interchange offered throughout the corridor at locations such as Glasnevin, O'Connell Street, Tara Street and St Stephen's Green, where many journeys on the MetroLink will 'terminate'. The terminus station for MetroLink is located at Estuary where all of the activities normally associated with a terminus take place. Charlemont station itself was chosen on the basis of its interchange potential with Luas, as well as local bus services, as outlined above. The section of the line between St Stephen's Green and Charlemont generates considerable benefits for the scheme in terms of increased patronage. As noted in response item (2), during the morning peak, at Charlemont station the flows include 1,800 passengers alighting, 2,300 boarding and 1,229 passengers alighting, 2,276 boarding during the evening peak. The fact that the Charlemont Station is now being referred to and considered as a "terminus station" rather than an interchange station, does not change the environmental impacts the station has on its local environment, in terms of passenger demand, airborne noise. vibration and other environmental effects. If the scheme were to terminate at St Stephen's Green, it would be inconsistent with the GDA Transport Strategy 2022-2042 to locate the terminus at Charlemont.

Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) order 2022 Case Reference Number NA29N.314724				
4	Letter - Point 2	1	2. Expensive Duplication of Rail infrastructure - The inclusion of an expensive and costly section between St. Stephens Green and Charlemont is strategically weak and duplicates the existing Luas Green Line services. NTA's cost estimate for this 1km section at€650M is an expensive duplication and significant investment that deprives other parts of Dublin that are in immediate need of rail infrastructure to support housing and urban development. If the Green Luas Line is becoming overloaded, surely that is because it is the only north/south transit system going through South Dublin; a better, and cheaper, solution would be to build 1 or 2 parallel new Luas lines to service South Dublin, which would reduce the demand on the Green Line.	The Board is not responsible for any decisions in relation to the funding the Project. It is solely responsible for assessing whether the Project is consistent with proper planning and sustainable development and that its effects on the environment are acceptable. The responsibility for funding the Project lies with the NTA, the Government and ultimately the Oireachtas. It has received all necessary approvals, including under the Public Spending Code for the making of a Railway Order. It will undergo further scrutiny and approvals, including under the Public Spending Code, before it is funded. It is not appropriate for the Board to make findings in relation to value-for-money that are outside its statutory functions and would cut across those arrangements. Members of the public are entitled to make representations to their TDs in relation to the value-for-money of any element of the Project. In any case, TII do not agree with this statement for the reasons set out by response (2) above, noting that infrastructure is not being duplicated given the capacity of the Luas south from St. Stephen's Green is restricted due to on-street running. There is a limit to the potential of the Luas to provide additional capacity in the on-street non-segregated section of the Luas Green Line from Charlemont northwards through the city centre. The nature of this route and the fact that it currently crosses several road junctions (Adelaide Road, Harcourt Street / Hatch Street upper and Harcourt Street / St Stephen's Green south) limit the service to a maximum of 24 trams per hour per direction. The projected demand for this section would require a higher frequency of up to 30 trams per hour and this demand cannot be met with on-street systems (Luas / bus). The interchange between Luas and MetroLink proposed at Charlemont will provide the necessary capacity to address the demand on this corridor and reduce overall travel time for passengers. There is also high passenger demand forecast for a Metrolink station at Charlemont, including from the Ranelagh area, which would be lost if St. Stephen's Green was the MetroLink southern interchange station. The additional fare revenues collected by the Charlemont Station interchange increase the benefits delivered by the Project, reflected by an improved Project Benefit Cost Ration (BCR). Further, to ensure that public investment delivers value for money, the Public Spending Code sets out requirements for the evaluation, planning and management of public investment. The preparation of a Business Case is a key element of meeting these requirements. The Public Spending Code requires that both the Preliminary Business Case and Final Business Case for public investment projects are published. In July 2022, the Government granted Approval in Principle to the NTA to enable the submission of a railway order application by TII to An Bord Pleanála in respect of the MetroLink project (Decision Gate 1). This approval was granted after the Preliminary Business Case (PBC) had undergone significant scrutiny and challenge by bodies that are independent of TII, including DoT and DPER review (including independent review by JASPERS and the Major Projects Advisory Group (MPAG)) of the PBC around timeline, costs and benefits that were updated to inform the Government decision." In any case, TII do not agree with this statement for the reasons set out by response (2) above, noting that infrastructure is not being duplicated given the capacity of the Luas south from St. Stephen's Green is restricted due to on-street running. There is a limit to the potential of the Luas to provide additional capacity in the on-street non-segregated section of the Luas Green Line from Charlemont northwards through the city centre. The nature of this route and the fact that it currently crosses several road junctions (Adelaide Road, Harcourt Street / Hatch Street upper and Harcourt Street / St Stephen's Green south) limit the service to a maximum of 24 trams per hour per direction. The projected demand for this section would require a higher frequency of up to 30 trams per hour and this demand cannot be met with on-street systems (Luas / bus). The interchange between Luas and MetroLink proposed at Charlemont will provide the necessary capacity to address the demand on this corridor and reduce overall travel time for passengers There is also high passenger demand forecast for a Metrolink station at Charlemont, including from the Ranelagh area, which would be lost if St. Stephen's Green was the MetroLink southern interchange station. The additional fare revenues collected by the Charlemont Station interchange increase the benefits delivered by the Project, reflected by an improved Project Benefit Cost Ration (BCR).

Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) order 2022 Case Reference Number NA29N.314724				
			Response (4) continued.	Further, to ensure that public investment delivers value for money, the Public Spending Code sets out requirements for the evaluation, planning and management of public investment. The preparation of a Business Case is a key element of meeting these requirements. The Public Spending Code requires that both the Preliminary Business Case and Final Business Case for public investment projects are published. In July 2022, the Government granted Approval in Principle to the NTA to enable the submission of a railway order application by TII to An Bord Pleanála in respect of the MetroLink project (Decision Gate 1). This approval was granted after the Preliminary Business Case (PBC) had undergone significant scrutiny and challenge by bodies that are independent of TII, including DoT and DPER review (including independent review by JASPERS and the Major Projects Advisory Group (MPAG)) of the PBC around timeline, costs and benefits that were updated to inform the Government decision. Regards the suggestion to build additional Luas lines, TII do not consider this a better solution than MetroLink as new Luas lines would still be constrained by on-street running as a result of their integration with the road network, these new lines would have to be tied in to the existing Luas Green Line stations that would need to be increased in size at St Stephen's Green and Charlemont where space is limited, noting also Charlemont is also on a viaduct, or completely new lines and stations constructed with little to no available surface space to accommodate this. Whilst noting for the reasons explained above that Charlemont provides a better interchange location with the Luas Green Line than St Stephen's Green.
5	Letter - Point 3	2	3. The station box at Charlemont, as constructed in 2021/22 by the Developer Hines, does not have the benefit of planning permission and has not been part of the EIA undertaken for this project. Processing the current Railway Order application, which is reliant on these preliminary and now constructed works, is legally unsafe and contravenes the provisions of the EIA Directive.	The MetroLink enabling works constructed as part of the Hines development was included in the planning application for the Hines Development and has the benefit of planning permission which was granted in April 2019.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) order 2022 Case Reference Number NA29N.314724				
6	Letter - Point 4	2	4. The station box at Charlemont will result in only one possible future tie in with the Luas Green Line to the south, which would result in an option that was previously dismissed as part of the Tie-In study from March 2017. No alternatives to the station box at Charlemont were considered as its location was fixed in order to accommodate the design of the Grand Parade commercial development by Hines. The implication of this new alignment is very significant on our wider community as it will involve top down construction that will only be possible when many houses on Manders Terrace, Oakley Road and Charleston Road are demolished	The station box at Charlemont allows for a future tie into the Luas Green Line should it be determined in the future that through running metro services to Sandyford is the required solution to address the public transport needs to the south of the city. It is incorrect to say that the current proposal is based on an option that was previously dismissed as part of the March 2017 Green Line tie in study. The station design is in affect a modification to the preferred Green Line Tie Option 4B which was modified as result of the postponement of the upgrade of the Green Line to metro standard. The station box location was not fixed by the Charlemont Development. The preferred route for MetroLink was published in March 2019 following a comprehensive route options study. The preferred route was based on the emerging preferred route for the scheme which included a station at Charlemont. The Charlemont Metro Enabling Works were constructed to enable the Charlemont Development to proceed whilst simultaneously ensuring there was an option available to construct a station at Charlemont that avoided unnecessary demolition, took advantage of an available site, provided infrastructure that is integrated with planned development rather than necessitating later changes and retrospective adjustments to a new development or even possible demolition of the new development, whilst providing protected provision for the future extension of the scheme south, if required. It is also important to recognise that the station location at Charlemont is influenced by available vacant land and thus avoids unnecessary demolition. The submission seeks to portray the construction of the Metro Enabling Works as prejudicial to future decisions on proper planning and sustainable development of the area. It implies that the counterfactual would have had no effect on such decisions. That is not the case. There was a planning conflict between the EPR and the Grand Parade Development at the time the latter development was proposed. There was no resolution to that conflict that was free of implications for future decisions on the proper planning and sustainable development of the area. The Board could have refused permission for the Grand Parade Development, inevitably creating an underutilised and potentially vacant and idle site in a commercial hub location. The Board could have granted permission with no provision to facilitate a station at this location, resulting in a requirement for the railway order to provide for the demolition of a new office building. The Board's actual decision was reasonable and lawful in seeking to minimise the prejudice to an important office development and a critical piece of national infrastructure. It was also not particularly restrictive of future decisions in relation to the proper planning and sustainable development of the area. Of the three options open at the date of the Grand Parade planning application, two remain open: the Board can still require changes to the station design that require the demolition of the commercial building and it can grant an order that avoids demolition by using the Metro Enabling Works. It is agreed that the short-term implications for local residents will be significant as the scheme progresses through the construction stage, however the EIAR assesses the environmental impacts of the construction phase and commits to the implementation of appropriate mitigation measures that reduce the environmental impacts to not significant. The same is true of the operations phase for the project. TII will work closely with local residents to ensure the required mitigation measures are put in place. If in the future, the metro was extended south, this does not mean that inevitably open cut construction will be required or demolition of property will be necessary. In designing an extension, the promoter will seek to reduce the requirement for demolition by looking for tunnel launch sites at the southern extent of the scheme and, if one can be identified, driving the Tunnel Boring Machine northwards ultimately connecting into the existing tunnel. In that case, even if the new alignment were under the properties identified in the submission, the tunnel underneath them would be constructed by the Tunnel Boring Machine without the need for above ground works.

Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) order 2022 Case Reference Number NA29N.314724				
7	Letter - Point 5	2	5. The Environmental Impact Assessment is inadequate in relation to the description of development, alternatives, transport assessment, noise and the cumulative effects of the development on the Charlemont-Dartmouth Community. For a project of this size, scale, investment to date, it is inadequate to propose a Railway Order with so many important studies and analyses missing. Full details of this inadequacy are set out in the observations submitted by the Charlemont-Dartmouth Community Group, of which we are members.	TII do not agree that the Environmental Impact Assessment is deficient, inadequate or missing information. The Railway Order application comprises a very detailed environmental impact assessment that has identified and assessed the potential environmental impacts of MetroLink and proposed mitigations for these impacts where necessary. TII would also draw attention to the detailed project description, construction phase description and operational phase description provided in EIAR Chapters 4 and 5 and 6, and EIAR Chapter 7 and associated appendices that present details of alternatives considered. EIAR Chapter 9 and appendices provides a detailed analysis of transport and traffic effects, and EIAR Chapters 13 Airborne Noise & Vibration, and 14 Groundborne Noise & Vibration provide a detailed assessment of potential noise and vibration effects, while Chapter 29 outlines the assessment of interactions between various environmental aspects, and Chapter 30 covers the cumulative impacts with other projects. This assessment is carried out for the full length of the alignment including relative to potential significant effects on the Charlemont-Dartmouth Community. TII can also confirm they have reviewed and responded to all submissions received in response to the submitted Railway Order application.

Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) order 2022 Case Reference Number NA29N.314724				
8	Letter - Point 6	2	6. The development would result in noise and disturbance during the construction and operational phases which will result in a loss of amenities for the area.	The EIAR presents a comprehensive and detailed assessment of both groundborne and airborne noise and vibration in Chapter 13 and 14 of the EIAR. The assessments include for predictive modelling in order to identify the potential impacts on all sensitive receptors during both the construction phase and the operational phase. Noise and disturbance during construction: No profound impacts have been identified for residents and mitigation measures proposed will be effective at reducing the impacts on these properties and in general terms impacts will be associated with the construction phase only. Significant mitigation is proposed to include 4m high noise barriers and further proposed mitigation in line with the Airborne and Groundborne Noise Mitigation Policy. On the implementation of these measures the residual impacts are predicted to be moderate. However, as outlined in Transport Infrastructure Ireland (TII) Airborne and Groundborne Noise Mitigation Policy (Appendix A14.6) there is a process in place whereby further mitigation measures can be implemented at individual properties should this be merited. Noise and disturbance during operation: No residual noise impacts are identified at this location during operation. The calculated rail noise levels across the proposed Project are not significant in terms of any widespread community disturbance and results in a not significant to slight impact when added to the prevailing noise environment. Loss of amenity during construction: EIAR Chapter 11, Population & Land Use provides an assessment of effects on community amenity during construction and operation, which relates to the interaction of impacts on air quality; visual amenity; traffic and transport; and noise and vibration. At this location during construction as outlined in Section 11.5.2 of Chapter 11, no impacts are identified on the retail sector or community and social infrastructure (e.g. schools or hospitals). Any severance/disruption to transport will be limited by site mitigation measures such as alternative routes reducing impacts to not significant. Loss of amenity during operation: No significant residual negative impacts are anticipated on the Population and Land Use from the operation of the proposed Project, following the incorporation of the mitigation measures into the design of the proposed Project and implementation on an ongoing basis throughout the lifecycle. The residual effects that will arise during operation will be permanent and positive as detailed in EIAR Chapter 11, section 11.1.1. The zoning under the Dublin City Development Plan 2022 - 2027 for the residential properties in question is "Z2 Residential Neighbourhoods (Conservation Areas)" with an objective to "protect them from unsuitable new developments or works that would have a negative impact on the amenity or architectural quality of the area (See Table 3.11 of the submitted Planning Report). As outlined in Section 4.5.18.6 of the Planning Report, the element of the Project within the Z2 zoning area will affect a below ground area only and as such will not compromise the land use objective for the lands overhead. The majority of the proposed Charlemont Station and all above ground elements are located within the lands zoned Z5 with the objective "To provide for the creation and protection of enterprise and facilitate opportunities for employment creation". The Station has been designed so that it is integrated with the proposed redevelopment of this site by a third party development, and as such, demonstrates that the proposed Project is consistent with the zoning objective. The MetroLink station design does not result in any segregation of the area, with no surface barriers or walls proposed. See below in relation to the submission that the Traffic Study for Charlemont is inadequate because it omitted the impact of airport users from south Dublin travelling to this location.

Submission No.			166

Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) order 2022 Case Reference Number NA29N.314724					
9	Letter - Point 6	2	point 6 (continued) The Traffic Study for the local Charlemont area is wholly inadequate as it omitted the modelling of the impact of Airport users coming to the only Dublin South Metrolink station at Charlemont. The Traffic Study uses a strategic, generalised regional model that does not take local factors into account. extract from point 9) - The EIA did not properly assess the impact of additional local traffic volumes, rather they used a generalised regional model that does not take local factors into account. A key local factor at a Terminus station in Charlemont that runs to the Airport is the huge volume of anticipated airport users from Dublin South and greater Dublin/Leinster that will come to Charlemont via car or taxi with baggage for onward travel to the airport. Grand Parade and the residential area around Charlemont-Dartmouth cannot sustain the significant additional traffic volumes associated with this development	The MetroLink forms part of an integrated public transport network. The system is designed in an integrated manner so that people travelling from the area south of Dublin to access locations north of Charlemont, such as Dublin Airport, Mater, Swords etc. will utilise public transport to interchange with the MetroLink, or will walk or cycle to access their local station. The system is not designed to encourage people to drive to stations within the City and TII actively discourage people from doing so other than the Park & Ride station at Estuary. TII therefore do not agree with the observation that there will be a “huge volume of anticipated airport users from Dublin South and greater Dublin/Leinster that will come to Charlemont via car or taxi with luggage for onward destination to the airport” as this is not borne out by our transport analysis. The Transport Assessment for MetroLink includes for people travelling to/from Dublin Airport from all areas within the extents of the GDA area, therefore it is incorrect to say “The Traffic Study for the local Charlemont area is wholly inadequate as it omitted the modelling of the impact of Airport users coming to the only Dublin South Metrolink station at Charlemont”. The NTA's Eastern regional Model (ERM) incorporates a wide range of data sources, including demographic data, land use data, transportation network data, and travel survey data. The system is designed to model a variety of transportation modes, including private vehicles, public transit, walking, and cycling, and to simulate the interactions between these modes. The ERM model has been validated and calibrated using a range of localised data sources to ensure that the model can accurately represent the transport network, these include public transport and vehicle counts from the canal cordon counts. The outputs from the model have been combined with local survey data to undertake the more localised modelling, such as the pedestrian impact assessments, or the local traffic signals. This does not support the observations made “The Traffic Study uses a strategic, generalised regional model that does not take local factors into account.” or “The EIA did not properly assess the impact of additional local traffic volumes, rather they used a generalised regional model that does not take local factors into account.” Regards the observation there will be a "huge volume of anticipated airport users from Dublin South and greater Dublin/Leinster that will come to Charlemont via car or taxi with luggage for onward destination to the airport. Grand Parade and the residential area around Charlemont-Dartmouth cannot sustain the significant additional traffic volumes associated with this development", this is covered by response (12) below.

Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) order 2022 Case Reference Number NA29N.314724				
10			7. The noise and disturbance for our dwelling, that we will experience during construction, will be far in excess of that indicated in the Applicant's EIA. The level of noise, vibration and disturbance, combined with its duration, will render this house uninhabitable.	TII do not agree that noise and disturbance will be far in excess of that set out by the MetroLink EIAR, summarised below, or that your house will be rendered uninhabitable, noting that no profound effects from noise and vibration are predicted. Construction Airborne Noise and Vibration Potential impacts identified due to airborne noise and vibration are presented in EIAR Chapter 13. Noise mitigation proposed for works at Charlemont Station are summarised in Section 13.6.1 of the EIAR and include for boundary hoarding around the working area, including a 4m high hoarding at the southern, northern and western boundaries, increasing to 7m high on the eastern boundary. In addition, the above ground support works for below ground sprayed concrete tunnelling works will be enclosed within an acoustically clad steel framed building to control noise breakout to surrounding receptors. With consideration of the proposed noise mitigation measures, residual impacts during the construction of Charlemont Station have been set out in Table 13.90, where it is indicated that noise impacts at receptors at 11 Dartmouth Square West will be reduced to a Moderate magnitude. The Contractor will be required to set out site specific measures to manage and mitigate airborne noise in their Construction Environmental Management Plan (CEMP), an outline of which is included in EIAR Appendix A5.1. Should an Enforceable Railway Order be granted, prior to the commencement of any construction works, a detailed noise assessment for each work site will be undertaken based on the most up to date information for each site. There is no published statutory Irish guidance relating to the maximum permissible noise level that may be generated during the Construction Phase of a project. Local authorities normally control construction activities by imposing limits on the hours of operation and consider noise limits at their discretion. Additionally, the contractor undertaking the construction of the works will be required to take specific noise abatement measures to the extent required to comply with the recommendations of BS 5228-1 (BSI 2014a). EIAR Appendix A14.5, Groundborne Noise and Vibration and Blasting Modelling Results, 14.4 Section AZ4 Northwood to Charlemont presents the predicted vibration levels during TBM passage for various sensitive receptors and outlines the predicted VDV (Vibration Dose Value is a parameter that combines the magnitude of vibration and the time for which it occurs) for TBM Passage during the day and night. At 11 Dartmouth Square West these are predicted to be 0.233ms-1.75 (VDV day) and 0.196ms-1.75 (VDV night) respectively. Both of these values are lower than the VDV Threshold Levels of 1.0ms-1.75 (VDV day) and 0.5ms-1.75 (VDV night). Levels of vibration during mechanical excavation of Charlemont Station are predicted to be 0.003ms-1.75 and 0.003ms-1.75 for day and night-time respectively, which is lower than the VDV Threshold Levels of 0.8 ms-1.75 daytime and 0.4 ms-1.75 night-time, resulting in a not significant impact on the building and its occupants. The threshold levels have been set in relation to human response to vibration, and thresholds for building damage are much higher. As the predicted levels of vibration from TBM passage and mechanical excavation are below these thresholds, no impact is predicted for either the building or for residents of this address. The predicted level of groundborne noise during TBM passage is 47 dB LASmax at 11 Dartmouth Square West, which is above the 45 dB LASmax threshold, resulting in a significant impact on the occupants of this address for the relatively short 2-week duration of the TBM passage. Unfortunately there are no effective methods available to reduce groundborne noise from TBMs at source and therefore the principal mitigation measure is advance consultation and engagement to inform residents of the timing of the TBM passing to allow building occupants to prepare for the temporary elevated noise levels. Predictions of vibration during blasting at Charlemont Station have also been made. For 11 Dartmouth Square West with a predicted exceedance vibration level of 8.4mm/s PPV (Peak Particle Velocity) compared to the threshold level for this building of 8mm/s resulting in a potential significant impact. As a result, mitigation measures will be implemented to reduce the risk to buildings as outlined in EIAR Chapter 14, Section 14.5.1.2, including measures to reduce the impact of blasting through the preparation of specific blast design at each location, minimisation of the maximum instantaneous charge weight or alternatives to blasting. With the implementation of appropriate mitigation to reduce vibration from blasting the residual impact is predicted to be reduced to not-significant. The predicted level of groundborne noise during the mechanical excavation of Charlemont Station is 40 dB LASmax, which meets the 40 dB LASmax threshold level. As outlined in Transport Infrastructure Ireland (TII) Airborne and Groundborne Noise Mitigation Policy (Appendix A14.6) there is a process in place whereby further mitigation measures can be implemented at individual properties should this be merited, such as noise insulation or temporary rehousing.

Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) order 2022 Case Reference Number NA29N.314724					
11		3	8. Locating part of the proposed Charlemont station box within the curtilage of our property, so close to the Victorian masonry walls of our Victorian-era Protected Structure, should not be regarded as being in accordance with the proper planning and development of what the Planning Authority has deemed to be an Architectural Conservation Area. Because of the breach of planning procedures noted in #3 above, it will not be possible to modify this location by conditioning an approval; the only way to resolve it would be to reject the proposed location of the Charlemont terminus.	The proposed station is not located within the curtilage of said property although some substratum acquisition is proposed below your garden. The impact of construction of the station in proximity to your property has been assessed and takes into account the protected status of your building. The approach taken by TII for assessing the impact of construction generated ground movements reflects the industry standard three-phased ground movement impact assessment process that is undertaken on tunnelling and underground projects around the world, that includes Channel Tunnel Rail Link (CTRL), Dublin Port Tunnel, Crossrail and High Speed 2. EIAR Appendix A 5.17 Building Damage Report, covers the assessed impacts of construction generated ground movements and settlement and includes for the assessed impact on 11 Dartmouth Square West. EIAR Appendix 5.17 refers. The Phase 2 assessment of the ground movement impact to this building is "slight" (an explanation for which can be found in Table 4-4), please refer to building B-150 in table 5-2 of the appendix. As your property is a designated Protected Structure, it has been designated as "special", and hence a further Stage 3 refined assessment, despite the impact only being assessed as 'slight' will be undertaken that will take account of final design and construction methodology details most likely utilising advanced numerical modelling techniques and further surveys of the building. The results of this refined assessment typically show that earlier assessments are conservative and overestimate the likely impact of construction generated ground movements. Monitoring instrumentation will also be installed in the area to monitor the performance of the works and potential environmental impacts, including those discussed above to ensure that acceptable limits are not breached. TII would also draw attention to the fact that private properties within 50m of the station excavation, or 30m of the tunnel are eligible to subscribe to the Property Owners Protection Scheme (POPs) which includes for pre and post-construction condition surveys and repair of damage, but noting that irrespective of subscription to the POPs, in the event of any damage occurring that is attributable to MetroLink works, this will be repaired at no cost to the property owner up to a value of €45,000. Further details on POPs can be found in Chapter 11 (Population and Land Use) section 11.6.1. Please refer to response (6) above that explains why TII consider there has been no breach of planning procedures.

Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) order 2022 Case Reference Number NA29N.314724				
12	Construction/Operational Phase	3	9. The development would have an adverse impact upon traffic during the construction and operational phase; access has not been properly designed and there is poor integration with other modes of transport. Pedestrian movements in and around the station would be difficult. Grand Parade is an already heavily congested orbital route.	Metrolink is designed to form part of an integrated public transport network with Charlemont selected as the preferred interchange location in order to maximise the potential interchange with the existing Luas Green Line. In overall terms, Charlemont Station will provide for improvements to the public transport network resulting in decreases in private car usage/trips, increases in public transport usages and will facilitate walking and cycling to the station, without significantly impacting on the operation of the road network in the area. Construction Phase: EIAR Appendix A9.5 Scheme Traffic Management Plan presents the analysis undertaken to assess the impact of the traffic management measures on the local road network surrounding the proposed Charlemont Station during the construction phase. At the local level the following parameters have been used to assess impacts on general traffic and on pedestrians: • Increase in walking distance/quality of service for pedestrians (through removal of footpath, reduction of quality of service, removal of a pedestrian crossing or relocation of crossing by more than 100m); • Increase in driver delays at junctions; • Changes in traffic flows on surrounding streets; and, • Additional distance travelled due to diversions. The analysis undertaken at this location indicates that the increased volume of traffic on Grand Parade and Northbrook Road does not translate into any significant increase in driver delay. The largest increase in driver delay of 12 seconds is registered on the westbound approach on Grand Parade to the Ranelagh Road signalised junction. During the construction phase, pedestrians will experience a reduction in quality of pedestrian infrastructure and space. The construction site boundary will encroach upon footways in the local area, including the northern side of Dartmouth Road, and the southern side of Grand Parade. However, a temporary signalised crossing will be provided west of the Luas to maintain pedestrian access to and from the Stop. Whilst there are partial closures on Dartmouth Road and Grand Parade, pedestrian movements will be maintained on appropriately sized footways through the area. With particular regard to cycle safety, as part of the traffic assessment presented in EIAR Appendix A9.5 Scheme Traffic Management Plan, the impact on cycle safety has been considered. A two-stage screening assessment methodology has been adopted, ensuring that any reduction in quality of service for cyclists (by one level or more) has been captured, with remedial measures including the temporary installation of cycle ways where appropriate, to minimise the impact on cyclists. Where the existing level of service cannot be maintained in the vicinity of the construction sites, alternative routes will be designated to minimise the risk to vulnerable users. As such, the traffic management measures have been designed in line with the hierarchy of road users identified in the GDA Transport Strategy, giving highest preference to pedestrians and cyclists. Prior to implementation, all traffic management measures will be agreed with DCC, and where relevant, consultation with An Garda Síochána and other statutory stakeholders will be undertaken to ensure the safety of users.

Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) order 2022 Case Reference Number NA29N.314724					
			Response (12) continued.	Operational Phase: A microsimulation VisWalk model has been developed for the immediate area surrounding Charlemont Station during the operational phase. The model covers the full extent of the publicly accessible station area, including the immediate vicinity of the station entrance at street level, the Luas stop and nearby junctions at Charlemont Bridge. In order to accommodate the forecast demand from the proposed Charlemont Station, a new staircase with 2.4m stair width is proposed at the south east corner of Charlemont Luas stop. An elevator will also be provided at this location. Both are sized for MetroLink to Luas, and Luas to MetroLink passenger numbers. In addition, it is proposed that the pedestrian crossing on R111 Grand Parade will be repositioned to the front of the building being developed by Hines. With this infrastructure in place, the model indicates that the R111 Grand Parade will have an acceptable level of service overall, with some reductions in service seen at the pedestrian crossing where pedestrians are required to wait for a green phase at the signals. Overall, it is considered that the model displays an acceptable level of network performance. The proposed pedestrian crossing on Grand Parade will have minimal impact on the traffic flow along Grand Parade and can be programmed to operate in sync with the existing signalised junction at Grand Parade /Charlemont Street to maintain the flow of traffic movements. When the Project is operational, car mode share will decrease, with a reduction of up to approximately 830 car tips to and from the zones surrounding Charlemont Station over the 12hr period in 2065. In overall terms, the Charlemont Station will provide for improvements to the public transport network resulting in decreases in private car usage/trips, increases in public transport usages and will facilitate walking and cycling to the station, without significantly impacting on the operation of the road network in the area. Furthermore, TII have deliberately designed the Station with minimum set down space (with the exception of a drop-off on Grand Parade for persons of restricted mobility only) or room for taxi ranks so that it does not encourage the Station to be used for a significant volume of car or taxi trips.

Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) order 2022 Case Reference Number NA29N.314724				
13	Adverse impact on Property Values	3	10. The development will have an adverse impact upon property values, particularly during the construction phase. For many houses in the area, and for our house in particular, there will be a long term and permanent adverse Impact upon property values from noise of the operating rail Infrastructure, vents, tannoy systems, escalators and large traffic volumes - vehicular and pedestrian - using the station 19 hours per day. The adverse Impact also extends to the loss of amenity for the wider community by changing a quiet, residential neighbourhood into a noisy, busy, congested major transport hub.	TII do not agree that the development will have a long term and permanent negative affect. In fact there is strong evidence to suggest that property values will in fact increase in close proximity to public transport infrastructure and that local residents will greatly benefit from having a world class metro system providing access to the city centre, airport and north city at their door step. No significant impacts during the operational phase are predicted, including with regards to noise or amenity, as summarised below. While response (12) summarises the assessed traffic and pedestrian impacts, noting that MetroLink forms part of an integrated public transport network. The system is designed in an integrated manner so that people travelling from the area south of Dublin to access locations north of Charlemont, such as Dublin Airport, Mater, Swords etc. will utilise public transport to interchange with the MetroLink, or will walk or cycle to access their local station. The system is not designed to encourage people to drive to stations within the City and TII actively discourage people from doing so other than the Park & Ride station at Estuary. In overall terms Charlemont Station will provide for improvements to the public transport network resulting in decreases in private car usage/trips. Operational Noise and Vibration With regards to the noise of operating rail infrastructure, EIAR Chapters 13 and 14 present a comprehensive and detailed assessment of operational airborne and groundborne noise and vibration. No residual noise impacts are identified at this location during operation. The calculated rail noise levels across the proposed Project are not significant in terms of any widespread community disturbance and result in a not significant to slight impact when added to the prevailing noise environment. EIAR Chapter 13, sections 13.2.3.2 and 13.5.3.2.3 recognise that ventilation systems if not designed and mitigated effectively are potential noise sources. Section 13.6.2.3 outlines the detailed considerations that will be included in the design to ensure that the ventilation systems do not exceed limits as per BS 4142, including: • Reduction of induct flow rates; • Reduction of elements in the airflow; • In duct attenuators; • Orientation of grilles and louvres away from sensitive receptors; • Acoustic louvres; and • Anti-vibration mountings and couplings will be incorporated into the design to control vibration. Measures to mitigate noise from the use of public address systems is also detailed in Chapter 13 (sections 13.5.3.2.4 and 13.6.2.4). Best practice design principles will be employed to minimise noise breakout at the surface from these systems via escalators, lift shafts and stairwells. Mechanical elements associated with escalators are housed below ground and are fully enclosed. The operation of escalators does not generate any notable noise sources during operation and will not be audible above the prevailing noise environment. With regards to stations entrances, these are transient areas for passengers entering and exiting the station. These activities are not the source of significant noise generation and form part of the existing soundscape in the existing prevailing environment. It is acknowledged footfall numbers will increase in the vicinity of the station entrance, however this activity does not translate to significant noise impacts. Finally, noise levels arising from the station during the operational phase will be required to adhere to limits to ensure that there are no significant effects. To provide further assurance, it will also be a requirement placed upon the MetroLink operator to act responsibly and considerately, and be a 'good neighbour' when operating the station. Loss of amenity during operation - Please refer to response (8) above.

Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) order 2022 Case Reference Number NA29N.314724				
14	Requested Amendments	4	We request the following amendments: 1. Omit from the Railway Order the Section from Tara Street Station to Charlemont Station and associated onward tunnel extension and intervention tunnel; 2. Require the submission of a railway order for a section from Tara Street Station to St. Stephens Green which would effectively provide for a terminal hub station that can Integrate with the Luas Green Line, multiple bus routes, future DART underground and possible future Luas line out the Nil. 3. In addition to the above, we wish to advise that the Application is in breach of agreed terms between TII and us. TII agreed a position prior to any planning application and in those circumstances, it is submitted that TII ought to amend the Application to comply with the terms of what was previously agreed.	The above responses to the observations made explain why TII do not consider it is correct or appropriate that the MetroLink alignment south of the proposed Tara Station should be omitted, and also demonstrates why the proposed Charlemont Station has been selected by TII as the preferred interchange with the Luas Green Line A scheme which terminates at Tara Street would not be consistent with the Transport Strategy for Greater Dublin Area (2022-2042). In addition any decision to terminate the scheme at Tara will significantly impact on the overall viability and benefits of scheme. TII note that there was an error in the temporary land take drawings submitted as part of the application. TII have written to the parties to confirm that it will be rectified and will provide the correct drawing at oral hearing.

Re: Railway (Metro Link Estuary to Charlemont via Dublin Airport) Order 2022Mr Leonard Kinsella 1 Harcourt Terrace Dublin 2 Ref: ML6EU16				
1	Introduction	1	With regards to the above matter I can confirm that I have been instructed to act on behalf of the above named party in relation to the above compulsory acquisition order as it effects their property. We would like to correct the record in that the letter was addressed to the previous owner of the property. The property is now owned by Lette Accommodation Ltd. The schedule should be amended to reflect this and all correspondence should be addressed to Mr. Justin Kinsella at 1 Harcourt Terrace. My client's property is part of a set piece regency terrace which was developed in the 1830's and is unique in that it is still largely intact and is therefore of significant architectural and historical significance. The property is also a protected structure under the current Dublin city Development plan.	Thank you for sharing this information. TII confirm that the schedule will be amended and all correspondence will be addressed to the new property owner. TII acknowledge the architectural and historical significance of the property, and recognise that the property is also designated as a protected structure. Hence, the property has been included in the impact assessment and presented in EIAR Chapter 26 (Architectural Heritage), Table 26.25: "BH-564 - 1 Harcourt Terrace - Three-storey over basement, three-bay detached house with central breakfront and rendered façade; RPS 3561 DCC; NIAH 50110463".
2	Draft of Proposed RO (paragraph 1)	1	My client was issued a letter dated the 20th of September 2022, which included several extracts from plans and a copy of the public advertisement placed in the Irish Independent on the 17th of September 2022, which proports to indicate they have applied for the relevant railway order. However, in their letter they refer to relevant extracts from the "draft of the proposed Railway Order". Indeed the booklet provided is called the Draft Railway order.	TII confirm that a letter (Ref. CAP_ML_0946_38) was issued on 20th of September 2022 to Mr. Leonard Kinsella at 1 Harcourt Terrace with reference to 'Intended application by the National Roads Authority (operating as Transport Infrastructure Ireland) for the Railway (MetroLink–Estuary to Charlemont via Dublin Airport) Order [2022]'. Please note that the reference to a "draft Railway Order" is correct and that it reflects the fact that it is a description of what is proposed by TII for approval. The "draft" railway Order will become a "Railway Order" only if and when An Bord Pleanála approve it and update to include any specific additional requirements that the Board identify as being required.
3	Draft of Proposed RO (paragraph 2)	2	In my view there should be no draft involved at this juncture either TII wish to apply for a railway order or they don't. If they wish to apply for a Railway Order to the Bord then both the Bord and Land owner should know exactly what is in the order and there should be no equivocation, which appears to be the case here were the documents are only draft. It begs the question of when will the final Order be submitted and will it be any different from the Draft Order. It is difficult to see how a land owner can make submissions or how the Bord can make decisions based on a draft.	Please refer to response item (2) above in relation to the term 'Draft'.

Re: Railway (Metro Link Estuary to Charlemont via Dublin Airport) Order 2022Mr Leonard Kinsella 1 Harcourt Terrace Dublin 2 Ref: ML6EU16				
4	COMPUSORY PURCHASE AND SUPPORTING INFORMATION	2	In respect of the draft Order I would point out that reference is consistently made to the schedules which are not attached. In particular in part three makes reference to several schedules which are meant to indicate the lands being acquired. Again without these schedules and plans it is not possible for us to properly identify the lands being acquired and the possible effects on our property. I would also draw the Bords attention to section 7.59 of the Non - Technical summary which states that there is are "limits of deviation during the construction phase. There is no such provision allowed in law. In fact schedule three of the 1966 Housing act states "the compulsory purchase order shall be in a prescribed form and shall describe by reference to a map the land to which it relates and shall incorporate, subject to the modifications here and after mentioned any necessary adaptations" Clearly the documentation provide to date does not meet this legal requirement.	Individual property notices were issued. Notification letter CAP_ML_0946_38 issued on 20th of September 2022 at 1 Harcourt Terrace includes relevant extracts from the Book of Reference to the plan, indicating the identity of the owners and of the occupiers of the lands described in the Plan. The unique land take referencing and numbering for 1 Harcourt Terrace is "ML6E-U16". The book of reference - third schedule (substratum land which may be acquired) for 1 Harcourt Terrace (ML6E-U16) is attached to the above mentioned notification letter. Relevant extracts of plans (including maps or drawings) which indicate the extent of the lands or land rights affected were also enclosed to the notification letter and include: • Individualised Property Details (Plan drawing no. ML1-JAI-BOR-ROUT_XX-DR-Y-03762, ML6E-U16), which is the drawing marking out your property (only), which is extracted from the below property plan. • Property Details Hatch Street Lower to Grande Parade (Plan drawing no. ML1-JAI-BOR-ROUT_XX-DR-Y-01097, ML-P 306 E-O), which shows the extent and types of land acquisition that TII proposes to acquire to facilitate the construction, operation, and maintenance of the MetroLink project along the section of the route close to your property. • Alignment Long Section 18 (Plan drawing no. ML-LN O-O18), which shows the indicative depth of the tunnel along the section of the route close to your property. • General Arrangement Hatch Street Lower to Grande Parade (Plan drawing no. ML-RO 306 E-O), which shows the general arrangement of the tunnel along the section of the route close to your property. The design includes for a limit of deviation which is required to allow for unforeseen obstructions and construction tolerances which may necessitate a change to the alignment. In the highly unlikely event that this were to occur, any resulting environmental impacts will comply with the limits set by the enforceable Railway Order. TII has carried out a comprehensive set of ground investigations in accordance with relevant guidelines and best practice. It has a high confidence that MetroLink can be constructed along the proposed alignment without requiring vertical or horizontal adjustment. However, in order to guard against rare and undetectable subterranean conditions that might interfere with construction, the Railway Order provides for limits of deviation (as have other railway authorisation since at least the 1840s). The impacts of potential changes within the Limits of Deviation are considered in the Wider Effects Report (Appendix A5.19).

Re: Railway (Metro Link Estuary to Charlemont via Dublin Airport) Order 2022Mr Leonard Kinsella 1 Harcourt Terrace Dublin 2 Ref: ML6EU16				
5	SUBSTRATUM DEFINITION (paragraph 1)	2	The documentation supplied to date makes reference to acquiring substratum. There is no definition supplied as to what this is. Is it measured from the top or the bottom of the Tunnel? When they say the surface what do they mean, is it the floor of a basement and what consideration has been given to any structures with piled foundations or underground car parking? One can only presume that TII will attempt to rely on rule 17 as introduced by section 48 of the Planning and development (strategic infrastructure Act 2006 which states "the value of any land 10 meters or more below the surface of that land shall be taken to be nil, unless it is shown to be of a greater value by the claimant". All the other rules for the assessment of compensation are based on the open market Value of the lands, which can be determined by an Arbitrator in default of agreement. It is simply not credible that legislation can be introduced where the state has in essence predetermined a nil value to part of someone's property. Indeed even in the case of a half road bed which is controlled by a local authority this is not the case. We would ask that the Bord should seek legal clarity from the Courts as to whether this legislation is legal in the first instance.	Substratum' refers to an underlying layer or substance, in particular a layer of rock or soil beneath the surface of the ground. The substratum land take has been generated by creating a limit of deviation (LOD) ranging from 5 metres vertically upwards and 10 metres downwards to 15 metres laterally for the tunnel alignment. Substratum land take is shown on the Property Drawings submitted with the RO application (please refer to the 1 Harcourt Terrace property details plan mentioned at Item 4 above) and on Figure 21.1. of the EIAR Chapter 21 (Land Take). Rule 17 introduced by Section 48 of the Planning and Development (Strategic Infrastructure) Act 2006, states: 'The value of any land lying 10 metres or more below the surface of that land shall be taken to be nil, unless it is shown to be of a greater value by the claimant'. For MetroLink project, the depth of tunnel will vary along the route but it is expected that the average depth will be approximately 24m from ground level to track level. In the vast majority of cases the subsoil can be acquired without affecting the above ground property. For 1 Harcourt Terrace property the following data are shown on the individualised property details plan (please refer to Plan drawing no. ML1-JAI-BOR-ROUT_XX-DR-Y-03762, ML6E-U16 listed at Item 4 above): • Ground level to crown of tunnel (m) - 17.3; • Ground level to track (m) - 24. EIAR Chapter 21 (Land Take), Section 21.6.1.2, outlines the Compensation for Compulsory Purchase process. Under the Transport (Railway Infrastructure) Act 2001 (as amended) (the ‘Act’) upon commencement of the Railway Order (RO), TII will be authorised to acquire compulsorily any land or rights in, under or over land or any substratum of land specified in the RO, and, for that purpose, the RO shall have effect as if it were a compulsory purchase order (as referred to in Section 10(1) of the Local Government (No.2) Act 1960 (as inserted by Section 86 of the Housing Act, 1966) which has been duly made and confirmed) with modifications. Accordingly, TII is authorised to serve a notice to treat pursuant to the provisions of the Housing Act, 1966, including Section 79 thereof. TII also has the right to enter onto other lands for the purposes of carrying out the works permitted under the RO in certain circumstances. The acquisition of the various specified rights and interests in land and property, is necessary in order to ensure the delivery of the MetroLink project in its entirety. Further information can be obtained from the MetroLink Compulsory Purchase Order Guideline document (September 2022) which can be found on-line at: https://www.metrolink.ie/media/0jlpbyso/metrolink_cpoguideline_final_september-2022.pdf
6	SUBSTRATUM DEFINITION (paragraph 2)	2	The lack of detailed design drawings means that we have no indication of where the top of the Tunnel will be in relation to the underside of our basement floor level of our property or any foundations. This will have serious implications for the property in terms of risk from Vibration during the works and also when the Rail is operational, and also in relation the possible interpretation of rule 17, as referred to previously.	Relevant preliminary drawings (alignment longitudinal section, general arrangement, property details) have been issued to 1 Harcourt Terrace property - please refer to Item no. 4 and 5 above. Details have been provided. With regards to your concerns related to potential vibration impacts, EIAR Appendix A14.5, Groundborne Noise and Vibration and Blasting Modelling Results, 14.4 Section AZ4 Northwood to Charlemont, presents the predicted day and night VDV levels (Vibration Dose Value is a parameter that combines the magnitude of vibration and the time for which it occurs) for TBM passage during construction phase and for railway operation, with the results for 1 Harcourt Terrace summarised below: • The predicted day and night levels of groundborne vibration during TBM Passage are 0.254ms-1.75 (VDV day) and 0.213ms-1.75 (VDV night). Both of these values are lower than the VDV Threshold Levels of 1ms-1.75 (VDV day) and 0.5ms-1.75 (VDV night) presented in EIAR Chapter 14.2.1.2.3 Vibration from Construction Sources other than Blasting, meaning that no significant impact is expected on the property as a result of vibrations during TBM passage. • The predicted day and night levels of groundborne vibration during railway operation are 0.007ms-1.75 (VDV day) and 0.004ms-1.75 (VDV night). Both of these values are much lower than the VDV Threshold Levels of 0.8ms-1.75 (VDV day) and 0.4ms-1.75 (VDV night) presented in EIAR Chapter 14.2.1.2.4 Vibration from Operation, meaning that no significant impact is expected on the property as a result of vibrations during railway operation.

Organisation Name or Name of Submitter			Leonard Kinsella	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Railway (Metro Link Estuary to Charlemont via Dublin Airport) Order 2022Mr Leonard Kinsella 1 Harcourt Terrace Dublin 2 Ref: ML6EU16				
7	APPROPRIATE ASSESSMENT (paragraph 1)	3	We also note that the Historic nature of Harcourt Terrace doesn't feature anywhere in the non -Technical summary not even in section 10.17 of the non -Technical summary which purports to deal with Archaeology and Cultural Heritage. One can only conclude that it has not been considered in TII's deliberations in relation to possible effects on a architecturally significant part of Dublin.	The Non-Technical Summary document summarises in non-technical language the Environmental Impact Assessment Report (EIAR), including the likely significant effects identified, the mitigation and monitoring measures proposed, as well as any residual effects arising from MetroLink that have been identified during the Construction and Operational Phases to inform the planning consent process. This document does not present the detailed assessments undertaken. The specific chapters of the EIAR present details on the impact assessment of the MetroLink Project on the receiving environment during the Construction Phase and Operational Phase. EIAR Chapter 26 (Architectural Heritage) describes and assesses the likely direct and indirect significant effects of the proposed Project on Architectural Heritage. The protected structure status of the building is known (see Table 26.25: Architectural Heritage Constraints from St Stephen's Green Station to Charlemont Station) hence your property has been subject to impact assessment and the results are presented in the Section 26.5.4.15 St Stephen's Green Station to Charlemont Station. According to the findings of impact assessment, no direct impacts on architectural heritage are predicted during Construction Phase in this section of the study area. Also, no direct or indirect impacts on architectural heritage are predicted during Operational Phase.

Submission No.			167

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Railway (Metro Link Estuary to Charlemont via Dublin Airport) Order 2022Mr Leonard Kinsella 1 Harcourt Terrace Dublin 2 Ref: ML6EU16				
8	APPROPRIATE ASSESSMENT (paragraph 2)	3	In relation to Section 10.12 Soils and Geology, in the non-technical summary. It is our view that it is far too vague, so as to be of little use when considering possible impacts on our property. We would like to put on record that there is a granite rock seam which runs through the lands adjacent to Harcourt Terrace and our property which will in our view constitute a risk of damage occurring to our property, especially during the works. This would appear not to have been considered. We also note that there is an underground river called the river Steyne which flows below the Terrace, similarly, there has been no cognisance or consideration of this demonstrated within these proposals.	As stated in response item (7) above, the Non-Technical Summary document summarises in non-technical language the Environmental Impact Assessment Report (EIAR), including the likely significant effects identified, the mitigation and monitoring measures proposed, as well as any residual effects arising from MetroLink that have been identified during the Construction and Operational Phases to inform the planning consent process. This document does not present the detailed assessments undertaken. The local geological conditions were considered (including the presence of River Steyne/Stein) and presented in detail in EIAR Chapter 20 (Soils and Geology). EIAR Appendix A5.17, Building Damage Report, covers the assessed impacts of construction generated ground movements and settlement on property. The settlement contours calculated were used to undertake the buildings damage assessment. It is important to recognise that your property is a 'special' building (designated protected structure) and hence will be further assessed (Phase 3) at the detailed design stage to verify the impacts. Currently, the building is assessed at Damage category 2 or below. The damage categories are described in section 4.3.2 of the EIAR Appendix A 5.17, Building Damage Report. The Phase 3 assessment will take account of final design and construction methodology details. A detailed survey will be carried out as part of the Phase 3 assessment to provide the necessary additional information to inform this detailed analysis of how the individual elements of the building would be affected by the predicted ground movements. The method and extent of the detailed analysis will be determined on a case-by case basis and may include a more sophisticated semi-empirical or a detailed soil-structure interaction using finite element modelling methods. The results of this refined assessment typically show that earlier assessments are conservative and overestimate the likely impact of construction generated ground movements. 1 Harcourt Terrace building is a designated protected structure and as referred to in EIAR Chapter 26 (Architectural Heritage), in all cases where the built heritage structures are in the vicinity of the proposed tunnelling these buildings will be included in the Property Owner Protection Scheme (POPS), whereby they are to have condition surveys carried out prior to the commencement of tunnelling and again after completion. In those cases where the POPS survey identifies that damage has occurred as a result of the tunnelling works repairs are to be to be prepared in accordance with method statements prepared by the POPS Conservation Architects and approved where necessary by the MetroLink Project Conservation Architect (PCA). It is currently envisaged that all such repairs will relate to the infilling of cosmetic cracking and will not constitute 'works'. Further detail on the POPS process can be found in Chapter 26 (Architectural Heritage), Chapter 21 (Land Take) and Chapter 11 (Population & Land Use) of the EIAR.
9	APPROPRIATE ASSESSMENT (paragraph 3)	4	For the reason stated above we feel that the Bord should reject the draft order as submitted and also on the basis that the acquisition of our lands would constitute a breach of my Clients constitutional right to the quiet enjoyment of their property.	This is a matter for ABP.
10	Conclusion	4	In conclusion we would request that in any decision the Bord makes they should direct that my Clients costs, incurred in dealing with this matter should be discharged by the TII.	See item 5 above.

Submission No.			168	
Organisation Name or Name of Submitter			Lesley Hewson (6 Prospect Square, Glasnevin)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: Observation relating to An Bord Pleanála Case Reference Number: NA29N.314724 - Railway (Metrolink - Estuary to Charlemont via Dublin Airport) Order [2022], as it relates to my home at 6 Prospect Square.				
1	Letter	1	The house is quite old, it was built in 1905/6 and stands on very shallow foundations on boulder clay as we have been informed by the IEE. There are underground waterways known as the Cemetery Drain to both the front and back of the houses here. As I have no idea what the effect of drilling is likely to have on the ground on which the ACA is built I will have to look hard at where I carry out any other work on the house for the foreseeable future. While the IEE has been helpful in explaining the different phases of assessing houses for potential damage, I don't know if my house will be included in a meaningful way in these assessments. If it is not included, and damage does ensue- and we should remember that far more robust houses in Marino were damaged by tunnelling there - then I possibly face many years of trying to get the State to acknowledge that responsibility, similar to residents in Marino. Given that I am 61 now I might be an elderly woman while still trying to deal with this. Such legal matters could potentially last a very long time into my old age.	Thank you for your submission and for sharing your concerns with regards to the MetroLink project to which we have responded below. A comprehensive Settlement Assessment has been undertaken to determine the potential impacts that construction of the proposed Project will have on sensitive receptors such as buildings and infrastructure from the advance of the TBM. The ground movement predictions and the building damage assessment methodology adopted for MetroLink is based on the approach adopted in most tunnel projects around the world, including London Crossrail and High Speed 2 in England. This is described in EIAR Section 5.4.11 (Ground Settlement Monitoring and Mitigation Works). EIAR Appendix A5.17 Building Damage Report, covers the assessed impacts of construction generated ground movements and settlement on property. Section 5.2 of this report sets out the rationale for the assessment of properties similar to yours. The results of the assessment provided in Table 5.2 shows that Ref B - 141, one of the representative properties selected which is located approximately 80m east of your property, has been assessed as falling within the 'Negligible' category. The building risk categories shown in Table 4-4 of the aforementioned report are used to define the degree of building damage related to the Risk Category. According to this Table, the Negligible damage category refers to hairline cracks. As your property is approximately 80m from the central tunnel alignment, lesser impacts are expected. As your property is within the negligible category no further assessment beyond the Phase 2a Building Damage Assessment is required. Appendix A5.17 Appendix C contains the predicted settlement contour drawings. Sheet 20 of 28, drawing ML1-JAI-EIA-Rout_XX-DR-T-21140 refers to the tunnel alignment relevant to your property. Information regarding relocation and financial compensation related to the proposed Project is provided in Chapter 11 (Population & Land Use) and Chapter 21 (Land Take) of the EIAR. The Property Owner Protection Scheme (POPS), committed to by TII, allows residential property owners to register with TII if their residential property is within thirty (30) metres of the edge of the MetroLink alignment or fifty (50) metres of station structures. The POPS comprises condition surveys of residential properties along the route of the proposed Project. The purpose of the condition surveys is to ascertain the condition of the properties before, during (if deemed necessary), and after the completion of the proposed Project to determine whether there has been any deterioration of any of the properties surveyed and whether same may be attributable to the proposed Project, and subsequently to recommend repairs as appropriate. Condition survey data gathered pre and post construction, and possibly during construction, will be used to assist the property owner and TII in swift and accurate verification of any property damage claims which may be received from property owners. The POPS is designed to cater for / address repair work which may be necessary for any damage (attributable to the proposed Project) to a qualifying residential property up to a threshold of €45,000. The POPS will be introduced by TII through public consultation and will be formally advised to eligible property owners by the Public Relations Department. However, as your property is approximately 80m from the centre tunnel alignment, and therefore will have negligible impacts, you may not be eligible for this scheme. Further information on POPS is available in Chapter 11 (Population & Land Use). Useful information can also be found in the MetroLink Frequently Asked Questions document which can be found online at: https://www.metrolink.ie/en/your-property/property-owners-protection-scheme/ , and this is where useful updates will be made available as the proposed Project progresses. In cases where parts of properties are occupied, access to the remaining unoccupied parts will be maintained, where it is possible and safe to do so. Protection such as hoarding will be used to ensure that the boundary of any construction site will be maintained, and damage would not occur outside of this boundary. Where damage could not be avoided, it would be repaired.

Submission No.			168	
Organisation Name or Name of Submitter			Lesley Hewson (6 Prospect Square, Glasnevin)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: Observation relating to An Bord Pleanála Case Reference Number: NA29N.314724 - Railway (Metrolink - Estuary to Charlemont via Dublin Airport) Order [2022], as it relates to my home at 6 Prospect Square.				
2	Letter	1 and 2	I am aware that damage occurs to properties throughout the world during drilling and that a certain amount of 'collateral damage' is inevitable. We can't make omelettes without breaking eggs of course. Nevertheless, given that the State has already spent in the region of €88m on this project and many billions more should it go ahead, then I am left wondering why it is the people who are going to live with the mess and the inconvenience and indeed the worry who are also expected to fully accept all risks to their property arising from the construction of a piece of infrastructure that is to benefit the entire nation. Given the scale of the spending on this project I suppose I am trying to figure out why it is the people who live, or own businesses close to the alignment, not directly above it, are the ones required to bear such a significant risk and why they, of all the myriad groups involved in a mega-project should be seen as an unnecessary cost while huge amounts of money are made available for its every other aspect!	Please refer to response item (1) above in relation to predicted impacts to your property. As noted, your property is approximately 80m from the centre tunnel alignment and therefore negligible impacts are expected. TII acknowledge the concerns you may have around the potential impact to your property during the construction of MetroLink. However, the various assessments and mitigation measures proposed in the EIAR raise only one slight negative impact for your location relative to the Project in relation to traffic management. The traffic assessment during the construction phase, as set out in EIAR Appendix A9.5 Scheme Traffic Management Plan, section 7.6 indicates an average of 50 construction vehicle movements to and from Glasnevin Station site per day during the main construction phase. The main HGV routing proposed to and from Glasnevin Station is along the Finglas Road (to the east of your property) to Junction 5 of the M50 (see Figure 7.22 of Appendix 9.5). The detailed work undertaken in the EIAR for Railway Order indicates that this will result in a slight increase in traffic flows in the area.
3	Letter	2	I therefore ask that ABP give full consideration to the provision of a very thorough risk assessment process for vulnerable properties, not just as is currently provided in the obvious place above the alignment and the zone of inclusion, but also for those further away from the line but who are realistically at risk also due to the type of ground and the age and structure of the property they own.	Please refer to response item (1) in relation to the predicted impacts to your property during the construction of MetroLink, and the compensation offered by TII to affected properties. Where a property has been identified in the assessment as impacted by the planned tunnelling operation, a programme of ground movement monitoring will be implemented. The Airborne Noise and Groundborne Noise Mitigation Policy (Appendix A14.6) sets out the construction mitigation measures to be implemented.
4	Letter	2	I also ask for enhanced monitoring of the drilling process when that occurs in vulnerable areas to allow corrections to be made that minimise damage and disturbance of the ground. Finally I ask for continued and prolonged monitoring of ground settlement after drilling has taken place so that problems can be addressed in a timely manner.	Please refer to response item (3) above in relation to the mitigation for noise and vibration impacts. Appendix A5.1 Outline CEMP details the minimum requirements with regards to the appropriate mitigation, monitoring, inspection and reporting mechanisms that need to be implemented throughout construction. Documents such as the Blasting Plan (including monitoring) and the Construction Noise and Vibration Management Plan will be provided by the contractor(s) and incorporated into the detailed CEMP. Mitigation and monitoring will be carried out in accordance with the requirements of the EIAR and Natura Impact Statement so that construction activities are undertaken in a manner that does not give rise to significant negative effects. Suitable monitoring programmes will need to be developed, implemented, documented and assessed in accordance with the specification outline in the detailed CEMP(s). The results of all environmental monitoring activities will be reviewed by the Environmental Manager on an ongoing basis to enable trends or exceedance of criteria to be identified and corrective actions to be implemented as necessary. The contractor(s) will be required to inform TII of any exceedances of criteria.

Submission No.			169		
Organisation Name or Name of Submitter			LIDL Ireland GmbH (represented by Tony Bamford Planning Consultants)		
Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
Re: Submission on behalf of LIDL Ireland GmbH to “Railway (Metrolink-Estuary to Charlemont via Dublin Airport) Order 2022”					
1	Over Station Development (page 5 and 6 of Submission)	6&7	The Draft Railway Order is silent on the potential for Over Station Development at this location which we consider a missed opportunity but one that can be rectified within the scope of Railway Order process as the key aspects are not policy based but rather technical in nature. The problem we foresee at this time is that the opportunity to forward plan now for OSD, if not taken, will close the door to it in future. Amongst the challenges identified in the report by the “Centre For London” associated with retrofitting OSD are: <i>“Engineering and Operations: Building over operational stations is complex, and this often influences development scale and shape, requiring costly and disruptive possessions of infrastructure”.</i> The solution to overcome these problems is to design in future OSD,	TII thank you for your letter, noting your support for MetroLink. We provide our responses to the matters raised by your representatives below. MetroLink will be a catalyst for and provide opportunity for future development and regeneration. While the MetroLink Railway Order does not include for future neighbouring or overhead development, the tunnels and stations are designed to support appropriate future imposed loads. TII will be required to make submissions in relation to planning applications for proposed future developments on or adjacent to MetroLink and there will necessarily be some engineering constraints (such as permissible loadings) required. However MetroLink is committed to engaging with known development proposals and new development proposals as they emerge with the intent of facilitating such developments as they emerge to the maximum extent consistent with the safe operation of the proposed Project. Again in common with other existing rail and tunnel projects, following grant of the Railway Order and development of detailed design, TII will produce “Guidance Note for Developers” that will be the subject of bye-laws following the grant of Railway Order and which is designed to facilitate future adjacent or over-site development while protecting the integrity and safety of the MetroLink works and operations. Therefore at this stage TII is dealing with known development proposals on a case by case basis, TII will work with parties in the future to assist with the wider development of sites over and above stations and tunnels. In this context TII has successfully engaged with a number of developers over the last two years to accommodate development over and in proximity to the alignment and there have been no material restrictions on development subject to the implementation of agreed design and mitigation measures and it is not anticipated that MetroLink will have a material impact on the development potential of sites above and in proximity to the alignment in future.	
2	Response of the Project to the Impacted Land's (North Wood) Zoning (page 6 of Submission)	7	The submitted Planning report sets out a comprehensive response to various policies and objectives contained in National, Regional and local planning documents. The emphasis in our position is how the applicant is responding to the content of these. In particular what does the applicant propose as their position in respect of Over Station Development?	Please refer to response item number (1) above.	
3	Response of the Project to the Impacted Land's (North Wood) Zoning (page 7 of Submission)	8	The position in respect of Northwood station, where the applicant is silent on Over Station Development, is contrasted with responses in respect of the Dublin City Development Plan. In response to Dublin City Development Plan MTO 1, as referred to page 77 of the Planning Report, highlights that: <i>‘It is an objective of Dublin City Council to encourage intensification and mixed-use development along existing and planned public transport corridors and at transport-nodes where sufficient public transport capacity and accessibility exists to meet the sustainable transport requirements of the development, having regard to conservation policies set out elsewhere in this plan and the need to make best use of urban land. Dublin City Council will seek to prepare SDZs, LAPs or other plans for areas surrounding key transport nodes, where appropriate, in order to guide future sustainable development.’</i> The response of the applicant at page 77 of the Metrolink Planning Report is as follows: <i>The proposed Project will facilitate intensification and mixed-use development along its corridor, subject to the policies of the DCDP. In particular, the proposed Project, where possible, <u>facilitates the development of the station sites themselves for oversite development</u>, on those station lands and over the tunnel alignment that are zoned for such development. The future development of land above or surrounding the station sites, station lands or over the tunnel alignment will be subject to separate planning, assessment and consultation processes.</i>	Please refer to response item number (1) above.	

Submission No.			169		
Organisation Name or Name of Submitter			LIDL Ireland GmbH (represented by Tony Bamford Planning Consultants)		
Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
Re: Submission on behalf of LIDL Ireland GmbH to “Railway (Metrolink-Estuary to Charlemont via Dublin Airport) Order 2022"					
4	Response of the Project to the Impacted Land's (North Wood) Zoning (page 7)	8	The interesting aspect of this is that MTO1 as an example indicates, like the objective for the Metro Economic Corridor Zoning, the need for high density, mixed use, development along existing and planned public transport. However, the report we believe omits reference to over-station development for our client's site at Northwood, which is not explained or justified. The obvious question therefore is why in the specific case of the Northwood station is there not the same emphasis. We assume that this is an omission from the Planning Report that could be easily rectified.	Please refer to response item number (1) above.	
5	Conclusions (page 7 of Submission)	8	• We would therefore ask that over station development is specifically recognised in the Railway Order. • We also refer to the attending report from Transport Insights which sets out additional technical queries that need to be addressed during the application process.	Please refer to response item number (1) above.	
6	Transport Insights Report, Maximising Metro Economic Corridor Zoning Opportunity (page 4 and 5 of the report)	13&14	Our client would wish to maximise the usable area of their site and would ask that the proposed Northwood station design/ layout be reconsidered to ensure it does not restrict development of the areas to be handed back and that over station development be considered further on the subject site.	Please refer to response item number (1) above.	
7	Transport Insights Report, Discount Food Store Requirements (page 5 and 6 of the report)	14&15	As part of a potential future mixed-use development of the subject site, our client, would look to provide a discount Food store on the site. The MetroLink proposals indicate two areas for potential development adjacent to the proposed station but other sections, such as the northern portion of the site (which the track alignment passes through) do not indicate potential for future development. Vehicle access and car parking provision is an important consideration for a discount Food store (in conjunction with sustainable modes of travel). Vehicle access to the site would likely have to be taken from the Old Ballymun Road positioned towards the northern end of the site (as proposed in the 2013 planning application, see Figure 2), given the layout of the surrounding road network. In turn, this would predetermine access requirements for the car parking layout (both at surface and underground level) and the location of the loading servicing/ delivery facilities for a potential discount food store. As such, ABP in their consideration of the MetroLink proposals should seek to enable a larger area of the subject site be utilised for future development, allowing for the provision for a high-density mixed-use development.	MetroLink public realm has been designed in consultation with Lidl by taking Lidl's future development plans into consideration. As discussed in several consultation meetings, the proposed Northwood Station construction works will require the acquisition of the entire site on a temporary basis and the acquisition of the western part on a permanent basis as shown on the RO property plans . Upon completion of the MetroLink construction works, the retained lands in consultation with TII, can accommodate development in line with zoning objectives, proposed development plans. However, design for any future building or structure immediately adjacent to MetroLink station and tunnel must take cognisance of the MetroLink structures and avoid impact, with the intention of preserving and optimising the scale and value of the Adjacent Site Development recognising that the operational requirements of the station are the overarching priority.	
8	Transport Insights Report, Station Access Requirements (page 6 of the report)	15	The MetroLink proposal indicates access to the station is to be facilitated by two main entrance points, one on either side of the Ballymun Road, as well as separate emergency access points. It is unclear from the proposal drawing if there are other access requirements to the station or track which our client would have to consider when planning future development. As such, further consideration should be given by ABP at this planning stage, and if necessary, consultation undertaken with our client.	There are two main pedestrian entrances to the station. There are additionally lift locations either side of Ballymun Road each comprising 2 lifts with one for Dublin Fire Brigade. There are additionally surface penetrations for, inter alia, smoke, ventilation and draught relief. TII will require maintenance access to these locations. With regard to development adjacent to the station please refer to Item number (1) above.	

Submission No.			169	
Organisation Name or Name of Submitter			LIDL Ireland GmbH (represented by Tony Bamford Planning Consultants)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Submission on behalf of LIDL Ireland GmbH to “Railway (Metrolink-Estuary to Charlemont via Dublin Airport) Order 2022”				
9	Transport Insights Report, Construction Considerations (page 6 of the report)	15	As set out in chapter 5 of the EIAR MetroLink Construction Phase, the Northwood station box and track alignment in its vicinity is proposed to be constructed using a cut and cover approach. Our Client would seek further consultation and input at this planning stage to better understand the potential limits construction using cut and cover methods may place on the future development potential of the subject site. Considerations such as (not exhaustive): o Maximum loadings (permanent and temporary) that can be imposed on the cut and cover. o Maximum excavation depths over and adjacent to the cut and cover, and Northwood station structure. o Minimum working clearances allowed from the proposed land acquisition extent. o How the station would be supported against external loads, would ground anchors be required.	The station structure and retaining walls, as well as the tunnels are designed and constructed to support future imposed loads. Please refer to response item (1).
10	Transport Insights Report, Site Condition Post Construction (page 6 of the report)	15	To construction and facilitate eventual operation of the MetroLink the subject site is to form part of one of the projects main construction compounds. The extent of temporary and permanent land take has been indicated in the proposals. Our client seeks further information on the condition to which area(s) of temporary land take are to be returned following completion of construction. Considerations such as (not exhaustive): o Contamination o Drainage o Site level o Boundary conditions such as fencing, walls etc. o Service connections (whether original or newly created during construction)	TII will consult with the landowner prior to land hand back to optimise the land hand back process. TII will (if no subsequent local agreements are reached) hand back land in the same condition in which it was received unless specified demolition works are undertaken. This will include removal of any surface treatments, temporary facilities and hoardings / fencing. A condition survey will be undertaken to record the existing condition prior to MetroLink occupancy of the land.

Submission No.			170	
Organisation Name or Name of Submitter			LOKRA Lower Kimmage Road Residents Association	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Submission to An Bord Planeala 16 th January 2023				
1	Introduction	1	LOKRA (Lower Kimmage Road Residents' Association) is fully supportive of the immediate implementation of the MetroLink Project from Estuary to St. Stephen's Green. Our concerns relate only to the portion of the proposal south of St. Stephen's Green to Charlemont / Mander's Terrace. In this regard LOKRA endorses the submission of MSWG (Metro South West Group), of which we are a member.	TII appreciates your endorsement of the MetroLink Project from Estuary to St Stephen's Green. TII also note your concerns regards the section of the alignment south of St Stephen's Green and your endorsement of the MSWG submission. TII have responded below to your observations raised, and separately to the submission made by MSWG.
2	Main Concerns Limitations of Charlemont as an appropriate terminus:	1	MSWG (along with many others) has clearly outlined the unsuitability of Charlemont as a terminus and a major city centre transport hub for MetroLink. We believe that if the tunnel boring machine is parked at Mander's Terrace, it seriously compromises the ability to include some highly populated city suburbs such as Portobello, Lower Rathmines, and Harold's Cross in any future potential extensions to the line. This creates an embedded bias in favour of east bound, over south west bound, projects from the perspective of cost / benefit analysis. We believe this can only be fairly balanced by evaluating a more neutral (central) starting point (eg. Saint Stephen's Green) for alternative south bound extension route analysis (south east or south west). On the decision to choose Charlemont as the MetroLink terminus, Frank McDonald (former environmental editor for the Irish Times), wrote in a recent Irish Times article: "<i>This issue was raised by An Bord Pleandla representatives during pre-application consultations with the National Transport Authority (NTA) and Transport Infrastructure Ireland (TII) when they queried "the appropriateness of the selection of Charlemont as the end-point in the light of the decision to omit the Luas Green Line upgrade ". That question has never been satisfactorily answered . "</i> Ref: Irish Times 2nd Jan 2023	TII do not agree with the observation that Charlemont is an unsuitable location for an interchange with the Luas Green Line for the reasons set out below. The connection from St Stephens Green to Charlemont / Ranelagh is supported by the previous Transport Strategy for Greater Dublin Area (2016-2035) and the current Transport Strategy for Greater Dublin Area (2022-2042). The latter considers a range of options for the onward extension of MetroLink to meet the demand for travel over the period of the strategy. This includes consideration of the need for the upgrade of the Luas Green Line to Metro with a Metro extension to Dublin south west, south or south east. Whilst the strategy envisages that further extensions will be delivered after 2042, MetroLink which terminates at Charlemont allows for the possible extension of the metro in all the above directions. The proximity of the Metro to the Luas line at Charlemont provides for a positive customer experience for all users with short interchange distance and due to the proximity, clear wayfinding and high visibility of the interchange. The interchange arrangements at Charlemont provide for significantly better interchange arrangements compared to an alternative interchange at St Stephen's Green Station. Passengers wishing to interchange between Luas and Metro at an altnative St Stephen's Green terminus would face a 500m-walk along a route either through St Stephen's Green park or along the footpath north of the park, which adds significantly to the time for interchange and therefore the overall journey time for passengers and a less positive customer experience for all interchange users. This passenger experience would be reduced further for those with mobility or visual impairments as well as those travelling to/from the airport with luggage. The section of MetroLink route between St Stephen's Green and Charlemont Stations contributes significantly to the overall benefits of the scheme. It serves a significant area of the south city of Dublin and offers enhanced access from the local area to the city centre and a direct connection to Dublin Airport. It serves key trip attractors including residential areas and offices / workplace locations, with high passenger boarding and alighting figures in the peak hours. During the morning peak, at Charlemont station the flows include 1,800 passengers alighting, 2,300 boarding and 1,229 passengers alighting, 2,276 boarding during the evening peak. The passenger numbers contribute significantly to the overall benefits of the scheme and the effect of these benefits outweigh the additional costs that are associated with the delivery and operation of the section from St Stephen's Green to Charlemont station. Further information is available in Chapter 7: Consideration of the Alternatives, section 7.7.8 MetroLink Southern Terminus Location. TII does not agree that a southern extension is compromised by locating a MetroLink interchange at Charlemont. The location of the interchange at Charlemont does not preclude onward extension south. An interchange at Charlemont is supported by policy including the Dublin City Development Plan 2022 - 2028 and the Transport Strategy for the Greater Dublin Area. As noted by the GDA Transport Strategy 2022-2042, section 12.3.2, "Charlemont offers the optimal location for the primary interchange with the Green Line in response to growing demand in the longer term and is an appropriate location to facilitate any potential future metro extensions to serve the south west, south or south east of the city region should sufficient demand arise." By extending MetroLink to Charlemont it provides for future proofing of the Green Line, bypassing the capacity constrained Luas on-street running section, and ensures potential future connectivity options are enabled, either to the Green Line or for extensions of the Metro. The Charlemont Station interchange provides for increased passenger utilisation of the MetroLink system, thereby increasing the benefits delivered by the Project, reflected by an improved Project Benefit Cost Ration (BCR). Any future extention of metro services to the locations decribed do not form part of the MetroLink Railway Order Application.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
Re: Submission to An Bord Planeala 16 th January 2023					
3	Main Concerns Climate action	2	While the current climate-change budget calls for a massive reduction in carbon emissions from the transport sector, as Janies Wickham (Fellow Emeritus ofTCD and author of European Societies Today: Inequality, Diversity, Divergence (Routledge 2020)) states in a recent article: <i>"The lack of urgency involved in rail projects is exemplified by the continued delays of the MetroLink project. First suggested in the Dublin Transportation Office 's Platform for Change in 2001, a proposal was finally submitted by the National Transport Authority (NTA) to An Bord Planeala on September 30th, 2022 . "</i> and: <i>"Investment in public transport is investment in a public good and a public service... A serious expansion of rail-based transport in the greater Dublin area is the single most realistic method of shifting journeys away from the private car. Precisely because this requires substantial investment, the obvious need is to make the investment immediately so the benefits materialise as early as possible. "</i> Ref: Irish Times 14th December 2022. If climate action goals are to be achieved, LOKRA believes there is a huge opportunity with Metrolink and the initiation of an underground metro services for Dublin, to get the basics right at the start will allow for rapid and incremental roll-out of extensions to the service. A core element of this is the choice of a future-proofed city centre terminus and progression of cost / benefit analysis of future extensions in parallel with the initiation of the MetroLink project. Underground metro is the only serious option that will ensure a modal shift from car to public transport for the 320,000 population of the south west of Dublin between the Red and Green Luas lines - with nothing to look forward to but busses up to and beyond 2042.	In response to the observation ""The lack of urgency involved in rail projects is exemplified by the continued delays of the MetroLink project", TII as the Government Agency responsible for delivering MetroLink are committed to expediting the delivery of this transformative project on receipt of an Enforceable Railway Order and in accordance with Government direction. TII also agree with the points made by the observation with regards to investment, and climate action goals and a modal shift from private car use, key objectives of the MetroLink Project. However, for the reasons set out by response (2) above, TII are of the view that the choice of Charlemont Station as the preferred location for interchanging with the Luas Green Line is correct as it allows for future proofing whilst addressing current transport needs.	
4	Main Concerns Healthier Neighbourhoods:	2	LOKRA believes that an underground Metro service should be the backbone of any integrated, multi-modal, transport system that aims to free up precious and already seriously limited road space in order to enable a healthy urban living and working environment. Yet, according to James Wickham: <i>"In 2030 there will be more cars on the road in Ireland than there are at present. As a direct result of current climate change policy, the private car will be more embedded in Irish society than ever before. "</i> Ref: Irish Times 14th December 2022 The NTA has already accepted that even with the highest level of bus service provision possible, buses alone will be inadequate to support the forecast demand in south west Dublin and yet, as stated by James Wickham in a recent Irish Times Article: <i>"...the upgrading of Dublin's bus routes through the BusConnects project is presented by the NTA as obviating the need for other major rail investment for another decade "</i> Ref: Ref: Irish Times , 14th December 2022 The negative effects of extensive car usage are now well established. Low-traffic road environments optimise the efficiency and attractiveness of flexible public transport options (such as bus and shared modes of transport), cycling and other forms of micro-mobility as well as walking.	TII agree that MetroLink will play a key role in freeing up limited road space and deliver a healthier urban living and working environment. EIAR Chapter 3, Background to the MetroLink Project outlines how MetroLink will respond to issues of sustainable mobility and change the current reliance on private vehicles and congestion on the road network. MetroLink will provide significant benefits not only to those you choose to use it, but also to other transport system users, by reducing the demand for scarce road space, and so creates the opportunity for the road transport system to achieve optimum levels of efficiency and effectiveness. Through consideration of a number of alternatives as set out by EIAR Chapter 7, Consideration of Alternatives, it has been identified that MetroLink provides the best medium and long-term transport project for the Greater Dublin Area for a number of reasons, including its ability to deliver the highest level of transport benefits when compared to other options, and offering critical interchange with other modes of transport that will discourage the use of private vehicles. As noted by EIAR Chapter 3, MetroLink will divert 6.8 million car trips per annum in the early years, growing to 12million per annum by 2045. Subsequently, there will be strong modal shift along all sections of the alignment, with a 45-58% increase in public transport usage in trips to/from the AZ1 Northern Section (R132 area). Additionally, all stations have been designed to ensure maximum interchange with other modes, specifically sustainable modes of transport such as walking, cycling and public transport, rather than private vehicles. Through a combination of these modes, and the corresponding reduction in car usage, the MetroLink project will make a significant contribution in helping Ireland meet its climate change targets in line with Climate Action Plan 2021 and make Dublin a more liveable and sustainable city. For further details on the approach taken with the design of MetroLink, please refer to Chapter 3: Background to the MetroLink Project, section 3.4 MetroLink Response to Challenges.	
5	Main Concerns Healthier Neighbourhoods:	3	In the context of Kimmage Road lower, the NTA has proposed LUAS as the only possible additional option for services beyond 2042. The imposition of large capacity buses and / or LUAS lines on Kimmage Road Lower will do nothing to facilitate the aim of a healthier and safer neighbourhood and does not respect road user hierarchy. This proposal is still to be properly evaluated and LOKRA believes that a Metro option should be given equal and fair consideration and evaluation within the timeframe of the next Dublin Area Transport Strategy review, by 2028. An underground metro service for the greater south west Dublin area, would allow for the re- imagining of road space in residential areas and significantly improving the quality of life for residents and commuters alike.	Further to response (2) above, any future extention of metro services to the locations decribed do not form part of the MetroLink Railway Order Application.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Submission to An Bord Planeala 16 th January 2023				
6	Recommendation:	3	We submit therefore, that An Bord Pleanala should approve the full implementation of the MetroLink plan as far as St. Stephen's Green and defer the authorisation of the final section of MetroLink beyond the St Stephen's Green station, pending further comprehensive and comparative analysis of St. Stephen's Green vs Charlemont stations as preferred city centre hubs and starting points for future possible extensions. This and the evaluation of future south Dublin extension options, to be carried out within the timeframe of the next Dublin Area Transport Strategy review (by 2028).	The above responses to the observations made explain why TII do not consider it is correct or appropriate that the MetroLink alignment should only extend as far as St Stephen's Green, and also demonstrates why the proposed Charlemont Station has been selected by TII as the preferred interchange with the Luas Green Line A scheme which terminates at St Stephen's Green would not be consistent with the Transport Strategy for Greater Dublin Area (2022-2042). In addition any decision to terminate the scheme at St Stephen's Green will significantly impact on the overall viability and benefits of scheme.

Submission No.			171	
Organisation Name or Name of Submitter			Lorraine Rooney (resident - 8 Saint Teresa's Place, Glasnevin)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: Intended Application by the NRA (Operating as TII Ireland) for te Railway (MetroLink Estuary to Charlemont via Dublin Airport) order (2022)				
1	Letter	1	I do not feel that this €50.00 fee should apply on a local level due to the nature and extent of the build. TII, An Bord Pleanála and the stakeholders are not taking into account that local residents are giving over the land in question without any meaningful exchange from any parties involved, including local representatives with regard to the extent, size and duration of this project. As per an entry of in the Law Society Gazette 31/01/2022 the total spend on this project is 88.1m since 2016. In this instance giving the fact that this amount of money can be spent on a project that has not even begun this fee should have been waived.	The application of the fee is a matter for ABP.
2	Communication from TII to local residents	1	TII have not been transparent throughout the planning process of this proposed project. There has been no effort to bring communities on board since the consultations held in March 2019. These were a PR exercise that failed to meet the needs of the areas that will be subjected to huge disruption caused by this mega construction project. The stakeholders do not seem to have any interest in consenting local communities to have any input into the process, addressing genuine concerns about the route, the loss of green spaces, closing off sections of local amenities, and design of stations. There should have been meetings specific to each area, like the Prospect ACA, GADRA, IDRA, D7 Allianz to name but a few. As a result of the change of the date for submission this shows that there is ineptitude within TII as how a large tract of documentation for a railway order of this size was omitted is beyond belief.	Chapter 8 (Consultation) presents an overview of all stakeholder and public consultation undertaken to inform the development of the MetroLink project. Consultation was undertaken throughout the project development, including but not limited to the Emerging Preferred Route (EPR) Consultation, Environmental Impact Assessment (EIA) Scoping Consultation, Preferred Route Public Consultation and the Albert College Park Local Area Consultation. As noted, early and continuous public participation has influenced the design and development of the MetroLink project. The MetroLink Project Team has responded to the submissions and feedback received during the above-mentioned non-statutory consultation periods. The MetroLink Project Team has at all times endeavoured to ensure the widest possible access for the public, stakeholders and landowners to information about the project at all stages of its pre-planning development. As detailed in Appendix A8.19 Meetings Register, numerous meetings have been held with GADRA, Prospect ACA and District 7 Community Alliance, with dates provided for evidence. The consultation period was extended to allow for review of an inadvertently ommitted document. The document was part of a larger compilation of documents in appendices, and was not intentionally omitted.
3	Provision of Detail	1 and 2	Provision of detail in lay terms is non-existent, it is scant to say the least. There is a wealth of technical detail in the various on-line reports. This involved many hours of trawling through different reports which is arduous and time consuming especially when there was such a tight deadline for the railway order. The stakeholders had all this knowledge well in advance of the deadline, giving them the advantage. And from meeting with the various groups the prospect ACA have liaised with this was the general consensus. That the stakeholders held the advantage and local representatives were not dealing with constituents concerns. I also believe that RINA are only completing their independent report so this railway order should not be going through until this report has been looked at in greater detail.	The EIA process has been undertaken in line with the EIA Directive, based on the guidance presented in the Environmental Protection Agency (EPA) 'Guidelines on the Information to be contained in EIARs' (EPA, 2022) and other relevant guidance. The Non-Technical Summary of the EIAR for the proposed MetroLink Project is provided in Volume 1 of the Railway Order. This document summarises in non-technical language the EIAR, including the likely significant effects identified, the mitigation and monitoring measures proposed, as well as any residual effects arising from MetroLink that have been identified during the Construction and Operational Phases to inform the planning consent process. Please refer to response item (2) above in relation to the engagement with local stakeholders in this area. TII confirm that the RINA report was issued to resident groups on the 9th November and 23rd December 2022.

Organisation Name or Name of Submitter			Lorraine Rooney (resident - 8 Saint Teresa's Place, Glasnevin)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: Intended Application by the NRA (Operating as TII Ireland) for te Railway (MetroLink Estuary to Charlemont via Dublin Airport) order (2022)				
4	Monitoring of Foundations	2	The properties along this section of the route have the standard foundations which would attributed to a property build over 100 years ago. The house is sitting on boulder clay and monitoring must be carried out to the highest standard. This ACA area is referenced in the documentation but no studies appear to have been completed. Foundations under these homes, would realistically be effected by vibration and changes to the water table. "<i>Areas of Architectural Conservation (ACAs) like Prospect Square, De Courcey Square and environs must be treated with great care and sensitivity and the residents and the Local Authority consulted at every stage of development</i>". Above is has been taken from a TII report.	EIAR Appendix A5.17, Building Damage Report, covers the assessed impacts of construction generated ground movements and settlement on property. The settlement contours are presented in Appendix A5.17 Building Damage Report showing that 8 Saint Teresa Place is outside the 1mm contour and therefore is not impacted due to ground movement associated with MetroLink. Additionally a programme of area ground movement monitoring will be implemented, with the monitoring locations informed by further analysis to be undertaken during the detailed design stage. Refer to EIAR Chapter 5 generally and specifically section 5.4.1. TII reaffirm that the local geological and hydrogeological conditions were considered during the settlement assessment. Refer to Appendix 5.17 and Chapter 20 Soils and Geology. With regard to goundborne vibration, the calculated vibration levels from Mechanical Excavation and TBM Passage are below the threshold for structural damage for any building type. Refer to Chapter 14 Groundborne Noise and Vibration.
5	Monitoring of Foundations	2	An in-depth ground movement study must take place, and residents need to be involved throughout this process. There is a query over the 30M zone, which has been moved down from 50M. There is no way of predicting a zone for any property, as properties with varying ages, size, builds will all react differently to vibration. The distance of the zone may need to be irregular depending on the settlement calculations done for each building. International standards must be adhered to and be contractually imposed to the contractor. No consultation has taken place with prospect ACA as a group to alleviate concerns about the close proximity of properties to the tunnel, or properties directly over the bore.	Please refer to response item (4) above in relation to the ground movement assessment at your property. A full settlement assessment has been undertaken and presented in Appendix A5.17 Building Damage Report. The contours show the buildings potentially impacted by ground movement and assessed. The contours are calculated and not building specific, only buildings within the 1mm contour are potentially impacted. Your property is outside this zone. A programme of area ground movement monitoring will be implemented, with the monitoring locations informed by further analysis to be undertaken during the detailed design stage. Please refer to response item (2) in relation to the engagement with local stakeholders such as Prospect ACA.
6	Blast Risk Management	2	Risk management in blasting work is increasingly becoming more challenging as work inevitably occurs in more populated areas. Not only is the work closer to people and structures, but concern about blasting effects on utilities are also increasing. Sometimes it is possible to use mechanical methods to excavate rock, but these are slower, costly, and may still have vibration issues. Regardless of the scale of the blasting work, sometimes engineers and contractors underestimate the importance of preparing blasting controls and public relations programs. The consequences of this are often severe. There is limited information of the duration of blasting that will be required for the station area, will this be a duration of days, weeks. Advice we have been given that there could possibly be one blast per day going on for several weeks. Can information be provided in depth on the possible vibration effects of such a procedure? How will the buildings that are protected structures dotted around this section be managed during this work. All blasting projects— large or small— occurring near any concerned neighbours, require some level of public relations work. The level of this public relations (PR) work is a function of the blasting duration, timing, and the level of concern by the neighbours. The public should not be ignored and should be allowed a meeting to discuss their concerns over blasting close to their homes and the canal.	As presented in Chapter 14 (Groundborne Noise and Vibration) and Figure 14.4 Blasting Contours of PPV, no blasting activities will take place at Glasnevin Station and as a result no impact on the buildings will arise. In the cases where blasting will be used (at other station locations) mitigation measures will include a series of controls to reduce groundborne noise and vibration to acceptable levels, these include the following points: • Blasting will only take place at defined discrete times (maximum of two per day) during the daytime. • Suitable advanced warning will be given to anyone who may experience noise or vibration. • Vibration from each blast will be monitored to enable blasting parameters to be optimised and to ensure that damaging levels of vibration are not reached. • If necessary, alternative chemical or hydraulic splitting methods will be used. Please refer to response item (2) above in relation to the engagement with local stakeholders in this area.

Submission No.			171	
Organisation Name or Name of Submitter			Lorraine Rooney (resident - 8 Saint Teresa's Place, Glasnevin)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: Intended Application by the NRA (Operating as TII Ireland) for te Railway (MetroLink Estuary to Charlemont via Dublin Airport) order (2022)				
7	Subsidence	3	As this is a terraced street, where there is the potential for movement of the boulder clay. It is very possible one weaker structure on the terrace could negatively impact all the properties and cause issues with subsidence/cracking/issues with doors windows/roof/drains, or more serious damage there does not appear to have been any impact study done in this instance. There seems to be discrepancies regarding the zone of inclusion, some residents received information that the zone was 50m, TII reports now have a 30M zone, another householder has been advised that if one of the properties on a terrace falls into zone of inclusion should a property become effected as a result of ground movement the whole terrace/street will be covered. This zone should be extended much further due to the building layout of the area and the interconnection of many of the properties. There is one property in particular on the junction of DeCourcey Square and Prospect road that is noticeably subsiding which gives a clear indication that there is movement in the ground below this area. This happens to be close to an underground source of water which would indicate a full investigation of the quality of the boulder clay/substrata is required.	As stated above in response items (4) and (5) an assessment of impacts of construction generated ground movements and settlement on properties was undertaken with the results presented in Appendix A5.17. As presented in Chapter 20 (Soils and Geology), a geotechnical survey (including investigation boreholes) has been undertaken along the MetroLink route. Details regarding the geotechnical conditions were used for impact assessment of the construction works impact. In the area you refer to, two boreholes were made, NBH 213 and ABH35, at depth of 31 and 29 meter respectively with the resulting geological cross section being presented in Appendix A20.9 Geological Cross Sections. For the Phase 1 survey for the damage report, a zone of influence of the tunnel and other works was taken as 30m width on either side of the tunnel plus half the tunnel diameter. This is equivalent to a 45-degree influence line from the tunnel axis level at a depth of 30m. Please also refer to Item (4). Your property is outside the 1mm contour and unimpacted due to tunnelling induced ground movement. Additionally no buildings in the vicinity are assessed to suffer any structural issues due to MetroLink - i.e. no building is predicted to have greater than "Slight" damage. Please refer to Appendix A5.17 for details of the damage categorisation.
8	Insurance	3	If this type of damage occurs what is the plan if the property has to be vacated for a period of time if remedial work needs to be carried out. As with the current situation and the housing shortage there would not be a viable alternative to house people. Also there would need to be an assurance that all contents in the house needed to be adequately insured in the event the damage necessitates the vacation of the home. There is no clarity as to how private Home Insurance Policies will operate, how do TII/stakeholders propose indemnifying the house and contents for this period of time.	The Property Owner Protection Scheme (POPS), committed to by TII, allows residential property owners to register with TII if their residential property is within thirty (30) metres of the edge of the MetroLink alignment or fifty (50) metres of station structures. The POPS comprises condition surveys of residential properties along the route of the proposed Project. The purpose of the condition surveys is to ascertain the condition of the properties before, during (if deemed necessary), and after the completion of the proposed Project to determine whether there has been any deterioration of any of the properties surveyed and whether same may be attributable to the proposed Project, and subsequently to recommend repairs as appropriate. Condition survey data gathered pre and post construction, and possibly during construction, will be used to assist the property owner and TII in swift and accurate verification of any property damage claims which may be received from property owners. The POPS is designed to cater for / address repair work which may be necessary for any damage (attributable to the proposed Project) to a qualifying residential property up to a threshold of €45,000. The POPS will be introduced by TII through public consultation and will be formally advised to eligible property owners by the Public Relations Department. Further information on POPS is available in Chapter 11 (Population & Land Use). Useful information can also be found in the MetroLink Frequently Asked Questions document which can be found online at: https://www.metrolink.ie/en/your-property/property-owners-protection-scheme/ , and this is where useful updates will be made available as the proposed Project progresses. In cases where parts of properties are occupied, access to the remaining unoccupied parts will be maintained, where it is possible and safe to do so. Protection such as hoarding will be used to ensure that the boundary of any construction site will be maintained, and damage would not occur outside of this boundary. Where damage could not be avoided, it would be repaired. Information regarding any situations requiring relocation and the process for financial compensation for property impacts directly related to the proposed Project is provided in Chapter 11(Population &Land Use) and Chapter 21 (Land Take) of the EIAR. Property owners will continue to be responsible for notifying their insurance provider, of any change in circumstance, which may impact their policy. TII do not a expect there to be any adverse impact on the insurability of residential properties arising from MetroLink.

Submission No.			171	
Organisation Name or Name of Submitter			Lorraine Rooney (resident - 8 Saint Teresa's Place, Glasnevin)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: Intended Application by the NRA (Operating as TII Ireland) for te Railway (MetroLink Estuary to Charlemont via Dublin Airport) order (2022)				
9	Speed of Remedial Work	3	How quickly would TII address the issues, in the event of damage would this immediately be assessed and repaired.	Please note that your property is outside the 1mm contour. As presented in Chapter 11 (Population and Land Use), condition survey data gathered pre and post construction, and possibly during construction, will be used to assist the property owner and TII in the swift and accurate verification of any property damage claims which may be received from property owners. Condition surveys to be undertaken will take the form of: •Pre-works condition surveys; •Interim-works condition surveys (if required); •Interim-works condition surveys (post repair works) (if required); and •Post-works condition surveys. The nominated panel surveyor will contact the property owner directly and agree a mutually convenient time to carry out an internal and external pre-works condition survey on the owner's property. The panel surveyor shall ensure the survey is carried out prior to construction work commencing following instruction from the proposed Project team. After the completion of the proposed Project works in the vicinity of a particular property, the property owner will be sent a letter by the proposed Project team advising that the proposed Project works have concluded and inviting them to allow a post-works condition survey to be carried out. Please refer to the POPs as noted above in Item 8. The same panel surveyor that carried out the pre-works condition survey, shall carry out the post-works condition survey to facilitate comparison of the property condition pre and post construction unless the property owner objects with good reason. Interim-works condition surveys may be instructed by the proposed Project team where there is a particular concern that a property has been damaged by the proposed Project works and where such an interim-works condition survey might mitigate future loss. It should be noted that where repair works are identified as required by an interim-works condition survey, a separate Repair Recommendation Report shall be provided. Following the repairs being carried out, a further interim-works condition survey (post repair works) shall be carried out by the panel surveyor. All condition survey reports will be issued by the panel surveyor to the property owner and the TII representative by post and email respectively on the same day. The property owner may submit an application to the POPS to have their property rectified where a survey report by the panel surveyor outlined in a Repair Recommendation Report identifies defects: •which have been caused to the property as a result of the proposed Project works; and •for which the estimated cost of rectification will not exceed €45,000.00 excluding VAT. This is detailed in section 11.6.1.1 of EIAR Chapter 11 (Population and Land Use).
10	Timeframe	3	The timeframe of the tunnelling close to this particular street and how far the vibration is expected to radiate from the bore sight.	The possible impact of noise and vibration from TBM Passage only relates to impact on residents as the calculated vibration levels from Mechanical Excavation and TBM Passage are below the threshold for structural damage for any building type. Refer to Chapter 14 Groundborne Noise and Vibration. The duration of this impact from TBM Passage will be in the order of up to two weeks as the TBM passes. TII will liaise with residents to ensure the timing of these impacts are known. Unfortunately, there are no effective methods are available to reduce groundborne noise from TBMs at source. The principal mitigation measures aimed at minimising impacts are as follows: • Advance public consultation and stakeholder engagement can greatly reduce the significance of groundborne noise effects during construction, as building occupants would be prepared for the passage of the TBM and resultant elevated noise and vibration levels. • TII will accept and consider applications for additional measures on a case-by case basis, in accordance with its Noise and Vibration Mitigation Policy (see Appendix A14.6).

Submission No.			171	
Organisation Name or Name of Submitter			Lorraine Rooney (resident - 8 Saint Teresa's Place, Glasnevin)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: Intended Application by the NRA (Operating as TII Ireland) for te Railway (MetroLink Estuary to Charlemont via Dublin Airport) order (2022)				
11	Depth of Tunnel	3	The tunnel from ground to top level will be 15 metres. This is just short of 50ft which is not deep. The average depth of the underground in London is 24 metres, which would equate to 78ft.	The depth of the tunnel is suffcient and all assessments have been based on this depth. The assessments presented in Appendix 5.17 confirm the suitability of the alignment. Please refer to response item (4) and (5) above in relation to the assessment of the impact of ground construction activities at your property.
12	Drains & Water Table	3	There are several underground drains/culverts one that appears to run down the centre of St. Teresa's Place as on occasion the small drains have discharged water when there is excessive rain and the manhole cover at junction of Prospect Road and St. Teresa's place has lifted on occasion. In exceptionally heavy rain there is a channel of water running down each side of the street as there in an incline heading towards Botanic Road. Drains need adequate monitoring to ensure that no effluent is running into the surrounding ground.	The impact on water systems has been assessed and is presented in Chapter 18 (Hydrology) of the EIAR. As set out in Section 18.2.1 appropriate measures have been incorporated into the design of the proposed Project to avoid impacts where possible. Stringent mitigation measures are proposed and include for the management of the water regime within the vicinity of the Project as well as control of potential polluting activities associated with the Construction Phase. Refer to the Outline CEMP in Appendix 5.1 of the EIAR for proposed environmental mitigation measures. As noted, the contractor will produce a Water Management Plan that includes the objectives and information described in EIAR Appendix A5.1 which includes detail on the following: * The activities requiring water and the anticipated peak water demand for each site; * Where the water for each site will be sourced; * Strategies for minimising water use; * Strategies or conserving water; * Treatment of wastewater; and, * The means of disposal of wastewater. Under no circumstances will treated water be discharged to a watercourse without the respective water quality meeting the statutory limits as set out under the relevant EU Environmental Objectives for surface water. Detailed monitoring requirements will depend on discharge permit agreements put in place prior to any works commencing. The installation of continuous monitoring equipment may be required as part of the temporary discharge permit and/or license. This would include the installation field monitoring probes connected to telemetry system to continuously monitor parameters such as temperature, pH, TOC (Total Organic Carbon), total suspended soils (TSS), total disolved solids (TDS) and EC (Electrical Conductivity).

Letter Re: Intended Application by the NRA (Operating as TII Ireland) for te Railway (MetroLink Estuary to Charlemont via Dublin Airport) order (2022)				
13	Station Building	4	The building in the drawings does not enhance this area rather it detracts from what has the potential to be developed into a thriving business area, it is not in keeping with any of the local architecture. A building should grab people's attention, and become something that the community are proud of, are able to use as more than a station. This needs much more development as the Brian Boru is a landmark for anyone visiting the area with links to James Joyce's Ulysses, the mural on the side alone is something particular to the area. The station name is also very generic, and it if historic building are proposed for demolition there should be something kept in the memory banks, name the station the Brian Boru or similar. No one refers to this part of the city as Glasnevin it has been called Harts Corner since the 1920's when the Hearts Building was constructed. Is it the policy for large building projects to eliminate all connection with the previous history of an area? There is the possibility of a James Joyce Museum to be integrated into this building. This is a quote from document metrolink-concept-engineering-design-report.pdf. I fail to see where any of this has been incorporated in the station proposal for Glasnevin North.	TII disagree and believe the commissioning of internatially renowned architect Nicholas Grimshaw and Partners, has delivered a contemporary station design which is appropriate for a state of the art metro system such as MetroLink. Appropriately, significant emphasis is placed on the public spaces. Where feasible, the station concourse is a soaring space illuminated from above with natural light. Dublin's rich architectural heritage has been respected, but not copied in a pastiche imitation. In accordance with best conservation principles, as set out in the ICOMOS Venice Charter of 1964, the stations are architecturally distinguishable so as not to falsify the existing historic context. Reference and due respect to that context is made through the choice of high quality and appropriate materials and the scale of the interventions. The Project will deliver a robust and authentic design with a strong metropolitan identity, unique and sympathetic to Dublin. Concepts such as singular station volumes, use of natural light, intuitive wayfinding, robust and long-lasting materials, and contextual placemaking will be followed through all stages of development and construction, combining to form the very best in architectural vision. The 'Materials Palette' that has also been included with the Railway Order application further confirms the 'MetroLink Design Vision Principles', including the principle of achieving a 'Sense of Place' that reflects the local area, that are appropriate to the City, and the local context / character. Please refer to EIAR Chater 4. Unfortunately, due to the available land, combined with the construction challenges associated with providing this complex multi-modal interchange station that will deliver significant transport benefits by nature of its connectivity, there is no means of retaining the Brian Boru pub. TII acknowledge this is a significant impact. Before proposing the demolition of the Brian Boru pub, TII did carefully examine the alternative of locating a station at Drumcondra rather than Glasnevin as reported by EIAR Chapter 7, Consideration of Alternatives, section 7.6.5. Both options would require demolition of buildings with potential for significant impacts on architectural heritage, however, once the construction is complete, the proposed station location at Glasnevin offers a much better interchange station location for passengers, a key Project objective of MetroLink. The station is named Glasnevin Station for the purpose of the Railway Order Application. There are no current plans to change its name. The impacts of the Glasnevin works have been assessed and reported in the EIAR in Books 1 -4 of Volume 3. The Brian Boru pub will be recorded by means of photography and written description to English Heritage Level 3 standard prior to demolition. Please refer to Chapter 25 Archaeological and Cultural Heritage and Chapter 26 Architectural Heritage. A James Joyce Museum is not part of the Railway Order application.
14	Steering and Monitoring Group	4	A steering group needs to be set up; as there has to be a direct connection between the project developers with the local community and the residents, this has not been discussed. There needs to be full accountability and transparency. As we are to have to deal with a huge building project both underneath our homes and at a section of the community where our GP practice is and our chemists, what is the proposal if in the event of the station build these services have to be relocated.	Please refer to response item (2) in relation to the egagement that has been undertaken with local stakeholders in this area. As noted in Appendix A5.1 Outline CEMP, TII and the contractor(s) will take all reasonable steps to engage with stakeholders in the local community, especially those who may be affected by the construction works, including residents, businesses, community resources and specific vulnerable groups. The contractor(s) will be responsible for putting in place a Stakeholder Communications Plan which will be developed under the consent of a designated Public Liaison Officer appointed by TII. This plan will provide a two-way mechanism for members of the public to communicate with a designated member of the contractor(s)'s staff and for the contractor(s) to communicate important information on various aspects of the proposed Project to the general public. Regarding Prospect Medical Centre, this building is not on the list of demolition required for the construction of the Glasnevin Station. Additionally, during the construction of the station, pedestrian access to the Prospect Medical Centre will be assured at all times as presented in Appendix A9.5 Scheme Traffic Management Plan and the noise and vibration levels for Prospect Medical Centre (as presented in Appendix A14.5) will be below the threshold values thus a temporary relocation will not be necessary.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: Intended Application by the NRA (Operating as TII Ireland) for te Railway (MetroLink Estuary to Charlemont via Dublin Airport) order (2022)				
15	Community Fund	4	A fund needs to be set up for the local community as this area has no community hall, no facilities for residents to have community groups/functions/meetings and this should be incorporated into the new station. The proposed station building can easily accommodate commuters and residents. It is important that something is given back to the community as we are giving a huge amount, from having the potential of property damage, to the problems that may be caused commuting to the city centre and the effect it will have on local amenities/services especially for the elderly person.	TII will work with established Community Groups through the local community liaison officers along the route to identify projects at local level that would involve the Community in the delivery of MetroLink and its legacy. Such projects could include: - A local school learning programme. - Enhancement of community amenity within agreed funding limits. - Engagement with final landscape and finishing options, including aspects of biodiversity. TII are willing to explore mechanisms for investing in local initiatives to support affected communities during the works, such initiatives will be subject to funding being made available. As detailed in Chapter 3 (Background to the MetroLink Project), MetroLink will contribue to addressing challenges of compact growth, sustainable mobility, enhanced regional connectivity, enhanced international connectivity, transition to a low carbon and climate-resilient society, enhanced amenity and heritage, maximising sustainability gains, strong economy supported by enterprise innovation skills, access to quality childcare, education and health services and stenghtened rural economies and communities.

Letter Re: Intended Application by the NRA (Operating as TII Ireland) for te Railway (MetroLink Estuary to Charlemont via Dublin Airport) order (2022)				
16	Employment Prospects	5	How many employees do the shareholders envisage in this large station, what way will security be monitored throughout the station and the large plaza planned for this tract of land. Unmanned zones like this are a mecca for anti-social behaviour especially at night. How safe would people feel in an unmanned station and if there is an incident how quickly can this be addressed, as in a medical emergency, assault, train incident as you have in London with people stepping/falling out on front of trains. People like to feel safe in stations, especially at night so I do not envisage any station in Dublin feeling safe without a security service/garda presence.	The numbers of staff required to operate MetroLink have been estimated in order to design the facilities required at Dardistown Depot, including the Operational Control Centre, at the stations, Estuary Park and Ride, and other installations. The staffing numbers are presented in EIAR Chapter 6 MetroLink Operations and Maintenance and specifically section 6.11.However, the actual workforce will be determined some years into the future by the operator of the proposed Project, who has not been appointed at this stage. As presented in Chapter 6 (MetroLink Operations & Maintenance) while the supervision, control and surveillance of the stations will largely be carried out from the OCC (Operational Control Centre), some tasks will be performed within the stations themselves. Staff directed to the stations would be able to supervise and operate various systems from the station control room such as, the operation of escalators and lifts, lighting, PSDs (Platform Screen Doors), ticket vending machines, video surveillance, attend to help points, make announcements over the public address system, and fire detection and firefighting. Station staff may be required to sort out incidents, for example, rescuing passengers from lifts and restarting the lifts and opening and closing the PSDs. Refer to EIAR Chapter 6. The staff working at the OCC will be responsible for supervising the service, train management, power supply, customer support and security. In the event of an incident, they will be able to direct the response through controlling aspects of the train service (such as opening and closing train doors, and controlling lifts and escalators), monitor events through CCTV (Closed Circuit Television) in the stations and on the trains, respond to fire detection systems and anti-intrusion alarms, direct staff working at the stations and present on the trains to mobilise to the incident site, and liaise with the emergency services. At each station there will be a station incident room, which will be unattended during normal operation. The station incident room can be staffed locally to operate and control station systems, including associated sections of tunnel, without connection to the OCC during any emergencies or incidents. In case of an incident the protocol for the evacuation of the station includes: (Section 6.6.5 of Chapter 6 refers) •Release of security-controlled doors to facilitate evacuation from the station e.g. unlocking accesses and the doors to the technical rooms in the BOH (Back of House); •Escalators operating in the opposite direction to the egress will be smooth stopped; •The PAVA (Public Address and Voice Alarm) system will broadcast pre-recorded messages to guide the evacuation and ask passengers to keep calm; •Any equipment which can interfere audibly or visually with the alarm will be deactivated; •All lights will be forced upwards; •All emergency lighting will be activated to provide maximum visibility for evacuation; and •MetroLink operational personnel will be moved to the affected station to guide and supervise the evacuation. If the incident is due to a fire in the station, then additional automatic procedures are: •Immediate notification to the emergency services; •Activating visual and audible alarms; •Activation of the gas extinguishing system if the fire starts in a technical room equipped with this feature; •The sprinkler system will be activated in the area where the fire has been detected; •Normal HVAC (Heating, Ventilation and Air Conditioning) operation will be stopped except in the technical rooms; •The emergency smoke exhaust system inside the station will be activated; and •The over-pressure system in the emergency stairs will be activated to keep them smoke-free. The proposed project has been designed to prevent access to the track, including the installation of Platform Screen Doors (PSDs) at all stations and security fencing around the surface sections of the alignment. Unauthorised access will be monitored by CCTV placed at key locations and via the Access Control and Intrusion Detection system (ACID). EIAR Chapter 6 refers. The proposed Project requires command and control systems to operate the train service in a safe, efficient and reliable manner. These systems provide remote control and monitoring of the stations and trains, voice and data communications, information to passengers and the security to ensure safe operation.

Submission No.			171	
Organisation Name or Name of Submitter			Lorraine Rooney (resident - 8 Saint Teresa's Place, Glasnevin)

Letter Re: Intended Application by the NRA (Operating as TII Ireland) for te Railway (MetroLink Estuary to Charlemont via Dublin Airport) order (2022)				
17	Summary	5	So it is not just some old house to me, this street has witnessed the history of the area and has serviced many families since it was first built. It is not acceptable to put people in a situation that the house was so badly damaged it is deemed not fit for purpose what is the alternative proposed by the stakeholders in such a situation.	Please refer to response items (4), (5), (6), (7) above in relation to the assessment of construction generated ground movements and settlement. Please refer to response item (8) in relation to the proposed compensation offered by TII.
18	Summary	5	If we are to have a thriving area that people want to live in and visit we need to start to respect and appreciate our architecture which is considerably better and more durable than buildings that are going up today. They have a character that is an essential part of Dublin as a city and to allow a project to go ahead that may allow the demolition of some protected buildings and damage others is total lack of foresight on behalf of TII/Dublin City Council/other bodies involved with this project.	Please refer to response item (13) above in relation to the architectural design of te stations. TII's commitment to preserving Architectural Heritage is outlined in EIAR Chapter 26. As detailed, a Project Conservation Architect has been engaged to oversee the implementation of the Project. Prior to the establishment of construction compounds, the Project Conservation Architect (PCA) will undertake Structural and Condition Surveys of any built and cultural heritage constraints that will require removal to secure storage (followed by conservation and reinstatement) or protection in-situ. The PCA will also prepare specifications for these works. A specialist Heritage Works Contractor will be appointed to remove, store and conserve these constraints. The Main Construction Works Contractors will appoint Consultant Conservation Architects to implement required preservation of in situ works.
19	Summary	5	I do not believe that this metro will provide the income to cover the cost of building for decades to come and is another wasteful project that will take years to pay dividends.	In July 2022, the Government granted Approval in Principle to the NTA to enable the submission of a railway order application by TII to An Bord Pleanála in respect of the MetroLink project (Decision Gate 1). This approval was granted after the Preliminary Business Case (PBC) had undergone significant scrutiny and challenge by bodies that are independent of TII, including DoT and DPER review (including independent review by JASPERS and the Major Projects Advisory Group (MPAG)) of the PBC around timeline, costs and benefits that were updated to inform the Government decision.
20	Summary	5	There is also a total lack of communication from TII, a refusal to engage with the residents who are actually granting them permission to proceed, there is a huge displeasure within the area with the way TII/stakeholders and local representatives did not engage with residents. But this seems to be a standard procedure with these large construction projects which is a sad indictment for both our large infrastructure agencies and our local elected representatives.	TII disagree that there has been a total lack of communication and engagement with residents. Please refer to response item (2) above in relation to the engagement with local stakeholders including residents associations. Dates and details of these meetings have been presented in Appendix A8.19 Meetings Register.

Submission No.			173		
Organisation Name or Name of Submitter			Louise Broughton and Glenn Sharpe (114 Ballymun Road)		
Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
Letter Re: Metrolink Submission Land Tag - ML4G-ULL Area Number - 304: The White House 114 Ballymun Road Glasnevin Dublin 9					
1	Concerns	2	Metrolink's plans for a tunnel that runs directly under our property (See Appendix E) has the potential to damage not only our windows (which are single pane glazing) but the entire structure of the house.	Buildings and Infrastructure - A comprehensive Settlement Assessment (see EIAR Appendix A5.17 Building Damage Report) has been undertaken to determine the potential impacts that construction of the proposed Project will have on sensitive receptors such as buildings of Architectural Heritage importance such as yours from the advance of the TBM. In the case of your building, we can confirm that it is not directly above the tunnel, and approximately 25 m away from the tunnel centre line. The ground movement predictions and the building damage assessment methodology adopted for MetroLink is based on the approach adopted in most tunnel projects around the world, including London Crossrail and High Speed 2 in England. This is described in EIAR Section 5.4.11 (Ground Settlement Monitoring and Mitigation Works). EIAR Appendix A 5.17 Building Damage Report, covers the assessed impacts of construction generated ground movements and settlement on property. Table 5.2 of this report shows that your property (Reference B-145) has been assessed as falling within the '<i>Negligible</i>' category currently. The building risk categories shown in Table 4-4 of the aforementioned report are used to define the degree of building damage related to the Risk Category. The assessment undertaken is considered moderately conservative and has taken into account the type and significance of the building. Despite the minimal impact, as your building has been categorised as a special building, it will have a further Phase 3 assessment undertaken by the contractor taking into account the final design and methodology. Phase 3 assessments typically demonstrate impacts will be less than that currently assessed. Prior to any works commencing on the station and tunnelling works, a programme of area environmental monitoring will be undertaken, that will include ground movement, with predetermined monitoring trigger levels set to ensure that environmental limits are not breached. See EIAR Chapter 5, MetroLink Construction Phase, Sections 5.4.1. and 5.4.2, and Chapter 31 Summaries of the Route Wide Mitigation & Monitoring Proposed.	
2	Concerns	2	We were promised that Metrolink would make available to us a conservation architect (Summer 2020) to discuss our concerns. To date no architect conservation or otherwise has been in touch with us.	As described in the EIAR Chapter 26, Architectural Heritage, Section 26.7, a Project Conservation Architect (PCA) has been engaged to oversee the implementation of the Project. Prior to the establishment of construction compounds, the Project Conservation Architect (PCA) will oversee Structural and Condition Surveys of any built and cultural heritage structures. While the current settlement predictions are falling within the 'Negligible' category, due to its Architectural Heritage importance and proximity to the tunnel, your property will still be subject to a condition survey undertaken by the Project Conservation Architect (PCA). The purpose of the condition surveys would be to ascertain the condition of the property before, during (if deemed necessary), and after the completion of the proposed Project to determine whether there has been any deterioration of any of the property surveyed and whether the same may be attributable to the proposed Project and it will recommend repairs as appropriate. The surveys need to be closer to the time when construction commences to ensure the existing condition of the property is up to date. The role of the PCA, and the condition surveys and specifications they are required to undertake, is outlined in the Draft MetroLink Cultural Heritage Strategy provided as Appendix A25.1 to the EIAR. TII would also note that private home owners within 30m of the proposed tunnel (as defined in EIAR Appendix A5,17, Building Damage report, Section 4.6) are eligible to subscribe to the Property Owners Protection Scheme (POPS). The Property Owners' Protection Scheme is in addition to the existing legal rights of property owners and is in place to provide a simple and prompt way of rectifying any damage caused under the project up to the ceiling of €45,000. If the sum should exceed this amount the normal claims process would be used with the insurance companies for TII and/or the contractor. Useful information on POPS can also be found in the MetroLink Frequently Asked Questions document which can be found on-line at: https://www.metrolink.ie/assets/downloads/MetroLink_FAQ.pdf	
3	Concerns	2 and 3	We require assurances that a conservation architect will be made available to us if the proposed construction of the tunnel and the current preferred route transpires.	As described in the EIAR Chapter 26, Architectural Heritage, Section 26.7, a Project Conservation Architect (PCA) has been engaged to oversee the implementation of the Project and TII confirm that the Project Conservation Architect will be made available to you. They will coordinate the necessary surveys and will compile a photographic record of condition.	
4	Concerns	3	In the event that construction does go ahead and our property is damaged in any way we formally call upon Metrolink/TII to make good that damage in the form of suitable compensation. In this regard we formally request that our property is registered with the Property Owners' Protection Scheme.	Please refer to Response (2) above related to the POPS scheme.

Letter Re: Metrolink Submission Land Tag - ML4G-ULL Area Number - 304: The White House 114 Ballymun Road Glasnevin Dublin 9					
5	Intervention shaft location/ construction and operational impacts / zoning / protected structure	3	We have alluded to the additional submissions that we are supporting and in the context of the proposed location of the Tunnel Intervention Shaft we would have grave concerns given its close proximity to our house not only at construction stage but operationally also. If the shaft is constructed in its proposed current location we will be the closest property to the shaft. We feel that this shaft location is inconsistent with the Development Plan and the current zoning of our area. It seems incongruous to us that a protected structure would not be afforded the protection it surely deserves by the ill thought out construction of a ventilation shaft on its doorstep. We therefore call on the Bord to consider the prohibiting of a shaft at this location in favour of a station in the midway section of Albert College Park.	The Intervention shaft is approximately 50m north of your property boundary and due cognisance of the protected status of your property has been taken. Refer to Response (2). TII disagree with the statement that the location of the intervention shaft has been poorly planned. The rationale for the location, layout, access provision, finishing and landscaping of the proposed Albert College Park Shaft (ACP) are provided in the Report on the ACP Tunnel Intervention Shaft included as Appendix A8.16 of the EIAR Chapter 8, Consultation. The location of an intervention shaft needs to be in close proximity to the alignment in order to avoid the requirement for an elongated intervention tunnel. Diagram 7.39 of EIAR Chapter 7, Consideration of the Alternatives identifies the limited area within which it is possible to locate an intervention shaft at this location. The location assessment considered a number of factors including environmental impact, constructability, distance from the main tunnel and suitable road access. The intervention shaft should be no more than 1000m from either Collins Avenue or Griffith Park Stations. As a result, the intervention shaft must be situated either immediately north of Hampstead Avenue in the south-west corner of Albert College Park; or within the residential area immediately south of Hampstead Avenue. As set out in section 4.17.5 of the EIAR Chapter 4, Description of the MetroLink Project, and detailed on drawing ML1-JAI-SRD-ROUT_XX-DR-Y-03001 Plan Drawings ML-VT- 304 G-H, the shaft is located on the South West corner of Albert College Park. Access and egress has focused on resident feedback with both provided onto Ballymun Road. The EIAR sets out the mitigation measures to reduce the impact locally during construction phase and also in operation. In construction phase the appointed contractor will be required to prepare their plans for the delivery of the Works at ACP in accordance with the requirements set out in the Construction Environmental Management Plan (CEMP), an outline of which based on the EIAR is provided in Appendix A5.1 of the EIAR. Operational impacts have been offset by consideration of the design of the structure and buildings and the proposed landscaping. As referred to in Appendix A8.15, the outline details of the proposed shaft were shared during the Local Area Consultation in early 2020. Feedback taken from that consultation together with discussions with Dublin Fire Brigade and other stakeholders have influenced the development of site layout and the landscaping to mitigate any visual impact, with access and egress provision now provided of Ballymun Road. As set out in section 4.17.5 of the EIAR Chapter 4, Description of the MetroLink Project, and detailed on drawing ML1-JAI-SRD-ROUT_XX-DR-Y-03001 Plan Drawings ML-VT- 304 G-H, the shaft is located on the South West corner of Albert College Park. Access and egress has focused on resident feedback with both provided onto Ballymun Road. Chapters 27 (Landscape & Visual) and 15 (Biodiversity) set out the assessment into the potential impacts at Albert College Park. The proposed ventilation shaft lies within lands zoned Z9 in the Dublin City Development Plan 2016-2022 (in force at the date of lodgement) and the Dublin City Development Plan 2022-2028 which is now in force. As a structure considered to come within the description of Public Service Installation in the Dublin City Development Plan 2022-2028, it is considered that the Ventilation Shaft is a Permissible Use under the Z9 zoning and is therefore compliant with the zoning objective.	

Submission No.			174	
Organisation Name or Name of Submitter			Hanashoe Solicitors, on behalf of the Estate of John Quinn (Deceased) (Represented by Kevin J. Hamell & Associates - Consulting Architects)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Intended Application by the National Roads Authority (operating as Transport Infrastucture Ireland) for the Railway (Metrolink-Estuary to Charlemont via Dublin Airport) Order (2022).				
1	Introduction	2	I have been instructed by M.E. Hanahoe Solicitors of Sunlight Chambers, 21 Parliament Street, Dublin 2 to make a submission regarding the above on behalf of the Estate of John Quinn (Deceased) Apartment 10, Block A, Dalcassian Court, Dalcassian Downs, Finglas Road, Dublin 11. M.E. Hanahoe are Executors for the Estate of the said late John Quinn. The attached Title Map shows the location of Apartment 10 Block A and its designated car parking space. The proposed development will adversely affect the property in many ways. - The Railway Order itself as a threat to the property. - The proposed permanent land take. - The proposed temporary land take. - The construction works.	TII thank you for your response. We have reviewed the submission and provided detailed responses for the issues and concerns raised below.
2	The Railway Order Itself as a Threat to the Property (paragraph 1)	2	The very fact that the property is affected by a Railway Order means that even by now Apartment 10 Block A will have greatly depreciated in value. Potential buyers will not want to buy an apartment with no carparking and no open space during the 10 year construction period. Even when construction is complete there will be very little parking and very little open space.	Where an entitlement to statutory compensation exists, each claim will be assessed on its own merits. The assessment of compensation and relevant heads of claim are derived from a combination of statute, case law and established practices which are referred to as the compensation code. There needs to be casual connection between the loss and the acquisition due to the scheme, which should not be too remote. Claimants are expected to take reasonable steps to mitigate their loss and cannot claim any unavoidable losses. Experienced professionals should advise on the relevant heads of claim which commonly include the following: (i) value of legal interest in land e.g. freehold or leasehold (ii) severance or other injurious affection which relates to the devaluation of the retained lands (iii) disturbance and other matters including professional fees and losses sustained or expenses incurred by an owner as a result of the acquisition of land. While the duration of all works at Glasnevin are anticipated to take approximately 8.5 years to complete (EIAR Chapter 5, Diagram 5.4: Summary Construction Programme), the duration of temporary land possession outside Dalcassian Court will be approximately 6.5 years. Further, TII commit to procuring their contractor to further reduce this temporary land possession period during the construction phase.
3	The Railway Order Itself as a Threat to the Property (paragraph 2)	2	Apartment 10 currently has a designated car parking space in the area of the temporary land take. There is no certainty that this situation will still obtain when the construction works are completed and the temporary land take areas are returned to the apartment complex. Residents of Blocks A & B will have lost virtually all their amenity space as well as all their parking spaces.	On completion of the works at Glasnevin Station, TII intend to reinstate the existing carpark and amenity in a reconfigured layout. Please refer to Railway Order Plans\Drawings - Structures Details Book 2 of 3 MetroLink Stations Dublin City Council, sheet 21 of 61 (Drawing reference ML1-JAI-SRD-ROUT_XX-DR-Y-02057). Referring to land parcel reference ML 4N A2 - The permanent plot is referenced as it is the footprint of the underground station box where it is top down construction. TII can return surface rights, subject to any necessary restrictions, to the balance of ML 4N A2 lands not required permanently by MetroLink at surface level i.e. Fire brigade lift etc. In the case of The Court Dalcassian the property acquisition requirements are represented on the property plans and include, permanent and temporary elements together with substratum requirements in relation to the underground tunnel element. The above-mentioned drawing shows the reinstatement of large parts of the enclosed estate common areas at surface level, including the restoration of the equivalent number of demarcated car park spaces, landscaping and heritage items. In the intervening period, between the commencement of construction and subsequent reinstatement of car park spaces, temporary parking will be provided. TII are in discussion with the local authority and other parties to identify a suitable location in the immediate vicinity. This process will involve engagement with parties whose property interests may be directly impacted by the proposed works and it is the intention to communicate and outline all available options with as much notice as possible in advance of the works commencing within the grounds of the apartment development. See response (2) above where an entitlement to statutory compensation exists.
4	The Railway Order Itself as a Threat to the Property (paragraph 3)	3	The Metrolink Non-Technical Summary 7. 5.6.3.1 confirms that the Glasnevin Interchange Station is classed as Major Construction Works. Construction will include the new Glasnevin Station, new railway platforms for the Western Commuter Line and the Southwestern Commuter Line and a vast common concourse. There will be major alignment works to the existing Iarnrod Eireann track. There will also be extensive works to the Royal Canal involving closure of the canal and its walkways.	TII acknowledge that there will be extensive works required at Glasnevin Station for a prolonged period and that these works will be disruptive. The impacts of the works and the measures proposed to mitigate during construction and operation of the MetroLink are set out in the EIAR documents. It should be noted that the closure to the canal is temporary in nature, as is the walkway closure with suitable alternative provided as evidenced in Chapter 5 of the EIAR.

Submission No.			174	
Organisation Name or Name of Submitter			Hanashoe Solicitors, on behalf of the Estate of John Quinn (Deceased) (Represented by Kevin J. Hamell & Associates - Consulting Architects)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
5	The Railway Order Itself as a Threat to the Property (paragraph 4)	3	When completed Glasnevin Station will transform my client's environment from being a tranquil backwater to a bustling hub of activity. Many of the existing occupants of the apartments will choose to leave the area and thus destroy the feeling of community within the three blocks of apartments.	TII acknowledge that the surrounding environment will change with the implementation of this Project. The Dublin City Development Plan zoning for this area is" a district centre" Section 11.5.3.1 of Chapter 11 of the EIAR outlines the proposed Glasnevin Station shall positively facilitate the land use zoning 'District Centre' and will enhance the public realm. The impact on the local population post construction is considered to be positive, moderate, and long-term, as the proposed station will enhance the functioning of the area as a "district centre" allowing enhanced connectivity to the area, benefiting the local communities and businesses.
6	The Proposed Permanent Land Take. (paragraph 1/2)	3	I attach Map A showing the Dalcassian Court apartment complex outlined in red and the permanent Land Take Area coloured yellow. The yellow area comprises circa 1,445 sq. metres and is made up of 23 car parking spaces and a very large amount of visually attractive planted open space amenity area. The enclosed Map B shows the apartment complex outlined in red and the extent of landscaping that will be lost forever.	The existing landscape will be significantly impacted during the construction phase of the project requiring the felling of trees and the removal of other vegetation in this area (Refer to Chapter 27 Landscape). However, it is important to note that on completion of the construction phase, planting will be re-established within the garden area to be reinstated, although at a reduced size when compared to the existing area. For details of the proposed carpark and garden area reinstatement, please also refer to response item number (3) above.
7	The Proposed Permanent Land Take. (paragraph 3)	3	The development of the Dalcassian Court apartments was granted planning permission on foot of drawings showing these 23 car parking spaces and the full extent of the existing open space amenity.	The planning application for the site is no longer applicable as the site has already been developed, in line with that planning approval. Once granted, the Railway Order will authorise the land-take proposed in the application documents. During the construction phase, the loss of parking and landscape at the site will result in a significant impact. Following completion of the station works, the parking spaces will be reinstated and although reduced in size the vast majority of the landscaped area will also be reinstated in a new reconfigured layout. For details, please refer to response item number (3) above.
8	The Proposed Permanent Land Take. (paragraph 4)	3	To reduce both car parking and open space by the extent shown on the proposed land take would render the planning permission null and void. The apartments would then become unmarketable and would not constitute legitimate collateral in terms of raising finance.	Please refer to response item numbers (3), (6) and (7) above.
9	The Proposed Permanent Land Take. (paragraph 5)	3	At the completion of the construction period the residual land between Block B and the permanent land take area could only provide safe parking for about 6 cars. This would leave a permanent deficit of 17 car parking spaces as well as the loss of grassed and planted open space.	Please refer to response item numbers (3), (6) and (7) above.
10	The Proposed Permanent Land Take. (paragraph 6)	3	Perhaps additional parking could be provided by Transport Infrastructure Ireland on the land at the rear of the Brian Boru Pub.	As set out in the application documentation, the rear of the Brian Boru is required for construction and subsequently by the station and hence is unavailable.
11	The Proposed Temporary Land Take. (paragraph 1-3)	3	The extent of the temporary land take is shown coloured blue on the attached Map A. It comprises circa 1,054 sq. metres which currently contains 9 car parking spaces and a large tract of landscaped open space running from east to west across the full width of the land south of Blocks A & B. During the construction period neither Block A nor Block B would have any car parking spaces available to their residents. Blocks A & B combined comprise 12 Two Bedroom and 24 One Bedroom dwelling units. They are homes to circa 60 people. There is no other part of the apartment complex that could accommodate additional parking spaces.	Please refer to response item numbers (3), (6) and (7) above.

Submission No.			174	
Organisation Name or Name of Submitter			Hanashoe Solicitors, on behalf of the Estate of John Quinn (Deceased) (Represented by Kevin J. Hamell & Associates - Consulting Architects)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
12	The Proposed Temporary Land Take. (paragraph 4/5)	4	Transport Infrastructure Ireland haven't offered any alternative parking for the construction stage or post-construction. The north boundary of the temporary land take area is shown to be 5 metres from the south wall of Block A and 2 metres from the south wall of Block B. This situation might be tolerable for a very short period of say 3 months but it would be absolutely unbearable for a period of 10 years.	TII acknowledge the impact that the proximity of the construction site will have on these properties together with loss of parking during the construction phase. TII are actively engaged in sourcing suitable alternative parking for residents for the duration of the works. It is in anticipated that tempoary carparking arrangements will be secured in advance the commencement of tthe works. See also item (3) above. While the duration of all works at Glasnevin are anticipated to take approximately 8.5 years to complete (EIAR Chapter 5, Diagram 5.4: Summary Construction Programme), the duration of temporary land possession outside Dalcassian Court will be approximately 6.5 years. Further, TII commit to procuring their contractor to further reduce this temporary land possession period during the construction phase.
13	The Proposed Temporary Land Take. (paragraph 6	4	The south walls of Blocks A & B have 24 living room and bedroom windows and 6 balconies which will virtually touch the hoarding of the temporary land take area. This situation will have to be brought to the attention of the Health & Safety Authority. It simply cannot be permitted.	The positioning of Hoarding in such close proximity to the apartments at Dalcassian Downs is not considered by TII to be a health and safety risk and in fact is being proposed to protect the residents from the potential impacts arising from the construction of MetroLink. However it is acknowledged that the proximity of such hoarding will have the effect of reducing light to these properties and as such TII will be engaging with the owners and occupiers of the effected properties to arrived at appropriate alternative arrangements to mitigate these construction phase effects.
14	The Construction Works. (paragraph 2)	4	The Dalcassian apartments, as they adjoin the construction site, will suffer from heavy traffic, restricted vehicular access to their homes, loss of their tranquil open space amenity, loss of parking spaces, poor air quality and virtually non-stop demolition and construction noise and dust.	Access and Parking: Appendix A9.5 to the EIAR outlines an assessment of the potential traffic impacts in the area of Dalcassian Downs during the construction period. It has identified that there will be no restricted vehicular access to Dalcassian Downs and that impacts on traffic flows in the area will be minor, primarily occuring during the enabling works period. As referred to in response item number (12) above, it is acknowledged that reducing parking within areas of the estate will mean that people may need to walk further from their cars to their apartments. Noise and Vibration: As identified in the EIAR (Chapter 13 Airborne Noise& Vibration), the exceedence of noise limits at the majority of properties within Dalcassian Downs will be mitigated by the use of mitigation measures described in that chapter, including the use of hoarding. However further mitigation measures will be required in line with the TII Airborne and Groundborne Noise Mitigation Policy at 1-18 The Court Apartments and 19-36 The Court Apartments, Dalcassian Downs. Air Quality: In terms of dust generation there is potential for significant dust generation at Glasnevin as outlined in Table 16.44 of Chapter 16 Air Quality of the EIAR, if not miitgated. However Section 16.61 of Chapter 16 Air Quality and the Construction Environmental Management Plan outlines measures that will be undertaken to manage the effects of the generation dust. Consistent implementation of good dustmitigation practices will ensure that the impact from construction dust is not significant.
15	The Construction Works. (paragraph 3/4)	4	Paragraph 7.1.1 of the Metrolink Non-Technical Summary states that the normal working hours will be 07.00 to 19.00, with a 30 minute site preparation time either end. The site will therefore be in operation from 06.30 to 19.30, a total of 13 hours, every day except Saturday and Sunday. Saturday will have a working day of 7 hours, 06.30 to 13.30.	TII acknowledge that the wording within the Non Technical Summary is misleading when defining "normal working hours". For clarity, the proposed working hours at Glasnevin Station are set out in full within Chapter 5: MetroLink Construction Phase, section 5.2.4 Construction Working Hours, and table 5.5: Schedule of Working Hours at each Construction Compound. In terms of the definition of the standard working hours that would be applied at Glasnevin Station and elsewhere on the Project, we refer you to table 5.3 that allows for 30 minutes at the start and conclusion of each shift included within the standard working hours stated. For clarity the total normal working hours are 07.00 to 19.00 Mon-Fri and 07.00-13.00 on Saturday. (These times are inclusive of the site prep time at either end.)
16	The Construction Works. (paragraph 5)	4	In addition to this Paragraph 7.5.6.3.1 states that works to the Iarnrod Eireann infrastructure at the Glasnevin Station will operate for 24hrs every day.	This summary of the proposed working hours is correct, but the reference in the EIAR document for 24hour/7 day a week working is limited to some activities only. These activities are listed in Chapter 5: MetroLink Construction Phase, Table 5.5, stating as follows: - Sliding New Rail Bridge into position (GSWR). - Blockades or weekend possessions works required with Irish Rail, where works such as piling, structural or the installation of protection are next to the live operational railway lines. - MEP Works within the completed station structure.
17	The Construction Works. (paragraph 6)	4	Tunelling works will also operate for 24 hours every day.	This summary of the proposed working hours is correct. However, it should be noted that the passage of the Tunnel Boring Machine will only effect these properties for a short duration of time i.e maximum of up to 2 weeks (estimated)

Submission No.			174	
Organisation Name or Name of Submitter			Hanashoe Solicitors, on behalf of the Estate of John Quinn (Deceased) (Represented by Kevin J. Hamell & Associates - Consulting Architects)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
18	The Construction Works. (paragraph 6)	4	Residents of these departments are going to undergo a dreadful ten years of severe disturbance.	We note the concern. Mitigation measures will be put in place to minimise the construction impacts and disturbance to the residents as outlined in the EIAR and further referred to above in response item numbers (12), (13) and (14) above. In addition, the statutory compensation process will be available to all parties entitled to make a claim. Further information is available on the Compulsory Purchase Order (CPO) Guidelines available under the Your Property section of the MetroLink website. https://www.metrolink.ie/media/0jlpbyso/metrolink_cpoguideline_final_september-2022.pdf
19	Conclusion	4	The proposed works will greatly and adversely affect Apartment 10 Block A Dalcassian Court in terms of loss of value, loss of amenity and loss of tranquillity both during and after construction.	Please refer also to response item number (2) above. TII acknowledge that there will be extensive works required at Glasnevin Station for a prolonged period and that these works will be disruptive. The impacts of the works and the measures proposed to mitigate during construction and operation of the MetroLink are set out in the EIAR documents. During the construction phase, the loss of parking and landscape at the site will result in a significant impact. Following completion of the station works, the parking spaces will be reinstated and although reduced in size the vast majority of the landscaped area will also be reinstated in a new enclosed and reconfigured layout. For details, please refer to response item number (3) above. In addition, further mitigation measures will be required in line with the TII Airborne and Groundborne Noise Mitigation Policy and TII is committed to engagement with residents and the owners management company in relation to impacts to common areas during works and proposed mitigation measures, temporary car park options, and common area reinstatement post construction.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) Order 2022				
1	(1) Metro North Proposal	2	An Bord Pleanála approved the original Metro North proposal in late 2011. Unfortunately the permission expired in 2021. Under that proposal there were 16 stations proposed from Belinstown to City Centre which is the same number being proposed for the Metrolink Project. We believe that there would be no impediment to a further application being made to An Bord Pleanála to extend the permission for a further period to facilitate approval from Government to proceed in respect of the Metro North proposal. This would mean that there would be a Metro from the airport to the City in a much quicker time scale than envisaged under the Metrolink proposal.	Thank you for your submission and for sharing your observations with regards to the MetroLink project to which we have responded below. EIAR Chapter 3 (Background to the MetroLink Project) presents a review of the need for the MetroLink project in the context of the historical development of a proposed metro system for Dublin as supported by transport and planning policy since 2001. The need for the proposed Project is discussed based on reference to the current challenges identified in relevant plans and policy documents and how these challenges would be met by the proposed Project. All policy documents referenced in this Chapter are publicly available documents and can be sourced from the documents authors. Alternatively, each of the documents cited below can be downloaded from the website www.MetroLink.ie/background information. Chapter 7 (Consideration of Alternatives) details the decision-making process that has led to the development of the proposed Project, including assessing the previous Old Metro North project. The proposed Project in its current form represents the same alignment as Old Metro North but includes for a number of significant variations such as shorter platforms, smaller stations, reduced rolling stock, fewer stations and vertical alignment changes. Therefore it presents an 'Optimised Metro North'. The assessment identified an Optimised Metro North (LR7) as the best medium- and long-term transport project for the Greater Dublin Area for the following reasons: * It was the most economically advantageous scheme when compared to other options, delivering the highest benefit to cost ratio (BCR) of 1.5, almost double the BCR of the next best scheme (Tunnelled Luas); * It generated the highest level of transport benefits when compared to other options, with the highest number of additional public transport trips generated in the morning peak travel period; * It provided a new strategic public transport corridor, avoiding reliance on either the existing heavy rail lines or the Luas Cross City line; * It delivered a connection right into the centre of the city, serving O'Connell Street and St. Stephen's Green; * It retained the opportunity to extend Luas Cross City to Finglas, which would not be feasible if the tunnelled LUAS options were selected, and it avoided reducing the service level on LUAS Cross City to Cabra and Broombridge; * Due to the high level of segregation, it was considered to significantly increase capacity to allow for potential future growth along the corridor, when compared to other options; * It could potentially be extended southwards in the longer term to alleviate high travel demand on the LUAS Green Line, and ultimately form a complete north south metro corridor traversing both the north and south city; and * This option delivered the highest safety benefits when compared to other options. The preferred route for MetroLink was published in 2019. The preferred route incorporates changes arising based on further design development and further assessment of alternatives arising out of consideration of the public feedback received on the 2018, Emerging Preferred Route. Significant changes included the termination of the route just south of Charlemont Station, a change from Twin Bore tunnel to Single Bore configuration, the replacement of the R132 elevated section to cut and cover running on the eastern verge of the R132. The preferred route also provided for a change of rolling stock from light rail vehicles (Luas Type vehicles) to Light metro vehicle and then introduction of automated trains to Grade of Automation 4 (GoA4). Refer to Chapter 7 (Consideration of the Alternatives) for details of alternatives assessed during this stage of design development.
2	(1) Metro North Proposal	2 and 3	It should also be noted that acquisition of property in the vicinity of Drumcondra Railway station, which was to be a Metro station under the Metro North proposal, has already been completed. Indeed the cost of property acquisition for the latter proposal equates to €23.2 million together with expenditure of €61.6 million on external consultancy fees. Information released in December 2021 by the National Transport Authority revealed that a total of €163.6 million has been spent to date on the Metro North Project, is this colossal sum now all to be wasted?	Please refer to response item (1) in relation to the development of the proposed Project from Old Metro North. The properties acquired for Metro North remain in the ownership of the state and have significantly appreciated since their purchase. The properties will remain in State ownership for the foreseeable future until such time as a decision on their future use is decided upon.

Organisation Name or Name of Submitter			Management Company Board on behalf of 17 The Court,Dalcassian Downs	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) Order 2022				
3	(2) Glasnevin Station (a) commentary on claimed justification for station location	3	It has been claimed by TII that trip indicator/trip demand for a station at Glasnevin is greater than for a station at Drumcondra. We do not accept this for the following reasons: • Increasing use of Croke Park stadium for sporting and concert events surely justifies a Metro station nearby. • In terms of residential development, there are plans to construct over 1600 residential units in the grounds of Clonliffe College on Clonliffe Road which proposal was approved by An Bord Pleanála towards the end of 2021. The expanded population in the Lower Drumcondra Road area will require access to a proximate Metro station whereas there is little land available near the proposed Glasnevin station to facilitate residential development now or in the future so one wonders where the trip demands will emanate from. • In addition and in relation to educational establishments, St Patricks College in Drumcondra and All Hallows College in Church Avenue, both now part of DCU, create a bigger demand for student transport usage than the Glasnevin station option which has no similar facilities anywhere nearby. • It has also been acknowledged that during the previous public consultation phase that the Drumcondra Metro station location fared better than the Glasnevin Station location under the headings of landscaping, visual effect, archaeology, architectural issues and cultural and heritage items.	As outlined in Chapter 7 (Consideration of Alternatives), the Glasnevin Station location was chosen instead of Drumcondra as the provision of a station at Glasnevin will better meet the requirements of the Transport Strategy for the GDA for the following reasons: • It will facilitate a seamless transfer/interchange with both the Maynooth (Western Commuter line) and Kildare railway line (South-Western Commuter line) because the PPT and Maynooth lines are at their closest point horizontally and vertically at Glasnevin, thereby providing the opportunity for a MetroLink station to capture transfer to and from these lines more effectively than at Drumcondra. • The Glasnevin location also facilitates the construction of an integrated metro station as the two heavy rail lines are beneath the existing ground level, making it possible to connect via an underground concourse to all three rails in a short plan distance. At Drumcondra, the connection to both lines would require a connection of approximately 110m with more significant vertical connections between the two lines also required. • The further advantage of Glasnevin is that it is located approximately 1km to the west of Drumcondra. This saves over 2 minutes in journey time by offering the opportunity for passengers to transfer sooner from heavy rail to MetroLink at Glasnevin to access city centre locations to the south or to the Airport/Swords to the north. • Route options serving the Glasnevin station are forecast to have approximately 6000 additional passengers per day when compared to an interchange station at Drumcondra. This is largely due to the increased interchange opportunity at Glasnevin with the heavy rail network. • Passengers transferring from the Maynooth or Kildare lines to MetroLink and travelling on to Dublin city centre will experience shorter journey times (approximately 3 minutes).
4	(2) Glasnevin Station (a) commentary on claimed justification for station location	3	For all these reasons, the divergence of the Metrolink preferred route from the Metro North route, thereby necessitating a station at Glasnevin, has not been justified beyond transport impact. We believe there is also a deficiency in modelling assumptions and baseline data collation. We also believe that the plans and documentation as prepared fail to demonstrate that an adequate and compelling case has been put forward by TII in support of the significant deviation from the previously approved Metro North proposal which adequately fulfilled the main objective of the overall exercise which is to create speedy access to the City Centre from North County Dublin and Dublin Airport.	Please refer to response items (1) and (3) above related to the assessment of the proposed Project in comparison with Old Metro North, and selection of Glasnevin Station.

Submission No.			175	
Organisation Name or Name of Submitter			Management Company Board on behalf of 17 The Court,Dalcassian Downs	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) Order 2022				
5	(2) Glasnevin Station (b) impact on residential community at the Court Dalcassian Downs	4	The apartment development at The Court Dalcassian Downs was constructed around 1990 by Bovale Developments. The complex is well maintained and contains attractive gardens. It consists of 48 apartments of varying sizes in 3 blocks. The major issues of concern to residents include the following: • impact on quality of life • parking disruption with the loss of 32 parking spaces • health impacts on residents, especially young children and elderly people • stress and anxiety leading up to and during construction • reduction in natural light • sleep disturbance • noise and vibration • dust and fumes • vermin disturbance and encroachment • reduction in property values • potential damage to properties • no view outwards because of proposed hoarding line directly outside the front doors and apartments of Blocks 1 and 2 along the edge of the construction site • loss of amenity • loss of shared communal green space • restricted access for emergency services	TII acknowledge the environmental impacts on the residents of Dalcassian Downs and have engaged with them on the development of the proposals. The EIAR details in full the proposed environmental protection measures to be implemented during construction. One of the key aspects of environmental control during the construction phase is the requirement for the appointed contractor to prepare a detailed design and construction methodologies plan in the form of a detailed Construction Environmental Management Plan (CEMP) to ensure all environmental impacts are managed and mitigated in accordance with the EIAR and Railway Order, assuming an Enforceable Railway Order is granted. This detailed CEMP(s) will be provided to DCC for consultation and approval in advance of any construction works on site. An Outline CEMP is included in Appendix A5.1 of the EIAR that will be developed further by the appointed contractors. Monitoring instrumentation will also be used throughout the works to monitor potential environmental impacts, including those discussed above to ensure that acceptable limits are not breached. In addition, TII will appoint an Employer Representative to monitor compliance with the CEMP on their behalf. This will involve the appointment of temporary or permanent specialists with appropriate skills and experience as required to implement on-site procedures and monitor construction on behalf of TII to ensure impacts do not exceed those identified in the RO, i.e., competent experts in biodiversity, architecture, archaeology and cultural heritage, noise and vibration, dust, waste, soils, land, ground movements, contamination, and water. In addition, regulatory and statutory bodies may undertake site visits to monitor compliance with legislative and regulatory requirements. A Freephone (e.g., 1800) helpline service will also be maintained during the Construction Phase to deal with enquiries and concerns from the general public. Furthermore, as detailed in EIAR Chapter 5 (MetroLink Construction Phase) the programme for the construction of the proposed Project has been optimised to minimise the duration of the Construction Phase in order to lessen the duration of potential environment impacts, while ensuring that the areas surrounding the work sites remain operational and functional. Work will run concurrently at all MetroLink site locations to ensure the Project is delivered in an effective and timely manner. The potential impacts associated with the construction phase activities of the proposed Project on the residences and businesses are addressed in the EIAR Chapter 11 (Population & Land Use) with mitigation measures proposed where required. This includes potential noise and vibration impacts from construction activities as detailed in Chapter 13 (Airborne Noise & Vibration) and Chapter 14 (Groundborne Noise & Vibration) disturbances to the local road network as detailed in Chapter 9 (Traffic & Transport) and dust risk as detailed in Chapter 16 (Air Quality). Measures to mitigate and monitor impacts as a result of construction activity across the proposed Project are also detailed in Chapter 5 (MetroLink Construction Phase) and summarised in Chapter 31 (Summaries of the Route Wide Mitigation & Monitoring Proposed). Please refer to the responses below for further details on the issues you have raised.

Submission No.			175	
Organisation Name or Name of Submitter			Management Company Board on behalf of 17 The Court,Dalcassian Downs	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) Order 2022				
6	(2) Glasnevin Station (c) impacts during and post construction	5	It is unquestionably the case that a number of residents will suffer extreme stress and anxiety in the lead up and during the construction phase of the Project. This is not something that can be prevented by TII and proposals to deal with this are set out in Section 3 later in this document, under the heading of General Comments on the Metrolink Project including Necessary Mitigation Measures. In conclusion under the heading of impacts, it is a fact that apartments at the Court will be rendered unsaleable during the construction phase of the Metrolink. Indeed apartments are already being put up for sale as their owners are very concerned about the potential negative effect on property values and are trying to get ahead of the Project so to speak. The matter of compensation for individual owners during construction, therefore, needs to be adequately addressed by TII and this issue will be further alluded to later in this document.	In the EIA process, potential adverse effects on psychological health are often mentioned, for example, anxiety and stress experienced by people worried that they would experience a change in the environment in which they live. The potential for psychological effects is detailed in EIAR Chapter 10 (Human Health), section 10.3.5.1.5. Within the EIAR Chapters, human receptors that may experience annoyance from the temporary and short-term effects of the Construction Phase, such as noise or dust, are identified. Annoyance is not in itself a health effect, although it is recognised that there can be potential impacts on a person's overall psychological wellbeing. If someone develops a psychological illness such as anxiety or depression this becomes a medical impact. There are various degrees of psychological impact, and these can be both positive and negative. Although identifying the potential impacts is possible, quantifying them is difficult as there are no direct measurements available, and the same impacts may have different effects on different people. For example, for some individuals demolishing an old building could be viewed as removing an eyesore or making way for something better but alternatively for others, it can be seen as a loss of heritage. While some impacts on health are predictable, such as the impacts of increasing noise or decreasing air quality, the impacts on psychological health from the same situation can differ very significantly between people depending on their perspectives. This summary is presented in section 10.3.5.1.5 of Chapter 10 (Human Health). There will also be negative effects of varying degrees. These can be minimised by construction and operational mitigation measures and also by communication and provision of regular factual information. In terms of assessing the psychological impact, an impact is assessed as either positive or negative, if it is likely that the overwhelming majority of people will experience that effect. Where different psychological impacts are anticipated from the same scenario the assessed psychological impact is neutral. This summary is presented in section 10.3.5.1.5 of Chapter 10 (Human Health). TII acknowledge that it will be difficult for owners to sell their properties while MetroLink works are ongoing, however TII does not have powers of compensation for this scenario where a property is outside of the project red line boundary for the scheme. TII believe however that affected owners will benefit from an uplift in the value and saleability of the affected property once the MetroLink is operational.
7	(3) General Comments on the MetroLink Project including necessary Mitigation Measures	5	Having examined the various documentation, we consider that the following mitigation measures and conditions need to be applied by An Bord Pleanala should it be decided to grant the Railway Order: • environmental limits need to be prescribed in specific conditions and in general at particular locations and at specific times of day.	Environmental limits will be prescribed by the Railway Order. A significant proportion of mitigation is already incorporated into the design of the proposed Project through mitigation by prevention. Where an impact to the environment has been deemed as unacceptable, mitigation has been embedded in the design or the unacceptable option has been ruled out. Mitigation measures have been proposed for all impacts resulting in a moderate significance or above. Furthermore, mitigation measures have also been proposed for some impacts with a lower significance where such measures are routinely applied (for example in the management of construction-related impacts) or where, based on professional judgement, there would be a material benefit to the receptor. EIAR Chapter 31 summarises the Construction and Operational Phase Mitigation and/or Monitoring Measures / Environmental Commitments outlined in the relevant EIAR technical assessments and should be read in conjunction with the mitigation outlined in the specific chapter. Appendix A5.1 Outline CEMP details that mitigation and monitoring will be carried out in accordance with the requirements of the EIAR and NIS so that construction activities are undertaken in a manner that does not give rise to significant negative effects. Suitable monitoring programmes will be developed, implemented, documented and assessed in accordance with the specification outline in the detailed CEMP. The results of all environmental monitoring activities will be reviewed by the Environmental Manager on an ongoing basis to enable trends or exceedance of criteria to be identified and corrective actions to be implemented as necessary. The contractor(s) will be required to inform TII of any continuous exceedances of criteria.

Submission No.			175	
Organisation Name or Name of Submitter			Management Company Board on behalf of 17 The Court,Dalcassian Downs	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) Order 2022				
8	(3) General Comments on the MetroLink Project including necessary Mitigation Measures	5	specific mitigation measures are required to be included in detailed design e.g. screening and limitations on working hours etc.	Please refer to response item (7) above related to mitigation and monitoring measures. Specific mitigation measures or performance requirements needed to ensure Environmental Limits are adhered to, will be included in the contracts for the design and build contractors. Appendix A5.1 Outline CEMP details the requirement for reporting and environmental records which will require TII review and approval, including environmental inspection and audit reports (internal and external), and Health and safety records. Any restrictions to working hours associated with major events in the area of works will be agreed with Local Authorities. In addition, a Construction Noise and Vibration Management Plan will be included as part of the final CEMP, and this will include for specific working hour measures at sensitive locations. For example, works outside churches will need to take into consideration mass or funeral events.
9	(3) General Comments on the MetroLink Project including necessary Mitigation Measures	5	conditions must be imposed regarding monitoring schemes for the major measurable impacts (eg noise, vibration, settlement, dust, air quality, etc. These need to be outlined and implemented before construction starts. Information from these monitoring schemes should be readily available to all stakeholders.	Please refer to response items (7) and (8) above related to mitigation and monitoring measures. As presented in the EIAR Chapter 13 (Airborne Noise and Vibration), a full monitoring and auditing programme will form part of the CNVMP (Construction Noise and Vibration Management Plan) which will be agreed with the Local Authorities prior to the commencement of the Construction Phase. As a minimum the monitoring programme will include an alert system for threshold exceedances, remote access and a platform for sharing monitoring results between the contractor, TII, DCC and FCC. Before commencing relevant works, an Air Quality Management Plan will be prepared and submitted for approval to the relevant local authority, in this case DCC. The plan will include all appropriate dust and emissions mitigation measures applicable to the circumstances of the relevant site, based on the local authority requirements and industry best practices. A plan will be developed by the contractor for each worksite, including Glasnevin. Strict dust prevention will be in place at all times to minimise any potential emissions and these procedures will be strictly monitored and assessed. In the event of dust nuisance occurring outside the site boundary, movements of materials likely to raise dust will be curtailed and satisfactory procedures implemented to rectify the problem before the resumption of construction operations. Further details are provided in response item (14) below.
10	(3) General Comments on the MetroLink Project including necessary Mitigation Measures	6	a means for obtaining a technical response in a speedy manner to enquiries and concerns for those affected, needs to be devised.	EIAR Chapter 5 (MetroLink Construction Phase) Section 5.12.4.5 sets out TII Plans for Community Engagement during the construction Phase. A Stakeholder and Community Engagement Plan has already been developed which has guided the frequency and means of communication to date. The proposed Project will continue to progress community engagement by: - Regularly reviewing and updating stakeholder and community engagement plans; - Actively maintaining partnerships and design focus groups established with the community; and - Communicating in a timely and open manner. Through the ongoing development of this plan, it is proposed that TII and its appointed contractor(s) will ensure that local residents, occupiers, businesses, local authorities and all other stakeholders affected by the proposed construction works, as outlined in this EIAR, will be informed in advance of work taking place. The plan will be developed under the consent of a designated Public Liaison Officer appointed by TII. This plan will provide a two-way mechanism for members of the public to communicate with a designated member of the contractor(s)'s staff and for the contractor(s) to communicate important information on various aspects of the proposed Project to the general public.

Submission No.			175	
Organisation Name or Name of Submitter			Management Company Board on behalf of 17 The Court,Dalcassian Downs	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) Order 2022				
11	(3) General Comments on the MetroLink Project including necessary Mitigation Measures	6	• conditions need to be applied requiring TII to set up a complaints procedure and dispute resolution process relating to all significant impacts. This to be agreed and implemented before construction commences.	Please refer to response item (10) above in relation to the proposed engagement and Public Liaison Officer. As noted in response item (5), a Freephone (e.g., 1800) helpline service will also be maintained during the Construction Phase to deal with enquiries and concerns from the general public.
12	(3) General Comments on the MetroLink Project including necessary Mitigation Measures	6	• conditions need to be imposed requiring TII to operate an adequate Property Protection Scheme to ensure that property owners who sustain damage to their properties will have the issue rapidly addressed. In this regard TII have stated that owners may avail of their own professional service provider but at their own expense. We believe that this is manifestly unfair and reasonable costs incurred by owners should be reimbursed by TII.	TII is committed to having a Property Owner Protection Scheme (POPS) in place prior to construction works commencing. The scheme allows residential property owners to register with TII if the property is within thirty metres of the edge of the MetroLink alignment or fifty metres of station structures. The POPS comprises condition surveys of private properties and other selected properties along the route of the proposed Project. The purpose of the condition surveys would be to ascertain the condition of the properties before, during (if deemed necessary), and after the completion of the proposed Project to determine whether there has been any deterioration of any of the properties surveyed and whether the same may be attributable to the proposed Project and recommend repairs as appropriate. Condition survey data gathered pre and post construction, and possibly during construction, will be used to assist the property owner and TII in the swift and accurate verification of any property damage claims which may be received from property owners. The POPS would be introduced by TII through public consultation and will be formally advised to eligible property owners by the Public Relations Department. Useful information on POPS can also be found in the MetroLink Frequently Asked Questions document which can be found on-line at: https://www.metrolink.ie/en/your-property/property-owners-protection-scheme/

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) Order 2022				
13	(3) General Comments on the MetroLink Project including necessary Mitigation Measures	6	- the issue of noise generation during construction is a major problem. We believe that the following matters need to be covered in order to give absolute clarity: noise profiling, when noise is likely to happen, duration of same, exceedances of the limits set, full access to noise monitoring equipment, confirmation that a noise complaints procedure and response protocol will be established. - the issue of vibrations is also a major issue. A protocol and oversight process similar to noise monitoring is required for this.	TII understand the reasons for your concerns and would like to provide the assurance that the potential disturbance impact on your property as a result of the proximity of the proposed tunnel and station has been carefully assessed. This includes the impact of noise and vibrations from: the tunnel boring machine (TBM), mechanical excavation and blasting; construction generated ground movements leading to settlement and possible building and property movement; and the operation of MetroLink. All of which have been assessed and reported in the EIAR and are summarised below. With exception of a temporary disturbance when the TBM passes your property, TII are predicting a 'not significant' impact to the building occupants and your building, or risk to the integrity of your house. Construction Phase – Airborne Noise and Vibration EIAR Chapter 13 Airborne Noise and Vibration, Table 13.62 summarises the potential significant construction noise impacts from the construction of the proposed Glasnevin Station, which includes The Court, Dalcassian Downs. The predicted impact without additional noise mitigation is Significant to Very Significant during some of the work phases. Noise mitigation measures are detailed in section 13.6.1 and include for a proposed 4m high acoustic noise screen along the north, east and southern boundaries of the Glasnevin construction compound. With these mitigations the construction impacts are reduced to below significant. Construction Phase – Groundborne Noise and Vibration EIAR Chapter 14 Groundborne Noise and Vibration, Appendix 14.5 presents the predicted groundborne noise and vibration levels during the construction phase of the project for The Court, Dalcassian Downs: - The predicted level of groundborne noise during TBM passage is 49 dB LASmax, which is above the 45 dB LASmax threshold resulting in a significant impact on the occupants of the building for the relatively short duration of TBM passage. - The predicted level of groundborne vibration during TBM passage is 0.263 ms-1.75 day and 0.221 ms-1.75 night, below the VDV (Vibration Dose Value is a parameter that combines the magnitude of vibration and the time for which it occurs) Threshold Level of 1.0 ms-1.75 day and 0.5 ms-1.75 night, resulting in a not significant impact on the building. - The predicted level of groundborne noise during mechanical excavation at Glasnevin Station is 41 dB LASmax, which is above the 40 dB LASmax threshold resulting in a significant impact on the occupants of the building. Unfortunately, there are no effective methods available to reduce groundborne noise or vibration from the TBM at source but noting that the duration of this impact will be temporary and of the order of up to two-weeks as the TBM passes. TII will undertake advanced consultation and stakeholder engagement to prepare people for the passing of the TBM and ensure the timing of these impacts are known. TII's contractor(s) will prepare a Construction Noise and Vibration Management Plan (CNVMP) for the proposed Project as referred to in EIAR Appendix A5.1, Outline Construction Environmental Management Plan (CEMP). The CNVMP will be a live document and will include a full monitoring and auditing programme which will be agreed with the Local Authorities prior to the commencement of the Construction Phase, including predetermined monitoring trigger levels to ensure noise and vibration limits are not breached, noting that it is not possible to mitigate TBM groundborne noise and vibration at source. Table 6.2: Noise and Vibration Measures of the Outline CEMP outlines the monitoring programme requirements. The Transport Infrastructure Ireland (TII) Airborne Noise and Ground-borne Noise Mitigation Policy (Appendix A14.6 of EIAR Chapter 14) also sets out the construction noise insulation and temporary rehousing measures to be implemented where required.

Submission No.			175

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) Order 2022				
			Response (13) continued.	Construction Generated Ground Movements EIAR Appendix A 5.17 Building Damage Report, covers the assessed impacts of construction generated ground movements and settlement on your property and has been predicted to not exceed the 'Very Slight' category, an explanation for which can be found in Table 4-4 of the aforementioned report. With particular regards to Protected Structures, these properties have been designated as "Case A"- they are on shallow foundation and are within a distance from a retained cutting, shaft or box equal to the excavated depth of superficial deposits or 50% of the total excavation depth, whichever is greater. Therefore, a further Stage 3 refined assessment will be undertaken that will take account of final design and construction methodology details most likely utilising advanced numerical modelling techniques and further surveys of the building. The results of this refined assessment typically show that earlier assessments are conservative and overestimate the likely impact of construction generated ground movements. Monitoring instrumentation will also be installed to monitor the performance of the works and potential environmental impacts, including those discussed above to ensure that acceptable limits are not breached. TII would also draw attention to the fact that residential property owners within 50m of the station excavation, or 30m of the tunnel are eligible to subscribe to the Property Owners Protection Scheme (POPs) which includes for pre and post-construction condition surveys and repair of damage.
14	(3) General Comments on the MetroLink Project including necessary Mitigation Measures	6	• in relation to dust generation, conditions imposed for this need to be explicitly outlined and enforced including the covering of materials stockpiled and exposed to wind and the use of water misting or sprays to dampen down dust.	The EIAR has fully assessed the potential impacts on the local population, including dust and other air quality emissions impact assessment and proposed mitigation measures in Chapter 16 (Air Quality). The potential risk from dust emissions has been reviewed for the critical activities at each of the construction areas. The Construction Environmental Management Plan (Appendix A5.1) will be used to manage the construction phase dust emissions. In addition, before commencing works, an Air Quality Management Plan shall be prepared and submitted in advance to the relevant planning authority. The plan will include all appropriate dust and emissions mitigation measures applicable to the circumstances of the relevant site, based on the local authority requirements and industry best practices. The plan will be developed by the Contractor and for each worksite shall include: - o An inventory and timetable of activities which may give rise to emissions or dust; - o Alert levels and system to be used (including notification process); - o Details of control measures; - o Details of dust monitoring arrangements, including the location of sensitive receptors, monitoring locations, and monitoring equipment to be used; and - o Details of the air quality reporting requirements. The types of measures that will be implemented to manage dust will include the following: •Material handling systems and site stockpiling of materials will be designed and laid out to minimise exposure to wind. Water misting or sprays will be used as required if particularly dusty activities are necessary during dry or windy periods; •Any blasting will be completed by specialised contractors with a specific blasting dust management plan; •Liaison with local authorities and community groups; •Hoarding will be provided around the construction compounds; and •It is anticipated that methods of collecting rainwater and recycling for general site use, will be adopted where practical. Requirements for dewatering installations at deep station and tunnel portals can also provide a valuable source of water for general site use.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
Letter Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) Order 2022					
15	(3) General Comments on the MetroLink Project including necessary Mitigation Measures	6	We believe that An Bord Pleanala also need to impose specific conditions relating to the following items with regard to the impacts of the construction of the Glasnevin Station adjacent to The Court, Dalcassian Downs: • As stated earlier in this document, the grounds of our complex are a particular feature and conditions need to be applied to ensure that the protected railings and the grounds are restored to a high standard, post construction.	A Project Conservation Architect (PCA) has been engaged to oversee the implementation of the Project. Prior to the establishment of construction compounds, the Project Conservation Architect (PCA) will undertake Structural and Condition Surveys of any built and cultural heritage constraints that will require removal to secure storage (followed by conservation and reinstatement) or protection in-situ. The PCA will also prepare specifications for these works. A specialist Heritage Works Contractor will be appointed to remove, store and conserve these constraints. The Main Construction Works Contractors will appoint Consultant Conservation Architects to implement required preservation of in situ works. Chapter 26 (Architectural Heritage) details the potential impacts during construction at Glasnevin. The protected railings and gates at Dalcassian Downs lie within the work area for Glasnevin Station and a significant section is to be removed during construction and reinstated on completion of the works in this area. The railings and their plinth walls are to be recorded by photography and written description prior to its removal. The railings and walls are to be taken down in accordance with a specification to be prepared by the PCA and the materials removed into a secure storage pending reinstatement. At the appropriate stage of construction, the materials are to be returned to site and the railings and walls reinstated in accordance with a conservation method statement to be prepared by the PCA. All works of dismantling, protection, transportation and reconstruction are to be carried out by a dedicated heritage contractor. The impact would be imperceptible following mitigation.	
16	(3) General Comments on the MetroLink Project including necessary Mitigation Measures	6	• As proposed, the hoarding line fronting Blocks 1-18 and 19-36 The Court is right up against the ground floor apartments and regardless of whether viewing panels are inserted a loss of natural light will arise for the entire construction period of 6 years. TII should be conditioned to move the hoarding back to alleviate the extreme physical and psychological discomfort resulting from a close up hoarding line.	TII acknowledge that the hoarding line is in close proximity to The Court apartment blocks, and the impacts are recognised in the EIAR. Hoarding is necessary to allow the construction of the works whilst minimising noise impacts to these blocks and hence cannot be realigned due to the site constraints. However, TII will work with the design and build contractors to minimise the duration that this hoarding line needs to remain at the proposed offset to the blocks and incentivise the contractor to relocate it at the earliest practical time. As detailed in the EIAR Chapter 5, MetroLink Construction Phase, the programme for the construction of the proposed Project has been optimised to minimise the duration of the Construction Phase in order to lessen the duration of potential environment impacts, while ensuring that the areas surrounding the work sites remain operational and functional. Work will run concurrently at all MetroLink site locations to ensure the Project is delivered in an effective and timely manner. Please refer to response item (6) above in relation to the anticipated impacts on psychological health during construction works.	
17	(3) General Comments on the MetroLink Project including necessary Mitigation Measures	6	• As proposed, the location of the Bentonite silos and filtration plants within the construction site will lead to a large loss of natural light to residents. TII should be conditioned to move these temporary structures as far back as possible from the apartment blocks.	During procurement of the Contractor, TII will work with the contractor to optimise the site layout and seek to maximise the separation of these tall structures /equipment from the site boundary.	
18	(3) General Comments on the MetroLink Project including necessary Mitigation Measures	6	• TII have indicated that they are in discussions with Dublin City Council with a view to extending the pay and display parking scheme which operates in the main Dalcassian Downs housing estate to residents of the Court whose 32 car parking spaces will be removed during the construction phase. No consultation took place with the Management Company Board prior to these discussions taking place between TII and Dublin City Council. This is contrary to the principles set out in the guidance document issued by DEPR in January 2019, in relation to public consultation.	It is recognised that locating suitable alternative parking for affected residents is challenging, however we continue to consult with DCC in identifying possible alternative parking for residents and are optimistic that such alternative parking can be confirmed in advance of the Oral Hearing.	

Submission No.			175	
Organisation Name or Name of Submitter			Management Company Board on behalf of 17 The Court,Dalcassian Downs	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) Order 2022				
19	(3) General Comments on the MetroLink Project including necessary Mitigation Measures	7	We believe that imposing Court resident parking on the residents in the main estate will cause resentment among those residents when currently the relationship between both sets of residents is extremely friendly. Accordingly we believe that An Bord Pleanala should impose a condition in the Railway Order that alternative parking for displaced residents at the Court must be provided in a cordoned off area within the adjoining construction site. In this regard consideration should be given to utilising "vertical rotary parking systems" which can be constructed over 2 or 3 parking spaces and are operated via touch screens, apps or chip technology. Such systems are widely used in Europe and could be assembled and then disassembled by TII and used elsewhere by them.	Please refer to response item (18) in relation to the impact on parking at Dalcassian Downs.
20	(3) General Comments on the MetroLink Project including necessary Mitigation Measures	7	As referenced earlier, we believe that TII should be conditioned to arrange and fund counselling services for those individuals at The Court, Dalcassian Downs, whose lives will be negatively transformed and who may wish to avail of counselling services. It should not be a matter for individuals to have to fund the help that they may feel they need.	Please refer to response item (6) above related to potential for psychological effects. TII will not be providing counselling services of the type suggested.
21	(3) General Comments on the MetroLink Project including necessary Mitigation Measures	7	We also believe that TII should be conditioned to fund some form of basic health screening at regular intervals to ensure that the underlying physical and mental health of residents does not deteriorate discemibly during the 6 year construction phase. If TII are confident that no health issues will arise, then they should not oppose this suggestion.	Please refer to response item (6) and (20) above related to potential for psychological effects. As detailed in Chapter 16 (Air Quality), the construction phase assessment identifies a generally negligible or slight negative impact on air quality in the vicinity of the proposed Project during the Construction Phase post mitigation. No exceedances of air quality standards are predicted, therefore, no significant adverse human health impacts are predicted. TII are confident that no health issues will arise and as such do not proposed to provide health screening.
22	(3) General Comments on the MetroLink Project including necessary Mitigation Measures	7	For those individuals who may wish to be temporarily rehoused during the construction phase, a scheme to cater for this possibility needs to be drawn up.	Please refer to response item (12) above related to POPS. In cases where parts of properties are occupied, access to the remaining unoccupied parts will be maintained, where it is possible and safe to do so. Protection such as hoarding will be used to ensure that the boundary of any construction site will be maintained, and damage would not occur outside of this boundary. Where damage could not be avoided, it would be repaired. Information regarding any situations requiring relocation and the process for financial compensation for property impacts directly related to the proposed Project is provided in Chapter 11 (Population & Land Use) and Chapter 21 (Land Take) of the EIAR. Please also refer to The Airborne Noise and Groundborne Noise Mitigation Policy which will facilitate relocation in certain circumstances.
23	(3) General Comments on the MetroLink Project including necessary Mitigation Measures	7	Finally, we believe that TII should be conditioned to provide compensation for individual owners at the Court Dalcassian Downs during construction to cater for the fact that their apartments will be virtually unsaleable during the lengthy and disruptive construction phase.	TII acknowledge that it will be difficult for owners to sell their properties while MetroLink works are ongoing, however TII does not have powers of compensation for this scenario where a property is outside of the project red line boundary for the scheme. TII believe however that affected owners will benefit from an uplift in the value and saleability of the affected property once the MetroLink is operational.

Submission No.			175	
Organisation Name or Name of Submitter			Management Company Board on behalf of 17 The Court,Dalcassian Downs	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) Order 2022				
24	(4) Compliance with Railway Order Conditions	7	We now wish to turn to the important subject of construction contract oversight of the Metrolink Project. In the documentation that we have examined there are copious references to contractors being obliged to adhere to the conditions laid down in the Railway Order. It is assumed that TII will apply sanctions or penalties for breaches of this arrangement. This is all very well but complications will arise if the Project falls behind schedule which is very likely. In that scenario it will benefit both parties if there are exceedances in working hours and traffic activity for example such that the Project gets back on schedule. The question needs to be asked as to which organisation will be overseeing adherence to conditions set down in the Railway Order? It will not be a matter for Dublin City Council planning enforcement section as they have no role in the oversight of major Infrastructural projects. We believe that the Environmental Protection Agency or some such body should be directed to oversee the compliance issues. The EPA already has national oversight of activities relating to water, waste water, waste, air, noise, radiation and chemicals. It makes no sense for An Bord Pleanala to lay down a range of conditions with TII self-administering the compliance issues as that approach is fundamentally flawed and inequitable for obvious reasons and does not provide for any sanctions on the Project sponsor.	As detailed in Appendix A5.1 Outline CEMP, independent external audits (either random or routine) will be conducted for the duration of the works to monitor the environmental performance of the contractor(s). Further, regulatory and statutory bodies may undertake site visits to monitor compliance with legislative and regulatory requirements. These site visits may occur randomly throughout the Construction Phase. The contractor(s) will facilitate these visits and the Environmental Manager will be available to provide information as required and deal with any issues that may arise during, or as a result of, these visits.
25	(4) Compliance with Railway Order Conditions	8	In the interests of transparency we also believe that a Local Liaison Group needs to be established by TII to include representatives of the various residents groups, contractor reps and TII reps. The Group should meet monthly, have an Independent Chair and have terms of reference agreed before it commences its activities. This should also be a condition of the Railway Order.	TII intends to establish a minimum of 3 local community liaisons offices along the MetroLink Route. It proposed to locate these offices in the city centre, Glasnevin and Swords Areas. The offices will be established at least 3 months prior to the commencement of Major Infrastructure works. Please refer to response item (10) in relation to the continued engagement throughout the construction phase.
26	(4) Compliance with Railway Order Conditions	8	Consideration should also be given to the creation of a Community Gain Fund by TII that could benefit local businesses and residents whose lives will be disrupted for quite a long time during the construction phase of the Project. The fund could also be used for Public Realm enhancements in the area post construction.	TII will work with all established Community Groups through the local community liaison offices along the route to identify projects at local level that would involve the Community in the delivery of MetroLink and its legacy. Such projects could include: - A local school learning programme. - Enhancement of community amenity within agreed funding limits. - Engagement with final landscape and finishing options
27	(4) Compliance with Railway Order Conditions	8	We also wish to formally request participation in the Oral Hearing which will undoubtedly be convened in respect of the Metrolink Project.	Thank you for the submission and request for Oral Hearing. We have reviewed the submission and provided response for the observations/ concerns raised in detail above. An overview of the Oral Hearing process is provided in the EIAR Chapter 8.9.2. An Bord Pleanála may, at its absolute discretion, hold an oral hearing on the Railway Order application. Given the scale and extent of the MetroLink project it is highly likely that an oral hearing will be held similar to past RO applications. The purpose of the oral hearing will be to allow issues relevant to an application for approval be examined. The oral hearing can be attended by anyone, but only those that have made a written application may make an oral submission at the oral hearing. The oral hearing is managed by the An Bord Pleanála.

Submission No.			176		
Organisation Name or Name of Submitter			Margaret Morrissey (22 The Court, Dalcassian Downs, Glasnevin)		
Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
Letter Re: Building Transport Hub at Glasnevin					
1	Letter	1	Building Transport Hub at Glasnevin: 1. Building 7 meter hoarding a few meters from main door of block.	As noted in Table 13.85 of Chapter 13 (Airborne Noise &Vibration) the construction hoarding at Glasnevin will be up to 4m in height on the northern, southern and eastern boundaries.	
2	Letter	1	2. Going under block – so noise, vibration, and possible damage to same.	TII understand the reasons for your concerns and would like to provide the assurance that the potential disturbance impact on your property as a result of the proximity of the proposed tunnel and station has been carefully assessed. This includes the impact of noise and vibrations from: the tunnel boring machine (TBM), mechanical excavation and blasting; construction generated ground movements leading to settlement and possible building and property movement; and the operation of MetroLink. All of which have been assessed and reported in the EIAR and are summarised below. With exception of a temporary disturbance when the TBM passes your property, TII are predicting a 'not significant' impact to the building occupants and your building, or risk to the integrity of your house, with the implementation of appropriate mitigation measures. <u>Construction Phase – Airborne Noise and Vibration</u> EIAR Chapter 13 Airborne Noise and Vibration, Table 13.62 summarises the potential significant construction noise impacts from the construction of the proposed Glasnevin Station, which includes receptors for The Court, Dalcassian Downs. The predicted impact without additional noise mitigation is Significant to Very Significant during some of the work phases. Noise mitigation measures are detailed in section 13.6.1 and include for a proposed 4m high acoustic noise screen along the north, east and southern boundaries of the Glasnevin construction compound. With these mitigations the construction impacts are reduced to below significant. Where residual construction noise levels at The Court Apartments, Dalcassian Downs remain above the trigger values, application of TII Airborne and Groundborne Noise Mitigation Policy will be implemented where eligibility has been established. <u>Construction Phase – Groundborne Noise and Vibration</u> EIAR Chapter 14 Groundborne Noise and Vibration, Appendix 14.5 presents the predicted groundborne noise and vibration levels during the construction phase of the project for The Court, Dalcassian Downs: • The predicted level of groundborne noise during TBM passage is 49 dB LASmax, which is above the 45 dB LASmax threshold resulting in a significant impact on the occupants of the building for the relatively short duration of TBM passage. • The predicted level of groundborne vibration during TBM passage is 0.263 ms-1.75 day and 0.221 ms-1.75 night, below the VDV (Vibration Dose Value is a parameter that combines the magnitude of vibration and the time for which it occurs) Threshold Level of 1.0 ms-1.75 day and 0.5 ms-1.75 night, resulting in a not significant impact on the building. • The predicted level of groundborne noise during mechanical excavation at Glasnevin Station is 41 dB LASmax, which is above the 40 dB LASmax threshold resulting in a significant impact on the occupants of the building. Unfortunately, there are no effective methods available to reduce groundborne noise or vibration from the TBM at source but noting that the duration of this impact will be temporary and of the order of up to two-weeks as the TBM passes. TII will undertake advanced consultation and stakeholder engagement to prepare people for the passing of the TBM and ensure the timing of these impacts are known. TII's contractor(s) will prepare a Construction Noise and Vibration Management Plan (CNVMP) for the proposed Project as referred to in EIAR Appendix A5.1, Outline Construction Environmental Management Plan (CEMP). The CNVMP will be a live document and will include a full monitoring and auditing programme which will be agreed with the Local Authorities prior to the commencement of the Construction Phase, including predetermined monitoring trigger levels to ensure noise and vibration limits are not breached, noting that it is not possible to mitigate TBM groundborne noise and vibration at source. Table 6.2: Noise and Vibration Measures of the Outline CEMP outlines the monitoring programme requirements. The Transport Infrastructure Ireland (TII) Airborne Noise and Groundborne Noise Mitigation Policy (Appendix A14.6 of EIAR Chapter 14) also sets out the construction noise insulation and temporary rehousing measures to be implemented where required.	

Submission No.			176	
Organisation Name or Name of Submitter			Margaret Morrissey (22 The Court, Dalcassian Downs, Glasnevin)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: Building Transport Hub at Glasnevin				
			Response (2) continued.	<u>Construction Generated Ground Movements</u> Excavation for the tunnels and other below ground structures could potentially lead to ground movements at the surface and below ground. An assessment of the effects of ground movements and potential impacts on existing buildings has been carried out as part of the Scheme Design. The EIAR Appendix A 5.17 Building Damage Report, covers the assessed impacts of construction generated ground movements and settlement on property. The results of the assessment provided in Table 5.4 shows that your property Ref AB-19 B-157a has been assessed as falling within the 'Very Slight' category of damage. The building risk categories shown in Table 4-4 of the aforementioned report are used to define the degree of building damage related to the Risk Category. According to this Table, the Very Slight damage category refers to fine cracks easily treated during normal redecoration, with perhaps isolated slight fracture in building. As your property is within the Very Slight category, it will be subject to a further assessment by the Damage and Buildings contractor as part of the Phase 2b assessment. The Property Owner Protection Scheme (POPS), committed to by TII, allows residential property owners to register with TII if their residential property is within thirty (30) metres of the edge of the MetroLink alignment or fifty (50) metres of station structures. The POPS comprises condition surveys of residential properties along the route of the proposed Project. The purpose of the condition surveys is to ascertain the condition of the properties before, during (if deemed necessary), and after the completion of the proposed Project to determine whether there has been any deterioration of any of the properties surveyed and whether same may be attributable to the proposed Project, and subsequently to recommend repairs as appropriate. Condition survey data gathered pre and post construction, and possibly during construction, will be used to assist the property owner and TII in swift and accurate verification of any property damage claims which may be received from property owners. The POPS is designed to cater for / address repair work which may be necessary for any damage (attributable to the proposed Project) to a qualifying residential property up to a threshold of €45,000. The POPS will be introduced by TII through public consultation and will be formally advised to eligible property owners by the Public Relations Department. Further information on POPS is available in Chapter 11 (Population & Land Use). Useful information can also be found in the MetroLink Frequently Asked Questions document which can be found online at: https://www.metrolink.ie/en/your-property/property-owners-protection-scheme/ , and this is where useful updates will be made available as the proposed Project progresses.
3	Letter	1	3. Access to home.	Chapter 5 of the EIAR (MetroLink Construction Phase) explains that traffic management plans for the construction phase of the Project have been developed to minimise the impact on road users, and to maintain access to businesses and other premises. Prior to implementation, all traffic management measures will be agreed with DCC and where relevant, consultation with An Garda Síochána and other statutory stakeholders will be undertaken. The design of traffic management measures and highways works is based on achieving the key objective of maintaining continual access to all properties during the works. Where necessary, a safe alternative route will be provided for pedestrians and vulnerable road users, such as children, and persons with restricted mobility, to maintain pedestrian access to premises. Where detour routes are required, these will be kept as short as possible and detour signage will be clear and easy to understand. All construction sites will be designed to be as unobtrusive as possible. During the Main Works for Glasnevin Station, no road closures or general traffic lane reductions are required, as noted in section 7.6.6.3 of Appendix A9.5 Scheme Traffic Management Plan. During the Enabling Works for Glasnevin Station, 90m of bus lane on Prospect Road northbound will be removed, with priority given to pedestrians, however there is no impact to local access in this area. In the general vicinity, local access to Royal Canal Way will be restricted however a diversion will be provided to maintain access to Coke Oven Cottages. As outlined in Appendix A5.1 Outline Construction Environmental Management Plan - CEMP, the appointed contactor(s) are required to implement the measures in relation to traffic and transportation during construction. Following the appointment, the contractor(s) will be required to develop an updated contract-specific CEMP which will detail all measures to be employed in relation to all potential impacts on traffic and transportation.

Submission No.			176		
Organisation Name or Name of Submitter			Margaret Morrissey (22 The Court, Dalcassian Downs, Glasnevin)		
Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
Letter Re: Building Transport Hub at Glasnevin					
4	Letter	1	4. Rodent control.	As detailed in Chapter 10 (Human Health), rodent control, good sanitation, disinfecting contaminated work areas, worker education via tool box talks and using personal protective equipment (PPE) when handling infected animals are important actions for prevention of Leptospirosis (or Weil's Disease). While rodents will be temporarily displaced as a result of initial construction activities, there is nothing in the Construction Phase which would lead to an increase in the number of rodents. With the rodent control policies in place, it is possible that there will be a reduction in the level of rodents and the subsequent risk associated with Leptospirosis. As there will not be an increase in vermin numbers and more likely a decrease because of vermin control measures, there will be no increase in vermin transmitted disease over and no significant adverse effect on human health.	
5	Letter	1	5. Parking for cars.	Please refer to response above (3) related to the Traffic management during the Construction Phase and maintained access to your property. Temporary management measures have been developed to minimize the impact on parking and loading. Site specific mitigation measures will be developed through consultation with stakeholders, including local authorities, residents and business owners. These impacts will be monitored throughout the Construction Phase to assess if any disrupted bays can be reinstated. Prior to commencement, all traffic management plans will be presented to DCC and local stakeholders to minimise the severity of impacts to affected road users. A Project Construction Traffic Forum will also be established allowing affected residents and stakeholders to raise any concerns around traffic management in the area. All staff and workforce will be encouraged to make their way to site and home from site by public transport, by project specific transport (e.g. minibuses), by bicycle or on foot. Limited parking spaces will be provided for vehicles required for the construction activity and for employees. The nominated contractor(s) may provide a transfer pick-up and drop-off service from suitable public transport hubs, therefore not creating additional demand on the existing car parking in the area.	
6	Letter	1	6. Building to take 6-8 years!!	As detailed in EIAR Chapter 5 (MetroLink Construction Phase) the programme for the construction of the proposed Project has been optimised to minimise the duration of the Construction Phase in order to lessen the duration of potential environment impacts, while ensuring that the areas surrounding the work sites remain operational and functional. Work will run concurrently at all MetroLink site locations to ensure the Project is delivered in an effective and timely manner. Standard working hours will be complied with in the majority of cases, however 24/7 working is required in some instances at Glasnevin to maintain the construction programme. Please refer to response items (1)-(4) in relation to the predicted impacts in the vicinity of your property during the construction phase and associated mitigation measures. The EIAR details in full the proposed environmental protection measures to be implemented during construction. One of the key aspects of environmental control during the construction phase is the requirement for the appointed contractor to prepare a detailed design and construction methodologies plan in the form of a detailed Construction Environmental Management Plan (CEMP) to ensure all environmental impacts are managed and mitigated in accordance with the EIAR and Railway Order, assuming an Enforceable Railway Order is granted. This detailed CEMP(s) will be provided to DCC for consultation and approval in advance of any construction works on site. An Outline CEMP is included in Appendix A5.1 of the EIAR that will be developed further by the appointed contractors. Monitoring instrumentation will also be used throughout the works to monitor potential environmental impacts, including those discussed above to ensure that acceptable limits are not breached.

Letter Re: Building Transport Hub at Glasnevin					
7	Letter	1	There is already planning for Drumcondra which has a higher footfall with Mater Hospital, Croke Park, Teacher Training College and DCU so why change the new route.	EIAR Chapter 7 (Consideration of Alternatives) presents the decision-making process that has led to the proposed Project, including the selection of Glasnevin Station instead of Drumcondra. The choice of a station location at either Drumcondra or Glasnevin has been considered in the context of the achievement of the Transport Strategy for the GDA, having particular regard to maximising the interchange opportunities between different services and to provide fast and convenient access to major transport destinations such as Dublin City Centre and Dublin Airport. It is considered that the provision of a station at Glasnevin will better meet the requirements of the Transport Strategy for the GDA for the following reasons: *It will facilitate a seamless transfer/interchange with both the Maynooth (Western Commuter Line) and the Kildare railway line (South-Western Commuter Line) because the Phoenix Park Tunnel and Maynooth lines are at their closest point horizontally and vertically at Glasnevin, thereby providing the opportunity for a MetroLink station to capture transfer to and from these lines more effectively than at Drumcondra; * The Glasnevin location also facilitates the construction of an integrated metro station as the two heavy rail lines are beneath the existing ground level, making it possible to connect via an underground concourse to all three rails in a short plan distance. At Drumcondra, the connection to both lines would require a connection of approximately 100m with more significant vertical connections between the two lines also required. * Improved journey times via Glasnevin than Drumcondra, offering the opportunity to transfer sooner from heavy rail. * Route options serving Glasnevin are forecast to have approximately 6,000 additional passengers per day when compared to an interchange station at Drumcondra. This is largely due to the increased opportunity to interchange at Glasnevin.

MetroLink Railway Order - Case Reference Number NA29N.314724. Maria O'Connor, 26 Townsend Street, D02 E032					
1	Letter - concerns	1	I wish to object to the unacceptable decision by Transport Infrastructure Ireland to go ahead with the Metrolink plans involving the Tara street station redevelopment at the expense of 78 homes and apartments and the local sports & leisure centre.	Chapter 07 (Consideration of Alternatives) details the decision-making process that has led to the development of the proposed Project, including the route alignment and station locations. A station at Tara Street provides good interchange opportunities, serves important key trip attractors in the study area with high potential passenger trips. This option also takes a direct route through areas of high demand in the centre of the study area. As Dublin's public transport network grows through the implementation of higher capacity bus routes, more frequent heavy rail services and coverage, and the expansion of the light rail network it is critically important that to achieve the full benefits and capitalise on these investments that they are integrated fully where appropriate to attain “the network effect”. High quality interchanges can significantly broaden the transport offer for their catchment and add to the appeal and attractiveness of sustainable transport by ensuring that people can easily change services to access a wider range of places by these modes, and each scheme should be designed to ensure that these are as seamless as possible. Please refer to response (3) which details the alternative options that were considered for this location, and outlines the reasons why this location (involving demolition) was ultimately identified as the preferred option.	
2	Letter - concerns	1	My home is one of those under threat, I am a tenant of DCC (Dublin City Council) and I live at 26 Townsend street and my house is due for demolition according to the Metrolink plans at Tara street (along with the other 77 homes & apartments), My parents moved into this house in Townsend street when it was built back in 1992, I then took up residence in the house in 2004 and have lived very happily here in the area for the last 18 years. It is a very close community, everybody knows one another and look after one another, a lot of the tenants are elderly and they rely on each other so this is a very frightening and worrying time for all involved. Several of these tenants were already forced to move back in 1992 from nearby Moss street area to make way for a large building development.	TII wish to thank you for your submission and acknowledge the concerns you have around the demolition of your home as part of the construction of Tara Street Station. Please refer to response (1) in relation to the strategic need for the MetroLink Tara Street Station. Response (3) details the alternatives that were considered for this location to avoid the demolition, presenting the reasons why this location (involving the demolition) was selected as the preferred option.	

Submission No.			178, 179 and 195

MetroLink Railway Order - Case Reference Number NA29N.314724. Maria O'Connor, 26 Townsend Street, D02 E032				
3	Letter - concerns	1	It is like this close inner city community is being pushed out of their area as Dublin City Council is now prioritising selling land to make money, rather than housing people and keeping communities intact. There is a sense of shock, anger and bewilderment in the area at the moment due to this unnecessary decision to demolish 78 homes (right in the middle of the biggest housing crisis in Ireland's history). What makes this decision even more ludicrous is the fact that there are other options out there for the Tara Street stage of Metrolink which would not involve destroying people's homes, but these options have not been even been considered by Transport Infrastructure Ireland.	Chapter 07 (Consideration of Alternatives) details the decision-making process that has led to the development of the proposed Project, including the route alignment and station locations. Appendix A7.2 Tara Street Station Report presents in detail the various options that were considered by TII for this location. Concerns had been raised during the public consultation on the Emerging Preferred Route (EPR) regarding the demolition required for the station in the location proposed, and concerns were again raised during the consultation on the Preferred Route. A number of alternative station locations were considered to try and address these concerns. Option 0 is the proposed station location, with a further 11 options assessed. Three options as submitted by College Gate residents, with the station relocated either to the north or south of the EPR proposed location, have been reviewed in detail. In addition, other options developed through the Preferred Route design process including a mined option and realignment of the route to the east of Tara Street Station have also been reviewed. All were assessed against the EPR proposed station location (Option 0) as a base case, adjusted to suit the single bore and reduced station box length. The various options were taken through a Mutli Criteria Analysis to compare aspects of each different option. Assessment of options considered the viability of the rail alignment, the quality/ease of interchange with Tara DART Station (a key requirement given that this will be one of the busiest stations on MetroLink with high passenger interchange with the DART), demolition/construction impacts (including minimising impacts on the existing DART infrastructure/operations), other environmental and planning issues, including traffic and utility impacts, and urban integration, health and safety issues, and potential construction costs. This has identified that for a number of reasons including constructability, cost, and retention of a good interchange facility, that Option 0, including demolition of College Gate and Markiewicz Centre, remains the preferred station location. Following assessment of the 11 alternative options, Option 0 has been retained as the preliminary design. The main reasons are: * This location retains a good interchange facility with Tara DART Station; * It reduces risk to the overall construction programme; * It offers cheaper overall construction cost; * It retains opportunity for future adjacent development by others; * Mitigation for the loss of the College Gate apartments and other properties is being addressed as part of the Project with the support of DCC. In particular, TII, in consultation with DCC, will support rehousing and provide compensation for the loss of the residential units; * TII will continue to work with DCC in relation to the development of an alternative sports and recreational facility to replace the Markiewicz leisure centre and intends to fund the alternative. However, TII does not have control over that development, which is part of DCC's function to provide public sport and recreational facilities in its function area. DCC may or may not be in a position to deliver it in parallel with the MetroLink project. Accordingly, the Board should assess the MetroLink project on the basis that the alternative may not be available. The impact would then be significant, but nonetheless one that would not outweigh the strategic scale long term benefits that MetroLink will deliver.
4	Letter - concerns	1	We are also disappointed with DCC's role in this, despite being long and loyal tenants we have been given no support or back up. DCC appear to be working closely with Transport Infrastructure Ireland, the National Transport Authority and the MetroLink project, pursuing the demolition of our homes and the Sports Centre, rather than in any way opposing the demolition or seeking alternatives which would preserve this community.	As noted in response (3) above, TII will continue to work with DCC in relation to the development of an alternative sports and recreational facility to replace the Markiewicz leisure centre and intends to fund the alternative. However, TII does not have control over that development, which is part of DCC's function to provide public sport and recreational facilities in its function area. DCC may or may not be in a position to deliver it in parallel with the MetroLink project. Accordingly, the Board should assess the MetroLink project on the basis that the alternative may not be available. The impact would then be significant, but nonetheless one that would not outweigh the strategic scale long term benefits that MetroLink will deliver. Please refer to response (3) in relation to the alternative options considered for this location, and the reasons for selecting this location as the preferred option.

Organisation Name or Name of Submitter			Maria O'Connor, Marie Balfe & Monica Deering		
Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
MetroLink Railway Order - Case Reference Number NA29N.314724. Maria O'Connor, 26 Townsend Street, D02 E032					
5	Letter - concerns	1	I have done my own research into this matter and found that there was a lack of proper investigation by Transport Infrastructure Ireland and MetroLink into the alternative routes that could have been used instead of this one that requires demolishing all these homes, there was also a lack of proper investigation of alternative construction methods (underground construction, rather thanwhat they call cut and cover, for the Tara metro station) that would mean that our homes could be preserved.	Please refer to response (3) above in relation to the options considered for Tara Street, and the reasons for the selection of the proposed station location. As part of the options assessed, a mined option (Option 4) was considered. This option would reduce the demolition involved, retaining the College Gate apartment block and the leisure centre, compared to Option 0 (the proposed location). Additionally, the option retains similar benefits to Option 0 in terms of interchange opportunity, traffic impacts, utility impacts, rail alignment and future development opportunities. The mined option comprises the construction of two deep shafts either side and immediately adjacent to the College Gate apartments to provide construction access for mining the tunnel under College Gate apartments and to subsequently provide permanent access, ventilation and back of house facilities for the operation of the station. The mining operation would need to progress 24 hours a day, 7 days per week. This would be necessary to ensure the safety and security of the works. As the tunnelling would be by "open faced " non pressurised tunnelling techniques (i.e. excavation in advance of the installation of the subsequent sprayed concrete tunnel lining) it would be critical to advance and support the excavated face continuously - particularly as the excavation would be below the water table. If a face was left unsupported for a period, ground movements become more challenging to manage and hence increase the likelihood of tunnel instability and surface settlement. This would add increased risk of damage to third party property, noting that the DART is also in close proximity and movements to the rails risk impacting the running of DART services. To not mine the tunnel 24 hours day would mean that the face would need to be secured at the end of every day shift, and the timing of blasting would need to adhere to a strict predetermined schedule so that the tunnel face is always secured at the end of each shift. In simple terms if such an approach was adopted, the impact on the programme would more than double the duration of cavern construction as a result of the constraint of day time working together with the inefficiencies in working this way. The sequence of working would also import risk and cost escalation. Therefore 24-hour working is essential for constructing the mined cavern. The nature of the work, drill and blast with mechanical excavation, would generate a level of groundborne noise and vibration that would mean it would not be possible to inhabit the College Gate apartment block due to the disturbance caused, leading to the need to relocate residents for a minimum of two years. There are also risks that could extend this duration further. This option therefore has a similar impact to the cut and cover station on College Gate residents. TII consider that when balanced against the risks and direct construction cost increase compared to the preferred cut and cover option, that demolition and redevelopment of the area around the site of the proposed Tara Station as part of the wider integrated development and regeneration of the site provides a better option. Additionally, the preferred proposed cut and cover station provides a higher quality operational station that is consistent with the MetroLink architectural vision and operational and maintenance strategy which the mined option compromises.	
6	Letter - concerns	1	Another factor to consider is that the land on which our houses sit is extremely valuable and the MetroLink group has a remit, once the new underground station has been built -- to sell this land which would at that stage be empty above ground -- in order to raise funds for the project, this is a blatant and obvious conflict of interest on the part of the state bodies involved. Myself, my neighbours and the local community are all affected by this and we are determined to make a stand against it.	As noted in Appendix A7.2 Tara Street Report (appendix to Chapter 07 Consideration of Alternatives), one of the reasons, among others, for the selection of the preferred location is that it provides opportunity for future oversight development by others as part of an urban integration plan. TII does not have a remit to sell lands once the new station is completed in order to raise funds for the project. The preliminary Business Case for the project approved in July 2021 does not include funding arising from the sale of lands.	
7	Letter - concerns	2	Since Transport Infrastructure Ireland made this announcement, my own health has suffered and I feel under constant stress along with so many others whose houses and homes are in danger, 78 houses and apartments, the local sports centre and swimming pool which is used by adults and children alike are all to be demolished, this cannot be allowed to happen,	Please refer to response (4) in relation to re-housing and the position in relation to the Markiewicz Centre.

MetroLink Railway Order - Case Reference Number NA29N.314724. Maria O'Connor, 26 Townsend Street, D02 E032				
8	Letter - concerns	2	I would like to finish by saying that I am not against Metrolink, I think a lot of the ideas and plans are excellent and Dublin city centre does need a rail link to the airport, and north county Dublin needs connection to the city. However the plans regarding the Tara street development of the Metrolink project must be stopped or changed, the country is in the middle of a housing crisis and there are other options for them to use which will not involve demolishing 78 homes and a sports centre.	TII wish to thank you for your submission and statement of support for the delivery of MetroLink. Response (1) outlines the strategic need for a station at Tara Street. Please refer to response (3) above in relation to the options considered for Tara Street, and the reasons for the selection of the proposed station location. Please refer to response (5) in relation to the mined option that was considered, and the reasons why this option was not progressed.
9	Letter - concerns	2	I love my house and I am very happy in this area in Townsend street and I appeal to An Bord Pleanála to please not let them destroy my home and so many other residents homes in the area, especially when it is not necessary as there are other alternatives out there, I thank you for your help.	TII have fully assessed the impacts of the construction of Tara Street Station and presented the assessment in the EIAR, including the obvious negative impacts on the local community. As noted above, TII have and will continue to work with DCC to mitigate these impacts. Response (1) outlines the strategic need for a station at Tara Street. Please refer to response (3) above in relation to the options considered for Tara Street, and the reasons for the selection of the proposed station location. Please refer to response (5) in relation to the mined option that was considered, and the reasons why this option was not progressed.

Submission No.			180	
Organisation Name or Name of Submitter			Marie McMahon (111 Botanic Road, Glasnevin)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: Metrolink North Project				
1	Letter	1	I wish to lodge my objection to the Metrolink North Project running under my house at 111, Botanic Rd. Glasnevin, Dublin 9. on the following grounds: 1. My house is over 100 years old and was built with little or no foundations as were the other houses on my terrace. Concrete was not readily available at the time of building these houses. 2. The depth of the excavations in my opinion is not nearly deep enough and this may cause subsidence and destabilize the house.	Thank you for your submission and for sharing your observations with regards to the MetroLink project to which we have responded below. Information about the tunneling works are provided in EIAR Chapter 5 (MetroLink Construction Phase) and Chapter 4 (Description of the MetroLink Project). The tunnel sections are provided to ensure that there is maximum operational efficiency of the proposed Project while also reducing potential impacts on the developed urban areas above the alignment. For the property at 111 Botanic Road, the following data is shown on the individualised property details plan (please refer to Plan drawing no. ML1-JAI-BOR-ROUT_XX-DR-Y-03077, ML4L-U53): •Ground level to crown of tunnel (m) - 13.3 •Ground level to track (m) - 19.9 A comprehensive Settlement Assessment has been undertaken to determine the potential impacts that construction of the proposed Project will have on sensitive receptors such as buildings and infrastructure from the advance of the Tunnel Boring Machine (TBM). The ground movement predictions and the building damage assessment methodology adopted for MetroLink is based on the approach adopted in most tunnel projects around the world, including London Crossrail and High Speed 2 in England. This is described in EIAR Section 5.4.11 (Ground Settlement Monitoring and Mitigation Works). EIAR Appendix A 5.17 Building Damage Report, covers the assessed impacts of construction generated ground movements and settlement on property. Section 5.2 of this report sets out the rationale for the assessment of properties similar to yours. The results of the assessment provided in Table 5.2 shows that property Ref B-123, as one of the representative properties selected similar to your property, has been assessed as falling within the '<i>Slight</i> ' category. This category indicates that redecoration may be required, with several slight fractures inside the building and visibility of exterior cracks. The building risk categories shown in Table 4.4 of Appendix A 5.17 are used to define the degree of building damage related to the Risk Category. TII is committed to having a Property Owner Protection Scheme (POPS) in place prior to construction works commencing. The scheme allows residential property owners to register with TII if the property is within thirty metres of the edge of the MetroLink alignment or fifty metres of station structures. The POPS comprises condition surveys of private properties and other selected properties along the route of the proposed Project. The purpose of the condition surveys would be to ascertain the condition of the properties before, during (if deemed necessary), and after the completion of the proposed Project to determine whether there has been any deterioration of any of the properties surveyed and whether the same may be attributable to the proposed Project and recommend repairs as appropriate. Condition survey data gathered pre and post construction, and possibly during construction, will be used to assist the property owner and TII in the swift and accurate verification of any property damage claims which may be received from property owners. The POPS would be introduced by TII through public consultation and will be formally advised to eligible property owners by the Public Relations Department. The Property Owners' Protection Scheme is in addition to the existing legal rights of property owners and is in place to provide a simple and prompt way of rectifying any damage caused under the project up to the ceiling of €45,000. If the sum should exceed this amount the normal claims process would be used with the insurance companies for TII and/or the contractor. Useful information on POPS can also be found in the MetroLink Frequently Asked Questions document which can be found on-line at: https://www.metrolink.ie/en/your-property/property-owners-protection-scheme/

Letter Re: Metrolink North Project				
2	Letter	1	3. Why was this particular terrace of houses chosen when much newer houses with proper foundations further up on next terrace were not chosen? The fact that this is presented to us with no choice in the matter is very upsetting .	EIAR Chapter 7 (Consideration of Alternatives) details alternative route options considered by TII in the development of the proposed Project and the rationale for ruling those options in and out, that included an assessment of the environmental impacts of each option considered, both positive and negative. Chapter 8 (Consultation) details that consultation has been undertaken throughout the project development, including but not limited to the Emerging Preferred Route (EPR) Consultation, Environmental Impact Assessment (EIA) Scoping Consultation and Preferred Route Public Consultation. EIAR Appendix A 5.17, Building Damage Report, describes the industry standard phased ground movement impact assessment process that is undertaken on tunnelling and underground projects around the world, and how it has been applied to the MetroLink project. The impacts on this terrace property have been assessed as 'slight' (refer to Table 5-2: Result of Phase 2a Building Damage Assessment – Representative Buildings for Building B-123) and therefore no protection works are anticipated to be required. The assessments undertaken at Phase 2a are considered moderately conservative. As part of the Phase 2b assessment, the Design and Build Contractor will review and refine the Phase 2a assessment results based on updated survey information, detail design development (increased design maturity) and finalising the construction methodology and planning. Please also refer to the response in Section 1.

Letter Re: Metrolink North Project				
3	Letter	1	4. I have a Bus stop outside my house for over forty years. The house rattles every time buses stop outside it. I can only imagine what further vibrations may do to it.	Potential impacts associated with noise and vibration during the construction phase of the proposed Project are addressed in Chapter 13 (Airborne Noise & Vibration) with mitigation measures proposed where required. The assessment of airborne noise and vibration during the construction of Glasnevin Station includes the consideration of the closest noise sensitive receptors to the works. The noise mitigation measures that will be put in place will also work to reduce potential noise impacts at this address which is approximately 125m from the works. Chapter 14 presents the assessment of Groundborne Noise and Vibration during Construction. The Appendix 14.5 Groundborne Noise and Vibration Blasting Modelling Results presents predicted groundborne noise and vibration levels during the construction and operation phases of the project. The predicted groundborne noise during passage of the tunnel boring machine (TBM) is 49 dB LASmax which is above the Threshold Level of 45 dB, indicating a significant adverse impact for the buildings occupants for a short-term duration of up to 2-weeks when the TBM is passing this address. Vibration levels are calculated as a Vibration Dose Value (VDV). The predicted vibration during TBM Passage during the day and night are 0.265ms^{-1.75} (VDV day) and 0.223ms^{-1.75} (VDV night). The results are shown in Section 14.4 of Appendix 14.5. Both of these values are lower than the VDV Threshold Levels of 1.0ms^{-1.75} (VDV day) and 0.5ms^{-1.75} (VDV night). These threshold levels have been established in relation to human response to vibration, and thresholds for building damage are much higher. As the predicted levels of vibration from TBM passage are below these thresholds then no impact from vibration during TBM passage is expected for this building or for occupants. Threshold levels for vibration impact assessment are considered in Section 14.2.1.2.3 of EIAR Chapter 14. Unfortunately, no effective methods are available to reduce groundborne noise or vibration from TBMs at source. The principal mitigation measures aimed at minimising impacts are as follows: • Advance public consultation and stakeholder engagement can greatly reduce the significance of groundborne noise effects during construction, as building occupants would be prepared for the passage of the TBM and resultant elevated noise and vibration levels. • TII will accept and consider applications for additional measures on a case-by case basis, in accordance with its Noise and Vibration Mitigation Policy (see Appendix A14.6). Appendix 5.1 of the EIAR contains an outline Construction Environmental Management Plan (CEMP) which outlines the proposed approach to noise and vibration mitigation during the construction phase in Table 6.2. A full monitoring and auditing programme will form part of the CNVMP which will be agreed with the Local Authorities prior to the commencement of the Construction Phase. The Transport Infrastructure Ireland (TII) Airborne Noise and Ground-borne Noise Mitigation Policy (Appendix A14.6 of Chapter 14) sets out the construction noise insulation and temporary rehousing measures to be implemented where required. During railway operation the predicted groundborne noise at 111 Botanic Road is 36 dB LASmax, which is below the threshold level of 40 dB LASmax indicating no significant impact to building occupants during railway operation. The predicted VDV (Vibration Dose Value is a parameter that combines the magnitude of vibration and the time for which it occurs) during railway operation is 0.009 ms^{-1.75} (VDV day) and 0.005 ms^{-1.75} (VDV night). Both of these values are well below the VDV Threshold Levels of 0.8ms^{-1.75} (VDV day) and 0.4ms^{-1.75} (VDV night) indicating no significant impact for the building or for residents of this address.
4	Letter	1	5. All sorts of promises are being made that surveys of properties will take place and that ground in these areas will be accessed before construction. So far I've had no contact from anyone on this matter.	Property condition surveys will be undertaken at protected or identified vulnerable buildings and structures within 50m of the proposed surface working compounds, and 30m of the proposed tunnel alignment. Property condition surveys will also be carried out at buildings and structures considered appropriate relative to their proximity to the works depending on their potential vulnerability to vibration and settlement. With regard to the surveys, these will be undertaken in advance of construction but closer to the date by which impacts could be expected to ensure that the existing condition is recognised. TII will employ Professionally Qualified Engineers / Surveyors with the appropriate expertise to undertake the pre and post construction condition surveys. (Refer to Table 6.2 Noise and Vibration Measures in the Outline Construction Environmental Management Plan, Appendix 5.1 of the EIAR). TII have undertaken extensive consultation across the route of MetroLink and have listened carefully to the concerns of stakeholders and the community, as documented within EIAR Chapter 8. Furthermore TII have undertaking a detailed and an extensive Environmental Impact Assessment that identifies and addresses environmental concerns as evidenced by the submitted EIAR, including proposed mitigations to reduce environmental impacts, that accompanies the MetroLink Railway Order application. Please note that as part of the consultation you were issued with an individual property information pack on the 20th September 2022 with details of the route directly below your property.

Letter Re: Metrolink North Project				
5	Letter	1	6. The fact that the historical value of the area is been ignored especially in the construction of the Glasnevin station is another worrying aspect of this Project.	Glasnevin Station will be a new multi-modal interchange station in Phibsborough, linking MetroLink, the two existing Iarnród Éireann heavy railway lines (Western Commuter Line and the South-Western Commuter Line), BusConnects, and connections by car, walking and cycling. Unfortunately, due to the available land, combined with the construction challenges associated with providing this complex multi-modal interchange station that will deliver significant transport benefits by nature of its connectivity, there is no means of retaining the Brian Boru pub. TII acknowledge this is a significant impact. TII also acknowledge that the architectural railings at Dalcassian will need to be temporarily removed. Before proposing the demolition of the Brian Boru pub, TII did carefully examine the alternative of locating a station at Drumcondra rather than Glasnevin as reported by EIAR Chapter 7, Consideration of Alternatives, section 7.6.5. Both options would require demolition of buildings with potential for significant impacts on architectural heritage, however, once the construction is complete, the proposed station location at Glasnevin offers a much better interchange station location for passengers, a key Project objective of MetroLink. The impacts of the Glasnevin construction works have been assessed and reported in the EIAR Chapter 25 (Archaeology and Cultural Heritage). The Brian Boru pub will be recorded by means of photography and written description to English Heritage Level 3 standard prior to demolition. (Refer to Table 25.9 and Section 25.6.1 of Chapter 25). The construction of the station will necessitate the removal of the historic railings at Dalcassian Downs. The railings and their plinth walls will be recorded by photography and written description prior to their removal. The railings and walls will be taken down in accordance with a specification to be prepared by the Project Conservation Architect (PCA) and the removed materials stored securely prior to cleaning, repair, and reinstatement. At the appropriate stage of construction, the materials are to be returned to site and the railings and walls reinstated in accordance with a conservation method statement prepared by the PCA. All works of dismantling, protection, transportation and reconstruction will be carried out by a dedicated heritage contractor with the assessed impact imperceptible following this mitigation. (Refer to EIAR Chapter 26, Architectural Heritage - Section 26.4.4.6: Glasnevin Station and Table 26.66: Proposed Mitigation).

Letter Re: MetroLink Railway Order Application submission REF - 314724					
1	1 Construction Management:	1	Construction of the three stations which are planned for Dublin 9 and 7 will have enormous impacts on the traffic flows in the area. Traffic management plans must be published, and consultation must take place with the local communities well in advance of any works commencing	Chapter 5 of the EIAR, MetroLink Construction Phase, explains that traffic management plans for the construction phase of the Project have been developed to minimise the impact on road users, and to maintain access to property. Prior to implementation, all traffic management measures will be agreed with DCC and where relevant, consultation with An Garda Síochána and other statutory stakeholders will be undertaken. The design of traffic management measures and highways works is based on achieving the key objective of maintaining continual access to all properties during the works. Where necessary, a safe alternative route will be provided for pedestrians and vulnerable road users, such as children, and persons with restricted mobility, to maintain pedestrian access. Where detour routes are required, these will be kept as short as possible and detour signage will be clear and easy to understand. All construction sites will be designed to be as unobtrusive as possible. EIAR Appendix A9.5, Scheme Traffic Management Plan (STMP) also describes the methodology used to assess the impact of the construction of the Project on all transport users and provides details of mitigation techniques and the types of measures to be employed to minimise the impacts generated by the Project during the Construction Phase. TII confirm that traffic management plans will be published, and consultation will take place well in advance of any works commencing as noted in Chapter 9 Traffic and Transport and Appendix A5.1 Outline CEMP of the EIAR. TII's contractor(s) will be responsible for putting in place a Stakeholder Communications Plan which will be developed under the consent of a designated Public Liaison Officer (or equivalent officer) appointed by TII. This plan will provide a two-way mechanism for members of the public to communicate with a designated member of the contractor(s)'s staff and for the contractor(s) to communicate important information on various aspects of the proposed Project to the public. Prior to the commencement of construction, a comprehensive publicity and information campaign will take place.	
2	1.1 Glasnevin Station	1	During the peak construction period of year 3 and year 4, there will be up to 200 construction vehicles travelling in and out of this area on a daily basis. This is going to have dramatic and enormous implications for traffic flows in the wider Phibsborough area. In particular there is a specific concern regarding the ability of Cross Guns bridge to take such high volumes of plant and machinery.	Traffic impacts have been assessed and included within EIAR Chapter 9, Traffic and Transport. During the main works at Glasnevin Station, as the construction site boundary is located away from the traffic network, there is expected to be no significant impact on traffic flows throughout the Construction Phase while temporary traffic management (TTM) is implemented. Average lorry movements during the main works are 50 - 100 movements. The maximum number of daily movements of 200 vehicles only occurs for two days as per Appendix A9.5 STMP. Analysis shows that construction traffic movements will likely result in a minor impact on the nearby signalised junctions and on Prospect Road, however traffic flow will generally be unaffected. There will be some impact on Prospect Road where site vehicles routing from the north to the site will be required to take a right turn into the site, leading to an increase in HGVs in the area. TII and their contractor(s) will monitor the traffic flows during construction to ensure no undue disruption occurs. With regards Cross Guns Bridge there are no traffic restrictions on this currently. It should be noted that HGV haul routes are located from the M50 to Glasnevin Station so there is no current requirement to cross Cross Guns Bridge. In the event that MetroLink abnormal vehicle loads are required to pass through Cross Guns Bridge, TII will consult with the DCC and make necessary arrangements.	
3	1.2 Griffith Park Station	1	Local residents will also need a very clear picture of the traffic management system here, given such high levels of heavy plant and machinery that will be in the area on a daily basis over an extended period.	Please refer to response (1) above. TII will implement signage strategies for access traffic and through traffic, the public will be provided with advanced warning of any proposed diversions and disruption, and there will be continuous updates on construction progress on the project website and through various social media outlets. These measures, and others, are detailed in EIAR Appendix A 9.5 Scheme Traffic Management Plan.	
4	1.3 Mater Station	1	Along with the problems associated with construction traffic, there is also a very significant concern here about parking in the area, this and other issues will need to be considered in advance of construction.	TII confirm that parking has been considered as part the MetroLink environmental impact assessment. TII will work with the local community to mitigate so far as is reasonably practicable impacts on parking. EIAR Appendix A9.5, Scheme Traffic Management Plan, section 7.7, assesses that there will be a moderate impact to designated on-street parking due to the removal of parking bays on Eccles Street and Berkley Road. TII will seek to ensure parking bays are not used by construction staff and operatives by implementing the Construction Mobility Plan to ensure that numbers of employee vehicles travelling to and from construction sites on a daily basis will be managed through transporting workers to site via buses/mini-buses from designated collection points (such as Luas and DART stations or other appropriate locations).The full list of Mitigation Measures in the Construction Phase are summarised in EIAR Chapter 9, Traffic & Transport, Table 9.147.	

Submission No.			181	
Organisation Name or Name of Submitter			Senator Marie Sherlock	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: MetroLink Railway Order Application submission REF - 314724				
5	2. Community Liaison	2	Given the major noise and physical impacts on the area, along with the high levels of plant and machinery that will be in the area, it is vital that there is a 24 hour help/liaison line put in place for the whole duration of the construction period.	As noted in Appendix A5.1 Outline CEMP, a Stakeholder Communications Plan will be developed under the consent of a designated Public Liaison Officer (or equivalent officer) appointed by TII. This will include for a 24 hour phonenumber during construction.
6	3. Vermin Control	2	Given that the works are in such close proximity to the Royal Canal, we ask that specific measures for vermin control are undertaken during construction works.	TII and their contractor(s) will implement rodent control measures. While rodents will be temporarily displaced as a result of initial construction activities, there is nothing in the Construction Phase which would lead to an increase in the number of rodents. With additional rodent control policies in place as a result of MetroLink it is possible that there will be a reduction in the level of rodents. Mitigation measures are outlined in A5.1 Outline CEMP - Table 6.6
7	4. Noise Protection	2	Given the significant levels of noise, we ask that there is greater detail given to residents living in Shandon and Dalcassian areas, along with those living along 'Berkeley Road, with respect to the construction of the Glasnevin and Mater stations.	Full noise assessments have been undertaken and presented in EIAR Chapters 13 and 14 that cover airborne and groundborne noise and vibration respectively. Chapter 13 considers noise impacts from above ground working, with some significant impacts remaining for receptors, that include some on Berkeley Road, adjacent to the construction of Glasnevin Station (Table 13.87 and 13.88 of the EIAR) and Mater Station (Table 13.89 of the EIAR) during piling works and track possessions at Glasnevin station and several work phases at Mater station. Chapter 14 considers groundborne noise and vibration identifies there will be exceedances of groundbourne noise thresholds for receptors closest to the tunnel route during the TBM passage. There will be no other exceedances of groundborne noise or vibration thresholds for receptors on Berkeley Road during construction. Unfortunately, there are no effective methods available to reduce groundborne noise or vibration from the TBM at source, but noting that the duration of this impact will be temporary and of the order of up to two-weeks as the TBM passes. TII will undertake advanced consultation and stakeholder engagement to prepare people for the passing of the TBM and ensure the timing of these impacts are known. TII's contractor(s) will prepare a Construction Noise and Vibration Management Plan (CNVMP) for the proposed Project as referred to in the EIAR Appendix A5.1, Outline Construction Environmental Management Plan (CEMP). The CNVMP will be a live document and will include a full monitoring and auditing programme which will be agreed with the Local Authority prior to the commencement of the Construction Phase, including predetermined monitoring trigger levels to ensure noise limits are not breached. The Transport Infrastructure Ireland (TII) Airborne Noise and Ground-borne Noise Mitigation Policy (Appendix A14.6 of EIAR Chapter 14) also sets out the construction noise insulation and temporary rehousing measures to be implemented where required. TII and the contractor(s) will engage further with stakeholders in the local community, especially those who may be affected by the construction works including residents, businesses, community resources and specific vulnerable groups. This will include residents in Shandon, Dalcassian and on the Berkely Road. The contractor(s) will be responsible for putting in place a Stakeholder Communications Plan which will be developed under the consent of a designated Public Liaison Officer (or equivalent officer) appointed by TII. This plan will provide a two-way mechanism for members of the public to communicate with a designated member of the contractor(s)'s staff and for the contractor(s) to communicate important information on various aspects of the proposed Project to the general public. Prior to the commencement of the Construction Phase, a comprehensive publicity and information campaign will take place.
8	5. Property	2	We wish to raise concerns about the limited nature of the POPS (Property Owner Protection Scheme) and the restriction of this to buildings within 30m - we believe that is overly restrictive and that other property owners who believe they will be affected should be allowed into the scheme.	TII do not consider that the POPS is overly restrictive. The 30m zone is designed to encompass the zone within which construction generated ground movements might be expected to occur that could have an impact on property. To provide further assurance, TII and their contractors will be undertaking comprehensive ground movement and vibration monitoring that will provide the data, that in the event a property owner considers their property may have been impacted by Metrolink construction, to determine whether that is the case.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: MetroLink Railway Order Application submission REF - 314724				
9	6. Ecological Protection and damage mitigation measures on the Royal Canal	2	It is extremely important that the impact of construction on wildlife habitats and on the biodiversity of the Royal Canal be minimised. We would like to see an ecological management plan in place for the period of construction to mitigate these risks.	EIAR Chapter 15, Biodiversity, Table 15.24 shows the residual impact significance on habitats and biodiversity for the Royal Canal (proposed Natural Heritage Areas, (pNHA)) and Canals (habitat type canals, FW3). Following mitigation this results in no likely significant residual effect. For the construction phase the contractor will be required to develop a site-specific Ecology and Landscape Management Plan, and a Non-Native Invasive Species Management Plan. The contractor will be legally obliged to ensure that procedures are implemented to control and minimise disturbance and damage to areas of conservation interest and legally protected and notable species, in accordance with the mitigation and control measures referred to above and as set out by Chapter 15.
10	7. Commitment to restoration of green space and planting:	2	In addition to the concerns about wildlife, we also want a commitment to ensure that any trees removed due to construction works will be replaced appropriately and any green space disturbed be re-planted.	TII and the MetroLink project are committed to minimising impacts on wildlife habitats and on biodiversity more generally. Proposals include for example, the provision of tree and woodland planting to replace trees unavoidably lost as a result of the alignment, design and construction of the proposed Project – this forms part of the embedded primary mitigation included within the landscape design. In most circumstances however, the designed planting as proposed is more appropriately scaled to the pertaining landscape context and is invariably more biodiverse than the baseline planting lost. These aspects of the proposed Project go beyond the requirements of mitigation and are in effect improvements over and above the baseline, and would therefore be considered “enhancements” as outlined in Chapter 27 Landscape & Visual. TII would also note that an Arboricultural Impact Assessment has been carried out (EIAR Appendix 27.3). This contains information on the existing tree conditions and the arboricultural impact of the proposed Project. EIAR Chapter 27 Landscape & Visual, Section 27.6.1 includes for a number of mitigation measures to reduce the impact of MetroLink, including: • Identification and retention of existing mature trees of good quality, through the adjustment of the alignment, location of structures/buildings and the outline design of the proposed Project; • Comprehensive proposals for hard and soft landscape works, including tree and hedgerow planting to offset the effects of net loss due to the proposed Project; • Where cut and cover sections of track and/or station boxes underground are to be planted over, the inclusion of sufficient appropriate substrate and adequate drainage to allow tree planting and growth for posterity. There is a general requirement for a minimum depth of 1.5m growing medium in such circumstances. • To improve biodiversity, the inclusion of species rich planting and wildflower meadows of primarily native species (and pollinator friendly plant species where deemed appropriate) as part of the planting strategy; • A detailed design of the incorporated biodiverse planting that will be developed with the project ecologist; • In sensitive locations, residual landscape and visual effects will be significantly reduced through the inclusion in the proposed planting of relatively mature specimen trees.
11	8. Station design	2	Given the high profile of the location of the Glasnevin station, we believe the opportunity should be taken to incorporate an eco-friendly, sustainable and imaginative design for the station, and that it be built on green building principles with consideration given to solar thermal systems, green roof and living walls.	TII confirm they are aligned with the observation made and this is enshrined in the overall project objective, as established by Transport Infrastructure Ireland (TII) and as outlined in the National Development Plan 2021-2030 (Government of Ireland, 2021a):‘<i>To provide a sustainable, safe, efficient, integrated and accessible public transport service between Swords, Dublin Airport and Dublin City Centre.</i>’. To achieve this ambition TII will procure the contractors to deliver the design based on specified environmental criteria and in line with TII's Sustainability Implementation Plan – Our Future (TII 2021), that sets out the vision to lead in the delivery and operation of sustainable transport, strengthen resilience to climate change, and maintain commitment to the environment. The Plan recognises the need to rethink, reimagine and redesign approaches to ensure sustainability is at the heart of everything that TII does, requiring it to be the leading provider of sustainable infrastructure. These provisions are contained within the EIAR Chapter 4 and specifically referenced in Section 4.6 Sustainable Design. The delivery of the Glasnevin Station design will follow these principles.

Organisation Name or Name of Submitter			Mark Campbell and Aimee O'Farrell (11 The Court, Dalcassian Downs, Glasnevin)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: Metrolink Glasnevin Station, proximal to The Court Apartments, Dalcassian Downs. Case reference: NA29N.314724 Estuary through Swords, Dublin Airport, Ballymun, Glasnevin and City Centre to Charlemont, Co. Dublin (Metrolink)				
1	1. Specific health risk to children	1	There are significant public health risks associated with the proposed works which I do not feel have been adequately described in the Environmental Impact Assessment Report (EIAR). Health risks described in the EIAR will be based on studies that explore adult health risk. There have not been adequate studies done to examine the specific risk to infants and children who have significantly different physiology and psychology. Long term disruption/ Long-term exposure to noise can cause a variety of health effects including annoyance, sleep disturbance, negative effects on the cardiovascular and metabolic system, immune system dysfunction, as well as cognitive impairment in children. Sleep disturbance has been shown to cause delay in reaching predicted growth centiles and developmental milestones and impair academic ability. (https://www.eea.europa.eu/articles/noise-pollution-is-a-major) Children have a higher respiratory rates, and smaller lungs, they are more susceptible to air pollutants. (https://journals.sagepub.com/doi/pdf/10.1080/1403495060Q677311) Children are more susceptible to airborne and groundborne noise due to a number of factors including their range of hearing (https://pubmed.ncbi.nlm.nih.gov/15129589/).	Thank you for your submission and for sharing your observations with regards to the MetroLink project to which we have responded below. As presented in EIAR Chapter 10 (Human Health) Section 10.3.4 Sensitive Receptors, some human beings are more sensitive than others, due to their age, health status or other reasons and in order to be conservative, and in keeping with the worst-case approach it has been assumed that there are vulnerable individuals at every receptor. In addition, the assessment is aided because Health Based Standards are derived to protect the vulnerable and not the robust. In terms of Human Health, all human beings are considered to be equally important. The use of the term 'importance' in this context refers to areas or buildings occupied by people. Their importance is considered to increase as the number of people increases and the duration of time spent there increases. Residential areas, public and private health facilities, workplaces, hotels and educational facilities are considered to be 'very important' areas because a number of persons usually spend a substantial amount of time at these locations. The sensitivity of an area or building in this context refers to the vulnerability of the population. Reasons for this include inherent vulnerability such as is the case for the very young or old. Residences, schools, workplaces, commercial areas and places of worship are considered 'highly sensitive'. This is because these areas will include populations of elderly, young people and people with health conditions. In conclusion the health impact assessment was done considering the most sensitive receptor, including children, and not simply the most healthy and fit adults. Noise and Vibration Health Impact <u>Construction airborne noise and vibration</u> As presented in EIAR Chapter 13, the airborne noise impact on the people living in The Court buildings during construction of the Glasnevin Station will be Significant to Very Significant. As a result, noise mitigation measures will be implemented according to TII Airborne and Groundborne Noise Mitigation Policy including a specific measure in the case of Glasnevin Compound -the site will have 4m high construction site hoarding on all boundaries instead of standard 2.4 m high. Where residual construction noise levels remain above the NI or TRH trigger values, application of TII Airborne and Groundborne Noise Mitigation Policy will be implemented with further control measures as Noise Insulation (NI) or Temporary Rehousing (TRH). Further details on the trigger values can be found in Appendix A14.6 Airborne Noise and Groundborne Noise Mitigation Policy Appendix A. The CNVMP (Construction Noise and Vibration Management Plan) will set out a detailed analysis of each construction compound relating to noise levels, durations and number of properties impacted and the planned approach for managing same. It is reiterated again that prior to any construction work commencing on any of the main work sites a detailed acoustic impact assessment will be undertaken which will involve a baseline noise study, model of the contractors final site layout, plant and equipment models, numbers and on-site location and the inclusion of all available on-site noise control measures. This is detailed in EIAR Chapter 13 (Airborne Noise and Vibration) section 13.6.1.2.7.

Letter Re: Metrolink Glasnevin Station, proximal to The Court Apartments, Dalcassian Downs. Case reference: NA29N.314724 Estuary through Swords, Dublin Airport, Ballymun, Glasnevin and City Centre to Charlemont, Co. Dublin (Metrolink)					
			Response (1) continued.	<u>Construction ground borne noise and vibration</u> As presented in EIAR Chapter 14, the ground borne noise impact on the people living in The Court buildings during construction of the Glasnevin Station will be Significant due to the Tunnel Boring Machine (TMB) Passage and Mechanical Excavation. The noise impact will be noticeable to all and disturbing to some over a number of days. The vibration during construction will have no impact on the residents of The Court Buildings. The TBM passage will be a temporary impact. The duration of this impact will be in the order of up to two weeks as the TBM passes. As a result mitigation measures will be implemented such as advance public consultation, stakeholder engagement and application of TII Airborne Noise and Ground-borne Noise Mitigation Policy (appendix A14.6) as presented above. Further details can be found in EIAR Chapter 14 (Groundborne Noise and Vibration) section 14.5, and Chapter 13 (Airborne Noise and Vibration) section 13.6. <u>Operation noise and vibration</u> As presented in EIAR Chapter 14 (Groundborne Noise and Vibration), section 14.4.2.6, the noise and vibration resulting during the operation period of MetroLink will have no impact on The Court buildings and residents. Air Quality Health Impact As presented in EIAR Chapter 10 (Human Health), when the dust minimisation measures detailed in the mitigation section of Chapter 16 (Air Quality) are implemented, fugitive emissions of dust from the site are not predicted to be significant and to pose no nuisance to human health and there will be no residual Construction Phase dust impacts. The Construction Phase of the Air Quality assessment, as detailed in Chapter 16 (Air Quality), identifies a generally negligible or slight negative impact on air quality in the vicinity of the proposed project during the Construction Phase post mitigation. No exceedances of air quality standards are predicted, therefore, no significant adverse human health impacts are predicted. This is detailed in section 10.5.1.1. of Chapter 10 (Human Health).	

Submission No.			182

Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
Letter Re: Metrolink Glasnevin Station, proximal to The Court Apartments, Dalcassian Downs. Case reference: NA29N.314724 Estuary through Swords, Dublin Airport, Ballymun, Glasnevin and City Centre to Charlemont, Co. Dublin (Metrolink)					
2	1. Specific health risk to children	1 and 2	Any mitigation measures and modelling included in the EIAR are based on adult data, these studies don't include and cannot accurately predict risk to children, and therefore cannot be relied upon. Specifically, EIAR suggests 'Significant to Very Significant' Airbourne Noise and Vibration (NV4) for Dalcassian Downs Court post mitigation measures. Whilst TII have documented 'Potential annoyance and disturbance of sleep for residents' this does not describe the potential risk to infants and small children, or night workers related to disturbance of daytime sleep patterns. Construction traffic holds another risk for children in addition to the noise and dust and pollutants caused by construction traffic. As children are smaller, they may be more difficult to see from the cabin of large vehicles. Being less visible to these drivers puts them at increased risk of injury/serious incidents/near misses.	Please refer to response item (1) above regarding the sensitive receptors, including children, and noise and vibration impacts. Shift workers have been acknowledged and considered in the assessment, however as presented in EIAR Chapter 10 (Human Health), the ambient noise levels, during day time, are much greater at this time so it is less likely that an additional noise source will have a significant effect. The assessment of impact on sleep is therefore based on night-time noise. This is detailed in section 10.3.6.1.1. of Chapter 10 (Human Health). Construction traffic impact on noise and air quality was considered into the overall noise and air quality impact. This is detailed in section 16.5.2.1 of Chapter 16 (Air Quality). Prior to the enabling works and the main construction phase a Traffic Management Plan will be developed (Refer to Appendix A9.5 of the EIAR). The use of a traffic management plan is critical to the management of construction phase traffic and vulnerable road users such as cyclists and pedestrians. The assessment did not consider children as a separate road user group. The contractor will be legally required to adhere to the requirements of the plan on a day by day basis and so any such measures will be implemented with a focus on managing traffic movements to ensure that there are no accidents. In EIAR Appendix A 9.5 Scheme Traffic Management Plan, mitigation measures are presented: - Construction vehicles will be controlled in terms of the hours of operation (i.e., construction traffic may be prohibited during periods of very heavy traffic) and by imposing restriction on vehicle size and weight; - There will be controls at the entrance/exits of sites for construction vehicles in order to ensure the safety of other road users; - Pedestrian routes will be maintained throughout the construction period, either around or through the construction site, where safety risks to the general public will not increase as a result of construction activity; - In very sensitive areas, the designated access and pedestrian routes around the construction sites, particularly at and/or along the hoarding lines, must not be perceived as uninviting by pedestrians. The environment around the sites, therefore, will be designed to ensure that pedestrians and cyclists feel they are entering a safe and accessible environment. This will ensure that impact to businesses and shops adjacent to the works areas is minimised. - Temporary pathways and cycle ways will be installed where appropriate and provision will be made to ensure access for the mobility impaired is maintained; and - Where the existing level of service cannot be maintained in the vicinity of the construction sites, an alternative route will be designated, be clearly visible, be safe and be signed and have the level of service required to cater for the pedestrian demand.	
3	2. Quality of life	2	These are very formative years for infants and children, their physical health, their growth potential, and their academic performance have been shown to be negatively impacted by disruption to their sleep, being exposed to prolonged periods of noise. They will no longer be able to socialise in the common areas, speak to neighbours, invite friends over. This will hinder their emotional development.	Please refer to response item (1) above in relation to the assessment of health impacts on children.

Organisation Name or Name of Submitter			Mark Campbell and Aimee O'Farrell (11 The Court, Dalcassian Downs, Glasnevin)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: Metrolink Glasnevin Station, proximal to The Court Apartments, Dalcassian Downs. Case reference: NA29N.314724 Estuary through Swords, Dublin Airport, Ballymun, Glasnevin and City Centre to Charlemont, Co. Dublin (Metrolink)				
4	3. Air Quality:	2	Air quality in the area already exceeds the World health organisation air quality guideline levels. There is a direct correlation between elevated pollutants and mortality. This is more significant on those with smaller lungs and higher respiratory rates such as children. (https://www.who.int/publications/i/item/9789240034228) Building a station/ transport system to reduce pollution in the future should not be offset by increasing the risk to the local population now. The proposed development will undoubtedly reduce the quality of life, the air quality, and the ability to use green spaces locally due to invasive/intrusive noise, dust.	Please refer to response item (1) above in relation to the impact on noise, vibration and air quality during both the construction and operational phases. As detailed in section 16.6.1.4 of Chapter 16 (Air Quality), the modelling of road traffic for impacts on human and ecological receptors has found no significant impacts that require mitigation measures with respect to the modelling of emissions. However, some mitigation measures can be put in place to minimise emissions: * Implement a policy which prevents idling of vehicles both on and off-site including HGV holding sites; * Construction Phase traffic should be monitored to ensure construction vehicles are using the designated haul routes; * Additional vehicular traffic will be managed through the CEMP and Temporary Traffic Management Plans for the proposed Project and stations as per Chapter 9 (Traffic & Transport); * Efficient scheduling of deliveries to minimise number of deliveries required, and in turn their emissions; and * Construction vehicles should conform to the current EU emissions standards and where reasonably practicable, their emissions should meet upcoming standards prior to the legal requirement date for the new standard. This will ensure emissions on haul routes are minimised. As detailed in section 16.6.1.4 of Chapter 16 (Air Quality), mitigation measures are required for the control of dust with respect of HGV moments on site and deliveries to/from the site: * HGV traffic leaving site will pass through a wheel wash; * Public roads outside the site will be regularly inspected for cleanliness and cleaned as necessary. If public roads are deemed to require additional cleaning where possible a suction device for road cleaning will be utilised which can access spaces around cars and other street furniture more effectively; and * During movement of materials both on and off-site, trucks will be stringently covered with tarpaulin at all times. Before entrance onto public roads, trucks will be adequately inspected to ensure no potential for dust emissions. As detailed in Chapter 16 (Air Quality), section 16.7.2, the air dispersion modelling assessment has found that in 2035 no receptors will have ambient air quality exceedances of the ambient air quality standards for the Do Something (and Do Minimum) scenario as a result of the proposed Project.

Submission No.			182		
Organisation Name or Name of Submitter			Mark Campbell and Aimee O'Farrell (11 The Court, Dalcassian Downs, Glasnevin)		
Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
Letter Re: Metrolink Glasnevin Station, proximal to The Court Apartments, Dalcassian Downs. Case reference: NA29N.314724 Estuary through Swords, Dublin Airport, Ballymun, Glasnevin and City Centre to Charlemont, Co. Dublin (Metrolink)					
5	4. Air and noise pollution:	2	The has been no sustained collection of air or noise quality readings at the site of the proposed station. This is already an area of elevated noise and poor air quality. There is no evidence that any mitigation measures would be capable of reducing the increased risk to human health. EIAR Section 10.5.1.2 suggests that working at this site will be 24h per day, and that mitigation methods are predicted not to adversely affect human health. As described above - These predictions cannot account for infant and child health. The impact on children is immeasurable. Noise control targets/Noise emission limits for drilling- (<50dB at The Court, <45dB vibration from Mechanical excavation). These limits should be reduced in evening and night-time by minimum 5-10 decibels).	Please refer to response item (1) above in relation to the impact on noise, vibration and air quality during both the construction and operational phases. Both Air Quality and Noise baselining has been undertaken and presented in the EIAR. EIAR Chapter 13 Airborne Noise details in section 13.3 the baselined environment. This is based on circa 11 monitoring locations surrounding the Glasnevin Station - Figure 13.1 refers. Chapter 16 Air Quality section 16.4 details the baseline conditions of the 3 monitoring locations in close proximity to the station - Figure 16.2 refers. As presented in the EIAR Chapter 5, Section 5.2.4 Working Hours, the majority of works will be done during standard working hours, from 07:00hrs to 19:00hrs on weekdays (excluding Bank and Public Holidays) and from 07:00hrs to 13:00hrs on Saturdays. There are however some activities that will require 24h per day working program and in the case of Glasnevin station these are: • Sliding new rail bridge into position; • MEP station works; • Blockades or weekend possession work required with Irish railway (GSWR & MGWR). Regarding the threshold limits for TBM Passage and Mechanical Excavation, there are no statutory standards in Ireland relating to noise and vibration limit values for railway sources or construction works. In the absence of specific statutory Irish guidelines, the assessment makes reference to other national guidelines and standards, where available, in addition to international standards relating to noise and or vibration impact for environmental sources. The convention has been established that groundborne noise is assessed in terms of the maximum A-weighted sound level using the index LpASmax. This approach was subject to scrutiny by the specialist assessor in the Oral Hearings for Old Metro North and the Dart Underground and considered appropriate. It has also been used in the UK for schemes including Crossrail (Elizabeth Line) and High Speed 2 where it underwent scrutiny in Parliamentary Select Committees. This is detailed in section 14.2.4 of Chapter 14 (Groundborne Noise and Vibration). An impact has been considered significant if groundborne noise levels exceed 40 dB LAmax,S. This excludes the passage of the TBM, which is short term and transitory, as it would progress continuously, at a variable rate depending on conditions at a particular location. It would therefore be within range of any particular location for a very limited duration. Based on experience of the driving of the Dublin Port Tunnel and other major tunnelling projects the implementation of a consultation and public relations programme in advance of the works will allow for a higher threshold of acceptability than is the case for the permanent operating railway. As a result a threshold is proposed for groundborne noise from the passage of a TBM 5dB LAmax,S greater than the thresholds for other sources. This is detailed in section 14.2.1.1 of Chapter 14 (Groundborne Noise and Vibration). As a result, TII consider that the limits used for the assessment are appropriate.	
6	Further questions that should be answered	2	• Who will be responsible for measuring noise levels during construction?	As presented in the EIAR Chapter 13 (Airborne Noise and Vibration), during the Construction Phase, the contractor will be required to carry out noise and vibration monitoring at representative Noise Sensitive Locations (NSLs) to evaluate and inform the requirement and/or implementation of noise and or vibration management measures. As detailed in Appendix A5.1 Outline CEMP, for the duration of the contract(s), the environmental performance of the contractor(s) will be monitored through site inspections and audits by the Environmental Manager. The programme for monitoring, inspections and audits will be specified in the contract and it is likely to be a combination of internal inspections and independent external audits that may be either random or routine.	

Submission No.			182		
Organisation Name or Name of Submitter			Mark Campbell and Aimee O'Farrell (11 The Court, Dalcassian Downs, Glasnevin)		
Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
Letter Re: Metrolink Glasnevin Station, proximal to The Court Apartments, Dalcassian Downs. Case reference: NA29N.314724 Estuary through Swords, Dublin Airport, Ballymun, Glasnevin and City Centre to Charlemont, Co. Dublin (Metrolink)					
7	Further questions that should be answered	2 and 3	• How will the equipment and measurements be validated, and who is responsible for monitoring and reporting? - o This telemetry should be publicly available on a hosted website for public access to records. - o Monitoring should be continuous. Monitoring equipment should be maintained/ inspected at regular intervals. - o Breaches should have swift and significant penalties, that should not be seen as merely an additional cost. - o Repeated or sustained breaches will require more severe penalties.	As presented in the EIAR Chapter 13, a full monitoring and auditing programme will form part of the CNVMP (Construction Noise and Vibration Management Plan) which will be agreed with the Local Authorities prior to the commencement of the Construction Phase. At a minimum, the monitoring programme will include an alert system for threshold exceedances, remote access and a platform for sharing monitoring results between the contractor, TII, DCC and FCC. Please refer to response item (6) above in relation to the programme for monitoring, inspections and audits. Mitigation and monitoring will be carried out in accordance with the requirements of the EIAR and NIS so that construction activities are undertaken in a manner that does not give rise to significant negative effects. Suitable monitoring programmes will need to be developed, implemented, documented and assessed in accordance with the specification outline in the detailed CEMP. The results of all environmental monitoring activities will be reviewed by the Environmental Manager on an ongoing basis to enable trends or exceedance of criteria to be identified and corrective actions to be implemented as necessary. The contractor(s) will be required to inform TII of any continuous exceedances of criteria. This is detailed in section 4.2.2 of Appendix A5.1 Outline CEMP. Further, regulatory and statutory bodies may undertake site visits to monitor compliance with legislative and regulatory requirements.	
8	Additional considerations	3	Given that many people are working from home, there are implications to our working day. As someone working in healthcare remotely, this presents a significant barrier to normal working conditions, and could cause undue levels of stress.	Please refer to response item (1) in relation to the anticipated impacts on noise during the construction phase. The Court buildings were assessed as a residential property, and the threshold limits for noise were used accordingly. These levels as presented in Tables 14.2 and 14.3 in EIAR Chapter 14 (Groundborne Noise and Vibration), are identical for residential use and for office buildings. As such the impact on working from home is no different from the impact on the residential receptors.	
9	Additional considerations	3	Control of noise at work regulation is relevant here, as not only peak noises, but sustained noise can interrupt video calls, telephone calls.	Please refer to response item (1) and (8) above in relation to the anticipated impacts on noise during the construction phase. As stated in section 14.2.5.2.4 of Chapter 14 (Groundborne Noise and Vibration), the duration of the noise will depend on whether mechanical excavation is used as a full substitute for blasting or as a means of removing rock not dislodged after blasting has taken place.	
10	Additional considerations	3	The current EIAR report does not examine the welfare of children and thus is inadequate. This group is physiologically different form adults and thus the same findings can't be universally applied to all ages. The health and welfare of children and infants in the area cannot be sacrificed nor should they be used as case studies in the future to highlight dangers that can be predicted.	Please refer to response item (1) above in relation to the assessment of impacts on children.	
11	Additional considerations	3	As residents of The Court, Dalcassian Downs, this construction will be taking place outside our front door and our apartment window. We will be living on a building site, and do not feel that the plans that are suggested are safe or appropriate.	The Glasnevin Compound will be clearly delimited from the surrounding areas by a 4m high hoarding that will provide a noise and dust protection for the residential buildings in the vicinity and a safe barrier between working and residential areas. Through the design, embedded measures and additional mitigation measures, TII will seek to minimize any possible impact on the residents of The Court buildings. TII will continue to engage with the residents of The Court buildings during the next phases of the project. Please refer to response item (1) in relation to the anticipated impacts on noise, vibration and air quality during the construction phase. Please refer to response item (2) above which details the proposed traffic management to ensure the safety of pedestrians and other traffic users in the vicinity of the construction sites.

RE: Observation on Metrolink, ABP Case number 314724					
1	Letter	1	I am not convinced of the necessity for a rail link to the airport. I believe the airport is well served by a network of public buses and taxis. Just because we are the only European capital city without a rail link to its airport should not dictate that we need one.	EIAR Chapter 03 (Background of the MetroLink Project) details how the MetroLink will address challenges within the Greater Dublin Area. In section 3.4.4, Quality International Connectivity is recognised as a challenge within Ireland that MetroLink will address. As detailed, to achieve the best economic performance, Irish airport need to be served by an efficient and effective transportation network. The proposed Project will support the efficiency and growth of Dublin Airport by creating an additional passenger access opportunity and allowing for optimisation of the surrounding road and public transport networks. Dublin Airport had 30.7m passengers (excluding transfers) in 2019 (last full year for which pre-Covid-19 passenger numbers are available) and there are approximately 19,200 people employed within the larger airport campus. Outbound passengers also experience significant impact due to unreliability of their journey time to the airport. TII analysis demonstrates that the M50 / M1 Motorway system adjacent to Dublin Airport can at times experience unstable traffic flow patterns or a complete breakdown of flow. In response to the consequential journey time uncertainty, many travellers to the airport will factor in a significant buffer time to ensure that they arrive at the airport in time. Of inbound passengers, over 60% used a car, van, or taxi to leave the airport – contributing to road network congestion. Without the proposed Project the use of private vehicles will grow as populations grow and more people fly. Modelling shows that the proposed Project will reduce private vehicle journeys to and from the airport by between 10,200 and 13,200 per 12-hour period. The proposed Project will improve international connectivity as tourists will be able to arrive at Dublin Airport and then access the rest of the rail network efficiently and effectively, confident in the time their journey will take and when they will arrive. Business travellers will be able to access Dublin City Centre more easily, increasing and improving the likelihood that international businesses will continue to make Ireland their European base of operations.	
2	Letter	1	This area in which I live - the junction of Phibsboro, Glasnevin and Drumcondra - has had its challenges over the decades. All in all, I am not of the opinion that it has improved. I believe that the Metrolink- with its stations at Crossguns Bridge and Mobhi Road - will not represent a turnaround. The reality is that the area has been dragged down by the presence of Mountjoy Jail and the declining Phibsboro Shopping Centre.	EIAR Chapter 03 (Background of the MetroLink Project) details how the MetroLink will address challenges within the Greater Dublin Area. The proposed Project stations will support communities to improve the urban environment, as will the associated reduction in vehicle numbers. The attractiveness of the urban environment is also a key determinant in where people choose to live. As the proposed Project improves this in North Dublin it will help to attract both people, amenities and businesses into the area, further encouraging compact growth, job opportunities and sustainable housing developments. The proposed Project will, by way of modal shift and by taking significant volumes of passenger movement underground, support the transformation of the surface level urban environment, making it more attractive for people to engage with. The stations will also attract a wide range of businesses keen to take advantage of the projected footfall. This will help to boost economic activity and generate an improvement to the urban public realm. Evidence of this is presented in Chapter 03.

RE: Observation on Metrolink, ABP Case number 314724				
3	Letter	1	Standing proud above the incremental drabness are the Botanic Gardens, Mobhi Road and the Brian Boru Pub. The Metrolink Stations on Mobhi Road and Crossguns will significantly impact the former and will completely obliterate the latter. This is really sad. Mobhi Road would be destroyed. So many mature trees would be removed.	Please refer to response item (2) in relation to how the Project will enhance the urban environment around stations. EIAR Chapter 27 (Landscape) details impacts to tree loss and the landscape surrounding the stations. During the construction phase at Griffith Park, the proposed Project will result in a loss of existing trees on the boundary of the upper football pitch, however the existing trees along St Mobhi Road (at road level) will be appropriately protected and will remain unaffected by the works. Please refer to Appendix A27.3. During the operational phase, at Griffith Park Station, the planted retaining wall will be themed to relate to the nearby Botanic Gardens and references other notable large single specimen evergreen conifers planted in this general area. Details on the proposed landscaping at Griffith Park can be found in Chapter 27 (The Landscape) section 27.5.4.18. The impact on Botanic Gardens is anticipated to be not-significant as it is outside of the Project Boundary, however it will face temporary severance impacts during the construction phase. At Glasnevin Station, whilst there will be removal of existing tress and landscape at this location, overall, the potential effects on the visual environment and on visual amenity during the Operational Phase will be significant and positive. Details on the proposed landscaping at Glasnevin station can be found in Chapter 27 (The Landscape) section 27.5.4.19. As detailed in Chapter 26 (Architectural Heritage) section 26.5.4.6.2, it is noted that the licensed premises, the Brian Boru' are to be demolished to facilitate the construction of Glasnevin Station. However, to mitigate the impact of this, the licensed premises are to be recorded by means of photography and written description to English Heritage level 3 prior to demolition. As detailed in Chapter 9 (Traffic and Transport) section 9.6.2.2.4.2, the existing road network layout at Griffith Park Station will be maintained in the Operational Phase, with one lane of vehicular traffic in each direction on St Mobhi Road. As part of the BusConnects Core Bus Corridor proposals, the future street level layout at Glasnevin station reduces the current road network to one lane in each direction to accommodate a designated bus lane and bus stop along R108 Prospect Road. As part of the proposed Project, a taxi/drop-off area will be provided to the north of the station entrance in lands currently occupied by the Brian Boru car park. A new access road from Prospect Road to these facilities will also provide access to the bicycle parking.
4	Letter	1	In particular, the plans to scrub the Brian Boru from the area is so crude. It's such a beautiful building. It features in James Joyce's Ulysees and it's the only pub in Ireland with a crucifix on the front! Could the station not be built down the road on the site of Phibsboro Shopping Centre? What an opportunity to get rid of an eyesore? Some good lateral thinking there?	EIAR Chapter 07 (Consideration of Alternatives) details the decision-making process that has led to the proposed Project, including station locations. The selection of the location for the Glasnevin Station has primarily been based on facilitating direct interchange between the Project and the heavy rail network. The rail lines are at their closest at the Cross Guns Bridge, therefore locating the station away from the existing heavy rail lines at this location would not meet the project's overall objective of providing for interchange. As such, the location of the Phibsboro Shopping Centre would not allow for the Project to meet its objectives. As Dublin's public transport network grows through the implementation of higher capacity bus routes, more frequent heavy rail services and coverage, and the expansion of the light rail network it is critically important that to achieve the full benefits and capitalise on these investments that they are integrated fully where appropriate to attain "the network effect". High quality interchanges can significantly broaden the transport offer for their catchment and add to the appeal and attractiveness of sustainable transport by ensuring that people can easily change services to access a wider range of places by these modes, and each scheme should be designed to ensure that these are as seamless as possible. Please refer to response item (3) in relation to the proposed mitigation for impacts to the Brian Boru.
5	Letter	2	In addition to the Brian Boru, three beautiful neo-Georgian houses are also slated for destruction. They too are lovely features on that street. It will be a shame if they go.	Please refer to response (4) in relation to the location of Glasnevin Station, and please refer to response (3) in relation to the requirement for the demolition of the Brian Boru. EIAR Chapter 26 (Architectural Heritage) details the impacts to buildings and the proposed mitigation measures to reduce the severity of impacts. The houses to be demolished as part of the construction of Glasnevin Station are to be recorded by means of photography and written description to English Heritage level 2 prior to demolition (a descriptive record of the exterior and interior of a building), reducing the significance of the impact. Please refer to response item (1) in relation to how MetroLink will contribute to improvements in the urban environment.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
RE: Observation on Metrolink, ABP Case number 314724					
6	Letter	2	The construction of the Metrolink stations at Crossguns and on Mobhi Road would add to the congestion in the area. It is important to note that permission has already been granted for a massive number of housing units a Crossguns/Royal Canal and further away on Botanic Road. These developments are in themselves unsuitable because proper provision has not been made for cars, retail, school and green play areas. The addition of Metrolink stations would draw significant amount of additional vehicular traffic - set-down and passing.	EIAR Chapter 09 (Traffic and Transport) details the modelling works that have been undertaken to assess the impact of the Project on traffic. A key input to the traffic modelling has been the provision of Planning Datasheets from the NTA, which determines forecasts for population, employment and education. The foundation of this planning sheet is heavily based on published policy documents. The NTA have also worked with the Regional Assemblies and the Local Authorities to incorporate their housing and growth priorities in the planning sheet. Distribution is also based on existing patterns, and zoning within the development plans. Therefore, future residential developments that are built on zoned lands have been accounted for, as best as possible. Details on the planning datasheets can be found in Appendix A9.6 Data Collection Report section 3.1. As detailed in Appendix A9.5 Scheme Traffic Management Plan section 7.5.5.3.1, analysis has been undertaken to assess the impact of the traffic management measures on the road network during the construction phase at Griffith Park, which primarily consists of the removal of the southbound bus lane in both the Enabling Works and Main Works. As a result, there will be a slight impact for general traffic and a subsequent slight increase in driver delay, however this is only a matter of seconds. The assessment of the impact of the construction works on general traffic at Glasnevin is presented in Appendix A9.5 Scheme Traffic Management Plans section 7.6.5.3.1. As detailed, the Enabling Works will result in a slight impact for general traffic at this location, with a driver delay on Prospect Road of approximately 40 seconds. During the main Works, there are no proposed lane closures, and therefore there will be no significant impact on traffic flows at this location. It is incorrect to say that the addition of the stations will draw significant amounts of additional traffic. Traffic modelling at this location in the operational phase indicates that whilst the R108 Prospect Road may see slight increases in AADT (Annual Average Daily Traffic) (up to an additional 250 AADT during the AM peak hour), there is a negligible impact on journey times and delays at this location, indicating that MetroLink will not contribute to vehicular congestion in the area. This is detailed in Chapter 9 (traffic and Transport) section 9.6.2.2.4.2 (Table 9.141). The proposed Project has been designed to ensure maximum interchange with other modes of transport, specifically more sustainable modes of transport such as walking, cycling and public transport. At Glasnevin Station, the direct interchange with the heavy rail network, and the proximate location of BusConnects services on the R108 will reduce the demand for access via car. Disability only drop-off facilities will be provided at this station, limiting the possibility for increased congestion. These details are presented in Chapter 6 (MetroLink Operations and Maintenance).	
7	Letter	2	Assuming that the Metrolink station does go ahead at Crossguns, has any consideration been given to preserving at least part of the Brian Boru? Could it be incorporated into the station? Could the building be uplifted and moved to an adjacent area? I believe one or both of these options could be viable.	From a construction perspective the retention of the Brian Boru would be problematic. Physically the station structures cut right through the building with deep diaphragm walling and secant piling through this location. Please refer to the Glasnevin Construction Report in Appendix A5.5. Once demolished this area is the entrance and exit to and from the site. This arrangement precludes retention of the Brian Boru facade. This entrance will have to be relocated a number of times to facilitate phased working on the site. Further constraints could make this unworkable. The proposed construction site is already very constrained and in order to carry out the works, multiple phasing of activities will be required. This is detailed in Appendix A5.5. Glasnevin Construction Report in section 2.1. Minimal site office and welfare complexes can be located within the site area and offsite facilities will need to be procured to allow the works. Any further reduction in available area will impact on the constructability of this station. As part of the proposed mitigation measures detailed in EIAR Chapter 26 (Architectural Heritage), the licensed premises are to be recorded by means of photography and written description to English Heritage level 3 prior to demolition. Level 3 is an analytical record and will comprise an introductory description followed by a systemic account of the building's origins, development and use. The record will include an account of the evidence on which the analysis has been based, allowing the validity of the record to be re-examined in detail. It will also include all drawn and photographic records that may be required to illustrate the building's appearance and structure to support a historical analysis.

Letter Re: Railway Order Application- Metro North: Estuary through Swords, Dublin Airport, Ballymun, Glasnevin and City Centre to Charlemont, Co. Dublin				
1	Introduction	1	I welcome the provision of more frequent, reliable, affordable, and environmentally efficient public transport service. The MetroLink has the potential to have a transformative effect on our capital city, the significant investment in the MetroLink project must provide users with a service that is future proof, accelerates climate action and supports sustainable economic and social development of our capital city and surrounding county.	TII wish to thank you for taking the time to make this submission. Your upport is gratefully appreciated, and for the reasons you have set out. TII is committed to realising the MetroLink Project and the benefits it will bring. We also note your observations to which we have responded below.
2	Station Design and Architecture, 1 st bullet	1	All stations and Metro stops must be designed for universal access, maximum safety and be architecturally sympathetic to Dublin’s rich architectural heritage and style.	EIAR Chapter 4, Description of the MetroLink Project, outlines TII's vision. The Project will deliver a robust and authentic design with a strong metropolitan identity, unique and sympathetic to Dublin. Concepts such as singular station volumes, use of natural light, intuitive wayfinding, robust and long-lasting materials, and contextual placemaking will be followed through all stages of development and construction, combining to form the very best in architectural vision. The overarching principle of universal design aims to make the proposed Project accessible for everyone to use, regardless of their age, gender, physical capabilities or cultural background. TII's 'Sustainability Implementation Plan – Our Future (TII 2021)' sets out the vision to lead in the delivery and operation of sustainable transport, enabling their networks to drive inclusive growth, create job opportunities and enhance the well-being of all persons, including vulnerable groups, strengthen resilience to climate change, maintain commitment to the environment and continuing to prioritise safety. The 'Materials Palette' that has also been included with the Railway Order application further confirms the 'MetroLink Design Vision Principles', including the principle of achieving a 'Sense of Place' that reflects the local area, that are appropriate to the City, and the local context / character. TII would also like to provide the assurance that the underlying significance of the historic city and suburbs is respected and has been taken account of by the EIAR, in particular Chapter 26 Architectural Heritage. The proposed route is entirely below ground through the historic city and its suburbs, with the exception of necessary above-ground elements at stations such as access points, ventilation shafts and skylights. These elements have a very localised presence. In some cases, such as Collins Avenue, Mater and St. Stephen's Green stations, the ground above is to be reinstated following construction, while at other locations, such as O'Connell Street, Tara Street and Charlemont Stations, the above-ground development would be carried out by others. In all cases, reinstatement and landscaping will be required to integrate the MetroLink above ground elements sympathetically with the existing environment. The stations are designed with safety in mind. Outside the station entrances the provision of bollards and planters provide security from errant vehicles whilst landscaping and public lighting ensure good visibility for station users. Inside the stations, the adoption of universal design principles ensures appropriate safety standards are provided for access and use of the stations. Passenger modelling as part of the preliminary design ensures the stations provide sufficient space to avoid overcrowding and stair and lift provision meet fire safety requirements.
3	Station Design and Architecture, 2 nd bullet	1	The proposed stations are anonymous, unimaginative, cheap and unworthy of Dublin's rich architectural heritage and leading European capital.	TII disagree, and believe the commissioning of internationally renowned architects, Nicholas Grimshaw and Partners, has delivered a contemporary station design which is appropriate for a state of the art metro system such as Metrolink. Appropriately, significant emphasis is placed on the public spaces. Where feasible, the station concourse is a soaring space illuminated from above with natural light. Dublin's rich architectural heritage has been respected, but not copied in a pastiche imitation. In accordance with best conservation principles, as set out in the ICOMOS Venice Charter of 1964, the stations are architecturally distinguishable so as not to falsify the existing historic context. Reference and due respect to that context is made through the choice of high quality and appropriate materials and the scale of the interventions. For example, at Mater station, the canopy entrance evokes the scale of park structures. At St Stephen's Green, the materials of the ventilation structures are chosen to respect the surrounding 18th century Georgian brick architecture. The aesthetic values of all eras, including our own, have cultural validity, and therefore the brick is used in a contemporary way reflecting contemporary aesthetic idioms derived from 21st century technology. TII believe the current station and surface level designs greatly enhance the public realm at all locations along the MetroLink route. There is a unifying commonality in the design of all stations, providing a consistent and coherent architectural language, which assists with orientation and wayfinding, and contributes a new architectural lexicon to the cultural iconography of the city.

Submission No.			185

Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
Letter Re: Railway Order Application- Metro North: Estuary through Swords, Dublin Airport, Ballymun, Glasnevin and City Centre to Charlemont, Co. Dublin					
4	Station Design and Architecture, 3 rd bullet	1	The proposed architectural design for the MetroLink stations should be rejected. They are modern, unimaginative, poor and bare no relation to the local architectural heritage of Dublin city, O'Connell Street, The Mater, the Royal Canal, Shandon Mills, Glasnevin cemetery.	Please refer to Response (2) above.	
5	Station Design and Architecture, 4 th bullet	1	The proposed stations on O'Connell Street/Moore Street, Eccles Street/Berkeley road, Cross Guns/Prospect Road and Mobhi Road should be architecturally designed to reflect and speak to the history of the area. Materials and finishes should complement and not detract from the rich architectural surrounds of redbrick, granite and slate.	Please refer to Response (2) above.	
6	Station Design and Architecture, 5 th bullet	1	All stations' structures, signage or any other associated architectural treatment should reflects the local architectural character.	As for the design of the stations themselves, the station signage will be developed in accordance with best conservation practice, and while respecting the surrounding and varying context, will utilise the benefits of contemporary graphic design and iconography. It will be consistent with Transport For Ireland's transport signage guidelines.	
7	Station Design and Architecture, 6 th bullet	1	Much of the MetroLink will be buried underground but the stations and the above ground elements of the project must respect the existing architectural heritage, be sympathetic to and enhance the traditional streetscape, reflect the character of Dublin and the localities surrounding the respective stations.	Please refer to Response (2) above.	
8	Station Design and Architecture 7 th bullet	1	At present, the proposed architectural aesthetics are anonymous, devoid of any connection with Dublin's heritage, culture, or distinctive architecture. The Metrolink has the potential to bring Dublin into the future, but it is of utmost importance that it maintains a connection with the city and its traditional characteristics.	Please refer to Response (2) above.	
9	Station Design and Architecture, 8 th bullet	1	The proposal to demolish Hedigans' Brian Boru pub, remove or tamper with the architectural railings at Dalcassian must be rejected. A new architectural proposal must be developed for this station that incorporates the existing building. This station will be a major city station for decades to come and it is imperative that it is consistent with and complimentary to the local residential architectural conservation area.	Glasnevin Station will be a new multi-modal interchange station in Phibsborough, linking MetroLink, the two existing Iarnród Éireann heavy railway lines (Western Commuter Line and the South-Western Commuter Line), BusConnects, and connections by car, walking and cycling. Unfortunately, due to the available land, combined with the construction challenges associated with providing this complex multi-modal interchange station that will deliver significant transport benefits by nature of its connectivity, there is no means of retaining the Brian Boru pub. TII acknowledge this is a significant impact. TII also acknowledge that the architectural railings at Dalcassian will need to be temporarily removed. Before proposing the demolition of the Brian Boru pub, TII did carefully examine the alternative of locating a station at Drumcondra rather than Glasnevin as reported by EIAR Chapter 7, Consideration of Alternatives, Section 7.6.5. Both options would require demolition of buildings with potential for significant impacts on architectural heritage, however, once the construction is complete, the proposed station location at Glasnevin offers a much better interchange station location for passengers, a key Project objective of MetroLink. The impacts of the Glasnevin works have been assessed and reported in the EIAR. The Brian Boru pub will be recorded by means of photography and written description to English Heritage Level 3 standard prior to demolition. The railings and their plinth walls will be recorded by photography and written description prior to their removal. The railings and walls will be taken down in accordance with a specification to be prepared by the Project Conservation Architect (PCA) and the removed materials stored securely prior to cleaning, repair, and reinstatement. At the appropriate stage of construction, the materials are to be returned to site and the railings and walls reinstated in accordance with a conservation method statement prepared by the PCA. All works of dismantling, protection, transportation and reconstruction will be carried out by a dedicated heritage contractor with the assessed impact imperceptible following this mitigation.

Letter Re: Railway Order Application- Metro North: Estuary through Swords, Dublin Airport, Ballymun, Glasnevin and City Centre to Charlemont, Co. Dublin				
10	Construction and Operations, 1 st bullet	2	The applicant must clearly demonstrate the benefit and rationale behind the decision to go from twin bore to single bore and how this will future-proof the infrastructure.	The EIAR provides the rationale and benefits of a single bore tunnel. Future proofing of MetroLink infrastructure is not dependent on the selection of a twin bore or single bore configuration. A detailed comparative analysis of twin versus single bore tunnel has been undertaken, that has included consultation with Barcelona Metro that currently successfully operates a single bore configuration. EIAR Chapter 7, Section 7.7.2.2.1 Overall Conclusions, notes that this analysis identified that a single bore tunnel option offered significant benefits for the proposed Project when compared to the twin bore solution that was proposed at the Emerging Preferred Route (EPR) stage. These benefits include: <u>Passenger Evacuation and Incident Management</u> • The single bore configuration enables faster passenger evacuation from the ends of the train directly onto tracks, rather than more challenging lateral evacuation on to an elevated walkway along the sides of the tunnel required for a twin bore configuration. • The single bore provides increased space for emergency services access and working space adjacent to a train in the tunnel. • Conditions can be created within a larger single bore diameter tunnel that facilitates smoke stratification at a high level in the bore for a longer period of time when compared to that in a twin bore configuration. Therefore, the single bore configuration facilitates enhanced evacuation conditions and provides better tunnel visibility during fire events when compared to the twin bore solution. • The single bore configuration offers a more flexible system throughout the life cycle of the asset in that it allows operational adjustments such as additional track crossovers without the need to build new infrastructure / tunnels. <u>Programme and Cost</u> - A single bore tunnel can be constructed at lower cost and quicker than a twin bore configuration due to: • The overall reduced volume of structure to be constructed i.e. twin bore tunnels will require more concrete and steel, and an overall greater volume of excavation. • Not only can the single bore tunnel itself be constructed more quickly, and hence reduce the construction programme as less overall volume of material needs to be excavated, but also there is no requirement for cross-passages, which are slow to construct and need to be mined as separate construction activities after the main tunnel has been built, adding time to the programme and a complex activity dependency to be managed.. • There is no requirement to construct extra mined/cut & cover sections required to accommodate track crossovers since these can be accommodated in the single bore tunnel, that the twin-bore cannot accommodate. (It is recognised that the single bore configuration unlike the twin bore arrangement means there is a need for intervention shafts where the distance between stations is greater than 1000m. This only occurs at one location on the Project between Griffith Park and Collins Avenue stations and overall is offset by the benefits listed.) • As there is only one TBM to drive or pull through stations under construction, the station programme durations are reduced together with schedule interface risks with other programme critical construction activities. <u>Environment</u> • The reduction in excavation means spoil, quantities, handling and disposal is reduced and hence traffic on the roads and the follow on volume of land fill disposal is reduced. • The reduction in concrete and steel that will be used to manufacturer the tunnel lining precast segments will be reduced for a single bore tunnel and will therefore reduce the traffic on the roads. • There is an overall reduced environmental impact since the construction programme is quicker, less materials are needed for construction (reduced use of natural resources and traffic to transport materials to site), less excavation (spoil disposal volumes are reduced resulting in less traffic on the roads and reduced landfill), and an overall reduction in embedded carbon as a result of the reduced volume of material (steel and concrete) required compared to a twin bore configuration. <u>Future Proofing</u> Whether the tunnels are twin bore or single bore does not impact the future proofing of the infrastructure. The proposal for MetroLink to use automated driverless trains provides the flexibility to easily increase train frequency to address rising demand in the future.

Submission No.			185	
Organisation Name or Name of Submitter			Senator Mary Fitzpatrick	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: Railway Order Application- Metro North: Estuary through Swords, Dublin Airport, Ballymun, Glasnevin and City Centre to Charlemont, Co. Dublin				
11	Construction and Operations 2 nd bullet	2	Amend the application to include an actual Metro Stop at Albert College instead of the proposed intervention shaft to maximise the benefit of the infrastructure for Albert College Park and surrounding area.	A station located at Albert College was considered, but as outlined in EIAR Chapter 7, section 7.7.10.7, the assessment undertaken at the Emerging Preferred Route (EPR) stage identified a preferred route and station location in this area at the proposed Collins Avenue Station location. It would not be necessary or economical to provide a further station at Albert College Park, and for the reasons summarised below, the proposed location for Collins Avenue Station is preferred since it increases the benefits that can be delivered by a MetroLink station in this area. The proposed location for Collins Avenue Station provides a number of advantages when compared to other location options: (1) It allows the project to achieve a core project objective of providing public transport that is integrated into the existing and future proposed transport network, providing for interchange between bus routes both on Collins Avenue and on Glasnevin Road. A station location further south at the northern section of Albert College Park would not provide a good level of interchange as there would be over 500m separating potential bus stop locations on Collins Avenue and the MetroLink station. (2) The proposed Collins Avenue Station will have a significant catchment area, noting the analysis undertaken at the Emerging Preferred Route (EPR) stage identified this route option had the highest potential passenger numbers when compared with other route options. (3) Construction traffic impacts associated to constructing a station at this location rather than an intervention shaft would be more significant due to the increased size of that works site and longer construction duration.
12	Construction and Operations 3 rd bullet	2	Outline plans and arrangement to prevent and minimise negative impact if at any point construction must be halted or abandoned.	If the works were halted temporarily, for example if monitoring of a particular environmental impact showed results were trending towards a breach of acceptable limits (note the monitoring is designed with pre-determined trigger levels designed to ensure acceptable levels are not breached) or a safety concern was identified, then the area of the works concerned would be secured and temporarily suspended until TII are satisfied the works can resume following an investigation, consideration of lessons learnt, and actions to be implemented to avoid any reoccurrence. Such plans will be set out by the contractor's Monitoring Action Plans (MAPs) and associated contingency plans. If in the highly unlikely event construction must be abandoned, in the first instance, all works would be made safe and secured, and then it would be a decision for Transport Infrastructure Ireland to determine to what extent further work should be undertaken. It must be stressed that abandoning MetroLink main works once underway is viewed as a highly unlikely event. The main works procurement and governance process that will determine whether MetroLink main works should proceed will be rigorous and robust to ensure that a future risk of abandonment of the Project is extremely unlikely / improbable.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: Railway Order Application- Metro North: Estuary through Swords, Dublin Airport, Ballymun, Glasnevin and City Centre to Charlemont, Co. Dublin				
13	Construction and Operations 4 th bullet	2	Detail what measures will be implemented to mitigate any structural and settlement damage to properties located within 1km of the MetroLink route.	TII are unaware of any requirement to assess structural and settlement damage to property within 1km of the MetroLink route, however In accordance with best international practice, TII have within a zone of 30 metres either side of the MetroLink centreline assessed the potential impact of MetroLink construction on property, including vibration, and construction generated ground movements leading to settlement and possible building and property movement. EIAR CHAPTER 14, Groundborne Noise and Vibration, presents predicted vibration levels arising from tunnel boring, mechanical excavation and blasting. In all cases, vibration levels will be maintained within limits that do not cause damage to property. EIAR Appendix A5.17, Building Damage Report, covers the assessed impacts of construction generated ground movements and settlement on property. TII's assessment provided in EIAR Appendix A5.17, Table 4-4 shows that currently no properties will experience a greater impact than Damage Category 2, defined as '<i>Cracks easily filled. Redecoration probably required. Several slight fractures inside building. Exterior cracks visible some repointing may be required for weather tightness. Doors and windows may stick slightly</i>'. There are a number of properties that will be progressed to a more detailed Phase 3 assessment due to particular features or for example due to their cultural or historical value. The Phase 3 assessment will take account of final design and construction methodology details, most likely utilising advanced numerical modelling techniques and further surveys of the building. The results of this refined assessment typically show that earlier assessments are conservative and over-estimate the likely impact of construction generated ground movements. Monitoring instrumentation will also be installed throughout the works to monitor the performance of the works and potential environmental impacts, including those discussed above to ensure that acceptable limits are not breached. A Property Owners Protection Scheme (POPS) is being made available to all property owners within the 30m Zone of the tunnel, or 50m of a cut and cover station excavation. Property owners can avail of the services of a panel of surveyors who will carryout pre and post condition surveys on the building concerned. Any damage deemed attributable to the MetroLink works (up to a value of €45,000) will be repaired by a Repair Contractor selected by the property owner from a panel of TII Repair Contractors. The POPS is in addition to a property owner's statutory rights to compensation under standard compulsory purchase order rules.
14	Construction and Operations 5 th bullet	2	Independent noise, vibration and structural monitoring during and post construction for minimum period of 20 years.	Monitoring of potential construction impacts will be continued until the completion of MetroLink construction works in each area of the route. Monitoring of potential operational environmental impacts will continue for the lifetime of the Project to ensure acceptable limits are not breached.
15	Construction and Operations 6 th bullet	2	Provision of independent experts throughout the construction period and post construction period to provide residents with both real time information and independent expert advice and consultation.	The services of the Independent Engineering Expert (RINA) are due to be concluded on completion of the Railway Order process (expected in 2024). The continuation of provision of independent engineering advice for residential stakeholder groups throughout the enabling works and main construction stages of the MetroLink project is currently being considered as part of an overall comprehensive community engagement plan, which will include amongst other initiatives, the appointment of dedicated MetroLink liaison representatives and local community forums which will provide detailed updates on construction activities in their areas.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: Railway Order Application- Metro North: Estuary through Swords, Dublin Airport, Ballymun, Glasnevin and City Centre to Charlemont, Co. Dublin				
16	Construction and Operations 7 th bullet	2	Permission should require NTA to demonstrate the necessity for removing green spaces like parks, park facilities, recreation areas and local heritage and clearly outline compensatory mitigation measures to be introduced.	As evidenced by the work presented in the EIAR, TII have demonstrated the necessity, and importantly the compensatory mitigations, for all the environmental impacts identified in the EIAR. Removal of green spaces like parks, park facilities, recreation areas and local heritage are necessary due to the specific locations of MetroLink infrastructure, the space required to construct this infrastructure, and the land required for compounds to facilitate MetroLink construction. The selection of each station location has been the subject of a detailed Alternatives Assessment. This commenced with the MetroLink Route Options study in 2018 which determined the Emerging Preferred Route for the scheme and with further assessment carried out as part of the identification of the Preferred Route for MetroLink in 2019. The proposed location for each station, intervention shaft and construction compounds were chosen following an alternatives comparison as detailed in EIAR Chapter 7 Alternatives, taking account of the following variables: - Compliance with transport and land use strategy; - Minimising environmental impacts, including congestion and associated pollution problems; - Generating social and economic benefits; - Delivering good quality transport integration; - Optimising capital and operating costs; - Delivering a safe and operationally efficient system; and - Achieving efficiency and minimising risk during construction. The environmental impact assessment of alternatives considered: - Air Quality; - Protected Structures; - Archaeology; - The Natural Environment; - Townscape and landscape; - Noise; and - Human Beings. This impact assessment and proposed compensatory mitigation measures are presented in specific EIAR Chapters 9 to 31.

Letter Re: Railway Order Application- Metro North: Estuary through Swords, Dublin Airport, Ballymun, Glasnevin and City Centre to Charlemont, Co. Dublin				
17	Construction and Operations 8 th bullet	2	A traffic management plan must be agreed with residents, Dublin City Council and the NTA for the period during and post construction. Residents already living in heavily congested areas will be significantly negatively impacted by a major multi-annual construction project on their doorsteps.	EIAR Chapter 5, MetroLink Construction Phase, explains that traffic management plans for the construction phase of the Project have been developed to minimise the impact on road users, and to maintain access to property, businesses and other premises. Prior to implementation, all traffic management measures will be agreed with the relevant local authority (FCC or DCC) and where relevant, consultation with An Garda Síochána and other statutory stakeholders will be undertaken. The design of traffic management measures and highways works is based on achieving the key objective of maintaining continual access to all properties during the works. Where necessary, a safe alternative route will be provided for pedestrians and vulnerable road users, such as children, and persons with restricted mobility, to maintain pedestrian access to premises. Where detour routes are required, these will be kept as short as possible and detour signage will be clear and easy to understand. EIAR Chapter 9, Traffic and Transport, section 9.7.1.2 includes for a Scheme Traffic Management Plan (STMP) to manage traffic movements during the construction phase to ensure traffic congestions is minimised. The Plan will include measures such as the establishment of Local Community forums which will cover areas local to each station, where stakeholders will have an opportunity to inform the traffic management element of the project. Other measures include the control of construction vehicles in terms of their hours of operation and restrictions on vehicle size and weight. During the operational phase of the Project, as outlined in EIAR Chapter 9, Traffic and Transport, notable reductions in traffic flow will be seen along key routes south of Dublin Airport, including along the M50 Motorway, and along most radial routes into Dublin City Centre. National roads such as the N11, N7, N4, M3 and M2 will also see reductions in traffic flows when the Project is operational. In all modelled scenarios, the number of car trips reduces when the Project is in place and operational, with car mode share also reducing in all model scenarios. As such, the reduction in private vehicles will reduce congestion on some road links and junctions, resulting in journey time savings on the road network. During the operational phase, minimal volumes of HGVs will be associated with the Project and overall traffic conditions will be improved.
18	Construction and Operations 9 th bullet	2	A permanent community liaison office must be established for the duration of the project.	TII intends to establish a minimum of 3 local community liaison offices along the MetroLink Route. It is proposed to locate these offices in the city centre, Glasnevin and Swords Areas. The offices will be established at least 3 months prior to the commencement of major infrastructure works.
19	Construction and Operations 10 th bullet	2	Measures and arrangements must be put in place at each Metro Station to limit and prevent anti-social behaviour associated with structures like metro stations.	Safety and Security is addressed by EIAR Chapter 6, MetroLink Operations and Maintenance. Section 6.6.5.8 specifically addresses managing the risk of "Vandalism or Anti-Social Behaviour on the Trains or within the Stations", and the wider chapter also addresses the broader design proposals for managing security challenges, including: •The architectural and urban realm design is designed to discourage anti-social behaviour, for example through the attractive setting, use of public lighting, open sight-lines, and avoidance of areas where individuals and groups of people can hide. •The Operational Control Centre (OCC) will be the central communications and operational hub, located in the administrative building at the Dardistown Depot. The role of the OCC will include monitoring and managing passenger safety and security and antisocial behaviour. The OCC will direct and deploy staff to manage incidents when required. •The access control and intrusion detection (ACID) system will identify intruders trying to enter locations where unauthorised access is prohibited. •CCTV will be installed throughout the MetroLink system including at station entrances, public realm and on trains to provide general security and surveillance of all the public areas, and to inform, if required, the directing and sending of staff to manage the situation. •There will be a MetroLink staff presence along the route for assisting passengers, security and deterring anti-social behaviour.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: Railway Order Application- Metro North: Estuary through Swords, Dublin Airport, Ballymun, Glasnevin and City Centre to Charlemont, Co. Dublin				
20	Construction and Operations 11 th bullet	2	Metro stations and services must operate 24 hours a day, 7 days a week	As set out by EIAR Chapter 6, MetroLink Operations and Maintenance, section 6.4.3, "It is anticipated that services will operate between 05:30 and 00:30, every day". At this time there is no economic justification for a service running 24 hours day, 7 days a week, however as with any transport system, the future development and needs for serving the Dublin population may change in time, and this would be considered if such a situation arose requiring extended MetroLink operating hours.
21	Construction and Operations 12 th bullet	2	Park & Ride facilities must be provided at the stations beyond the M50 to discourage private vehicle traffic entering the city.	TII disagree that Park & Ride (P&R) facilities must be provided at stations beyond the M50 to discourage vehicle traffic entering the city. MetroLink is not designed just to discourage vehicles entering the city, but to also reduce the use of private cars overall and thus deliver the benefits this brings to the wider environment. It is also of note that the local environmental impact on areas around the stations were they to include for station specific P&R facilities would be considerable. Attention is also drawn to the EIAR sections noted below that explain the strategic thinking and design applied to achieve the objective of discouraging private vehicle use, a key objective and benefit of the MetroLink Project. EIAR Chapter 3, Background to the MetroLink Project, explains the intent of MetroLink to provide a frequent and reliable public transport alternative to the private car, and that it is predicted to achieve significant modal shift to public transport along the corridor. EIAR Chapter 9, Traffic and Transport, presents an assessment of the modelled reduction in car trips, and the associated change in modal shift when the Project is in place. The model indicates that notable reductions in traffic flow will be seen along key routes south of Dublin Airport, including along the M50 Motorway, and along most radial routes into Dublin City Centre. National roads such as the N11, N7, N4, M3 and M2 also see reductions in traffic flows entering the city when the Project is in place. In the AZ4 section (From Northwood to Charlemont), there is a reduction of over 6,000 car tips over the 12 hour period. A reduction in car mode share can be seen in the model zones around the alignment, with a corresponding increase in public transport mode share and trips. EIAR Chapter 6, MetroLink Operations and Maintenance, explains that the proposed Project has been designed to ensure maximum interchange with other modes of transport, specifically more sustainable modes of transport such as walking, cycling and public transport, and therefore Park and Ride or drop-off facilities have not been provided at all stations, further discouraging private vehicles from entering the city. At the P&R facility planned for Estuary Station, over 3,000 car spaces will be provided, with 694 electric charging facilities, 208 accessible spaces, 2,139 standard parking spaces and 10 staff parking spaces. In addition, cycle access and bikes stands will be provided.

Metrolink Railway Order Application & Supporting Documentation, Our Clients: Mater Misericordiae and the Children’s University Hospitals Company Limited by Guarantee and Mater Misericordiae University Hospital, Address: Eccles Street, Dublin 7. Ref Nos: ML5B-A4, ML5B-U32, ML5C-U3, ML5C-U4 and ML5C-U5				
1	Cover Letter	4	In terms of its infrastructure, parts of the Hospital date from the 1860s. The relevant wing of the Hospital that will be most impacted by TII’s works is known as the Misericordiae wing and it is a protected structure. It is thus particularly sensitive to impacts from construction works.	TII and its consultants have undertaken surveys of the hospital building and discussed the operation of the hospital with the hospital managers in order to ensure that appropriate mitigation can be put in place during the construction phase of MetroLink. The architectural heritage importance of the Mater Hospital (building reference BH-469) is acknowledged, and the building is included in the impact assessment on the Architectural Heritage in Chapter 26 of the EIAR. According to the assessment, during the Construction Phase, an indirect impact on the building will occur due to the presence of the construction site directly in front of the protected structure. The magnitude of this impact will be 'medium', whilst the architectural heritage value is 'high'; the resulting impact is thus assessed to be 'very significant'. On completion of the works, the impact will be 'not significant'. A direct impact will arise from deep excavation to within 8.5m of the hospital boundary and 14m from the hospital building, together with works to divert utilities away from the site to accommodate the station. Mitigation measures for noise and air quality, and occupants' health, may require a hierarchy of repair and conservation works to the front façade windows of the hospital as assessed in Chapter 10 Human Health Sections 10.5 & 10.6 along with standard mitigation measures outlined in Chapters 13, 14, 16 & A5.1 CEMP. Chapter 26 Architectural Heritage Section 26.5.4.8 notes the magnitude of the impact will be 'medium', whilst the architectural heritage value is high, with the resulting impact assessed to be 'very significant'. As a result, mitigation measures will be implemented as follows: - Following the Metrolink Project Conservation Architect (PCA) condition surveys of the windows, a hierarchy of mitigation measures for necessary interventions will be agreed with the property owner and noise and air quality specialists, to mitigate impact on building occupants. The impact would decrease to 'slight' following mitigation. - The methodology for the construction of the D-wall for the station box to the front of the Mater Hospital is to be devised in conjunction with the PCA and is to take into account the nature of the construction of the retaining wall and boundary wall at the front of the hospital, and the nature of the hospital building. Vibration and settlement monitors are to be provided in the hospital building in the vicinity of the works, with alarms to identify any vibration that exceeds acceptable levels. In the event of the alarms being triggered, works would cease until the cause of the vibration is identified and systems modified to prevent recurrence. - The boundary walls are to be protected by means of hoardings to be erected prior to the commencement of construction.
2	Cover Letter	4	There is also a significant amount of sensitive and highly calibrated equipment throughout the Hospital and the buildings are operating at capacity.	Equipment at the Mater Hospital buildings was assessed for electromagnetic interference, based on the lists of equipment potentially sensitive to EMI supplied by the owners, with the results presented in Chapter 12 of the EIAR. During the construction phase, the significance of the effects of Electromagnetic Emissions and Stray Current on the equipment has been determined as 'Imperceptible', and the quality of effects is classed as 'Neutral', resulting in no impact on their operation. During operation of MetroLink, the impact on Mater Hospital is assessed as follows: 1 - Significance of effects from DC magnetic fields has been determined as 'Slight' with a quality of effects classed as 'Neutral'; 2 - Significance of effects from AC fields has been determined as 'Imperceptible' with a quality of effects classed as 'Neutral'; 3 - Significance of effects from RF and Microwave fields has been determined as 'Slight' with a quality of effects classed as 'Neutral'. As a result, the sensitive equipment at Mater Hospital will not be affected by either the construction or operation of Metrolink.

Metrolink Railway Order Application & Supporting Documentation, Our Clients: Mater Misericordiae and the Children’s University Hospitals Company Limited by Guarantee and Mater Misericordiae University Hospital, Address: Eccles Street, Dublin 7. Ref Nos: ML5B-A4, ML5B-U32, ML5C-U3, ML5C-U4 and ML5C-U5				
3	Cover Letter	4	Our clients are broadly supportive of the proposed Metrolink project, which has potential benefits for the Hospital and its patients. However, they remain concerned about potential impacts on the Hospital's operations both during construction and operation of the proposed project, and also about the extent of the permanent land take proposed to facilitate the scheme.	When MetroLink is operational, the operation of Mater Hospital will not be affected. During construction of MetroLink, with the proposed mitigation in place, the operation of Mater Hospital will not be affected with the exception of airborne noise and ground borne noise from the TBM passage. With the proposed mitigation, the residual impacts will be: 1 - Airborne noise – this may cause annoyance to patients and staff but as areas of the hospital primarily affected are the upper floors that do not contain wards, no residual health impact is predicted. 2 - Ground borne noise - this may cause annoyance to patients and staff, users and others, but with mitigation including potential temporary relocation, no residual health impacts are predicted. See also Responses (1), (2), and further Responses below for more detail on the mitigation and assessed impacts. Regarding permanent land take please see Response (17) below.
4	Cover Letter	4	It is hoped that continued engagement by TII with our clients' concerns will enable those concerns to be addressed to the satisfaction of our clients and then reflected in any Railway Order ultimately granted by the Board.	TII confirm their commitment to further engagement and consultation with the Hospital to address its concerns
5	Cover Letter	5	It is acknowledged that the application recognises that there are potential impacts on the Hospital. Based on the information provided, however, our clients remain concerned about a number of issues which will need to be addressed during the assessment of the application. The Hospital provides a vital public service which must be allowed function and develop both during and after the construction of the Metrolink Project. In brief, concerns arise under the following headings: 1 . Traffic impacts including access for emergency vehicles. 2. Construction impacts including noise, vibration and air quality impacts. 3. Operational impacts. 4. Extent of the proposed land take.	TII have responded to each of these concerns in turn below.

Metrolink Railway Order Application & Supporting Documentation, Our Clients: Mater Misericordiae and the Children’s University Hospitals Company Limited by Guarantee and Mater Misericordiae University Hospital, Address: Eccles Street, Dublin 7. Ref Nos: ML5B-A4, ML5B-U32, ML5C-U3, ML5C-U4 and ML5C-U5					
6	1. Traffic Impacts	5	1. Traffic Impacts It is, of course, essential that access to the Hospital be maintained at all times for staff, patients, patient visitors, suppliers as well as goods and services. In addition, the main entrance to both the emergency department and the underground car park is off Eccles Street. It is noted that Chapter 9 of the EIAR (Traffic and Transport) confirms that during Phase 2 works, Eccles Street will be closed to all traffic except emergency vehicles. This will clearly have very significant operational difficulties for the Hospital- and impact on its services for patients and staff wishing to access services including the emergency department; the dialysis unit; the underground car park; consultants’ rooms; the Hospital creche; the centre for nurse education (which is situate at 15, 16, 19 and 20 Nelson Street); the institute for cancer research etc. In addition, the Hospital's logistics and warehousing facilities for stock items are located on Eccles Street. It is further noted that TII’s anticipated opening date for the Metrolink Project is 2035, which indicates a potential for impacts on the Hospital over an extended period. During this time, there will be ongoing developments at the Hospital, including the new Major Trauma Centre, which is a development of national importance. The limitation proposed by TII on access to Eccles Street is a matter of particular concern in this regard. Clearly, the question of phasing of the construction works for the Metrolink Project and related implications for any future works on the hospital site needs careful consideration. It is absolutely essential that there be no interference with the ability of emergency vehicles to enter and leave the Hospital. In addition, as is clear from the above, there is concern as to how the Hospital can manage its day to day activities in light of essential areas of the Hospital being left with restricted access onto Eccles Street. It is far from clear how TII proposes to maintain unrestricted access for emergency vehicles in light of the proposal to close Eccles Street to traffic or how it is proposed that the Hospital will re-route patients, staff and deliveries to it. More generally, the impact of construction traffic on patients and the Hospital Building itself is a matter of concern and will need to be addressed comprehensively in conditions imposed on any Railway Order granted by the Board.	EIAR Appendix A9.5 section 7.7 details the construction traffic management associated with Mater Station. As identified, in Phase 2 and Phase 3 of the construction works, general traffic will not be able to access Eccles Street from Berkeley Road, however Emergency Vehicle access will be maintained from this location therefore ensuring there is no interference with the ability of emergency vehicles entering or leaving the hospital. As presented in EIAR Appendix A9.5, Figure 7.32 Proposed Traffic Management Phase 3, the road width available on Eccles Street adjacent to the junction with Berkeley Road will be locally reduced to a single lane due to the construction footprint requirement and which will be used for Emergency Vehicles only. The remainder of Eccles Street will be retained for general traffic use with access for all traffic as far as the area of reduced width, thus maintaining access to hospital buildings/services. General traffic access to the hospital will be maintained through the detailed diversion proposals. To clarify, general traffic access to Eccles Street will be maintained via the N1. Vehicles seeking to route from Berkeley Road to Eccles Street will be diverted and approach Eccles Street from the N1 via either North Circular Road or Blessington Street. Vehicles travelling away from Eccles Street will be diverted southbound along Nelson Street and from there can continue to travel along Berkeley Street, Mountjoy Street or Blessington Street. Therefore, access to the hospital is maintained at all times for staff, patients, patient visitors, suppliers and goods and services vehicles. Similarly, access to the emergency department and underground car park is maintained, and can be accessed from Eccles Street via the N1. Therefore, there should be minimal impact on the Hospital's operations throughout the works. It should also be noted that construction works on Eccles Street will be complete in advance of 2035 as seen in the Construction Programme (Appendix A5.2) TII will continue to work closely with Mater Hospital throughout the duration of the construction works to ensure minimal impact to the delivery of the new Major Trauma Centra, which is of national importance. TII will closely monitor all road closures to determine if they are required at all points of the works, or if they can be reinstated temporarily. As noted, access to Eccles Street will be maintained from the N1 direction, with the closure to non-emergency vehicles only impacting on the western junction with Berkeley Road. All diversions and closures will be displayed on appropriate signage, and a comprehensive publicity and information campaign will take place prior to the commencement of the Construction Phase. A Project Construction Traffic Forum will be formed, including representatives from key stakeholders such as Mater Hospital to ensure any issues or concerns can be addressed quickly and efficiently.	
7	2. Construction impacts	7	It is welcomed that the sensitivity of the Hospital is recognised in this way. However, our clients remain concerned that the extent of impacts have not been clearly identified, nor, more importantly, have the mechanisms for ensuring that adverse impacts on the Hospital and its patients can be avoided.	All potential impacts (air quality, noise, vibrations, settlement, human health etc.) on Mater Hospital along with their respective mitigation measures were assessed and presented in the relevant chapters of the EIAR. Refer to: Chapter 10 Human Health; Chapter 14 Ground-borne Noise and Vibration; Chapter 16 Air Quality; and Chapter 05 MetroLink Construction Phase - Appendix A5.17 Building Damage Report.	
8	2. Construction impacts	7	It is critically important that all patients are given the best possible environment from a health perspective. In Chapter 10 of the EIAR (Human Health), this is reflected in the description of the Hospital as a Very Highly Sensitive Receptor. It is noted that psychiatric services as well as the National Isolation Unit are provided in the part of the Hospital closest to the Mater Station construction works and to the tunnel alignment, thus patients potentially the most sensitive to disturbance from construction activities may be the most likely to be affected. In addition, the Hospital's research and training facilities are situate in the Misericordiae wing as well as the entire finance team for the Hospital.	The location of sensitive receptors (psychiatric patients, research facilities etc.) was considered during the impact assessment for Mater Hospital. The assessment of impacts on these patients and facilities is reported in Chapter 10 of the EIAR. Mitigation Measures will include: - Noise barriers up to 4m tall - Noise insulation in some locations within the hospital - Advanced communication and notification of works - Standard dust mitigation measures outlined in the Dust Management Plan (Appendix A16.4) - Standard construction mitigation measures outlined in Appendix A5.1 CEMP	

Submission No.			186 and 187 (Duplicate submissions)

Metrolink Railway Order Application & Supporting Documentation, Our Clients: Mater Misericordiae and the Children’s University Hospitals Company Limited by Guarantee and Mater Misericordiae University Hospital, Address: Eccles Street, Dublin 7. Ref Nos: ML5B-A4, ML5B-U32, ML5C-U3, ML5C-U4 and ML5C-U5				
9	2. Construction impacts i. Noise	7	Although the sensitivity of the Hospital, and of psychiatric patients in particular, is recognised in the EIAR, there is a lack of clarity with regard to how noise impacts will be mitigated during the construction phase. It does not appear as if construction noise levels which reflect the sensitivity of the receptor, or which are designed to suit the hospital environment, have been proposed. Increased noise levels will lead to negative consequences for patients and staff within the Hospital. In this regard, the Hospital is concerned that the proposed mitigations for airborne noise will not be effective to mitigate any impacts from ground borne noise. Noise monitoring and controls will be needed for the entire construction period.	TII note that within Chapter 10, Section 10.5.1.3 it is stated that along with standard mitigation measures, coordination with sensitive receptors such as Mater Hospital will be required and is an important mitigation measure to prevent adverse impacts for patients and staff within the hospital. TII will liaise closely with the hospital for the duration of works to ensure minimal impacts insofar as possible. Further detail on impacts/mitigation is provided in the below paragraphs. Airborne Noise EIAR Chapter 13 Airborne Noise and Vibration, Section 13.7.1.1.4 AZ4: Northwood to Charlemont, presents the airborne noise levels and mitigations measures proposed for Mater Hospital during construction. Construction noise levels at the rear of 39 – 51 Eccles Street (Mater Hospital) are calculated to exceed the Noise Insulation (NI) trigger value for a number of construction phases associated with the Mater Station construction activities, and a very significant effect is determined without further mitigation intervention. In this instance, NI is proposed to the rear facades of this building in accordance with the TII Airborne and Groundborne Noise Mitigation Policy (see EIAR Appendix A14.6). The residual effects are determined to be negative, moderate and short-term. Construction noise levels at the upper floors of the main Mater Hospital are calculated to exceed the NI trigger value, during one phase only when piling/D-wall activities are occurring for the north section of the station box. In this instance, NI or temporary relocation is proposed in accordance with the TII Airborne and Groundborne Noise Mitigation Policy. Ground borne noise and Vibration Threshold levels for the assessment of groundborne noise and vibration have been determined for buildings with different uses and sensitivities. The threshold levels used for Mater Hospital are based on guidance for hospital buildings, as indicated in EIAR Chapter 14, Table 14.3 from groundborne noise and Table 14.7 for vibration. In Section 14.4.1.8 AZ4 – Groundborne Noise during Construction, Table 14.29, are presented the predicted noise levels during the TBM passage compared to the threshold values for noise for various sensitive receptors (including Mater Hospital). The calculations are presented for the closest part of the building to the works, as this is where noise and vibration levels can be expected to be the highest. According to the calculations in Table 14.29, the LAm_{ax} for TBM passage at Mater Hospital has a value of 48 dB while the Threshold Level for this building is 45 dB, resulting in a significant impact on the buildings operation for an approximate 2 week duration during the TBM passage. Unfortunately, there are no effective methods available to reduce groundborne noise or vibration from TBMs at source. The principal mitigation measures aimed at minimising impacts are as follows: • Advance public consultation and stakeholder engagement can greatly reduce the significance of groundborne noise effects, as building occupants would be prepared for the passage of the TBM and resultant elevated noise and vibration levels. • TII will accept and consider applications for additional measures on a case-by case basis, in accordance with its Noise and Vibration Mitigation Policy (see Appendix A14.6). In Section 14.4.1.8 AZ4 – Groundborne Noise during Construction, Table 14.30, the predicted noise levels during mechanical excavation are presented compared to the threshold values for noise for various sensitive receptors (including Mater Hospital). At Mater Hospital the LAm_{ax} for mechanical excavation has a value of 33 dB compared to the Threshold Level for this building of 40 dB, resulting in no significant impact on the buildings operation. In Section 14.4.2.6.1 AZ4 - Groundborne Noise from Railway Operation, Table 14.44, the predicted noise levels during railway operation are presented compared to the threshold values for noise for various sensitive receptors (including Mater Hospital). At Mater Hospital, the LAm_{ax} for operation has a value of 29 dB compared to the Threshold Level for this building of 40 dB, resulting no impact on the buildings operation.

10	2. Construction impacts ii. Vibration	0	Given the sensitive nature of the health care equipment within the Hospital, the vibrations from construction activity and tunnelling are a major concern. Sensitive equipment may be negatively impacted by vibrations from construction activity and from the proposed tunnelling. Any impact on sensitive equipment will have critical implications in relation to patient care. It will also impact the Hospital's training and teaching department which uses sensitive equipment. Ensuring equipment remains calibrated will also be of vital importance. It is noted that vibration monitoring is proposed, but specific commitments regarding monitoring, calibration and the consequence of exceedance must be included in any Railway Order. In this regard, it is essential that the Order provide for a cessation of activities which may affect sensitive equipment before any such effect takes place, i.e. that thresholds are set at a level which entirely avoids the risk of exceedance. In addition, ongoing monitoring of vibrations will be needed throughout the operation of the proposed Metrolink.	Refer to EIAR Chapter 14, Section 14.4.1.9 AZ4 – Groundborne Vibration during Construction Table 14.32, presents the predicted vibration levels during TBM Passage compared to the threshold values for vibration for various sensitive receptors (including Mater Hospital). The VDV (Vibration Dose Value) for TBM Passage at Mater Hospital has a value of 0.249 m/s-1.75, which is lower than the VDV Threshold Level for this building of 0.4 m/s-1.75, resulting in no significant impact on the buildings operation. Table 14.33, presents the predicted vibration levels during Mechanical Excavation compared to the threshold values for vibration for various sensitive receptors (including Mater Hospital). The VDV (Vibration Dose Value) for Mechanical Excavation at Mater Hospital has a value of 0.001 m/s-1.75 much lower than the VDV Threshold Level for this building of 0.2 m/s-1.75, resulting in no significant impact on the buildings operation. Table 14.34, presents the predicted vibration levels during blasting compared to the threshold values for vibration for various sensitive receptors (including Mater Hospital). The PPV for blasting at Mater Hospital has a value of 3.1, much lower than the PPV Threshold Level for this building of 8, resulting in no significant impact on the buildings operation. In Section 14.4.2.6.2 AZ4 – Groundborne Vibration from Railway Operation, Table 14.45, are presented the predicted vibration levels during Railway Operation for various sensitive receptors (including Mater Hospital). The VDV (Vibration Dose Value) for Railway Operation at Mater Hospital has a value of 0.005 m/s-1.75, resulting in a 'not significant' impact on the buildings operations. With regard to vibration effects on the use of sensitive equipment, as outlined in Chapter 8 of the EIAR, consultation has been ongoing with the Mater Hospital since 2018. The hospital has been asked to identify sensitive equipment that may be impacted by groundborne noise and vibration, but to-date no locations of any such equipment have been identified within proximity to the works. However, It is understood that the locations of sensitive equipment could change over time, and in advance of the works an in-depth consultation exercise will be carried out with the Mater Hospital to re-confirm the location of sensitive equipment. The programme for the TBM will be planned by the contractor and there is potential to plan the passage of the TBM during weeks when critical use of sensitive equipment can be avoided.
11	2. Construction impacts ii. Vibration	8	Construction hours including use of the tunnel boring machine ("TBM") is of greater significance in this case. The standard construction hours set out in the EIAR will likely not be appropriate in relation to minimisation of adverse impacts on the Hospital, when medical or surgical training procedures are in session. Consideration should be given to establishing the most appropriate times to use the TBM and blasting of rock.	The progress of the TBM is a continuous operation throughout the 24-hour period and it is not proposed to introduce temporary stops in the progress due to risks associated with additional settlement above the TBM. However, as the programme for the TBM will be planned by the contractor, they will be able to give advance notice of the periods of time that the TBM will be passing in proximity to the hospital . There is thus the potential to plan use of sensitive or critical equipment around the passage of the TBM. Vibration from blasting has been considered, predicted levels of vibration are below the threshold for significant impact (see Response (10). Nonetheless, during consultation with Mater Hospital, there will be potential for the contractor to agree timing of blasting operations.
12	2. Construction impacts ii. Vibration	8	Section 7.53.2 of the Non-Technical summary highlights the potential use of 'blasting' to enable rock excavation as well as drilling. The Mater Station is noted as a location for blasting. This will likely generate higher levels of noise and vibration, however, the period of disruption will be over a shorter duration. The potential impact of the blasting must be carefully considered, in particular for potential damage to the fabric of the Hospital's Misericordiae wing as well as to the houses on Eccles Street.	The potential impacts of blasting have been addressed within the EIAR with predicted vibration levels during blasting given in EIAR Chapter 14, Table 14.34 for Mater Hospital. The predicted PPV from blasting at Mater Hospital is 3.1 mm/s, which is lower than the PPV Threshold Level for this building of 8 mm/s, resulting in no significant impact. The predicted Air Overpressure from blasting at Mater Hospital, given in Table 14.35, is 105.6, which is lower than the PPV Threshold Level for this building of 125, resulting in no significant impact.

Organisation Name or Name of Submitter			Mater Hospital	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Metrolink Railway Order Application & Supporting Documentation, Our Clients: Mater Misericordiae and the Children’s University Hospitals Company Limited by Guarantee and Mater Misericordiae University Hospital, Address: Eccles Street, Dublin 7. Ref Nos: ML5B-A4, ML5B-U32, ML5C-U3, ML5C-U4 and ML5C-U5				
13	2. Construction impacts ii. Vibration	9	Section 7.5.5 of the Non-Technical Summary suggests a boring rate of 'about 70m per week. As such, it is reasonable to think the actual boring works in the vicinity of the Hospital will be in the order of a number of weeks. Clearly, the construction of the Mater Station box will take a considerable period of time. TII's documents suggest that the disruption due to noise will be mitigated by its proposed top down construction sequence. While this will mitigate much of the airborne noise, it will not mitigate the impact of ground borne noise and vibration and it is far from clear how it is proposed to mitigate this impact.	The passage of the TBM is anticipated to impact upon buildings above its passage for a period of approximately 2-weeks. For proposed mitigation for groundborne noise from TBM passage see Response (9) above.
14	2. Construction impacts iii. Air Pollution and Dust Control	9	It is obvious that any impact on air quality in proximity to a major hospital could have adverse implications for patient care. In addition, the creation of dust from construction activities could have adverse impacts, particularly if it leads to elevated levels of aspergillus. Although this risk is identified in the application documents, our clients consider that insufficient attention has been paid to the nature of the Hospital buildings in assessing this risk. The Misericordiae wing of the Hospital is an old building relying mainly on natural ventilation from open windows. The proposal to “seal windows” in order to mitigate risk from construction dust and aspergillus is simply not feasible. In the circumstances, our clients will require that mitigation measures capable of being put in place at the Hospital are proposed and assessed as part of the consideration of the application. Specific dust control and monitoring will be needed on an ongoing basis and precise commitments will be needed in this regard.	As noted in EIAR Chapter 10 Human Health, Section 10.5.1.1.1 Very Highly Sensitive Receptors, in the vicinity of the Mater Hospital there are considerable earthworks and the dust emission magnitude for the proposed site area is classified as large. However, with the extensive mitigation measures proposed for the construction process, including measures for dust suppression, it is predicted that dust emissions from the construction sites will not be significant. Therefore, no exceedance of air quality standards is expected at the façade of the Mater Hospital and consequently no significant adverse effects to human health. In relation to aspergillus, survey and prevention works will take place before construction commences by a competent contractor in proximity to any sensitive buildings and in particular in proximity to the Mater Hospital site which utilises passive ventilation on Eccles Street. The National Guidelines for the Prevention of Nosocomial Invasive Aspergillosis During Construction/Renovation Activities (National Disease Surveillance Centre 2002) and National Guidelines for the Prevention of Nosocomial Aspergillosis (HSE 2018) will be taken into consideration by the competent contractor as a source for the Aspergillus Prevention Plan. The National Guidelines for the Prevention of Nosocomial Aspergillosis (HSE 2018) provide a risk assessment for aspergillus, preventative dust mitigation measures and, in Appendix B of the document, pre-project planning and contractor advice. If the resulting mitigation measures require interventions such as sealing windows to the Mater Hospital building, consultation with a Conservation Architect will be undertaken. In terms of biological risk, there may be vulnerable patients in the Mater Hospital and there are extensive guidelines in relation to how this risk can be managed and reduced. Vulnerable patients will typically be people with decreased immune systems due to illness or treatments for illnesses such as bone marrow transplants or haematological diseases. These, however, will be typically in wards that are designed to prevent Aspergillus build up in the area. These wards will have HEPA (High Efficiency Particulate Air) filters on windows and ventilation systems and controls in relation to items such as flowers or plants being on site. In this protected environment there are no significant increased risks because of the additional activity related to construction.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Metrolink Railway Order Application & Supporting Documentation, Our Clients: Mater Misericordiae and the Children’s University Hospitals Company Limited by Guarantee and Mater Misericordiae University Hospital, Address: Eccles Street, Dublin 7. Ref Nos: ML5B-A4, ML5B-U32, ML5C-U3, ML5C-U4 and ML5C-U5				
15	2. Construction impacts iii. Air Pollution and Dust Control	9	In addition, given the nature and context of the building, any agreed protection measures should be undertaken in consultation with a Conservation Architect. TII need to agree with the Hospital the proposed purpose and nature of the protection measures to ensure that the patient wards, the administration offices as well as the teaching/training spaces can be maintained in use for their current function. As this part of the Hospital is a protected structure, any interventions to the building fabric, including the window protection measures need to be agreed with the appropriate planning authority. TII need to carry out detailed condition surveys of the adjacent Hospital buildings prior to the works commencing. These should have detailed sections on the building fabric, including windows, stonework etc. and include both external and internal elements. Similarly, it has been recommended to the Hospital that TII carry out condition surveys of all public realm areas adjacent to the works that may be susceptible to settlement due to the construction activities. Having regard to the protected status of the structure, the uses to which they are being put, and the vulnerability of those who use its services, our clients have very limited flexibility in relation to how they can absorb impacts. It is noted that proposed mitigation of construction impacts at sensitive locations involves temporary re-housing of sensitive locations or people where mitigation is not possible. It is not clear what “re- housing” is proposed, or whether it will be appropriate or even feasible in a very busy hospital. Precise details of what is proposed will be required in order for the Hospital and the Board to assess the merits of this proposal. More generally, a detailed condition survey of the Hospital will be required before any works commence and, in the event the Railway Order is granted, detailed conditions regarding the timing of any works will need to be imposed.	Regarding protection measures to the building during construction, as outlined in EIAR Appendix A5.1 (CEMP), temporary or permanent specialists with appropriate skills and experience will monitor on-site construction on behalf of TII, where required. In terms of Architectural Heritage, this will include a Project Conservation Architect. A Cultural Heritage Strategy (see EIAR Appendix A25.1) has been prepared by TII’s Project Archaeologist and Conservation Architect, who will remain involved during the duration of the project. Where any specific works are considered necessary to the fabric of the building these would be agreed with the Planning Authorities. Regarding settlement, in EIAR Appendix A5.17 Building Damage Report Table 5.2 the Mater Hospital assessments to date indicate that the building falls into the 'Negligible' damage category and hence further assessment is not required. That said, due to the age and importance of the building, it has been designated "special" and hence a further assessment will be undertaken by the main works contractor. This further assessment will pick up on the building's condition close to the time when the building will be impacted. TII are happy to engage further with Mater Hospital regarding the works programme and timing before the construction works start. In relation to "temporary re-housing" it is noted that at Mater Hospital, the psychiatric ward is impacted by TBM passage which could require the relocation of patients to either another part of the hospital or to an alternative hospital for the period of time. It is noted in Chapter 10 that a best case scenario would be three days and a worst case scenario would be for two weeks. TII will work with Mater Hospital in consultation with hospital authorities in relation to this measure. In EIAR Chapter 13 (Airborne Noise & Vibration) Section 13.7.1.1.4 it notes for Mater Hospital that ‘Construction noise levels at the upper floors of the main Mater Hospital are calculated to exceed the NI trigger value for one phase when piling/D-wall activities are occurring for the north section of the station box. In this instance, NI or temporary relocation is proposed in accordance with the TII Airborne and Groundborne Noise Mitigation Policy’. It should be noted that this area is not used as a ward nevertheless TII will continue to consult with the Mater Hospital management regarding the most appropriate mitigation measures to be adopted regarding this mitigation.

Submission No.			186 and 187 (Duplicate submissions)	
Organisation Name or Name of Submitter			Mater Hospital	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Metrolink Railway Order Application & Supporting Documentation, Our Clients: Mater Misericordiae and the Children’s University Hospitals Company Limited by Guarantee and Mater Misericordiae University Hospital, Address: Eccles Street, Dublin 7. 16	3. Operation of Metrolink	10	In addition to our clients' concerns regarding the potential construction impacts, the operation of Metrolink, and in particular Mater Station, has the potential to permanently affect the Hospital and its operations. Although this clearly has the potential to benefit the Hospital, it will be necessary to ensure that the project is operated and managed in a manner which does not compromise the Hospital's operations. Commitments and safeguards will be required as part of any Railway Order.	During the Metrolink operation phase there are no predicted impacts affecting the Hospital's operations, as noted below. Airborne noise: During operation the Metrolink will be in tunnel within the Mater Hospital section of the proposed Project. As noted in EIAR Chapter 13, Section 13.5.3.2.3 Ventilation Systems, the primary operational noise sources will relate to the station and tunnel ventilation systems. The specific noise level from ventilation systems will be calculated as part of the further design development. Specifically, the operational noise level from each shaft and surface grill will be calculated to the nearest sensitive areas to each and specific attenuation designed for each system so as to not exceed the relevant design criteria for each location. As such, no mitigation will be required at the Hospital building itself. Ground borne Noise and Vibration: EIAR Chapter 14, Section 14.4.2.6.1, Table 14.44, presents the predicted noise levels during railway operation compared to the threshold values for noise for various sensitive receptors (including Mater Hospital). The predicted groundborne noise level for railway operation past Mater Hospital has a value of 29 dB LAmax,s which is below the Threshold Level for this building of 40 dB, resulting in no impact on the buildings operations. In Section 14.4.2.6.2 AZ4, Table 14.45, are presented the predicted vibration levels during railway operation for various sensitive receptors (including Mater Hospital). The VDV (Vibration Dose Value) for railway operation past Mater Hospital has a value of 0.005 ms-1.75, which is well below the 0.2 ms-1.75 VDV threshold level of for this building resulting in no significant impact on the buildings operations. Air Quality: The air dispersion modelling assessment has found that in the 2035 opening year no receptors will have ambient air quality exceedances of the ambient air quality standards for the Do Something (and Do Minimum) scenario as a result of the proposed Project. There is a single slight adverse effect but no moderate or substantial adverse effects expected as a result of the Operational Phase of the proposed Project. Therefore, overall, it is considered that the residual effects are within the EPA Guidelines (EPA 2022) with the likely effects considered overall as 'Neutral, Not Significant and Long-Term'. Electromagnetic Interference: The Radiology Department of the Mater Hospital is located in the Whitty Wing on Level 2. It is more than 100m from the proposed alignment and therefore modelled levels at this distance are such that no significant effects are likely to be experienced in the operation of the on-site MRI, CT and PET-CT scanning equipment. Accordingly, the significance of effects on the Mater Hospital from DC magnetic fields has been determined as 'Slight' with a quality of effects classed as 'Neutral'. Traffic: The Berkeley Rd/Eccles Street junction will be reinstated to provide for general traffic use.

17	4. Acquisition of Lands	10	Our clients are, ..., very concerned about the proposal to acquire permanently the Four Masters Memorial Park..... There is little or no recognition in the application documentation as to the historical import of this Park or that the Park is within our clients' ownership and used by them periodically for the benefit of the Hospital and its patients for symbolic and historical Hospital occasions - this is not recognised in the Planning Report accompanying the documentation at all. Our clients' understood that the Park would be required temporarily during the construction of the proposed project, but that it would be returned to our clients' use and ownership thereafter. The necessity for a permanent acquisition has not been explained in the application documentation and a basis for confirmation of the CPO element of the Railway Order has therefore not been made out.	According to Chapter 21 Land Take - Permanent land take is required at the proposed stations and along the surface, retained cut, and cut and cover sections of the proposed Project alignment. The acquisition of lands for cut-and-cover sections (including for the underground stations) has been considered as permanent land acquisition during the Construction Phase, although following construction, all or part of this land may have the potential to be returned (or the surface level made available for use) subject to agreement with the landowner. In addition to land take required for the footprint of the permanent works, lands will also be required temporarily for the construction of the project. In the context of this Chapter, temporary means land that is utilised for a period of time to facilitate the construction of the proposed Project but is then returned to its former, or another (non-MetroLink) usage. It is envisaged that the park will be re-instated upon completion of works albeit with modifications to landscaping and alignment. In the case of the Four Masters Memorial Park, the EIAR Chapter 27, (The Landscape) notes in Section 27.5.4.20 that - 'The proposed works will necessitate the removal of a substantial area of the park on a temporary basis, along with the perimeter railings, the nineteenth century memorial cross (The Four Masters Cross) and the sculpture (Healing Hands), dating from 2000. Whilst the station will be below ground, it will have a number of elements on the surface, including ventilation grilles, air intake shafts, fire access lift, emergency escape stairs and the main entrance to the station. These will be placed along the Berkeley Road frontage, mainly within the park. Following the completion of the station box, the Park will be reinstated on the surface to a shape and form similar to the existing Park with updated planting, including new trees along each side of the triangle. The railings and gates, the Four Masters Cross and the sculpture will all be reinstated to slightly amended alignment and locations. The existing garden and grotto adjoining and within the grounds of St Joseph's Church will also be reinstated on the existing footprint and in similar style to the Four Masters Park proposals with proposed trees. This allows the accommodation of the introduced elements of the station which will now be expressed at surface level'. So in the case of the Four Masters Memorial Park, whilst permanent land take is considered as permanent land acquisition during the Construction Phase, a significant part of this land will be able to be returned to use as a park after the reinstation works are finished. The intended compulsory purchase of the park as part of the Railway Order Application will allow TII to open the reinstated and improved park to the wider public who will be able to fully avail of its extraordinary amenity value.
18	Conclusion	11	It looks forward to the opportunity to engage further on these and other issues at an Oral Hearing and our clients are more than willing to have a preliminary meeting of the parties and observers In advance of the main oral hearing.	See Response (4).

Submission No.			188	
Organisation Name or Name of Submitter			(Hughes Planning & Development Consultants on behalf of) Maureen O'Scanaill (Milton Fields, Pinnock hill, Swords, Co Dublin)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: ABP Ref. No. NA29N.314724 Railway (MetroLink - Estuary to Charlemont via Dublin Airport) Order				
1	1.0 Introduction 7.0 Conclusion	1, 8	...this submission requests that An Bord Pleanála duly consider the negative implications arising on our client's residence. It is strongly contended that the proposed development has had no regard to our client's property, specifically access to and from her home. The proposed railway has been designed without due regard to our client's existing residential amenity at her dwelling at Pinnock Hill Roundabout. The impact of the proposed route on our client's lands would be detrimental to the amenity and would be a traffic hazard. Our client is also concerned about the impacts on the viability of the O'Scanaill Veterinary Clinic to the north of her dwelling which is run by her family.	TII thank you for your input and responses are provided below.
2	2.0 Site Description	1	Access to the property is provided from the north and northwest via an exit from the Pinnock hill roundabout. The access is used both by members and visitors to the dwelling, as well as by members of the public who avail of the services provided by the veterinary clinic. The proposal will disrupt access to the site during construction and operational stages which will impact on our client's property and family's veterinary practice (Swords Veterinary Clinic).	TII recognise the disruption likely to be caused to land, property and business owners along the route as a consequence of the delivery of MetroLink. As will be the case with all third party landowners/business, and in agreement with the respondent, TII and their appointed Contractors will maintain access to this business to ensure its ongoing viability during the course of the construction work and to minimise any further impacts that could affect the amenity of the location. See EIAR Appendix 9.5 Scheme Traffic Management Plan, Section 2.1.
3	2.0 Site Description	2	Our client is committed to its future in Fingal but are of the strong belief that an alternative location will have to be sourced for the family enterprise should the Railway Order be approved and subsequently carried out. It is requested that An Bord Pleanála note that... the impacts on viability of this business are considered (...the O'Scanaill Veterinary Clinic has been part of the Fingal commercial community for over seventy years, generating employment and revenue for the Fingal Area, providing an essential service to animal and pet owners in Swords and surrounding area and, in turn, supporting the region's growth...).	Please refer to response number (2) above.
4	2.0 Site Description	2	Additionally, our client had lived in the area for a number of years, since 1954 when the dwelling was first built and the proposal will gravely reduce the amenity which she has benefitted from in her time living here.	Refer to response number (2) and (3) above.
5	3.0 Proposed Railway Order Figure 5.0	4	...the extent of our client's premises which will be subject of acquisition. The blue hatch indicated lands to be temporarily acquired. As is shown, a large proportion of lands relating to the lands will be lost. This includes access to our client's home, as well as lands associated with the veterinary practice. As indicated above (in Figure 5.0) the proposal directly interferes with our clients' premises and the operational requirements of the family-run veterinary clinic.	The details of the proposed temporary and permanent landtake around this property are detailed in the following document within the Railway Order: Property Drawings - Property Details Book 1 of 2 Fingal County Council: Sheet 24 of 66, detail 301 ML-P-301 S-T. These details are also presented in the respondents correspondence figure 9.0. TII confirm that the area of temporary landtake shown on this document is the minimum area needed to provide the room necessary to maintain access into the business while the construction works are progressed.
6	5.0 Planning Policy	4	The relevant development plan against which any planning application at our client's premises would be assessed against is the Fingal Council Development Plan 2017-2023. We note, as per the provisions of the Fingal County Development Plan 2017-2023, that the subject site is subject to the 'HT - High Technology' zoning objective. The purpose of which is to 'Provide for office development and high technology/ high technology manufacturing type employment in a high quality built and landscaped environment'	MetroLink is fully compliant with all relevant development plans as is outlined in the Planning Report submitted as part of the Railway Order application. In particular section 3.6.1.2 of this document addresses the FCC Development Plan 2017-2023 and MetroLinks compliance with same.
7	6.0 Concerns on Submitted Application	6, 7	The application is a clear infringement on the existing standard of access as it will be significantly impacted at construction and operational stages of the development, if approved.	Refer to response number (2) and (3) above.

Submission No.			188	
Organisation Name or Name of Submitter			(Hughes Planning & Development Consultants on behalf of) Maureen O'Scanail (Milton Fields, Pinnock hill, Swords, Co Dublin)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: ABP Ref. No. NA29N.314724 Railway (MetroLink - Estuary to Charlemont via Dublin Airport) Order				
8	6.0 Concerns on Submitted Application	7	The full impact of the proposal on our client's premises has not been adequately demonstrated in the submitted documentation. Our client's access routes and gates will be the subject of temporary acquisition during the constructional stage of development. While these lands are stated to be temporarily acquired, no finite amount of time has been provided, creating an uncertainty on the length of time our clients will suffer from the loss of their lands. As stated, construction is anticipated to take upwards of 5 years along this specific area and this would impact the amenity afforded to our client's dwelling, as well as having severe implications on the existing business,	TII acknowledge that the landtake, both temporary and permanent, proposed for the MetroLink Works will have an impact on this business, particularly maintaining access. Please refer to response numbers (2) and (3) above. Where landtake is of a temporary nature, its primary function is to provide room to facilitate access to the business and property as well as to install hoarding and site demarcation. TII will agree the details of the full treatment for reinstatement with the owners on completion of the works. We understand that the duration of any disruption during the construction phase is a matter of concern for your business. We acknowledge that the current anticipated timeline for the impact may appear excessive. However, TII want to assure you that we are fully committed to minimising this duration to the best of our ability. See EIAR Chapter 5, MetroLink Construcion Phase, section 5.2.2.
9	6.0 Concerns on Submitted Application	7	As demonstrated in the following image, the access to our client's dwelling will completely be impacted by the proposed route. It is indicated that the existing entrance will be 'reinstated' for use by the owners, staff and clients of the veterinary clinic. However, this access will entail traversing the railway line to the premises which is quite a hazard. This issue is further worsened by the frequency of the route, with the Planning Report submitted by the Applicant noting that the trains will be operating 19 hours per day, 365 days a year; with 20 no. trains operating per hour at a frequency of three minutes in the opening year operations between trains. The trains are expected to be 64m long trains running up to every 100 seconds at peak demand. This will cause unsurmountable levels of disruptions and to accessing and existing the site and may result in clientele of the veterinary clinic seeking alternative veterinary practices, thus damaging the viability and vitality of the premises. This impact has been neglected by the planning application.	Access to and from the Surgery are to be reinstated. As this section of railway is below ground and in a cut and cover structure (and thus grade separated from the entrance road) and finished with an appropriate vehicle restraint barrier, there is no hazard nor conflict between the Veterinary practice entrance and MetroLink operations. See Plan Drawing No. ML-RO-301 S-T where hatched lines indicate below ground (tunnel) sections including across the property entrance.

Submission No.			188	
Organisation Name or Name of Submitter			(Hughes Planning & Development Consultants on behalf of) Maureen O'Scanail (Milton Fields, Pinnock hill, Swords, Co Dublin)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: ABP Ref. No. NA29N.314724 Railway (MetroLink - Estuary to Charlemont via Dublin Airport) Order				
10	6.0 Concerns on Submitted Application	8	Our client is also concerned with the extent of works located along the northern boundary of the veterinary clinic lands, including any required excavations, tunnelling and rail laying that will occur. Such works will have significant disturbances on our clients' property including by way of, for example, noise, vibration and dust generation.	Chapter 13 Airborne Noise and Vibration includes an assessment of airborne noise and vibration from the construction of the project. Chapter 13 presents the potential significant airborne noise impacts, with Table 13.44 summarising potential significant noise impacts during construction of the cut and cover and retained cut sections of the route. The predicted magnitude of impact at this location is Significant to Very Significant, prior to the consideration of any noise mitigation (included below). In order to mitigate airborne noise, an outline Construction Environmental Management Plan (CEMP) has been prepared and is included as Appendix A5.1. This is a working document that will be updated by the contractor prior to commencement of construction and regularly as the project progresses. The key principals for mitigation measures for airborne noise & vibration impacts are as follows: - Noise control at Source: Selection of quiet plant, site layout, attenuation at source, operational control (hours and periods); - Noise Control along Pathway: Localised screening to plant items on site, enclosures, site buildings, site hoarding and noise barriers; and - Noise Control at Receiver: Noise Insulation (NI) - Hoarding is proposed at this location with a height of 4m. - Prior to the commencement of the construction works at each compound, the Contractor will conduct an individual site assessment to verify the height and position of screening to control noise impacts based on the most up to date construction methodologies and input data. - An outline CEMP was prepared as part of the EIAR and it will continue as a live document for the appointed contractor to use throughout the construction of the project. Chapter 14 Groundborne Noise and Vibration considers the assessment of groundborne noise and vibration from the construction and operation of the project. Groundborne vibration from piling along this section of the route is discussed in Section 14.4.1.1 which concludes that there will be no significant vibration from works at any buildings, including at this location. As provided in the Outline Construction Environmental Management Plan (CEMP) within Volume 5 Appendix 5.1, standard working hours will apply at this location. In preparation for the construction phase, the appointed contractor will prepare their Construction Environmental Management Plan (CEMP) in accordance with the requirements set out in the outline CEMP in EIAR Appendix A5.1 addressing all construction environmental issues such as noise and dust generation. The contractors CEMP will include a Construction Noise & Vibration Management Plan (CNVMP). The contractor will consult with and obtain the approval of the CEMP from Fingal County Council prior to commencing the works. TII will utilise best practice techniques to curtail dust generation including: hoarded compounds, wheel wash facilities and dust suppression for all areas prone to dust (damping down, water misters / sprays, local extraction and filtering). Public health impacts are not anticipated as the dust levels on site will be controlled to strict levels for protection of the workforce in accordance with statutory health and safety legislation.

Submission No.			189	
Organisation Name or Name of Submitter			Metro South West Group	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Case reference: NA29N.3 14724- MetroLink. 314724 Estuary through Swords, Dublin Airport, Ballymun, Glasnevin and City Centre to Charlemont, Co. Dublin. 22nd November 2022				
1	Statement	1	For the avoidance of any doubt we are fully supportive of the project from Estuary to St. Stephen's Green, which we consider is long overdue.	TII note and appreciate the submission and the positive endorsement of the MetroLink Project.
2	Observations of Metro South West Group	1	We submit, however, that Bord Pleanala should defer the authorisation of the section of MetroLink beyond the St. Stephen's Green station, other than to create a turning section similar in length to that which is currently proposed beneath Manders Terrace.	In regards to the observation that MetroLink should not extend beyond St Stephen's Green, for the reasons set out below TII disagree. The connection from St Stephens Green to Charlemont / Ranelagh is supported by the previous Transport Strategy for Greater Dublin Area (2016-2035) and the current Transport Strategy for Greater Dublin Area (2022-2042). The latter considers a range of options for the onward extension of MetroLink to meet the demand for travel over the period of the strategy. This includes consideration of the need for the upgrade of the Luas Green Line to Metro with a Metro extension to Dublin south west, south or south east. Whilst the strategy envisages that further extensions will be delivered after 2042, MetroLink which terminates at Charlemont allows for the possible extension of the Metro in all the above directions. The proximity of the Metro to the Luas line at Charlemont provides for a positive customer experience for all users with short interchange distance and due to the proximity, clear wayfinding and high visibility of the interchange. The interchange arrangements at Charlemont provide for significantly better interchange arrangements compared to an alternative interchange at St Stephen's Green Station. Passengers wishing to interchange between Luas and metro at an alternative St Stephen's Green terminus would face a 500m-walk along a route either through St Stephen's Green park or along the footpath north of the park, which adds significantly to the time for interchange and therefore the overall journey time for passengers and a less positive customer experience for all interchange users. This passenger experience would be reduced further for those with mobility or visual impairments as well as those travelling to/from the airport with luggage. The section of MetroLink route between St Stephen's Green and Charlemont Stations contributes significantly to the overall benefits of the scheme. It serves a significant area of the south city of Dublin and offers enhanced access from the local area to the city centre and a direct connection to Dublin Airport. It serves key trip attractors including residential areas and offices / workplace locations, with high passenger boarding and alighting figures in the peak hours. During the morning peak, at Charlemont station the flows include 1,800 passengers alighting, 2,300 boarding and 1,229 passengers alighting, 2,276 boarding during the evening peak. The passenger numbers contribute significantly to the overall benefits of the scheme and the effect of these benefits outweigh the additional costs that are associated with the delivery and operation of the section from St Stephen's Green to Charlemont station. Further information is available in Chapter 7: Consideration of the Alternatives, section 7.7.8 MetroLink Southern Terminus Location. The location of the interchange at Charlemont does not preclude onward extension south. An interchange at Charlemont is supported by policy including the Dublin City Development Plan 2022 - 2028 and the Transport Strategy for the Greater Dublin Area. As noted by the GDA Transport Strategy 2022-2042, section 12.3.2, "Charlemont offers the optimal location for the primary interchange with the Green Line in response to growing demand in the longer term and is an appropriate location to facilitate any potential future metro extensions to serve the south west, south or south east of the city region should sufficient demand arise." By extending MetroLink to Charlemont it provides for future proofing of the Green Line, bypassing the capacity constrained Luas on-street running section, and ensures potential future connectivity options are enabled, either to the Green Line or for extensions of the Metro. The Charlemont Station interchange provides for increased passenger utilisation of the MetroLink system, thereby increasing the benefits delivered by the Project, reflected by an improved Project Benefit Cost Ration (BCR).

Re: Case reference: NA29N.3 14724- MetroLink. 314724 Estuary through Swords, Dublin Airport, Ballymun, Glasnevin and City Centre to Charlemont, Co. Dublin. 22nd November 2022					
3	Observations of Metro South West Group	1	We further believe that the decisions made now will affect the provision of necessary rail infrastructure, for South West Dublin for generations to come and, we respectfully request you to consider, carefully, the content, findings and analyses contained in this submission to support our case.	The proposed route alignment from Estuary to Charlemont is consistent and compliant with the GDA Transport Strategy 2022-2042 (published in January 2023) in which states that the south city terminus at Charlemont offers the optimal location for interchange with the Green Line in response to growing demand in the longer term and is an appropriate location to facilitate any potential future Metro extensions to serve the south west, south or south east of the city region should sufficient demand arise. Please also refer to response (2) that explains why Charlemont is preferred to St Stephen's Green for making future provision to the south.	
4	Observations of Metro South West Group	2	1. Limitations of Charlemont terminus for radial extensions to south city and the consequences for south west Dublin We believe that if the tunnel is bored as far as Manders Terrace, it seriously compromises the ability for a southern extension to include the highly populated city suburbs of Portobello, Lower Rathmines, and Harold's Cross. We would submit that proper planning requires a proper evaluation of the options for extension and, that it is not consistent with proper planning to permit a station at Charlemont with would compromise the options.	TII disagree that a southern extension is compromised by locating a MetroLink interchange at Charlemont for the reasons set out by responses (2) and (3) above. The GDA Transport Strategy 2022-2042 (published in January 2023), section 12.3.8 Additional Luas Lines Post-2042, further notes that the analysis undertaken for the Transport Strategy indicates that a number of corridors in the GDA will, in the longer term, generate travel demand above that which can be catered for by higher capacity bus systems and are likely to require upgrading to light rail in the period after 2042. The planning and design work associated with this longer term framework can commence during the strategy period. The Green Line Reconfiguration is proposed to provide a city centre line to Bray via UCD and Sandyford, however this is subject to the detailed appraisal, planning and design by the NTA. TII therefore consider "proper planning and proper evaluation" has been undertaken that is appropriate for informing the wider GDA strategy. Further, as noted by response (2) above, by extending MetroLink to Charlemont it provides for future proofing of the Green Line, bypassing the capacity constrained Luas on-street running section, and ensures potential future connectivity options are enabled, either to the Green Line or for extensions of the Metro. Future Metro services south of Charlemont do not form part of the Metrolink scheme. TII's role is to deliver Metrolink as supported by the Transport Strategy for Greater Dublin Area (2022-2042) and Dublin City Development Plan 2022-2028. The connection from St Stephens Green to Charlemont / Ranelagh is supported by the current Transport Strategy. The Transport Strategies were prepared by the National Transport Authority, scrutinised by the Joint Oireachtas Committee on Transport, and approved by the Minister for Transport. It notes in section 12.3.2, "Charlemont offers the optimal location for the primary interchange with the Green Line in response to growing demand in the longer term and is an appropriate location to facilitate any potential future metro extensions to serve the southwest, south or southeast of the city region should sufficient demand arise."	
5	Observations of Metro South West Group	2	2. Failure to consider an alternative routing, notably towards Rathmines as outlined by Metro South West Group We would submit that the Rathmines, or Portobello, area would be a far more suitable location for a terminus, including linkage with BusConnects corridors. TII has wholly failed to consider this. The south side terminus became relevant once it was decided not to convert the Green Line Luas to Metro.	Response (4) above explains why a MetroLink interchange with the Luas Green Line at Charlemont is preferred.	
6	Observations of Metro South West Group	2	3. Potential Environmental/Climate Action benefits of an alternative extension route. We believe that a metro extension as far as Rathmines would, initially, yield immediate benefits environmentally for South West Dublin, and avoid adverse environmental impact on the Grand Canal.	Response (4) above explains why a MetroLink extension south of Charlemont has not been considered.

Re: Case reference: NA29N.3 14724- MetroLink. 314724 Estuary through Swords, Dublin Airport, Ballymun, Glasnevin and City Centre to Charlemont, Co. Dublin. 22nd November 2022				
7	Observations of Metro South West Group	2	4. Inadequate plan for the supply of Public Transport to SW Dublin, and the critical need, at this juncture, for correct decisions to be made in relation to the MetroLink trajectory into South Dublin in the future. A proper feasibility study for continuing MetroLink to South West Dublin needs to be carried out.	As previously noted by response (4) above, the GDA Transport Strategy 2022-2042 (published in January 2023), section 12.3.8 Additional Luas Lines Post-2042, notes that the analysis undertaken for the Transport Strategy indicates that a number of corridors in the GDA will, in the longer term, generate travel demand above that which can be catered for by higher capacity bus systems and are likely to require upgrading to light rail in the period after 2042. The planning and design work associated with this longer term framework can commence during the strategy period. The Green Line Reconfiguration is proposed to provide a city centre line to Bray via UCD and Sandyford, however this is subject to the detailed appraisal, planning and design by the NTA. TII therefore consider "proper planning and proper evaluation" has been undertaken that is appropriate for informing the wider GDA strategy and the decisions made, that include where MetroLink interchanges with the Luas Green Line, with provision made for further planning and design work to build on the analysis undertaken to date that has informed the Transport Strategy.

Re: Case reference: NA29N.3 14724- MetroLink. 314724 Estuary through Swords, Dublin Airport, Ballymun, Glasnevin and City Centre to Charlemont, Co. Dublin. 22nd November 2022				
8	Observations of Metro South West Group	2	5. Many practicalities of linking MetroLink with the Luas Green Line at Charlemont have not been addressed. Many practicalities have not been addressed including passenger conflict on platforms and stairs; turning of trams.	This observation is incorrect. EIAR Chapter 4, Description of the MetroLink Project details the urban realm and landscaping design at Charlemont Station, including the key architectural design principle to 'improve the Luas connection at the ground level through additional stairs and lifts.' As noted, the Charlemont MetroLink station will have surface connectivity to the Luas Green Line along Grand Parade and has two entrances/exits from the station, one onto Grand Parade and one onto Dartmouth Road. The Grand Parade exit provides connectivity to the Luas stop with additional path width provided between the two modes of transport to minimise conflict between passenger movements. The path widths and circulation routes are improved between the entrance and Luas stairs and access lift on the western side of the Charlemont Luas Stop, mitigating passenger conflict. The Luas and MetroLink trams will not conflict as the Luas Green Line is elevated at this location, whereas the MetroLink station will be underground. A microsimulation VisWalk model has been developed for the immediate area surrounding Charlemont Station during the operational phase. The model covers the full extent of the publicly accessible station area, including the immediate vicinity of the station entrance at street level, the Luas stop and nearby junctions at Charlemont Bridge. In order to accommodate the forecast demand from the proposed Charlemont Station, a new staircase with 2.4m stair width is proposed at the south east corner of Charlemont Luas stop. An elevator will also be provided at this location. Both are sized for MetroLink to Luas, and Luas to MetroLink passenger numbers. Please refer to Chapter 9: Traffic & Transport, Appendix A9.2-B Traffic and Transport Assessment Charlemont Station, section 6.1.3. Pedestrian Impact Assessment. In addition, it is proposed that the pedestrian crossing on R111 Grand Parade will be repositioned to the front of the building being developed by Hines. With this infrastructure in place, the model indicates that the R111 Grand Parade will have an acceptable level of service overall, with some reductions in service seen at the pedestrian crossing where pedestrians are required to wait for a green phase at the signals. Overall, it is considered that the model displays an acceptable level of network performance. Chapter 9: Traffic & Transport, Appendix A9.2-B Traffic and Transport Assessment Charlemont Station, section 6.1.3. Pedestrian Impact Assessment refers. The proposed pedestrian crossing on Grand Parade will have minimal impact on the traffic flow along Grand Parade and can be programmed to operate in sync with the existing signalised junction at Grand Parade /Charlemont Street to maintain the flow of traffic movements. When the Project is operational, car mode share will decrease, with a reduction of up to approximately 830 car tips to and from the zones surrounding Charlemont Station over the 12hr period in 2065. In overall terms, the Charlemont Station will provide for improvements to the public transport network resulting in decreases in private car usage/trips, increases in public transport usages and will facilitate walking and cycling to the station, without significantly impacting on the operation of the road network in the area. Chapter 9: Traffic & transport, Appendix A9.2-B Traffic and Transport Assessment Charlemont Station, Section 6.1.2. refers. Furthermore, TII have deliberately designed the Station with minimum set down space (with the exception of a drop-off on Grand Parade for persons of restricted mobility only) or room for taxi ranks so that it does not encourage the Station to be used as a terminus. As referred to in EIAR Chapter 6 section 6.8.1 , the proposed Project has been designed to ensure maximum interchange with other modes of transport, specifically more sustainable modes of transport such as walking, cycling and public transport. To ensure that MetroLink provides sufficient capacity, and as outlined in EIAR Chapter 6, MetroLink Operations and Maintenance, the operational strategy of the proposed Project is driven by the forecasted passenger demand. Passenger demand modelling has been used to predict the numbers of passengers boarding and alighting at each station, and the resulting passenger load on the whole Project, for up to 30 years after opening. Passenger modelling identified that passenger numbers may peak at over 18,000 passengers for the AM peak hour southbound . As is common practice, MetroLink has been design to accommodate these peak hour levels irrespective of when they may occur. On the basis of the modelling prepared for the proposed Project and allowing for future growth in capacity beyond the projection year, the proposed Project is designed to accommodate 20,000 passengers per hour per direction and a train fleet comprising 40 trains for the Forecast Year (2065).

Re: Case reference: NA29N.3 14724- MetroLink. 314724 Estuary through Swords, Dublin Airport, Ballymun, Glasnevin and City Centre to Charlemont, Co. Dublin. 22nd November 2022					
9	Observations of Metro South West Group	3	6. Break of Aarhus Convention. We believe that the lack of consultation on important changes is a breach of the above.	EIAR Chapter 8, Consultation details how early and continuous public participation has influenced the design and development of the MetroLink project, including the identification of the Preferred Route. The chapter documents the extent and nature of public, stakeholder and landowner consultation and participation that has taken place over the course of the Project's development. It also addresses how the MetroLink Project Team responded to the submissions and feedback received during the non-statutory consultation periods. The MetroLink Project Team has at all times endeavored to ensure the widest possible access for the public, stakeholders and landowners to information about the project at all stages of its pre-planning development. Further, EIAR Appendix A8.19 Meetings Register provides a record of 9 No. meetings held with Charlemont and Dartmouth Square residents spanning a period from May 2019 to May 2022. In this regard, it is intended that the consultation undertaken in respect of the MetroLink Project will, when the railway order application process is complete, fully meet the requirements of the Aarhus Convention, Codified EIA Directive and Irish national legislation.	
10	Observations of Metro South West Group	3	7. Continuing MetroLink beyond St. Stephen's Green to Charlemont and Manders Terrace is unnecessary and premature. We believe that investigation now into the MSWG's suggestion of choosing an alternative terminus e.g.: Portobello / Cathal Brugha Barracks in Rathmines * Could bring Transport User Benefits and Revenue from a station at Portobello. * Cost approx. €650m (matching cost to Charlemont) * Lay the foundation of the Metro to the south west * Aid climate actin in the south west.	TII do not agree with the statement that "Continuing MetroLink beyond St. Stephen's Green to Charlemont and Manders Terrace is unnecessary and premature." for the reasons set out by TII's responses to the observations made by this submission. TII have also responded to why Charlemont is preferred for reasons of providing the best interchange with the Luas Green Line, whilst future proofing the Green Line by bypassing the capacity constrained Luas on-street running section and ensuring potential future connectivity options are enabled, either to the Green Line or for extensions of the metro.

Re: Metrolink Railway Order 2022, Estuary to Charlemont, Reference Number NA29N.314724				
1	Letter	1	I live at 34 Dartmouth Road..... Firstly, in general, I am in favour of the broad aim of the Metrolink project to connect Dublin's city centre to our national airport. However, as a resident living in the Dartmouth/Charlemont area, I wish to set out a number of observations, for the Board's consideration, regarding the proposal to locate the Terminus station at Charlemont-Dartmouth. My family home is in the midst of the community where the Terminus station at Charlemont is proposed to be located, and is dangerously close to the proposed very deep pile insertions and deep station box excavations. I would request that An Bord Pleanála give very serious considerations to the important issues raised in this submission, and, in consequence, mandate Planning Conditions appropriate to the nuisance value inherent in this application for a major transport hub located in a heretofore quiet Victorian residential location.	Thank you for taking the time to make a submission and your overall endorsement of the MetroLink Project generally. We have reviewed your submission and responded to the observations made below. TII would like to assure you that at no time will the safety of this property and its occupants be placed at risk, noting that the construction of the station and tunnels will be monitored, including surrounding ground and building movements, with predetermined trigger levels aligned with action plans to ensure movements do not exceed acceptable levels.
2	SETTLEMENT ZONE	4	SETTLEMENT ZONE The calculated size of the Settlement Zone is based on the centre line of the tunnel, or the secant wall, and extends for a distance of 1 to 2.5 times the depth of excavation, that is 30 to 75 meters, either side of the tunnel centre line. Projected settlement will be at maximum values close adjacent to the tunnel/secant wall centre line, and will taper away to zero at the edges of the Settlement Zone, forming a Settlement Slump Trough. Houses spanning the edge of the settlement zone, (which might appear to be at lesser risk) are apparently at increased risk, due to differential settlement, producing a hinge effect, and consequently, more serious cracking.	TII would like to provide assurance that the impacts of construction generated ground movements on 34 Dartmouth Road have been assessed. The approach taken by TII for assessing the impact of construction generated ground movements reflects the industry standard three-phased ground movement impact assessment process that is undertaken on tunnelling and underground projects around the world, that includes Channel Tunnel Rail Link (CTRL), Dublin Port Tunnel, Crossrail and High Speed 2. EIAR Appendix A 5.17 Building Damage Report, covers; how the zone of influence for ground movements has been determined for both tunnel and cut and cover construction (illustrated by the 1mm contour shown on the drawings in Appendix C, with further detail provided by response (3) below), the assessment methodology and parameters used, and the assessed impacts of construction generated ground movements and settlement (that includes account being taken of differential movement), that includes for the assessed impact on 34 Dartmouth Road. EIAR Appendix 5.17 refers. Despite this property being in close proximity to the station box excavation, the Phase 2 assessment of the assessed impact on this building is "slight" (an explanation for which can be found in Table 4-4), please refer to building B151 (32 Dartmouth Road) in table 5-2 of that appendix. As your property is in close proximity to the station box excavation, the assessment work undertaken for the EIAR has determined that your property along with other similar neighbouring properties have been designated as "special" (please refer to section 4 Subsidence Damage Assessment Methodology of Appendix A5.17). Consequently, the property will be subject to a further Phase 3 refined assessment (despite the impact only being assessed as 'slight') to take account of final design and construction methodology details. The Phase 3 assessment will most likely utilising advanced numerical modelling techniques and further surveys of the building. The results of this refined assessment typically show that earlier assessments are conservative and overestimate the likely impact of construction generated ground movements. Monitoring instrumentation will also be installed in the area to monitor the performance of the works and potential environmental impacts, including ground movements to ensure that acceptable limits, determined as part of the Phase 3 assessment, are not breached. TII would also draw attention to the fact that private properties within 50m of the station excavation, or 30m of the tunnel are eligible to subscribe to the Property Owners Protection Scheme (POPs). The Property Owners' Protection Scheme is in addition to the existing legal rights of property owners and is in place to provide a simple and prompt way of rectifying any damage caused under the project up to the ceiling of €45,000. If the sum should exceed this amount the normal claims process would be used with the insurance companies for TII and/or the contractor.

Re: Metrolink Railway Order 2022, Estuary to Charlemont, Reference Number NA29N.314724					
3	EXTENT OF SETTLEMENT	5	EXTENT OF SETTLEMENT The maximum settlement to be expected is extremely difficult to predict accurately, and will be influenced by, amongst other things, construction methods adapted, secant wall deflection, ground conditions, soil composition, and inevitable changes to the existing water table. Some engineering research would suggest that, even with the employment of modern best practice, settlement of 7mm to 15mm could be expected. Research by Moormann and Moormann, 2002, suggests little improvement has been made in the amount of settlement behind the wall, and that displacements in the range of 1% of the excavated depth should be expected. Other research (Peck, 1969) suggests settlement behind secant walls averaged at 0.2% to 0.4% of excavated depth, which in this instance is 90mm! Compounding the alarming settlement projections caused by the deep secant wall, and subsequent excavations, wall deformations, and disturber water table, the whole of the residential stock within the established slump zone will be subjected to further compounding settlement disruptions with the arrival, and departure, of the TBM tunnelling process, some two years later. Engineering research experience has shown that projection of accurate expected settlement is usually unreliable, and results usually fall within certain ranges above or below the expected. Expect the unexpected.	EIAR Appendix 5.17, section 4.2 explains the methodology, empirically based and industry recognised approach to estimate the predicted ground movements generated by tunnel, and cut and cover construction, taking account of the design, construction methods and ground conditions. TII agree with the observation that ground movements can be challenging to predict and hence the parameters used by TII to predict ground movements are intentionally conservative, and are based on documented empirical data. Settlement and horizontal movements for retaining wall construction and bulk excavation associated with the station box and retaining walls have been undertaken based on the case history data documented in CIRIA Report C760 “Embedded retaining walls – guidance for economic design”, taking account of the ground conditions, proposed design and construction methodology. Further details for which can be found in EIAR Appendix 5.17, section 4.2.5. The TBM will be of the type that maintains positive pressure to the face and surrounding ground while the segmental tunnel lining is installed, thereby allowing ground movements to be closely controlled and minimised. TII would also note that TBM entry and exit from the station box will be sealed, with possible ground treatment to further stabilise the ground if required, to manage ground movements within acceptable limits. The prediction of tunnelling generated ground movements has been undertaken in accordance with the volume loss methodology outlined in CIRIA PR 30. This is an empirical method based on the percentage of tunnel volume excavated that is over and above that required for the tunnel itself. The calculation of the resultant settlement trough requires the derivation of a number of ground factors, these are explained in EIAR Appendix 5.17, sections 4.2.2. to 4.2.4. Similar to the cut and cover ground movement predictions, conservative volume and trough width parameters have been selected to ensure the ground movements predictions at this stage are robust.	
4	EFFECT OF SETTLEMENT ON VICTORIAN HOUSES	5	EFFECT OF SETTLEMENT ON VICTORIAN HOUSES The compounding effects from very deep pile boring, very deep excavations, driving a TBM tunnel, and changing water tables, all in immediate proximity to Victorian houses without proper foundations, are likely to present enormous problems in accurately predicting settlement. All of the buildings under consideration are dangerously close to the projected centre line of the Settlement Slump Zone, some no more than 7 meters away from the bored piles. Settlement of 10mm, probably the minimum disturbance to be expected, will have profound effects on old buildings, built without proper foundations. Greater displacements than 10mm are to be expected. This will result in cracks to internal walls, to brickwork in facades, over window openings, door openings, and structurally weak building fabric links. The effects of settlement, following the driving of a TBM below residential property, have been well observed. The following periods of displacements have been documented. Ahead of approaching TBM face, Slight upward rise/deformation. At TBM cutter face, 6% of expected settlement, At TBM cutter shield, 30% of expected settlement, At TBM ring build, slurry fill to gap, 46% of expected settlement. Major settlement should be established by 10 days, to 8 weeks, but could be longer lasting, subject to local conditions. As old, more flexible, brick-built housing respond to imparted stress and strain, deformation of building fabric could take years to manifest.	Responses (2) and (3) above explain the conservative approach and methodology that has been taken by TII to estimate construction generated ground movements, and therefore why TII consider this ground movement impact assessment to be robust. The concern around foundations is noted, however TII would note that the ground movement impact assessment assumes the building flexes and follows the greenfield settlement profile. This is conservative since the building will have some inherent stiffness, but it provides a worst case for assessing the risk of damage to the property. EIAR Appendix 5.17, section 4.3 provides further detail on the approach taken to assess the impact of ground movements on buildings, noting as observed, that differential settlement and the point of inflection of the tunnel generated settlement trough are key points of note when assessing the impact of ground movements on buildings. As noted by response (2) above, movement monitoring will be undertaken. This will cover the pre-construction phase to establish a movement baseline, construction phase movement monitoring, and close-out movement monitoring. During the construction phase this will be linked to pre-determined trigger values and response plans to ensure movements do not exceed unacceptable levels. Condition surveys will also be undertaken pre and post construction, and will be linked to movement monitoring to establish when construction generated ground movements have ceased to cause potential impact.

Re: Metrolink Railway Order 2022, Estuary to Charlemont, Reference Number NA29N.314724				
5	SETTLEMENT, SUMMARY	6	SETTLEMENT, SUMMARY Tunnel engineering and secant wall design is a sophisticated and vastly complex endeavour, demanding the services of teams of greatly skilled and experienced professional engineers, across many fields of specialty. It is something we, as a community, know nothing about. What is obvious, however, is that this project will have an enormous impact on our lives, our properties, and our community. It has the potential to greatly disrupt and destroy our lives and our community, and cause great and permanent damage to our homes. Information on the effects of all of the above, insofar as they are included at all, were presented only in The Railway Order Submission, which was lodged far too late to enable us, or our advisers, to carry out any suitable or comprehensive analysis, or draw any satisfactory conclusions. We would request of An Bord Pleanála to insist of full clarification of engineering data, in the form of a formal written response, including all drawings, graphs, calculations, and clear and precise explanations of the following;	Responses (2), (3) and (4) above explain the robust and conservative construction ground movement impact assessment that has been undertaken, and how this will be supported by pre and post construction condition surveys and a monitoring programme to ensure ground movements do not exceed acceptable limits, so that "great and permanent damage" is not caused to your home. TII acknowledge that MetroLink is a significant project, and your particular and understandable concerns regards the proximity of 34 Dartmouth Road to the construction of the proposed Charlemont Station, and while TII are of the view that the construction environmental impacts can be mitigated, relocation is an available option during peak construction. TII are available to discuss this option if that is something the property owner would like to explore and consider. TII understand the complexity and voluminous nature of the material submitted under the Railway Order Application. However TII would note that the statutory time limit in relation to public consultation have been adhered to.
6	SETTLEMENT, SUMMARY	6	1.1 ACCURACY OF DEPICTION OF BORED PILES ON DARTMOUTH ROAD, Drawings do not accurately reflect actual position of bored piles.	The drawings do depicted the location of the station structure in relation to Dartmouth Road. Please refer to the submitted Railway Order drawings, Structures Details, Book 2 of 3, drawing ML1-JAI-SRD-ROUT_XX-DR-Z-02090, which indicates the outline of the station external walls (Diaphragm Wall piles) in relation to the properties along Dartmouth Road.. The EIAR Chapter 5, MetroLink Construction Phase, Section 5.10.13 and Appendix A5.3 Section 8.14, also indicates the position of the station wall and explains the proposed construction of Charlemont Station. Further information of the depth of the proposed station structure is provided on station floor level structural plan drawings ML1-JAI-SRD-ROUT_XX-DR-Z-02092 to 02095 together with associated longitudinal section Drawings ML1-JAI-SRD-ROUT_XX-DR-Z-02096.
7	SETTLEMENT, SUMMARY	6	1.2 SOIL CONDITIONS, Soil analysis of complete zone of excavation. Soil analysis of zone of tunnel boring. Soil analysis of proposed zone of ventilation tunnel.	Soil baseline conditions and soil analysis are described in EIAR Chapter 20 (Soil and Geology). Please also refer to Appendix A20.2 where a summary of the relevant exploratory boreholes are included, Appendix A20.4 which includes geological models for each station and Appendix A20.8 which presents a land contamination report. Further data in relation to Charlemont is also available within appendices A20.1 to A20.9. Specific data for Charlemont, refer to: *Appendix A20.2 - Table 20.2.4: List of Exploratory Hole Locations in AZ4, 'Charlemont' ('Within Works Area' and within '250m of Works Area'). and Table 20.2.5: Summary of Groundwater Monitoring Locations 'AZ4 - Charlemont'. *Appendix A20.4 - Page 18 of 18 refers to Charlemont Station, including areas of main and proposed ventilation tunnels.
8	SETTLEMENT, SUMMARY	6	1 .3 PROJECTED SOIL SUBSIDENCE, Engineering review of projected subsidence, Review of proposed remediation.	These matters are refer to in responses (2), (3) and (4) above.

Re: Metrolink Railway Order 2022, Estuary to Charlemont, Reference Number NA29N.314724				
9	SETTLEMENT, SUMMARY	6	1.4 WATER TABLES, Review of existing established water table, water courses. Projection of future water table, changes, and consequences.	Baseline assessments were undertaken for surface water and groundwater along the proposed project alignment from Estuary Station to Charlemont Station. Details of watercourses along the route of the proposed project can be found in EIAR Chapter 18 (Hydrology). The proposed alignment will cross beneath the Grand Canal at Grand Parade, with baseline conditions presented in section 18.4.3.4.6. The River Dodder was used as a monitoring point for surface water near Charlemont. Baseline conditions for the River Dodder can be found in Section 18.4.3.4.7. Other water features identified near Charlemont are Ranelagh Gardens and Swan River, which is mostly culverted (Table 18.10). The alignment will be tunnelled beneath these watercourses. The potential impacts on hydrology (surface water) during both the construction phase are presented in Section 18.8, with mitigation measures presented in Section 18.6, and residual impacts once mitigation measures have been implemented in Section 18.7. With mitigation included as part of the design, the magnitude of impact on Charlemont is temporary and not significant. There are no negative residual impacts on surface water near Charlemont. There is no increased flood risk and no significant impacts to canal / river / stream morphology. Full data supporting Chapter 18 is provided with Appendices A18.1 to A18.5. A review of the baseline groundwater quality is presented in Section 19.4 of EIAR Chapter 19, Hydrogeology. An assessment of potential impacts on groundwater, mitigation measures and residual impacts following the implementation of measures are also presented in EIAR Chapter 19. Further detailed information on groundwater quality, flow, and "barrier effect" assessments are presented in the appendices to Chapter 19. Results and summery text are presented in EIAR Appendix A19.1. Following the implementation of mitigation measures there are no negative residual impacts predicted on groundwater at Charlemont. Full data supporting Chapter 19 is provided with Appendices A19.1 to A19.11.
10	SETTLEMENT, SUMMARY	6	1.5 PRECISE TUNNELLING SYSTEMS PROPOSED, TBM proposed. Shield procedure, Ring erection, Gap grouting and time scale. Remediation procedures and face pressures.	Further to response (3), the EIAR Chapter 5: MetroLink Construction Phase, Section 5.5.3 Tunnelling describes the tunnelling requirements proposed to deliver the Project. Further details of the Tunnelling Systems and Operation for MetroLink is contained within EIAR Appendix A5.13, TBM Tunnels Construction Report. This document sets out the strategy and outline methodology for the construction of the TBM tunnels on MetroLink providing the details necessary for the completion of the assessments for the EIAR. The precise tunnelling systems deployed on the project will be subject to further detailed tunnel design, including the selection of the TBM and the development of final tunnelling plans by the MetroLink appointed Contractor. The methods and control of the TBM operation will be set out to meet the requirements of the Construction Environment Management Plan (CEMP), as referred to in Chapter 5, Appendix A5.1 Outline CEMP. The Contractor CEMP is subject to DCC review and approval in advance of construction commencement.
11	SETTLEMENT, SUMMARY	6	1.6 PROJECTED SECANT WALL DEFORMATIONS. Projected secant wall deformation at east boundary. Projected wall deformation at south boundary. Projected soil settlement in consequence thereof. Remediation proposals.	Please refer to responses (2), (3) and (4) above that explains the approach taken by TII to assess the impact of construction ground movements, and the assessed impact. Ground movement as a consequence of piling has been accounted for in the assessments. Please refer to A5.17, section 4.2.5 Ground Movement Due to Station Boxes and Retaining Walls, including reference to top down construction method chosen, minimising local settlement as excavation progressed.
12	SETTLEMENT, SUMMARY	7	1.7 ZONE OF SETTLEMENT. Precise maps of projected zone of settlement. Settlement slump trough graphs. Precise indication of properties to be effected. Scale of projected settlements.	All of these items are contained within EIAR Chapter 5, Appendix A5.17.
13	SETTLEMENT, SUMMARY	7	1.8 RANGE OF PROJECTED SETTLEMENT. Range of projected settlement for individual houses in slump zone. Projected settlement of 45mm is alarming for Victorian houses.	The predicted settlement is shown on the settlement contours in Appendix 5.17, Appendix C. Please also refer to responses (2), (3) and (4) above that explains the approach taken by TII to assess the impact of construction ground movements, and the assessed impact. Whilst the concerns of property owners is recognised, the impact on overlying properties has been assessed based on the predicted settlement and the results have concluded that no structural impacts will occur. It is further of note that the assessment to date is moderately conservative and over estimates the impact.

Submission No.			190		
Organisation Name or Name of Submitter			Michael A Doyle and Carmel Smith Doyle		
Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
Re: Metrolink Railway Order 2022, Estuary to Charlemont, Reference Number NA29N.314724					
14	SETTLEMENT, SUMMARY	7	1.9 CHARACTER OF ADJACENT BUILT ENVIRONMENT. The existence of foundations. Analysis of foundations for all effected properties. Projections for settlement for all effected properties. Remediation proposals for all effected properties.	Please refer to response (2), (3) and (4) above.	
15	SETTLEMENT, SUMMARY	7	1.10 PROJECTED DURATION OF SETTLEMENT, Precise projections for duration of TBM pass. Projections for settlement at shield pass, Projections for settlement at ring erection. Projections for duration of damage and settlement in future years.	TII will be able confirm the schedule for the TBM upon award of the main works construction contracts and finalisation of the construction programme, noting that the TBM will only take a day or two to pass your property. TII and their contractor will consult with residents to ensure they are aware of the time the TBM will pass. As noted by the above responses, in particular (2) and (3), a ground movement impact assessment has been undertaken in accordance with recognised industry best practice. It is expected that ground movements will occur almost immediately as the tunnel is excavated. When the TBM is approaching, typically the construction monitoring period will commence 100m ahead of the TBM face, and will continue until it is clear that the immediate ground movement is complete. Typically, this is once the tunnel has progressed 50m beyond that asset. Thus, for TBM tunnelling the construction period relating to any monitoring point is unlikely to exceed 4 weeks for each tunnel drive, but noting that follow-on 'close out' monitoring will continue until MetroLink generated ground movements can be demonstrated to have reached a level that will have no impact on the surrounding environment. For the construction of the station (cut and cover construction), construction movements will be considered to have ceased sufficiently when the wall together with any permanent props or diaphragms are complete, and immediate construction movements have ceased, at which point construction period monitoring will cease. Upon which follow-on 'close out' monitoring will continue in the same manner as described for tunnelling above. As noted above, condition surveys will also be undertaken pre and post construction, and will be linked to movement monitoring to establish when construction generated ground movements have ceased to cause potential impact.	
16	SETTLEMENT, SUMMARY	7	1.11 EVALUATION OF DAMAGE, COMPENSATION DISTURBANCE, AND DEVALUATION OF PROPERTY. Precise details for evaluation of damage to property. Precise details of evaluation of compensation. Precise details for evaluation of permanent devaluation of property Implications for house insurance/damage. Caretaking of abandoned houses during re-locations. Security of houses during re-locations.	Responses (2), (3) and (4) above have outlined the assessed impacts of construction generated ground movements on your property. As noted by response (2), private properties within 50m of the station excavation, or 30m of the tunnel are eligible to subscribe to the Property Owners Protection Scheme (POPs) which includes for pre and post-construction condition surveys and repair of damage. TII would also draw attention to the Transport Infrastructure Ireland (TII) Airborne and Groundborne Noise Mitigation Policy (Appendix A14.6) where there is a process in place whereby further mitigation measures can be implemented at individual properties should this be merited. TII also confirm that while of the view that the construction environmental impacts can be mitigated, relocation is an available option in certain circumstances during peak construction. TII are available to discuss this option if that is something the property owner would like to explore and consider. TII would also confirm that in the event of relocation, TII would be responsible for caretaking and securing of any property from which persons have vacated as a result of choosing to relocate. TII do not agree that the development will have a long term and permanent negative affect on the value of your property. In fact there is evidence to suggest that property values will in fact increase in close proximity to public transport infrastructure and that local residents will greatly benefit from having a world class metro system providing access to the city centre, airport and north city at their door step. The benefits of the project for all communities along the MetroLink route are described in Chapter 3: Background to the MetroLink Project, section 3.4 MetroLink Response to Challenges.	

Submission No.			190	
Organisation Name or Name of Submitter			Michael A Doyle and Carmel Smith Doyle	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Metrolink Railway Order 2022, Estuary to Charlemont, Reference Number NA29N.314724				
17	2. CONSTRUCTION STAGE, DUST, NOISE, AND VIBRATION.	8	2. CONSTRUCTION STAGE, DUST, NOISE, AND VIBRATION. Severe disruption from construction traffic, pile boring, excavation, tunnelling and on-going construction activities are a given, quite probably lasting for up to 9 years. This is an intolerable proposal, for us personally, and all the residents of Dartmouth Road.	TII acknowledge that the Project will cause disruption to residents, particularly during the partial and full closure of Dartmouth Road. While the duration of the Project will take 9 years to complete at Charlemont, the main activities contributing to the most significant impacts are anticipated to be completed in the first 5 to 6 years. The EIAR and associated appendices present the proposed mitigation measures for the Project. Chapter 13 and Chapter 14 of the EIAR identifies the required mitigation measures for noise and vibration associated with the Project, Chapter 16 provides mitigation measures associated with dust, and EIAR Appendix A9.5 Scheme Traffic Management Plan provides details of the proposed traffic management during the construction phase. Further detail on mitigation measures are provided in Appendix A5.1 Construction Environmental Management Plan (CEMP) and Appendix A16.4 Dust Management Plan. In summary: Dust / Air Quality Construction Phase EIAR Chapter 16, Air Quality, section 16.6 Mitigation Measures. The potential risk from dust emissions has been reviewed for the most important activities and each of the construction areas. Before commencing relevant works, an Air Quality Management Plan (referred to in section 16.6.1 Construction Phase) will be prepared and submitted for approval to the planning authority. The plan will take account of all relevant dust and emissions applicable to the circumstances of the relevant site, based on the local authority requirements and industry best practices. The plan will be developed by the contractor and for each worksite shall include: - An inventory and timetable of activities which may give rise to emissions or dust; - Alert levels; - Alert system to be used (including notification process); - Details of control measures; - Details of dust monitoring arrangements, including the location of sensitive receptors, monitoring locations, and monitoring equipment to be used; and - Details of the air quality reporting requirements. In order to ensure that no dust nuisance occurs, a series of measures will be implemented, as detailed in Appendix A16.4. In summary, the measures will include: - Material handling systems and site stockpiling of materials designed and laid out to minimise exposure to wind. Water misting or sprays will be used as required if particularly dusty activities are necessary during dry or windy periods; - Any blasting will be completed by specialised contractors with a specific blasting dust management plan; and - Hoarding will be provided around the construction compounds.

Submission No.			190	
Organisation Name or Name of Submitter			Michael A Doyle and Carmel Smith Doyle	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Metrolink Railway Order 2022, Estuary to Charlemont, Reference Number NA29N.314724				
			Response (17) continued.	Strict dust prevention will be in place at all times to minimise any potential emissions and these procedures will be strictly monitored and assessed. In the event of dust nuisance occurring outside the site boundary, movements of materials likely to raise dust will be curtailed and satisfactory procedures implemented to rectify the problem before the resumption of construction operations. Consistent implementation of good dust minimisation practices will ensure that the impact from construction dust is long-term, localised, reversible and not significant when considered with respect to the Environmental Protection Agency (EPA) description of effects (EPA 2022). Construction Noise and Vibration Potential impacts identified due to airborne noise and vibration are presented in EIAR Chapter 13. Noise mitigation proposed for works at Charlemont Station are summarised in Section 13.6.1 of the EIAR and include for boundary hoarding around the working area, including a 4m high hoarding at the southern boundary. In addition, the above ground support works for below ground sprayed concrete tunnelling works will be enclosed within an acoustically clad steel framed building to control noise breakout to surrounding receptors. On the implementation of these measures the residual impacts at 34 Dartmouth Road, are predicted to be Moderate to Significant. EIAR Appendix A14.5, Groundborne Noise and Vibration and Blasting Modelling Results, 14.4 Section AZ4 Northwood to Charlemont presents the predicted vibration levels during TBM passage for various sensitive receptors and outlines the predicted VDV (Vibration Dose Value is a parameter that combines the magnitude of vibration and the time for which it occurs) for TBM Passage during the day and night at 34 Dartmouth Road are 0.251ms-1.75 (VDV day) and 0.211ms-1.75 (VDV night) respectively. Both of these values are lower than the VDV Threshold Levels of 1.0ms-1.75 (VDV day) and 0.5ms-1.75 (VDV night). Levels of vibration during mechanical excavation of Charlemont Station are predicted to be 0.003ms-1.75 and 0.003ms-1.75 for day and night-time respectively. The threshold levels have been set in relation to human response to vibration, and thresholds for building damage are much higher. As the predicted levels of vibration from TBM passage and mechanical excavation are below these thresholds, no impact is predicted for either the building or for residents of this address. Predictions of vibration during blasting at Charlemont Station have also been made. For 34 Dartmouth Road an exceedance vibration level of 9.3mm/s PPV (Peak Particle Velocity) is predicted compared to the threshold level for this building of 8mm/s resulting in a potential significant impact. As a result, mitigation measures will be implemented to reduce the risk to buildings as outlined in EIAR Chapter 14, Section 14.5.1.2, including measures to reduce the impact of blasting through the preparation of specific blast design at each location, minimisation of the maximum instantaneous charge weight or alternatives to blasting. With the implementation of appropriate mitigation to reduce vibration from blasting the residual impact is predicted to be reduced to not-significant. The predicted level of groundborne noise during TBM passage is 48 dB LASmax at 34 Dartmouth Road, which is above the 45 dB LASmax threshold, resulting in a significant impact on the occupants of this address for the relatively short 2-week duration of the TBM passage. Unfortunately there are no effective methods available to reduce groundborne noise from TBMs at source and therefore the principal mitigation measure is advance consultation and engagement to inform residents of the timing of the TBM passing to allow building occupants to prepare for the temporary elevated noise levels. As outlined in Transport Infrastructure Ireland (TII) Airborne and Groundborne Noise Mitigation Policy (EIAR Chapter 14, Appendix A14.6) there is a process in place whereby further mitigation measures, including temporary relocation, can be implemented at individual properties should this be merited. Traffic Construction Phase (please see response (18) below regards particular access to 34 Dartmouth Road) EIAR Appendix A9.5 Scheme Traffic Management Plan presents the analysis undertaken to assess the impact of the traffic management measures on the local road network surrounding the proposed Charlemont Station during the construction phase. At the local level the following parameters have been used to assess impacts on general traffic and on pedestrians: • Increase in walking distance/quality of service for pedestrians (through removal of footpath, reduction of quality of service, removal of a pedestrian crossing or relocation of crossing by more than 100m); • Increase in driver delays at junctions; • Changes in traffic flows on surrounding streets; and, • Additional distance travelled due to diversions.

Submission No.			190	
Organisation Name or Name of Submitter			Michael A Doyle and Carmel Smith Doyle	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Metrolink Railway Order 2022, Estuary to Charlemont, Reference Number NA29N.314724				
			Response (17) continued.	The analysis undertaken at this location indicates that the increased volume of traffic on Grand Parade and Northbrook Road does not translate into any significant increase in driver delay. The largest increase in driver delay of 12 seconds is registered on the westbound approach on Grand Parade to the Ranelagh Road signalised junction. During the construction phase, pedestrians will experience a reduction in quality of pedestrian infrastructure and space. The construction site boundary will encroach upon footways in the local area, including the northern side of Dartmouth Road, and the southern side of Grand Parade. However, a temporary signalised crossing will be provided west of the Luas to maintain pedestrian access to and from the Stop. Whilst there are partial closures on Dartmouth Road and Grand Parade, pedestrian movements will be maintained on appropriately sized footways through the area. Overall Assessment TII understand your particular concerns regards the proximity of 34 Dartmouth Road to the construction of the proposed Charlemont Station, and while TII are of the view that the construction environmental impacts can be mitigated, relocation is an available option during peak construction. TII are available to discuss this option if that is something the property owner would like to explore and consider. Transport Infrastructure Ireland (TII) Airborne and Groundborne Noise Mitigation Policy (EIAR Chapter 14, Appendix A14.6) there is a process in place whereby further mitigation measures, including temporary relocation, can be implemented at individual properties should this be merited.
18	2.1 SCALE AND TIME-FRAME FOR CONSTRUCTION COMPOUND.	8	2.1 SCALE AND TIME-FRAME FOR CONSTRUCTION COMPOUND. The scale and scope of the proposed construction compound is totally unacceptable, and will result in intolerable living conditions for us as residents of 34 Dartmouth Road. It is proposed to close off the road, and erect a large high hoarding on the footpath outside our front door. Access to Dartmouth Road will be completely restricted, with no possibility parking anywhere near our houses, no facilities for delivery, collections, emergency services, and bin collection. Access will be extinguished, possibly for up to 9 years. Loss of daylight, light pollution and unbearable noise levels are proposed.	Response (17) above explains how during construction, dust, noise, vibration and traffic impacts will be mitigated. With regards to the following: Construction compound: The size of the main construction compound at Charlemont (4,200m3) is required to construct the Station. Please see section 5.3.1 of Chapter 5 for further information on construction compounds. The construction compound will be fully secured with fencing and hoarding surrounding all works areas to ensure there are no health and safety risks for local residents, and environmental impacts are managed to acceptable levels. Hoarding: This is necessary to secure the construction site, mitigate impacts on the landscape by concealing the construction site and activities, and as noted above, as a mitigation measure for noise.
			Response (18) continued.	In some locations, TII accept that the hoarding may cause annoyance due to disruption of sunlight but this is a necessary mitigation for noise and providing a secure and safe site. Road closure: It is correct that Dartmouth Road will be closed between Dartmouth Place and Dartmouth Square West during enabling works and construction works but diversions will be put in place for local access, including deliveries, emergency services, bin collection, and pedestrian access maintained to your property. The impacts on parking will be monitored during construction to reinstate any disrupted areas as soon as practicable. The impact on traffic around Charlement has been assessed within Chapter 9: Traffic & Transport, Appendix A9.5 STMP, with Figure 7.57 describing the closure of Dartmouth Road and diversions proposed. Lighting: This will be designed to ensure that artificial light emitted from the construction compound does not cause a nuisance to residents. Lighting will be positioned and directed so as not to intrude unnecessarily on adjacent properties. For further information on site lighting, see section 5.12.9 of Chapter 5 and EIAR Appendix A5.18 (Site Lighting Plan).

Re: Metrolink Railway Order 2022, Estuary to Charlemont, Reference Number NA29N.314724				
19	2.1 MANAGEMENT OF INTERACTIONS WITH IMPACTED PROPERTIES.	8	We would request of An Bord Pleanála to insist of full clarification, in particular, of the following issues; 2.1 MANAGEMENT OF INTERACTIONS WITH IMPACTED PROPERTIES. How will this issue be addressed? Who is responsible? When will process be initiated? Who will be appointed to mediate between parties? Can RINA provide reference information, including international precedence, in this regard?	Please refer to Section 5.12.4.5 of the EIAR which outlines that a Stakeholder and Community Engagement Plan will be used to guide community and stakeholder engagement during the construction phase. Both TII and their contractors will be responsible for ensuring that local residents are informed with regard to works on an ongoing basis. The reference to RINA providing reference information, including international precedence is not understood, however TII can confirm that the services of an independent engineer will be made available during the construction stage to provide independent advice to affected stakeholders. The services of the Independent Engineering Expert (RINA) are due to be concluded on completion of the Railway Order process (expected in 2024). The continuation of provision of independent engineering advice for residential stakeholder groups throughout the enabling works and main construction stages of the MetroLink project is currently being considered as part of an overall comprehensive community engagement plan, which will include amongst other initiatives, the appointment of dedicated MetroLink liaison representatives and local community forums which will provide detailed updates on construction activities in their areas.
20	Impact on properties	8	2.2 MONITORING AND SURVEYING OF IMPACTED PROPERTIES. What is precedence in other countries for impacted properties? What monitoring and surveying of properties will take place during construction - frequency etc and mitigation, if issues arise, particularly secant/boring implications?	As described in the outline Construction Management Plan (Outline CEMP) (Appendix A5.1), the appointed contractor(s) will be required to develop and implement an Environmental Management System (EMS) that follows the principles of ISO 14001. The EMS will include an environmental policy, operational, monitoring and auditing procedures to ensure compliance with all environmental requirements and to monitor compliance with environmental legislation and the environmental management provisions outlined in the relevant documentation. Mitigation and monitoring will be carried out in accordance with the requirements of the EIAR and NIS so that construction activities are undertaken in a manner that does not give rise to significant negative effects. Suitable monitoring programmes will be developed, implemented, documented and assessed in accordance with the specification outline in the detailed CEMP(s). The results of all environmental monitoring activities will be reviewed by the Environmental Manager on an ongoing basis to enable trends or exceedance of criteria to be identified and corrective actions to be implemented as necessary. The contractor(s) will be required to inform TII of any continuous exceedances of criteria, noting that trigger levels will be set with pre-determined action plans to ensure acceptable limits are not breached. It will be possible to contact the site 24 hours a day to report an incident occurring. TII and its appointed contractor(s) will ensure that local residents, occupiers, businesses, local authorities and all other stakeholders affected by the proposed construction works, as outlined in this EIAR, will be informed in advance of work taking place. The notifications will detail the estimated duration of the works, the working hours and the nature of the works. In the case of works required in response to an emergency, local residents will be advised as soon as reasonably practicable. A local helpline number will also be provided and will be available to call 24 hours a day. Please also refer to response (2) and (4) above that outlines the approach to ground and building movement monitoring and condition surveys.
21	2.3 RELOCATION - SECURITY OF ABANDONED PROPERTIES.	8	2.3 RELOCATION - SECURITY OF ABANDONED PROPERTIES. If impacted residents need to be relocated what is the proposal regarding security, insurance, maintenance, and upkeep of existing properties.	Please refer to response (16) above. In the event that it agreed that resident moves out of their property during the construction, reasonable costs incurrent in relation to the vacated property will be borne by TII and the MetroLink project.

Submission No.			190	
Organisation Name or Name of Submitter			Michael A Doyle and Carmel Smith Doyle	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Metrolink Railway Order 2022, Estuary to Charlemont, Reference Number NA29N.314724				
22	3. OPERATIONAL STAGE, NOISE, AND VIBRATION.	9	3. OPERATIONAL STAGE, NOISE, AND VIBRATION. Noise and vibration from operational activities are a far more serious concern, in that this disruption will be permanent, and persistent. Once established, it will be impossible to have remedied - for instance, noise from Luas, of which we all have bitter experience. In this light, the following issues have some major relevance.	Operational Noise and Vibration EIAR Chapters 13 and 14 present a comprehensive and detailed assessment of operational airborne and groundborne noise and vibration. No residual noise impacts are identified at this location during operation. The calculated rail noise levels across the proposed Project are not significant in terms of any widespread community disturbance and result in a not significant to slight impact when added to the prevailing noise environment. EIAR Chapter 13, sections 13.2.3.2 and 13.5.3.2.3 recognise that ventilation systems if not designed and mitigated effectively are potential noise sources. Section 13.6.2.3 outlines the detailed considerations that will be included in the design to ensure that the ventilation systems do not exceed limits as per BS 4142, including: • Reduction of induct flow rates; • Reduction of elements in the airflow; • In duct attenuators; • Orientation of grilles and louvres away from sensitive receptors; • Acoustic louvres; and • Anti-vibration mountings and couplings will be incorporated into the design to control vibration. Measures to mitigate noise from the use of public address systems is also detailed in Chapter 13 (sections 13.5.3.2.4 and 13.6.2.4). Best practice design principles will be employed to minimise noise breakout at the surface from these systems via escalators, lift shafts and stairwells. There are no significant impacts associated with this source.
23	NOISE AND VIBRATION FROM TRAIN MOVEMENTS.	9	NOISE AND VIBRATION FROM TRAIN MOVEMENTS. The problem of transmission of vibration and noise from passing trains in direct proximity to the Gate Theatre, and the Rotunda Maternity Hospital, is accepted as an issue in the Preferred Route Development Report 2019. It is noted (Appendix L. O'Connell Street Station, Page 12) that 'with appropriate mitigation this is not envisaged to introduce significant impacts' This would suggest that, under normal circumstance, significant impact could be expected. It is acknowledged that the type of track support, amongst other things, chosen for the metro system can have a significant impact on the level of vibration transmitted to receptors - for example, High Density Floating Track Systems offer best practice and best protection. This system is, however, more expensive to install. It is noted that High Density Floating Track Technology measures would be implemented at the Gate Theatre and Rotunda Hospital, as mitigating measures, suggests that the remainder of the track, and ordinary receptors, would be afforded no such luxury. <u>Attending at the Gate Theatre in an optional leisure activity.</u> <u>Trying to sleep in your own house is not.</u> It is anticipated trains will operate at up to 45 second intervals.	Airborne noise from trains within the tunnel and station will not be audible at ground level. The principal noise source associated with operational trains is groundborne noise which has been fully assessed in Chapter 14. No significant impacts are determined. Noise and vibration mitigation measures for trains are only proposed at locations where very sensitive equipment would be vulnerable from interference arising from the passage of the trains. The predicted levels of noise and vibration at Charlemont are well below limits that will effect residents and therefore the installation of floating track slab is not proposed at this location. Further information on the how these requirements were set is available in Chapter 14: Groundborne Noise and Vibration, section 14.5.2 Operational Phase, with proposed locations set out in Table 14.47. Further details on setting the requirements is provided in Appendix A14.3 Track Support Systems Assumptions.
24	NOISE FROM VENTILATION SHAFTS, EXTRACT FANS, AND FIXED PLANT.	9	NOISE FROM VENTILATION SHAFTS, EXTRACT FANS, AND FIXED PLANT. No proper assessment of the potential for permanent noise pollution from massive shaft excavation fans and fixed plant, located just below ventilation grills, at ground level, at Dartmouth Road and Dartmouth Square West, is presented. These fans will presumably run continually day and night. This is an intolerable proposal, for a quiet residential area, and we would request of An Bord Pleanála to insist on alternative methodology.	Please refer to response 22) above that outlines the approach that will be taken to ensure fans do not cause disturbance and nuisance.

Submission No.			190	
Organisation Name or Name of Submitter			Michael A Doyle and Carmel Smith Doyle	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Metrolink Railway Order 2022, Estuary to Charlemont, Reference Number NA29N.314724				
25	NOISE AND NUISANCE FROM ESCALATORS.	10	NOISE AND NUISANCE FROM ESCALATORS. Escalators are noisy - they rattle and groan continually, and grow noisier with age, as parts naturally age with usage. The escalator proposed for the Dartmouth Road exit/entry is exceptionally long, by any standard. These escalators will run continuously from early morning, probably 0530hr, to midnight, or later. The operation of roller shutter enclosures at escalator entrances is also a cause of concern, as such operations will always, by their nature, be very early in the morning, or very late at night. They are proposed to be located in direct proximity, in front of our house at Dartmouth Road. Again, we consider this to be an intolerable proposal, for a quiet residential area, and we would request of An Bord Pleanála to insist the removal of the second entrance to the station proposed for Dartmouth Road.	Escalators located within the stations will be modern equipment and will therefore not rattle or groan, or generate unacceptable noise levels. MetroLink assets such as escalators will also be subject to a maintenance regime detailed in a Maintenance Plan that will be developed by the operator as noted in Chapter 6, Table 6.5. Mechanical elements associated with escalators are housed below ground and are fully enclosed. The station entrance to the south of Charlemont station is located approximately 30m from the properties along Dartmouth Road. The operation of escalators do not generate any notable noise sources during operation and will not be audible above the prevailing noise environment to the adjacent residential properties across Dartmouth Road which is dominated by road traffic. The station entrances are enclosed with gates, there are no roller shutter doors proposed at the station entrances. Finally, noise levels arising from the station during the operational phase will be required to adhere to limits to ensure that there are no significant effects and a BS 4142 (BSI 2014 +A1 2019) assessment will be carried out to compare the external background sound level in the absence of plant items (such as an escalator) to the background sound level with the plant items when operational as noted in Chapter 13, Section 13.2.6.2.4.
26	4. NOISE, AND ACOUSTIC CALCULATIONS.	10	4. NOISE, AND ACOUSTIC CALCULATIONS. No proper analysis of the effects of noise pollution has been carried out for the houses at Dartmouth Road. This is an alarming omission, as these houses are the closest located adjacent the station entrance, permanently running escalators, late night traffic and travellers, and general anti-social behaviour generally associated with metro stations. (International evidence for same in general circulation).	It is not correct to say that "No proper analysis of the effects of noise pollution have been carried out". Assessments of airborne and groundborne noise during both the construction and operational phases have been undertaken for houses on Dartmouth Road, as presented within chapters 13 and 14 of the EIAR, and summarised by responses (22) to (25) above. The predicted noise from escalators is addressed by response (25) above. With regards to stations entrances, these are transient areas for passengers entering and exiting the station. These activities are not the source of significant noise generation and form part of the existing soundscape in the existing prevailing environment. It is acknowledged footfall numbers will increase in the vicinity of the station entrance, however this activity does not translate to significant noise impacts. TII have deliberately designed the Station with minimum set down space (with the exception of a drop-off on Grand Parade for persons of restricted mobility only) or room for taxi ranks so that it does not encourage the Station to be used as a terminus and pick-up point. With regards to the management of anti-social behaviour please refer to response (29) below.
27	LUAS EXPERIENCE.	10	LUAS EXPERIENCE. Many people in this area have suffered permanent disruption to their lives by the introduction of the Luas. Much legal wrangling ensued, but the experts could produce calculations in court, proving their figures averaged out to non- disturbance levels, over selective timeframes. The residents continue to live with the results.	TII believe the opening of the Luas line has benifited the local community. Previous proceeding in respect of its environmental impact are not a matter for this Railway Order Application.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
Re: Metrolink Railway Order 2022, Estuary to Charlemont, Reference Number NA29N.314724					
28	5. TRAFFIC PROJECTIONS.	10	5. TRAFFIC PROJECTIONS. A look at the map of South Dublin will reveal only one probable scenario - everybody heading to the airport from South Dublin will descent on Dartmouth Road for passenger drop-off, private transport, taxis, and buses. Foot passengers, with their rattling suitcases, will descent on the area, both day and night. Taxis will loiter. It is hard to image a more lucrative set-down area for a taxi to linger, day and night, than that proposed for Dartmouth Road. (There is ample space for a set down taxi bay, inset into the wide footpath at the office building entrance on Grand Parade, yet this location was not chosen for a set down bay!)	Transport modelling undertaken by TII does not show that "everybody heading to the airport from South Dublin will descend on Dartmouth Road for passenger drop-off, private transport, taxis and buses.", for the reasons explained below. The MetroLink forms part of an integrated public transport network. The system is designed in an integrated manner so that people travelling from the area south of Dublin to access locations north of Charlemont, such as Dublin Airport, Mater, Swords etc. will utilise public transport to interchange with the MetroLink, or will walk or cycle to access their local station. The system is not designed to encourage people to drive to stations within the City, and TII actively discourage people from doing so other than the Park & Ride station at Estuary. As noted in Appendix A9.2-B Charlemont Traffic and Transportation Assessment, when the Project is operational, car mode share will decrease, with a reduction of up to approximately 830 car trips to and from the zones surrounding Charlemont Station over the 12hr period in 2065. In overall terms, the Charlemont Station will provide for improvements to the public transport network resulting in decreases in private car usage/trips, increases in public transport usage/trips and will facilitate walking and cycling to the station, without significantly impacting on the operations of the road network in the area. As a result, significant increases in traffic flow to or on Dartmouth Road are not anticipated. The number of active modes trips (walking and cycling) to and from the station is shown to increase when the Project is in place, demonstrating a shift towards sustainable modes at this location. This also reinforces that a proportion of passengers at this station will originate from, or have destinations, within the walking catchment of the station, as opposed to originating from South Dublin. Appendix A9.2 B Charlemont Traffic and Transportation Assessment section 5.1.1.4 indicates that Charlemont Station is served by the Luas Green Line which runs every 15 minutes or better, with bus services located within a 5-minute walking distance. As a result, Charlemont passengers are characterised by high levels of public transport interchange, rather than 'foot passengers'. A microsimulation VisWalk model has been developed for the immediate area surrounding Charlemont Station during the operational phase to assess the impact of the increased number of pedestrians at this location. The model covers the full extent of the publicly accessible station area, including the immediate vicinity of the station entrance at street level, the Luas stop and nearby junctions at Charlemont Bridge. In order to accommodate the forecast demand from the Project station, a new staircase with 2.4m stair width is proposed at the south east corner of Charlemont Luas stop. An elevator would also be provided at this location. In addition, it is proposed that the pedestrian crossing on R111 Grand Parade would be repositioned to the front of the Hines Building. With this infrastructure in place, the model indicates that the R111 Grand Parade will have an acceptable level of service overall, with some reductions in service seen at the pedestrian crossing where pedestrians are required to wait for a green phase at the signals. Overall, it is considered that the model displays an acceptable level of network performance. As noted in Chapter 06 (MetroLink Operations and Maintenance), the Project has been designed to ensure maximum interchange with other modes of transport, specifically with sustainable modes such as public transport, walking and cycling, over cars. Furthermore, TII have deliberately designed the Station with minimum set down space (with the exception of a drop-off on Grand Parade for persons of restricted mobility only) or room for taxi ranks so that it does not encourage the Station to be used as a terminus. As noted above, there will be reductions in the number of car trips to and from the surrounding zones when the Project is operational. An area for drop off for limited mobility passengers is provided on Grand Parade.	
29	6. ANTI SOCIAL BEHAVIOUR.	11	6. ANTI SOCIAL BEHAVIOUR. The likely scenario of noisy inebriated passengers disgorging from the MetroLink station on Dartmouth Road, at midnight, is not hard to imagine. Combined with taxis waiting for fares, this all paints a disquieting picture.	The interchange will certainly increase the number of people passing through the area, however it is important to note that people will be using MetroLink, similar to Luas as a transport hub, moving quickly in and out of the area. The station will not be a destination attracting people to remain in the area. As noted above, TII have deliberately designed the Station with minimum set down space (with the exception of a drop-off on Grand Parade for persons of restricted mobility only) or room for taxi ranks so that it does not encourage the Station to be used as a terminus.

Re: Metrolink Railway Order 2022, Estuary to Charlemont, Reference Number NA29N.314724					
30	7. REMOVAL OF CHARLEMONT STATION FROM RAILWAY ORDER.	11	7. REMOVAL OF CHARLEMONT STATION FROM RAILWAY ORDER. It is our contention that the proposed Metrolink should be terminated at St Stephen’s Green West, and should not be at Charlemont location. St Stephen’s Green west is a perfect opportunity to make proper interconnectivity with Luas, and proposals for the Dart underground system. Charlemont is a totally unsuited location, being a quiet residential area.	Arising from the decision to postpone the future upgrade of the Green Line to metro services, it is being argued that Charlemont station effectively becomes a terminus station in the short to medium term. In this regard, it is true to say that the Metrolink trains will terminate and turn back at Charlemont station, however the public transport service offering for passengers does not terminate, it transfers from Metrolink to LUAS as part of the integrated transport network. The terminus station for MetroLink is located at Estuary where all of the activities normally associated with a terminus (train sideways, car parking etc) take place. At this location the high capacity public transport offering terminates and the public transport offering transfers to a completely different mode, i.e. Bus or car. The environmental effect of the Metrolink terminus are accordingly assessed in the EIAR. Charlemont Station does not have the associated infrastructure and services associated with a terminus location and in fact has more in common with a “system turn back location”. Charlemont Station is located within an area of high public transport accessibility, linking with the Luas Green Line which offers reasonably similar levels of services and frequency for journeys to and from the south of Dublin. As such, public transport service offering is not considered to terminate, but transfers onto the similar service offered by the Luas Green Line, forming part of a transport corridor running from Cherrywood to Estuary. The associated environmental impacts for the turnback and station at Charlemont have been fully assessed in the EIAR. Charlemont station itself was chosen on the basis of its interchange potential with Luas, as well as local bus services, as outlined above. The section of the line between St Stephen’s Green and Charlemont generates considerable benefits for the scheme in terms of increased patronage. Operationally, the Station will see people moving quickly in and out of the area, noting that it will act as an interchange, and has been deliberately designed with minimum set down space or room for taxis so that it does not encourage the Station to be used as a terminus. All operational environmental impacts are mitigated so they are not significant, while the impact on amenity will be permanent and positive. TII do not agree that Charlemont is the incorrect location for an interchange with the Luas Green Line for the reasons set out below, noting that the above responses have addressed how the environmental impacts will be managed and mitigated where required, during both the construction and operational phases of the Project. A number of route options were considered in the process of identifying the Emerging Preferred Route (EPR). Route alignments from St. Stephen’s Green West that would also provide an interchange with DART at Tara Street Station would require an intervention shaft between these locations and would also need an undesirable horizontal reverse curve and so are not favoured. As outlined by EIAR Chapter 3, Background to the MetroLink Project, one of the key objectives of the Project is the integration of it with the wider transport network that also includes for BusConnects and DART+ which are all included under Project Ireland 2040. Together, these projects will result in a reliable, sustainable, affordable, integrated public transport network that will support the economy, help Ireland meet its climate change targets in line with Climate Action Plan 2021 and make Dublin a more liveable and sustainable city. The Board is required to have regard to the likely consequences for proper planning and sustainable development in the area in which it is proposed to carry out railway works (section 43(1) of the 2001 Act) and as such the following matters are relevant.	

Submission No.			190

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Metrolink Railway Order 2022, Estuary to Charlemont, Reference Number NA29N.314724				
			Response (30) continued.	The connection from St Stephens Green to Charlemont / Ranelagh is supported by the current Transport Strategy for Greater Dublin Area (2022-2042). The Transport Strategies were prepared by the National Transport Authority, scrutinised by the Joint Oireachtas Committee on Transport and approved by the Minister for Transport. It notes in section 12.3.2, "Charlemont offers the optimal location for the primary interchange with the Green Line in response to growing demand in the longer term and is an appropriate location to facilitate any potential future metro extensions to serve the south west, south or south east of the city region should sufficient demand arise." The Transport Strategy is "a consideration material to the proper planning and sustainable development of the area or areas in question." Development Plans are required to be consistent with the Transport Strategy. The Dublin City Development Plan 2022-2028 envisages this station at Charlemont in policy SMT22 "To support the expeditious delivery of key sustainable transport projects so as to provide an integrated public transport network with efficient interchange between transport modes, serving the existing and future needs of the city and region and to support the integration of existing public transport infrastructure with other transport modes. In particular the following projects subject to environmental requirements and appropriate planning consents being obtained: ... MetroLink from Charlemont to Swords". Accordingly, the location of the Charlemont station was a strategic decision made at the highest levels of transport and land use planning and such is fully consistent with the proper planning and sustainable development of the area. The current Transport Strategy considers a range of options for the onward extension of MetroLink to meet the demand for travel over the period of the strategy. This includes consideration of the need for the upgrade of the Luas Green Line to metro with a metro extension to Dublin south west, south or south east. Whilst the strategy envisages that further extensions will be delivered after 2042, MetroLink which terminates at Charlemont allows for the possible extension of the metro in all any of the above directions. The proximity of the metro to the Luas line at Charlemont provides for a positive customer experience for all users with short interchange distance and due to the proximity, clear wayfinding and high visibility of the interchange. The interchange arrangements at Charlemont provide for significantly better interchange arrangements compared to an alternative interchange at St Stephen's Green Station. Passengers wishing to interchange between Luas and metro at the St Stephen's Green terminus would face a 500m-walk along a route either through St Stephen's Green park or along the footpath north of the park, which adds significantly to the time for interchange and therefore the overall journey time for passengers and a less positive customer experience for all interchange users. This passenger experience would be reduced further for those with mobility or visual impairments as well as those travelling to/from the airport with luggage. The detailed analysis done for the Railway Order application further confirms that the section of MetroLink route between St Stephen's Green and Charlemont Stations contributes significantly to the overall benefits of the scheme. It serves a significant area of the south city of Dublin and offers enhanced access from the local area to the city centre and a direct connection to Dublin Airport. It serves key trip attractors including residential areas and offices / workplace locations, with high passenger boarding and alighting figures in the peak hours. During the morning peak, at Charlemont station the flows include 1,800 passengers alighting, 2,300 boarding and 1,229 passengers alighting, 2,276 boarding during the evening peak. The passenger numbers contribute significantly to the overall benefits of the scheme and the effect of these benefits outweigh the additional costs that are associated with the delivery and operation of the section from St Stephen's Green to Charlemont station. Further information is available in Chapter 7: Consideration of the Alternatives, section 7.7.8 MetroLink Southern Terminus Location.

Re: Metrolink Railway Order 2022, Estuary to Charlemont, Reference Number NA29N.314724				
			Response (30) continued.	The location of the interchange at Charlemont does not preclude onward extension south. An interchange at Charlemont is supported by policy including the Dublin City Development Plan 2022 - 2028 and the Transport Strategy for the Greater Dublin Area. As noted by the GDA Transport Strategy 2022-2042, section 12.3.2, "Charlemont offers the optimal location for the primary interchange with the Green Line in response to growing demand in the longer term and is an appropriate location to facilitate any potential future metro extensions to serve the south west, south or south east of the city region should sufficient demand arise." By extending MetroLink to Charlemont it provides for future proofing of the Green Line, bypassing the capacity constrained Luas on-street running section, and ensures potential future connectivity options are enabled, either to the Green Line or for extensions of the metro. The Charlemont Station interchange provides for increased passenger utilisation of the MetroLink system, thereby increasing the benefits delivered by the Project, reflected by an improved Project Benefit Cost Ration (BCR). As stated above, it is important to note that the proposed route alignment from Estuary to Charlemont is consistent and compliant with the GDA Transport Strategy 2022-2042 (published in January 2023) in which states that the south city terminus at Charlemont offers the optimal location for interchange with the Green Line in response to growing demand in the longer term and is an appropriate location to facilitate any potential future metro extensions to serve the south west, south or south east of the city region should sufficient demand arise.

Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) Order 2022				
1	Letter	1	Just to begin, in a general sense, I want to say, that in my opinion, the Metrolink is an excellent initiative. Dublin needs a substantial investment in improving public transport - and this is an essential part of this.	Thank you for taking the time to make this submission and your positive endorsement of the MetroLink Project.
2	Letter	1	Location of Southern Terminus I suggest that the terminus of this Phase 1 (northern) of the project should be located at St Stephen's Green, as opposed to the present plan to end the line at Charlemont (with the 200 m run-on). The route for the ongoing continuation of the Metro (a Phase 2) to the south of the canal has not been determined, and I understand it is under study. There is a strong possibility (and in my opinion, it makes sense) that the southern part of the Metro will swing south west to cover Rathmines, Terenure, Templeogue etc. (in other words the south-western quadrant of Dublin city where, uniquely, there is no rail-based public transport to meet transport needs - demand there is solely provided by buses). Putting the terminus at Charlemont predetermines the outcome of the study of options for Phase 2, as if the Metro does swing over to Rathmines direction, in that case it would have to take an abrupt turn westwards.	TII do not agree that MetroLink should end at St Stephen's Green for the reasons set out below. The connection from St Stephens Green to Charlemont / Ranelagh is supported by the previous Transport Strategy for Greater Dublin Area (2016-2035) and the current Transport Strategy for Greater Dublin Area (2022-2042). The latter considers a range of options for the onward extension of MetroLink to meet the demand for travel over the period of the strategy. This includes consideration of the need for the upgrade of the Luas Green Line to metro with a metro extension to Dublin south west, south or south east. Whilst the strategy envisages that further extensions will be delivered after 2042, MetroLink which terminates at Charlemont allows for the possible extension of the metro in all the above directions. The proximity of the metro to the Luas line at Charlemont provides for a positive customer experience for all users with short interchange distance and due to the proximity, clear wayfinding and high visibility of the interchange. The interchange arrangements at Charlemont provide for significantly better interchange arrangements compared to an interchange at St Stephen's Green Station. Passengers wishing to interchange between Luas and metro at the St Stephen's Green terminus would face a 500m-walk along a route either through St Stephen's Green park or along the footpath north of the park, which adds significantly to the time for interchange and therefore the overall journey time for passengers and a less positive customer experience for all interchange users. This passenger experience would be reduced further for those with mobility or visual impairments as well as those travelling to/from the airport with luggage. See EIAR Ch7 Section 7.7.8, Table 7-16 (Passenger interchange section) The section of MetroLink route between St Stephen's Green and Charlemont Stations contributes significantly to the overall benefits of the scheme. It serves a significant area of the south city of Dublin and offers enhanced access from the local area to the city centre and a direct connection to Dublin Airport. It serves key trip attractors including residential areas and offices / workplace locations, with high passenger boarding and alighting figures in the peak hours. During the morning peak, at Charlemont station the flows include 1,800 passengers alighting, 2,300 boarding and 1,229 passengers alighting, 2,276 boarding during the evening peak. The passenger numbers contribute significantly to the overall benefits of the scheme and the effect of these benefits outweigh the additional costs that are associated with the delivery and operation of the section from St Stephen's Green to Charlemont station. The location of the interchange at Charlemont does not preclude onward extension south. An interchange at Charlemont is supported by policy including the Dublin City Development Plan 2022 - 2028 and the Transport Strategy for the Greater Dublin Area. As noted by the GDA Transport Strategy 2022-2042, section 12.3.2, "Charlemont offers the optimal location for the primary interchange with the Green Line in response to growing demand in the longer term and is an appropriate location to facilitate any potential future metro extensions to serve the south west, south or south east of the city region should sufficient demand arise." By extending MetroLink to Charlemont it provides for future proofing of the Green Line, bypassing the capacity constrained Luas on-street running section, and ensures potential future connectivity options are enabled, either to the Green Line or for extensions of the metro. The Charlemont Station interchange provides for increased passenger utilisation of the MetroLink system, thereby increasing the benefits delivered by the Project, reflected by an improved Project Benefit Cost Ration (BCR). See EIAR Ch7 Section 7.7.8, Table 7-16 (Passenger interchange section) The GDA Stategy 2022-2042 confirms that " The south city terminus at Charlemont offers the optimal location for interchange with the Green Line in response to growing demand in the longer term and is an appropriate location to facilitate any potential future metro extensions to serve the south west, south or south east of the city region should sufficient demand arise.

Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) Order 2022				
3	Letter	1	Additionally, If the Luas Green Line is allowed to continue as is, and not being subsumed by the Phase 2, southern, Metro, there is logic in choosing St Stephens Green as the interchange between the Metro and The Luas Green Line (for both its northern and southern directions).	Please refer to response (2) above that explains why the interchange with the Luas Green Line at Charlemont is preferred to St Stephen's Green.
4	Letter	1	Thus locating the terminus of Phase 1 at St Stephen's Green, would allow for all future options. Just a comment on the location in St Stephen's Green: it would better to move the Metro Station to the western side of the Green, nearer the existing Luas stop to make it easier for interchange with the Luas Green Line.	St. Stephen's Green West was ruled out as the alignment between the proposed Tara Station and a station on St Stephen's Green West would result in an undesirable horizontal reverse curve and an alignment greater than a 1000m long that would necessitate an intermediate intervention shaft located somewhere between these stations to comply with the MetroLink Fire Strategy. Further, as a potential station location, St Stephen's Green West itself is a very constrained location due to the presence of buildings, Luas and St Stephen's Green Park. Maintaining the Luas operational during station construction would be complex and challenging with significant disruption expected, whilst the impacts on St Stephen's Green Park would be greater for a station in this location compared to the proposed location on St Stephen's Green East. This would be the result of; the likely need to place more of the station in the Park compared to the proposed station on St Stephen's Green East; it would impact an area of the Park that has greater amenity value than St Stephen's Green East due to the nearby Park entrance adjacent to the southern end of Grafton Street, and there would be a risk of impacting the existing Park lake. In summary, an alignment that links the proposed Tara, St Stephen's Green East and Charlemont stations is a more direct and economic alignment, does not require additional intervention infrastructure, avoids a complex engineering interface with the Luas Green Line, impacts the Park less and has less potential for disruption during the construction phase. As outlined by EIAR Chapter 3, Background to the MetroLink Project, one of the key objectives of the Project is the integration of it with the wider transport network that also includes for BusConnects and DART+ which are all included under Project Ireland 2040. Together, these projects will result in a reliable, sustainable, affordable, integrated public transport network that will support the economy, help Ireland meet its climate change targets in line with Climate Action Plan 2021 and make Dublin a more liveable and sustainable city.

2023 Metrolink Railway Order Planning Observation - Senator Michael McDowell, Leinster House, Dublin 2 - 16 th of January 2022				
1	Introduction	1	Metrolink risks damaging a lot of Dublin's transport resources. This submission focuses primarily on the problems of locating the terminus in Charlemont for both residents and commuters. As an advocate for preserving historical structures, I am particularly concerned about how many buildings will be destroyed due to Metrolink's construction.	Thank you for taking the time to make a submission. TII have reviewed your submission and responded to the observations made below. TII do not agree that "Metrolink risks damaging a lot of Dublin's transport resources" and in fact does the opposite. EIAR Chapter 3, Background to the MetroLink Project, explains how the proposed Project will provide significant benefits not only to those who choose to use it, but also to other transport network users, by generating a modal shift from private car use, thereby reducing the demand for road space and creating the opportunity for the road transport system to achieve optimum levels of efficiency and effectiveness. Also as outlined in Chapter 3, the proposed Project is part of an integrated transport network that also includes for BusConnects and DART+ which are all included under Project Ireland 2040. Together, these projects will result in a reliable, sustainable, affordable, integrated public transport network that will support the economy, help Ireland meet its climate change targets in line with Climate Action Plan 2021 and make Dublin a more liveable and sustainable city. Whilst MetroLink is a standalone project that is not dependent on any other projects for its delivery or effective operation, it is nonetheless a critical part of the proposed integrated transport network for the Greater Dublin Area. With regards the destruction of buildings, TII would first of all note that the destruction of buildings, taken in this context to mean demolition, is always regrettable and TII fully appreciate and acknowledge the very significant impact this has on owners and tenants. Where demolition has been proposed, this has only been done so after careful consideration and evaluation of the impacts and benefits. In most cases TII have been able to preserve the architectural heritage of property, as outlined in EIAR Chapter 26 Architectural Heritage. TII also appoint a Project Conservation Architect (PCA) to oversee the MetroLink works. Considering the significant length of the proposed alignment through a primarily urban area, the number of buildings to be demolished is considered to be minimal (refer to EIAR Chapter 21, Land Take, Table 21.5) reflecting the efforts TII have taken in the design to achieve this. As outlined in Chapter 26 of the EIAR, properties of architectural heritage value that are to be demolished will be recorded by the Project Conservation Architect (PCA) by means of photography and a written description to English Heritage level 2 prior to demolition.
2	Problems for Commuters and Local Residents Near Metrolink Stations	1	The roads in the Charlemont area are very narrow. If drivers want to drop off or collect commuters from the terminus, it will cause congestion and other traffic-related issues.	TII have undertaken detailed transport modelling, further details below, that shows MetroLink will not cause congestion and related traffic issues. TII have deliberately designed the Station with minimum set down space (with the exception of a drop-off on Grand Parade for persons of restricted mobility only) or room for taxi ranks so that it does not encourage the Station to be used as a terminus, and instead as intended, as a through transport corridor. The MetroLink is designed to form part of an integrated public transport network with Charlemont selected as the preferred interchange location in order to maximise the potential interchange with the existing Luas Green Line. In overall terms, Charlemont Station will provide for improvements to the public transport network resulting in decreases in private car usage/trips, increases in public transport usages and will facilitate walking and cycling to the station, without significantly impacting on the operation of the road network in the area. A microsimulation VisWalk model has been developed for the immediate area surrounding Charlemont Station during the operational phase. The model covers the full extent of the publicly accessible station area, including the immediate vicinity of the station entrance at street level, the Luas stop and nearby junctions at Charlemont Bridge. In order to accommodate the forecast demand from the proposed Charlemont Station, a new staircase with 2.4m stair width is proposed at the south east corner of Charlemont Luas stop. An elevator will also be provided at this location. Both are sized for MetroLink to Luas, and Luas to MetroLink passenger numbers.
			Response (2) continued.	In addition, it is proposed that the pedestrian crossing on R111 Grand Parade will be repositioned to the front of the building being developed by Hines. With this infrastructure in place, the model indicates that the R111 Grand Parade will have an acceptable level of service overall, with some reductions in service seen at the pedestrian crossing where pedestrians are required to wait for a green phase at the signals. Overall, it is considered that the model displays an acceptable level of network performance. The proposed pedestrian crossing on Grand Parade will have minimal impact on the traffic flow along Grand Parade and can be programmed to operate in sync with the existing signalised junction at Grand Parade /Charlemont Street to maintain the flow of traffic movements. When the Project is operational, car mode share will decrease, with a reduction of up to approximately 830 car tips to and from the zones surrounding Charlemont Station over the 12hr period in 2065. In overall terms, the Charlemont Station will provide for improvements to the public transport network resulting in decreases in private car usage/trips, increases in public transport usages and will facilitate walking and cycling to the station, without significantly impacting on the operation of the road network in the area. The EIAR Chapter 9: Traffic & transport, Appendix A9.2-B Traffic and Transport Assessment Charlemont Station, Section 6.1.2. refers.

Submission No.			192	
Organisation Name or Name of Submitter			Senator Michael McDowell	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
2023 Metrolink Railway Order Planning Observation - Senator Michael McDowell, Leinster House, Dublin 2 - 16 th of January 2022				
3	Problems for Commuters and Local Residents Near Metrolink Stations	1	The construction of the interchange at Charlemont will involve tunnelling deep enough to avoid the Grand Canal and the main sewerage line serving Tallaght that runs alongside it. This will continue southwards for 360 metres in order to create a “turnback facility” for an underground station located beside Dartmouth Square.	Yes this observation is correct.
4	Problems for Commuters and Local Residents Near Metrolink Stations	1	Most of the bus routes nearby run through Rathmines, Ranelagh and Terenure. Many commuters will have to walk for at least 10 minutes. This causes significant difficulties for people with disabilities and others with mobility issues. For this reason, transport routes must overlap. The Metrolink Station for St Stephen’s Green also presents similar problems.	The choice of Charlemont as a station location and interchange point is based on robust analysis that has identified that this location provides significant passenger numbers for the proposed MetroLink. Passengers using MetroLink will arise from (1) The ability for an immediate interchange with Luas (which is one of the key project objectives), (2) passenger demand modelling which identified significant demand within the catchment served by this station, and (3) It should also be noted that the proposed station is within a 5-minute walk distance of the Bus Connects proposed A Spine and E Spine routes. The proposed Project has been designed on the principle of Access for All and as outlined above there will be a drop off location at Charlemont station for people with restricted mobility only. The location of the St Stephens’ Green station was chosen as it will provide interchange with DART at Tara Street. One of the key project objectives is to maximise interchange opportunities with other public transport and a station location at St. Stephen’s Green West did not allow for the key interchange with DART services. A number of route options were considered in the process of identifying the Emerging Preferred Route (EPR). However these options were ruled out primarily on the basis that they did not allow for an economic alignment that would allow for interchange with other public transport. Further it should be noted that there is a limit to the potential of the Luas to provide additional capacity in the on-street non-segregated section of the Luas Green Line from Charlemont northwards through the city centre. The nature of this route and the fact that it currently crosses several road junctions (Adelaide Road, Harcourt Street / Hatch Street upper and Harcourt Street / St Stephen’s Green south) limit the service to a maximum of 24 trams per hour per direction. The projected demand for this section would require a higher frequency of up to 30 trams per hour and this demand cannot be met with on-street systems (Luas / bus). The interchange between Luas and MetroLink proposed at Charlemont will provide the necessary capacity to address the demand on this corridor and reduce overall travel time for passengers.
5	Problems for Commuters and Local Residents Near Metrolink Stations	1	The Green Line of the Luas will have to be closed for two years as the Charlemont Station is being constructed. This will no doubt put a strain on Dublin’s transport infrastructure. Metrolink will also cause other problems for commuters living on the Green Line in the Ranelagh area.	The construction of the MetroLink Charlemont Station will not interfere with the operation, or require the closure of the Luas Green Line.
6	Problems for Commuters and Local Residents Near Metrolink Stations	1	College Gate apartments, Townsend Street, Markievicz Leisure Centre, and Ashford House on Tara Street will all have to be knocked down to build Metrolink. Local residents have been left in a state of limbo as a result of these decisions.	As noted above, TII regret any demolition of property, and fully appreciate and acknowledge the very significant impact this has on owners and tenants. Where demolition has been proposed, this has only been done after careful consideration and evaluation of the impacts and benefits. TII appreciate that this is a worrying time for owners and residents and will offer compensation to property owners for land that is deemed to be acquired land in accordance with the general compulsory purchase code through the Compulsory Purchase Order (CPO) process. This is set out in EIAR Chapter 21 Land Take, section 21.6.1.2 Compensation for Compulsory Purchase. TII are committed to working with the residents who will be affected to find an agreeable resolution. While it regrettable that demolition of properties is required to enable the construction of MetroLink, TII believe that in the longer term station greatly enhance and improve the local area and will ultimately bring benefits to those living in proximity the proposed station.

2023 Metrolink Railway Order Planning Observation - Senator Michael McDowell, Leinster House, Dublin 2 - 16 th of January 2022					
7	Demolition of Historical and Protected Structures	1	Building the Metrolink terminus in Charlemont will cause damage to the historic Dartmouth Square residential quarter by the imposition of a deep interchange.	TII acknowledge the architectural and historical significance of the Dartmouth Square buildings and recognise that the properties are also designated Protected Structures. Hence the properties are included in the impact assessment and presented in the EIAR Chapter 26 (Architectural Heritage), Table 26.26, BH-581 to BH-617. TII can provide assurance that structural damage will not be caused to Dartmouth Square properties. Both the impact of construction generated ground movements and vibration have been assessed. EIAR Appendix A 5.17 Building Damage Report, covers the assessed impacts of construction generated ground movements and settlement on Dartmouth Square where the prediction for settlement is not to exceed the 'Slight' category, an explanation for which can be found in Table 4-4 of the aforementioned report. The assessment work undertaken for the EIAR has determined that properties adjacent to the site along Dartmouth Square have been designated as "special" and hence a further Phase 3 refined assessment will be undertaken that will take account of final design and construction methodology details most likely utilising advanced numerical modelling techniques and further surveys of the building. The results of this refined assessment typically show that earlier assessments are conservative and overestimate the likely impact of construction generated ground movements. Monitoring instrumentation will also be installed to monitor the performance of the works and potential environmental impacts, including those discussed above to ensure that acceptable limits, set as part of the Phase 3 assessment, are not breached. TII would also draw attention to the fact that private properties within 50m of the station excavation, or 30m of the tunnel are eligible to subscribe to the Property Owners Protection Scheme (POPs) which includes for pre and post-construction condition surveys and repair of any damage attributed to the scheme. As outlined in chapter 26, the only impact on architectural heritage during construction or operation of Metrolink will be on the "BH-581 and BH-582: Dartmouth Square and Environs ACA and granite kerbing at Dartmouth Square" due to provision of utilities along Dartmouth Square West that will impact the steps leading down from Grand Parade to Dartmouth Square, with potential impact on granite steps, granite kerbing and historic concrete lamp standards. Following mitigation, which will be prepared by the Project Conservation Architect (PCA), the residual impact will be reduced to slight.	
8	Demolition of Historical and Protected Structures	1	Under the current plans, the Carlton Cinema dating from 1938, will be demolished. This was a landmark in O’Connell Street for decades until its closure in 1994. Other neoclassical and art deco buildings will also be destroyed.	Before submitting the Railway Order application with proposals for demolition, TII have carefully considered and evaluated options and associated impacts and benefits, details of which are provided in EIAR Chapter 7, Consideration of Alternatives. Unfortunately, due to the available land, combined with the construction challenges associated with providing O’Connell Street Station, there is no means of retaining the Carlton Cinema structure, however the facade is retained in recognition that the property is on the Dublin City Record of Protected Structures (RPS) and the National Inventory of Architectural Heritage (NIAH). Prior to the demolition of number 52-54 O’Connell Street Upper, the building is to be recorded to English Heritage level 3. The recording of associated coal cellars to facilitate propping of the facades, the demolition, and the propping of the facade will be carried out in accordance with a method statement approved by the Project Conservation Architect (PCA). As referred to in response (7) above, to ensure the protection of the facade during construction, vibration and settlement monitoring equipment will be installed and monitored to ensure that at no time do vibrations or settlement exceed given limits. As covered in response (7) above, in the event of predetermined trigger limits (set through the Phase 3 assessment process) being breached, all work in the vicinity will to stop until the cause of the issue is identified and resolved.	
9	Suggestions	2	South Dublin County, in their Tallaght Town Centre LAP (2020-2026) proposed running a light rail transport facility through the area. Although some feasibility studies have said relying on Bus Connects is the best for Dublin South West, many have noted that the existing public transport infrastructure underserves the area.	TII's role is to deliver Metrolink as supported by the Transport Strategy for Greater Dublin Area (2022-2042) and Dublin City Development Plan 2022-2028 . The connection from St Stephens Green to Charlemont / Ranelagh is supported by the current Transport Strategy. The Transport Strategies were prepared by the National Transport Authority, scrutinised by the Joint Oireachtas Committee on Transport and approved by the Minister for Transport. It notes in section 12.3.2, "Charlemont offers the optimal location for the primary interchange with the Green Line in response to growing demand in the longer term and is an appropriate location to facilitate any potential future metro extensions to serve the south west, south or south east of the city region should sufficient demand arise."	

Submission No.			192	
Organisation Name or Name of Submitter			Senator Michael McDowell	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
2023 Metrolink Railway Order Planning Observation - Senator Michael McDowell, Leinster House, Dublin 2 - 16 th of January 2022				
10	Suggestions	2	At an Oireachtas Committee earlier this year, Mr Hugh Creegan said one of the reasons for choosing Charlemont as a terminus is that it would allow the Metrolink to be expanded to Dublin South West at a later point. If there were a plan to have a Metrolink Station in Dublin South West now, this would likely cause fewer transport disruptions after Metrolink is built. It's not plausible that there is no space to build a Metrolink terminus in either Terenure, Rathfarnham, Templeogue, Knocklyon or Firhouse. There are also no plans to run the metro through Portobello, Rathmines, Harold's Cross or the Cathal Brugha Barracks site, which will be a large residential area in years to come. Rethink Metrolink drafted a transport strategy consultation submission. This should be reviewed so adequate changes can be made. Peter Twamley Railway Order application for the MetroLink Project submitted 30 September 2022 also makes important points that should be considered.	As noted by response (9) above, the location of the interchange at Charlemont does not preclude onward extension south. TII therefore do not agree that MetroLink proposals require a rethink, and TII also confirm they have responded to the submission made by Peter Twamley, noting also that the connection from St Stephens Green to Charlemont / Ranelagh is supported by the current Transport Strategy for Greater Dublin Area (2022-2042). The Transport Strategies were prepared by the National Transport Authority, scrutinised by the Joint Oireachtas Committee on Transport and approved by the Minister for Transport.
11	Suggestions	2	Metrolink will not be built until 2032 at the earliest. However, it's development is likely to be delayed. It won't be operational until 2042, in all likelihood. The budget for Metrolink initially was €4 billion; it has grown to approximately €20 billion within the last five years. The money being spent on Metrolink could be invested in other areas of our transport infrastructure such as light-rail, which would not be as disruptive.	The Board is not responsible for any decisions in relation to the funding the Project. It is solely responsible for assessing whether the Project is consistent with proper planning and sustainable development and that its effects on the environment are acceptable. The responsibility for funding the Project lies with the NTA, the Government and ultimately the Oireachtas. It has received all necessary approvals, including under the Public Spending Code for the making of a Railway Order. It will undergo further scrutiny and approvals, including under the Public Spending Code, before it is funded. It is not appropriate for the Board to make findings in relation to value-for-money that are outside its statutory functions and would cut across those arrangements. Members of the public are entitled to make representations to their TDs in relation to the value-for-money of any element of the Project. In any case, as noted by response (1) above, MetroLink will deliver significant benefits and thus return on its investment, by generating a modal shift from private car use and the associated benefits that brings with it. Further, to ensure that public investment delivers value for money, the Public Spending Code sets out requirements for the evaluation, planning and management of public investment. The preparation of a Business Case is a key element of meeting these requirements. The Public Spending Code requires that both the Preliminary Business Case and Final Business Case for public investment projects are published. In July 2022, the Government granted Approval in Principle to the NTA to enable the submission of a railway order application by TII to An Bord Pleanála in respect of the MetroLink project (Decision Gate 1). This approval was granted after the Preliminary Business Case (PBC) had undergone significant scrutiny and challenge by bodies that are independent of TII, including DoT and DPER review (including independent review by JASPERS and the Major Projects Advisory Group (MPAG)) of the PBC around timeline, costs and benefits that were updated to inform the Government decision. The opening of MetroLink is currently forecast for 2035, not 2042 as stated.
12	Conclusion	2	Significant changes are required to the plans for Metrolink. Situating the terminus for the Metrolink in Charlemont will cause significant problems for both commuters and residents. The city's southwest will continue to be underserved even after its construction. Given the cost, disruptions, and time it will take to build, it would be better for the government to focus on developing surface Luas-like tram lines in the medium to long term. This could be developed quicker and will cause minimal disruptions by comparison.	TII do not agree that "Significant changes are required to the plans for Metrolink". TII have undertaken detailed transport modelling, that shows a MetroLink station at Charlemont will not cause congestion and related traffic issues, and in overall terms, the Charlemont Station will provide for improvements to the public transport network resulting in decreases in private car usage/trips, increases in public transport usages and will facilitate walking and cycling to the station, without significantly impacting on the operation of the road network in the area. Future possible extension of the metro has been considered as reflected by the GDA Transport Strategy 2022-2042, section 12.3.2, "Charlemont offers the optimal location for the primary interchange with the Green Line in response to growing demand in the longer term and is an appropriate location to facilitate any potential future metro extensions to serve the south west, south or south east of the city region should sufficient demand arise." Finally, MetroLink will deliver significant benefits and thus return on its investment, by generating a modal shift from private car use and the associated benefits that brings with it. This was reflected in July 2022, the Government granted Approval in Principle to the NTA to enable the submission of a railway order application by TII to An Bord Pleanála in respect of the MetroLink project (Decision Gate 1). This approval was granted after the Preliminary Business Case (PBC) had undergone significant scrutiny and challenge by bodies that are independent of TII.

Submission No.			193	
Organisation Name or Name of Submitter			Michael Quinn (resident - 20 Saint Teresa's Place, Glasnevin)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: Railway Order Application - Metro North: Estuary through Swords, Dublin Airport, Ballymun, Glasnevin and City Centre to Charlemont, Co. Dublin - 20 Saint Teresa's Place, Glasnevin				
1	Letter	1	Having been a resident of the area since 1984 I am objecting on the strongest possible grounds to the proposed works that could be involved if the project were to go ahead in its current format. One of the many reasons that I have remained living in the area and in such a contended manner is because of the importance of the local community to me. The area has always been a vibrant place to live that is welcoming in equal terms to both strangers and locals. The environs of Phibsboro and Glasnevin could be described as being multi-cultural and self- supporting in many ways. The sporting facilities available to those of that age with an interest in same are numerous and very well used. Living here we have free access to the second largest green space (Glasnevin Cemetery and The National Botanic Gardens) in Dublin. This feature has and continues to be a major attraction to me. I believe that the work that would be involved in creating Glasnevin Station at Cross Guns Bridge would have a major impact on the infrastructure and fabric of this quiet, low profile and well established residential area.	TII wish to thank you for your submission and understand the concerns you may have around the construction of Glasnevin Station. We have reviewed the submission and provided a response below in relation to impacts that are anticipated in your residential area. Your broad concerns of potential impacts of the Project on the local community are noted. While regrettable, where impacts of significance do occur, these are mitigated through the EIAR, with details provided further in this response below. Access to the local green space amenity referred to in your response is unaffected by the Project. Where sporting facilities have been impacted, alternatives have been considered in the EIAR planning, as referred to in Chapter 21, section 21.6.1.5 Protection of Sports and Leisure Facilities. The benefits of the Project locally, such as improved air quality, the stimulation of economic activity and the enhancement of amenity around Glasnevin, as with other proposed stations of the MetroLink and the city of Dublin generally, is provided in EIAR Chapter 3: Background to the MetroLink Project, section 3.4 MetroLink Response to Challenges. Station Construction: The EIAR Chapter 5: MetroLink Construction Phase, Appendix A5.5. Glasnevin Construction Report describes the sequencing and methodology required to construct the proposed Glasnevin Station. TII recognise that the Glasnevin Station development is a complex project with key interfaces with other infrastructure stakeholders and is proposed to be located in proximity to residential areas. However, appropriate mitigations have been proposed to minimise the impact of the construction works as much as practicable within the local environment. The programme for the construction of the proposed Project has been optimised to minimise the duration (102 months) of the Construction Phase, where possible, in order to lessen the duration of potential environmental impacts, while ensuring that the areas surrounding the works sites remain operational and functional. Due to the construction of the station and the two commuter platforms for Iarnród Éireann, there is a requirement to modify the track layout and alignment at Glasnevin, which involves lowering a large section of the track by circa 2m and modification to the existing junction. A coordinated approach for the track lowering is proposed to avoid closing both railways at the same time for the station construction works, in order to minimise the severity of the impact. Following consultation with Iarnród Éireann, closure of the Sligo/Maynooth (MGWR) line for a period of 21 months is proposed, reopening before the immediate closure of the Newbridge/Hazelhatch (GWSR) line for 5 months. For further information, refer to the EIAR Chapter 5: MetroLink Construction Phase, Appendix A5.2 Construction Programme and Appendix A5.3 Construction Sequence Report (section 8.7. Glasnevin). Working Hours: As presented in EIAR Chapter 5, Section 5.2.4 Working Hours, the majority of works will be done during standard working hours, from 07:00hrs to 19:00hrs on weekdays (excluding Bank and Public Holidays) and from 07:00hrs to 13:00hrs on Saturdays. There are however some activities that will require 24h per day working and in the case of Glasnevin station these are: •Sliding new rail bridge into position; •MEP station works; and •Blockades or weekend possession work required with Irish railway Great Southern and Western Railway (GSWR) and Midland Great Western Railway (MGWR). Construction Environmental Management Plan: EIAR Appendix A5.1 Outline Construction Environmental Management Plan (CEMP) details the proposed programme for monitoring and mitigation to be implemented on the Project to ensure construction work thresholds are not exceeded. Detailed plans for air quality management, traffic management, and construction noise and vibration management, among others, will be prepared by the contractor(s) for the approval of Dublin City Council (DCC) before the commencement of works. Details of the requirements and approval process of the CEMP for construction are further set out in section 1.3 of Appendix A5.1. Given the distance from your residential area to the construction site at Glasnevin, not all impacts related to the construction site is anticipated to affect your residential area. Traffic and Transport: Chapter 9: Traffic & Transport, Appendix A9.5 Scheme Traffic Management Plan, section 7.6 Glasnevin Station, details the impact of the temporary traffic management measures on all road users. There will be slight increases in traffic flow on the R108 Prospect Road during the Enabling Works, with minimal traffic delays of 40 seconds. During the Main Works, the current traffic layout on R108 Prospect Road will be maintained, with no lane closures proposed. Royal Canal Way will be closed to local access, pedestrians, and cyclists; however, diversions are proposed to maintain access for all affected users, minimising the level of disruption within the community.

Submission No.			193	
Organisation Name or Name of Submitter			Michael Quinn (resident - 20 Saint Teresa's Place, Glasnevin)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: Railway Order Application - Metro North: Estuary through Swords, Dublin Airport, Ballymun, Glasnevin and City Centre to Charlemont, Co. Dublin - 20 Saint Teresa's Place, Glasnevin				
			Response (1) continued.	Noise and vibration: Details regarding noise and vibration levels for individual buildings near Glasnevin Station can be found in Chapter 13 (Airborne Noise and Vibration) and Appendix 13.7 (Construction Phase Modelling). A number of residences in Glasnevin in close proximity to the site have been identified with the potential to have significant noise impact during the construction phase. These are referred to in identified on Table 13.87 Glasnevin Station – Residual Significant Construction Noise Impacts – Daytime, and Table 13.88 Glasnevin – Track Possession works - Potential Residual Night-time Significant Construction Noise Impacts. Mitigation measures proposed include 4m high hoarding to the north, south, east, and west construction site boundaries which will significantly reduce any effect from noise. Given the distance from your residential area to the construction site, no airborne noise and vibration related to the construction site is anticipated at your residential area. At your property, noise impacts will arise from the TBM passage when the noise value (as presented in Chapter 14: Groundborne Noise & Vibration, Appendix 14.5 of the EIAR) of 46 dB will be above the threshold value of 45 dB resulting in a significant impact on residents for the limited duration during TBM passage. Unfortunately, there are no effective methods available to reduce groundborne noise or vibration from TBMs at source but noting that the duration of this impact will be in the order of up to two weeks as the TBM passes. TII will liaise with the residents to ensure the timing of these impacts are known. In any case where residual noise impacts remain during the construction phase the application of Transport Infrastructure Ireland (TII) Airborne and Groundborne Noise Mitigation Policy will be implemented where eligibility has been established. Please refer to Chapter 14, Appendix A14.6. Air quality: Chapter 16 (Air Quality) details that there will be a generally negligible or slight negative impact on air quality in the vicinity of the proposed project at Glasnevin during the Construction Phase post mitigation. However, no exceedances of air quality standards are predicted once the measure set out in section 16.6 Mitigation Measures are implemented; therefore, no significant adverse human health impacts are predicted.
2	Letter	1	Concerns I have centre around the many unknowns as to what affect such works would have on the foundations of my house, what the likelihood of subsidence might be, what affect it would have on the insurability of my property as well as the impact that any additional traffic, noise and construction would have on the locality. I would ask that cognisance be taken of this submission and of the others that will be received from District 7 at this very important juncture in the future of our locality.	TII recognise and have considered the concerns raised in connection with the possible impact on the foundations of your property within the assessments undertaken within the EIAR supporting this Railway Order. EIAR Appendix A5.17, Building Damage Report, covers the assessed impacts of construction generated ground movements and settlement on property. As presented in Table 5.2, the assessments to date of 20 Saint Teresa Place indicate that the building (representative building B-141 on Table 5.2) falls into the Negligible damage category and hence further assessment is not required. The Negligible damage category assumes hairline cracks (< 0.1 mm width). Additionally a programme of ground movement monitoring will be implemented, with the monitoring locations informed by further analysis to be undertaken during the detailed design stage. Please refer to EIAR Chapter 5: MetroLink Construction Phase, section 5.4.11 Ground Settlement Monitoring and Mitigation Works. Setting aside the completion of the building assessment on your property as stated above, TII is committed to having a Property Owner Protection Scheme (POPS) in place prior to construction works commencing. The scheme allows residential property owners to register with TII if the property is within thirty metres of the edge of the MetroLink alignment or fifty metres of station structures. As part of this scheme, conditions surveys of applicable properties are undertaken in advance of construction activities that are likely to impact, which for this property will be the arrival of the TBM. Further details on this scheme is provided in Chapter 21: Land Take, section 21.6.1.4 Property Protection. TII confirm that the local geological and hydrogeological conditions were considered during the settlement assessment. For the geological conditions anticipated, the predicted impacts and mitigation measure are referred to in Chapter 20: Soils and Geology, sections 20.4 and 20.6 respectively. While the Hydrogeology assessments and mitigation plans are referred to in Chapter 19: Hydrogeology, sections 19.5 and 19.6 respectively. TII are not aware of any undue impact to insurability of individual properties arising from MetroLink works. We would not expect there to be any insurance considerations arising as was confirmed by Dublin Port. Similarly Insurance Ireland (representative body for Insurers) has not expressed any concerns at any time going back to 2008 when MetroNorth was first proposed. Please refer to response item (1) above for details for the impact of construction traffic and noise around Glasnevin Station and your property.

Submission No.			194	
Organisation Name or Name of Submitter			Ambassador_Millenium Theatre Company (MTC)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
MTC Cover letter - Re: Application by the National Roads Authority (operating as TII) for the Railway (Metrolink Estuary to Charlemont via Dublin Airport) Order [2022] Case Number. ABP-302010				
1	1. Introduction 1.7	4	There has been little substantive engagement by TII or discussion on mitigation measures prior to the submission of its application, and consequently MTC has had little time to consider the possible implications of the proposed development and to agree such mitigation measures in advance.	All mitigation measures have been carefully identified and assessed. Efforts were made to contact the landowner on more than one occasion prior to submission of the RO. TII continues to engage with landowners relative to their submissions
2	1. Introduction 1.8	4	MTC would welcome constructive engagement over the coming months so that the concerns outlined in our Report, are addressed by the TII as soon as possible.	TII have responded to all issues raised below but remain available if clarifications are require.
3	2. Proposed Development by TII 2.2	5	From what we can establish the proposed tunnel sits between around 16-1 8m below the ground level as it runs from Parnell Street, beneath the Ambassador Theatre. However, there are extensive below ground vaults at the Ambassador, and consequently the tunnel could be a little as 12m below the vaults in place. This does not appear to have been noted by TII in its application documentation. This raises immediate issues arise in connection with the possible construction impacts on the building structure at the Ambassador.	The Ambassador Theatre was surveyed in 2007 and the basements as noted were picked up on that survey together with the existing condition. These surveys have educated the damage assessment undertaken and TII are content that the assessment undertaken to date is robust, incorporating conservative parameters. On the MetroLink Project, the approach to ground movement and building damage assessment follows the industry standard three-phased ground movement impact assessment process that is undertaken on tunnelling and underground projects around the world, that includes Channel Tunnel Rail Link (CTRL), Dublin Port Tunnel, Crossrail and High Speed 2. The MetroLink tunnel has been assessed going under these properties at the depth and on the alignment proposed and TII are satisfied that the assessed movements will not lead to structural damage to these properties. EIAR Appendix A 5.17, Building Damage Report, covers the assessed impacts of construction generated ground movements and settlement on property. Table 5-2 of this report shows that your building has been assessed as falling within the "Slight damage" category currently (building reference B -81), an explanation for which can be found in Table 4-4 of the aforementioned report. Despite no structural impacts (only cosmetic damage) being assessed, as your building has been designated a "special" building it will therefore be subject to a further detailed assessment. Refer to EIAR Appendix A5.17. The Phase 3 assessment will take account of final design and construction methodology details. For the Phase 3 assessment, each building will be subject to detailed assessment on an individual basis. A detailed survey will be carried out as part of the Phase 3 assessment to provide the necessary additional information to inform this detailed analysis of how the individual elements of the building would be affected by the predicted ground movements. The method and extent of the detailed analysis will be determined on a case-by case basis and may include a more sophisticated semi-empirical or a detailed soil-structure interaction using finite element modelling methods. It is likely that the Phase 3 assessment will yield further improvement to the damage category determined by the Phase 2b assessment. The results of this refined assessment typically show that earlier assessments are conservative and over estimate the likely impact of construction generated ground movements. Details on the subsequent Phase 2b and Phase3 building damage assessments are presented in the EIAR Appendix A 5.17, Building Damage Report.
4	2. Proposed Development by TII 2.3	5	In addition to the construction impacts the potential long term zone of influence of the tunnels extends over the entirety of the Ambassador Theatre as set out on the drawing below.	The assessment noted above has taken all predicted movement in to account. Please note that once operational no further settlement impacts are anticipated.
5	2. Proposed Development by TII 2.4	6	The application, if granted, will also include powers for TII to acquire compulsorily land or rights in, under or over land or any substratum of land specified in the order: we understand that this will include substratum lands at the Ambassador although the MTC has not been advised of the extent of the lands this will impact.	TII wrote to the Millennium Theatre Company (letter reference CAP_ML_1175_48 dated 20th September 2022) and included all details with regard to the extent of subsurface acquisition proposed. Please refer to drgs ML-P 305 E-F and ML-5E-U16 included in this property pack.

Submission No.			194	
Organisation Name or Name of Submitter			Ambassador_Millenium Theatre Company (MTC)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
MTC Cover letter - Re: Application by the National Roads Authority (operating as TII) for the Railway (Metrolink Estuary to Charlemont via Dublin Airport) Order [2022] Case Number. ABP-302010				
6	2. Proposed Development by TII 2.5	6	In summary MTC is very concerned that the proposals submitted by TII will have significant adverse impacts on buildings and on the provision of services at the Ambassador, and that these impacts have not been addressed by the TII in the proposals as currently submitted to the Board.	The impacts on the Ambassador Theatre have been full assessed and included with the EIAR. The assessment of airborne noise during the construction phase for works being undertaken at O’Connell Street Station has been presented within Chapter 13 Airborne Noise and Vibration of the EIAR. The Ambassador Theatre also falls within the study area for groundborne noise and vibration, and calculations of groundborne noise and vibration during the construction and operation phases have been carried out and presented in Appendix 14.5 to Chapter 14 Groundborne Noise and Vibration of the EIAR. As noted in response (1) the impacts of ground movement has been assessed and included within EIAR Appendix A5.17 Building Damage Report.
7	3. MTC Property and Substratum Lands at the Ambassador 3.1,3.2	6	The application drawings submitted by TII indicate the area of Ambassador Theatre substratum lands may be compulsorily acquired as part of the development. The Ambassador Theatre MTC has advised that it has received no prior notice from TII, and is unaware of, the extent of substratum lands impacted by the Railway Order.	Substratum land take is detailed drawing ML-P 305 E-F and that we are willing to engage with them in repect to the impact the substratum acquision on any furture developments that they are planning.
8	3. MTC Property and Substratum Lands at the Ambassador 3.3	6	The Ambassador Theatre / MTC has advised that it is unaware of, and has received no information from TII on, the impact of any such acquisition on possible future developments at the Ambassador. [	MetroLink will be a catalyst for and provide opportunity for future development and regeneration. While the MetroLink Railway Order does not include for future neighbouring or overhead development, the tunnels and stations are designed to support appropriate future imposed loads. TII will be required to make submissions in relation to planning applications for proposed future developments on or adjacent to MetroLink and there will necessarily be some engineering constraints (such as permissible loadings) required. However MetroLink is committed to engaging with known development proposals and new development proposals as they emerge with the intent of facilitating such developments as they emerge to the maximum extent consistent with the safe operation of the proposed Project. Again in common with other existing rail and tunnel projects, following grant of the Railway Order and development of detailed design, TII will produce “Guidance Note for Developers” that will be the subject of bye-laws following the grant of Railway Order and which is designed to facilitate future adjacent or over-site development while protecting the integrity and safety of the MetroLink works and operations. It is inappropriate and unworkable to produce this policy at this stage because it would have to be in broad terms that deal not only with the current RO proposal and any contingencies that might arise from the Board seeking revised designs or new conditionality as part of the RO application process. Therefore at this stage TII is dealing with known development proposals on a case by case basis, TII will work with parties in the future to assist with the wider development of sites over and above stations and tunnels. In this context TII has successfully engaged with a number of developers over the last two years to accommodate development over and in proximity to the alignment and there have been no material restrictions on development subject to the implementation of agreed design and mitigation measures and it is not anticipated that MetroLink will have a material impact on the development potential of sites above and in proximity to the alignment in future.
9	4.1 Impacts of Proposed Development on Ambassador Theatre - Noise & Vibration (a)	7	It is not clear that the applicant has assessed the Ambassador Theatre; however, we would submit, having regard to the national importance of the structure, (as confirmed by the NIAH), that this needs assessment needs to be urgently carried out by the applicant.	The relevant assessments have been undertaken and clearly articulated in the EIAR. The status and use of this building is known and has been used to assess impacts. Please refer to response (6).

Submission No.			194	
Organisation Name or Name of Submitter			Ambassador_Millenium Theatre Company (MTC)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
MTC Cover letter - Re: Application by the National Roads Authority (operating as TII) for the Railway (Metrolink Estuary to Charlemont via Dublin Airport) Order [2022] Case Number. ABP-302010				
10	4.1 Impacts of Proposed Development on Ambassador Theatre - Noise & Vibration (b)	8	Threshold limits set out by the applicant are dependent on Building Categorisations which need to be clarified— we believe this may need reconsideration and assessment + appropriate mitigation accordingly.	The assessment approach does not need reconsideration. In Chapter 14 Ground borne Noise & Vibration, Section 14.2.1 Appraisal Method for the Assessment of Impacts presents the assessment methods undertaken. It is acknowledged that the assessment is complex due to the consideration of groundborne noise and vibration arising from different activities such as the progress of the TBM, mechanical excavation etc. For the purposes of assigning a criteria for Groundborne Noise and Vibration, please refer to table 14.3. The Ambassador Theatre was considered a theatre in this assessment and so was assigned a noise assessment threshold of 25 dB LAmax,S above which groundborne noise impacts would be considered significant. For the purposes of assessing the progression of the TBM, the assessment criteria were different, due to the very short duration of this activity at any single location. As a result a threshold is proposed for groundborne noise from the passage of a TBM is 5dB LAmax,S greater than the thresholds for other sources shown in Table 14.3 i.e. 30 dB LAmax,S. In the assessment of vibration, a number of different assessment thresholds were used as outlined in section 14.2.1.2. The Ambassador Theatre was considered a particularly sensitive to groundborne noise and vibration impacts along with buildings like libraries, lecture theatres, auditoria, hospitals, churches, schools.
11	4.1 Impacts of Proposed Development on Ambassador Theatre - Noise & Vibration (c)	8	The applicant notes “Unfortunately, there are no effective methods available to reduce groundborne noise or vibration from TBM at source” and notes such impacts are of a Temporary nature (while TBM passes). This is a significant issue of concern in connection with services at the Ambassador.	Unfortunately, there are no effective methods are available to reduce groundborne noise or vibration from TBMs at source. However the following mitigation measures are proposed in the EIAR aimed at minimising the effects are as follows: •Advance public consultation and stakeholder engagement can greatly reduce the significance of groundborne noise effects, as building occupants would be prepared for the passage of the TBM and resultant elevated noise and vibration levels. •TII will accept and consider applications for additional measures on a case-by case basis, in accordance with its Noise and Vibration Mitigation Policy (see Appendix A14.6 of the EIAR). It is important to note that the advancement of the Tunnel Boring Machine will be for a very short duration over a matter of days. TII and their contractors will engage with the Millennium Theatre Company regarding the potential impacts of these works and the proposed programme for the same once this information is available.
12	4.1 Impacts of Proposed Development on Ambassador Theatre - Noise & Vibration (d)	8	The application references some mitigation measures primarily around Consultation and pre-Planning of activities; however, MTC has confirmed that no such consultations have taken place, and we are unaware of any mitigation measures.	As noted in Response 1, TII have made a number of efforts to engage with the Owners but were unsuccessful in getting a response from the site owner. TII are happy to engage further with Millennium Theatre Company regarding the potential impacts of these works and the proposed mitigation measures for Ambassador Theatre.

Submission No.			194	
Organisation Name or Name of Submitter			Ambassador_Millenium Theatre Company (MTC)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
MTC Cover letter - Re: Application by the National Roads Authority (operating as TII) for the Railway (Metrolink Estuary to Charlemont via Dublin Airport) Order [2022] Case Number. ABP-302010				
13	4.1 Impacts of Proposed Development on Ambassador Theatre - Noise & Vibration (e)	8	The construction of the deep underground O'Connell St. station is in close proximity to the Ambassador Theatre, and it is unclear to what extent this has been assessed for potential impacts on the Ambassador Theatre.	Construction Phase Firstly, the assessment of airborne noise from above ground construction activities at O'Connell Street station, as presented in Chapter 13 of the EIAR, has predicted airborne noise levels at Ambassador Theatre below the construction noise threshold level of 75 dB LAeq,T and are therefore considered Not-Significant. Secondly, the Ambassador Theatre was also assessed for potential groundborne noise and vibration impacts from the construction of the O'Connell St. station. Groundborne Noise and Vibration and Blasting modelling results are given in Appendix 14.5 of the EIAR. The predicted L_{Amax,s} during mechanical excavation (from O'Connell St Station) at the Ambassador Theatre has a value of 21 dB while the Threshold Level for this building is 25 dB, resulting in no significant impact on the buildings operation arising from proposed mechanical operation. Levels of groundborne vibration during construction at the Ambassador Theatre are predicted to be 0.262 m/s-1.75 during TBM passage and 0 m/s-1.75 during mechanical excavation, which are below the VDV Threshold Level for this building of 1.0 m/s-1.75, resulting in a not significant impact on the buildings operation. Operational Phase During railway operation the predicted L_{Amax,s} at Ambassador Theatre is 34 dB while the Threshold Level for this building is 25 dB, resulting a significant impact on the buildings operation in the absence of mitigation. However, in recognition of the sensitivity of the Gate Theatre and the Ambassador Theatre it is proposed in Section 14.5.2 of the EIAR, that for the operational phase specific mitigation measures will be to use a Floating Slab Track system between Chainage 16+400 to Chainage 16+600, resulting in a residual impact considered not significant. Groundborne Vibration from Railway Operation is predicted to be 0.008 m/s-1.75, which i.e. below the threshold value of 0.8 m/s-1.75 resulting a not significant impact on the buildings operations.
14	4.1 Impacts of Proposed Development on Ambassador Theatre - Noise & Vibration (f)	8	The applicant should be requested to incorporate and extend the "Floating Slab Track" for the entire Ambassador Theatre and well beyond as mitigation and to protect the building and to mitigate the impact on services at the Ambassador.	According to Chapter 14 Ground-borne Noise and Vibration, Table 14.47, Floating Slab Track will be used between Chainage 16+400 to Chainage 16+600. As the Ambassador Theatre building is located at Chainage 16+440 we consider that this length and positioning of the Floating Slab Track is adequate.
15	4.2 Impacts of Proposed Development on Ambassador Theatre - Potential Settlement & Building Damage Assessment	8	The Ambassador building is a protected structure dating back to the 1700's. It is a masonry construction, typical at the time, and is highly sensitive to movements. Such potential movements (particularly if differential settlements of the order per the Phase 1 were to realise) have the potential to cause damage across the Ambassador, and also impact on service delivery. We submit that the applicant should be requested to carry out a more detailed Phase 3 building damage impact assessment immediately, prior to any planning decision by ABP on the overall application.	Please refer to response (3). The Ambassador Theatre due to the age and importance of the building it has been designated "special" and hence a further (Phase 3) assessment will be undertaken by the main works contractor. This further assessment will pick up on the building's condition close to the time when the building may be impacted
16	4.2 Impacts of Proposed Development on Ambassador Theatre - Potential Settlement & Building Damage Assessment	9	It is essential that the Ambassador Theatre is consulted and kept well informed on outcomes and potential impacts of these further assessments together with details on any proposed mitigation measures for agreement.	Please refer to response item (1) above.

Submission No.			194		
Organisation Name or Name of Submitter			Ambassador_Millenium Theatre Company (MTC)		
Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
MTC Cover letter - Re: Application by the National Roads Authority (operating as TII) for the Railway (Metrolink Estuary to Charlemont via Dublin Airport) Order [2022] Case Number. ABP-302010					
17	4.3 Impacts of Proposed Development on Ambassador Theatre - Monitoring	9	Subject to satisfactory resolution of the above noise, vibration and settlement issues, we recommend that a comprehensive suite of settlement, noise and vibration monitoring equipment be installed at and within the Ambassador building to: i. Assess current background levels to inform appropriate “Trigger” levels ii. Monitor during the Construction Works iii. Monitor during Operation Appropriate “trigger” levels on a traffic light system basis should be established and agreed based on background levels together with best practice and industry standards referenced and predicted within the EIAR. The instrumentation should be logged in "real-time” basis and if/when trigger levels are exceeded, ALL Stakeholders are contacted, and pre-agreed mitigation proposals implemented.	TII will procure its contractors to develop Instrumentation and Monitoring Plans in tandem with Monitoring Action Plans in accordance with EIAR Appendix 5.1. These plans will help assure that the risks associated with tunnelling and station excavations impacting any OPW property are appropriately managed and controlled. TII will provide details of any monitoring proposed by the contractor at detailed design stage and agree the methodology of installation to the OPW property. TII will provide advance notice of any attendance that the monitoring contractor may require. With regard to the timing of monitoring specific to ground movement TII will ensure that it is commenced 3 months prior to the construction activities that would give rise to the settlement. However, as these construction activities may complete years prior to the MetroLink operational phase the termination of monitoring will be linked to a determination that settlement has effectively ceased, allowing a removal of the instrumentation. Operational groundborne noise and vibration monitoring will be undertaken during the commissioning phase to demonstrate the efficacy of the mitigation measures and to ensure thresholds are not breached. The monitoring systems will employ suitable trigger level alerts and notification in case of breach of threshold.	
18	4.4 Impacts of Proposed Development on Ambassador Theatre - Consultation	9	MTC and its advisors have not been consulted by the applicant in any meaningful way prior to the application, and have had little time to review the potential consequences and implications of this significant project. It asks the Board to direct TII to engage immediately in discussions in connection with the Ambassador Theatre, and to set out proposals and mitigation measures on potential impacts to the buildings and services at the Ambassador. MTC request to be kept informed by ABP throughout the remainder of the application process, reserving the right to seek further information and comment on the construction and operation of the Metrolink.	Please refer to response item (1) above.	
19	5. Impacts of Proposed Development on Ambassador Theatre - Engagement with TII	10	Notwithstanding the fact that TII has not engaged in any meaningful way on such matters with the MTC reading the Ambassador Theatre to date, MTC would welcome engagement with TII, even at this late stage in the process. MTC confirms it will facilitate engagement in advance of any potential Oral Hearing the Board may wish to convene. MTC would be grateful if the Board would also encourage and invite TII to engage regarding the Ambassador Theatre and to set out clear proposals to mitigate potential impacts to the building and to ensure and protect the continuing provision of services at the Ambassador Theatre.	Please refer to response item (1) above.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
RE: RAILWAY (METROLINK-ESTUARY TO CHARLEMONT VIA DUBLIN AIRPORT) ORDER 2022 - LANDS AT SILLOGUE GREEN LANE AND BALLYSTRUAN LANE, SWORDS, CO. DUBLIN				
1	Introduction (page 1 and 2 of submission)	2&3	In this regard, our client seeks: • Relocation of the Dardistown Depot and associated services lines. • Realignment of the Metrolink route to avoid the infringement onto its lands. • Recognition of the permitted and established use of its sites as an abattoir which is a sensitive receptor as part of the Environmental Impact Assessment. • Unencumbered and unrestricted access and egress to the site and unrestricted and unencumbered operational capabilities at the site and the WWTP during the course of construction and during the operational phase of the scheme.	Please refer to the specific responses below to these concerns.
2	Introduction (page 3 of submission)	4	2.2 Our client has engaged with Transport Infrastructure Ireland at every opportunity during the non-statutory consultation process In 2018 and 2019 when submissions were made clearly Identifying the use of the established and permitted factory building as an abattoir. The use of part of the site by Frylite is temporary. The temporary planning permission under which Frylite operate will lapse in 2024.	TI thank you for your continued engagement with the Project. The proposed Project has taken into consideration the use of the site, and as such the Railway Order application incorporates measures to ensure the continued use of the site during construction and operational phases.
3	Introduction (page 3 of submission)	4	It Is therefore essential that the plant retains full and unencumbered access, egress and operational capability during the construction and operational phases of Metrolink. Our client Is very concerned that the assessment of the chosen route for Metrolink and the Dardistown Depot has not taken this sensitive use Into consideration in the Environmental Impact Assessment for the project.	As identified in Response (2) access will be maintained to the factory at all times during both the construction and operation phase. During the determination of an appropriate location for the proposed depot (and alignment into the depot), consideration was taken of the location of this facility in order to identify the potential for a direct impact on the facility or an indirect impact in terms of potential impacts on the access to the site. The chosen depot location was chosen (partially) on the basis of ensuring that the facility could remain operational during both the construction and operational phase. Standard mitigation measures as identified in the CEMP (Appendix 5.1 to the EIAR) will be implemented to ensure that there are no significant environmental effects during the construction phase. There are no anticipated significant effects identified to this site during the operational phase of the proposed Project. Chapter 7 (Consideration of Alternatives) section 7.7.4 presents the two-stage assessment for the identification of a location for the depot. As part of the environmental assessment of both Estuary and Dardistown locations, Population and Land Use was considered, with 'local sensitivities' identified. It is considered that the population at Dardistown would be less sensitive to disruption during the Construction Phase and/or the Operational Phase when compared to Estuary as there are fewer sensitive locations in close proximity to the proposed site and those that are present are already exposed to high levels of noise from Dublin Airport and the M50 Motorway.
4	Proposed works affecting the subject lands (page 4 of submission)	5	The Identification of 'temporary lands' takes no account of future servicing of the line or wayleaves associated with the operating line which would prevent future development. In addition, the change in the lands to accommodate future possible development as a result of the metro line, while they may be 'reinstated' at the surface, are essentially severed from surroundings lands that have no subsurface development. It is submitted that the lands either side of the tracks and particularly between the tracks should be seen as permanent as they effectively create a no development zone.	Maintenance of the line is to be undertaken from the permanent railway corridor, with wayleaves included within the Railway Order application where otherwise considered necessary. Where the track alignment is provided as cut and cover sections, these will facilitate the provision of access across the line where required in the future, limiting severance of land areas and avoiding the need for unnecessary land take.
5	Proposed works affecting the subject lands (page 4 of submission)	5	The statutory compensation process is considered a mitigation measure under the assessment of Land Take. As such the extent of land take and potential long term impact Is a material consideration of the EIA process.	As presented in Chapter 21 (Land Take), the acquisition of the various specified rights and interests in land and property, is necessary in order to ensure the delivery of the MetroLink project in its entirety. Land owners who have land acquired will be entitled to apply for compensation in accordance with the general compulsory purchase code. Property owners who have properties that are subject to short-term and/or temporary acquisition can also apply for compensation. Compensation will be provided through the Compulsory Purchase Order (CPO).

Submission No.			196	
Organisation Name or Name of Submitter			Mouna Unlimited Company (represented by Stephen Ward Town Planning & Development Consultants Limited)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
RE: RAILWAY (METROLINK-ESTUARY TO CHARLEMONT VIA DUBLIN AIRPORT) ORDER 2022 - LANDS AT SILLOGUE GREEN LANE AND BALLYSTRUAN LANE, SWORDS, CO. DUBLIN				
6	Note 1 to proposed works affecting the subject lands (page 4 of submission)	5	We note there appears to be a discrepancy between the figures contained within able 21.5 of Chapter 21 of the EIAR and the Railway Order Book of Reference Second Schedule (Land which may be acquired) and Fourth Schedule (Land of which temporary possession may be taken). The total area of lands affected In both cases is 8,569sq.m.	Table 21.6 (not 21.5) in EIAR Chapter 21 (Land Take) states an area of 8569m2 required, comprising Plot ML39-T2 6742m2 (Temporary); Plot ML39-T3 1496m2 (Permanent); Plot ML3E-T21 225m2 (Temporary); and Plot ML38-T3 106m2 (Temporary).
7	Grounds of submission (page 4 of submission)	5	In particular, the position of the Dardistown Depot will have a long term Impact on this sensitive receptor that has not been adequately assessed as part of the documents submitted with the application for a Railway Order.	TII disagree with the statement that the long term impact on the receptor has not been adequately assessed. The EIAR provides a comprehensive and detailed assessment of the potential impacts, mitigation measures and residual effects on sensitive and non-sensitive locations along the entire alignment. Industrial facilities are generally not considered particularly sensitive, so long as the proposed Project does not impact the operation of the facility (such as severed access). As detailed in Chapter 11 (Population and Land Use), sensitive receptors are considered to include homes(houses as well as case homes and residential facilities) and social infrastructure, including medical, educational, rehabilitation and recreational facilities (i.e. sports, leisure and recreation) along with tourism and economic facilities such as businesses and visitor attractions recognised for their cultural or historic significance and/or natural assets. However an assessment has been undertaken under a number of relevant headings identifying the potential impacts on this facility as outlined here. Air quality impact during construction and operation phases of MetroLink was assessed in Chapter 16 Air Quality of the EIAR. According to the assessment there will be no impact on the Mouna Unlimited Company’s operation during construction or operation period of MetroLink as follow: “The Construction Phase of the assessment identifies a generally negligible or beneficial effect on air quality in the vicinity of the proposed Project. Therefore, overall, it is considered that the residual effects with the EPA Guidelines (EPA 2022) and considering the likely effects of emissions from the proposed Project construction, the likely effects are considered overall Neutral, Not Significant and Medium-Term.” and “Therefore, overall, it is considered that the residual effects with the EPA Guidelines (EPA 2022) and considering the likely effect of emissions from the Operational Phase of the proposed Project, the likely effects are considered overall Neutral, Not Significant and Long-Term.” Ground-borne noise and vibration impact during construction and operation phases of MetroLink was assessed in the EIAR Chapter 14 Ground-borne Noise and Vibration. According to the assessment there will be no impact on the Mouna Unlimited Company’s operation due to ground-borne vibrations and no significant impact due to ground-borne noise during construction and operation phases. Airborne noise and vibration impact during construction and operation phases of Metrolink was assessed in Chapter 13 Airborne Noise and Vibration. The facilities operated by Mouna Unlimited Company are assessed as industrial buildings. According to British Standard BS 5228 – 1: 2009+A1:2014 – Fixed Limits, the noise limit is “75dB (LAeq,T) daytime (12hr) & Saturday AM (6hr)”. According to the assessment in EIAR Appendix 13.7 Construction Phase modelling and Appendix 13.8 Operational Phase Modelling, this threshold will not be reached during the construction or operation of Metrolink, resulting in no impact on Mouna Unlimited Company operations. Furthermore access to the site will be maintained throughout but the construction phase and the operational phase of the project to ensure that the site can continue to operate. During the construction phase, it is considered that mitigation measures as outlined in the EIAR and the CEMP will provide sufficient protection to ensure that there are no impacts on the operation of the facility. There are no significant impacts predicted here during the operational phase of the project.
8	Grounds of submission (page 5 of submission)	5	4.2 It is submitted the proposed site for the depot and associated tracks and infrastructure Is not the optimum location for the delivery of the Metrolink Project and servicing of the trams. There are adequate lands available to the west and north that could facilitate the metro line and service depot that are more suited and which also avoid land take from our client and the relocation of the depot would negate the need for the two depot access lines which sever a key proportion of the factory site. It is our client's preference to have the Metrolink line moved to the west and the depot moved to an alternative location to avoid our client's property and lands.	Options for the location of the depot and the associated access lines into the depot have been extensively assessed as part of the development of the proposed Project. The proposals incorporated in the RO application are considered to provide the best balance between operational requirements; compliance with planning designations (with the majority of the proposed site within 'General Employment' rather than 'High Technology' zoned land area; environmental impact; and retention of the ability for future adjacent land development as envisaged in local plans. Further details are provided in EIAR Chapter 7 (Consideration of Alternatives (Section 7.7.4.2 to 7.7.4.5) and EIAR Appendix A7.6 (Depot Location Options Report).

Submission No.			196	
Organisation Name or Name of Submitter			Mouna Unlimited Company (represented by Stephen Ward Town Planning & Development Consultants Limited)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
RE: RAILWAY (METROLINK-ESTUARY TO CHARLEMONT VIA DUBLIN AIRPORT) ORDER 2022 - LANDS AT SILLOGUE GREEN LANE AND BALLYSTRUAN LANE, SWORDS, CO. DUBLIN				
9	Proposed Works and Impact on ABP Industrial Plant (page 6 of submission)	7	Our client does not consent to any measure proposing the loss of land occupied by the Industrial facility and/or the WWTP. Any intrusion into these works has the potential to Impact upon the operating capacity of ABP business group. It is submitted that the route of the MetroLink and construction zone should be repositioned to adjacent undeveloped lands where no concerns re access to a working facility or protection of a food safe facility exists.	Please refer to response item (8) above regarding the selection of depot location and track alignment. The proposed track alignment and depot do not impact or require land take from the Waste Water Treatment Plant (WWTP) site. Permanent land take from the industrial facility area is limited to a small area of open land on the north-west corner of the site, away from the industrial buildings.
10	Services (page 6 of submission)	7	Our client is gravely concerned that the proposal has the potential to impact on pipelines and other buried services crucial to the operation of the facility due to the proposal to provide the MetroLink below ground level in the vicinity of the submission lands. Our client requests cross sections, longitudinal sections and drainage proposals to fully assess the potential impact on essential services.	The proposed Project has incorporated utility diversions where necessary to accommodate the proposed construction works and operational railway. For the Dardistown area these are indicated on the RO drawings in Utilities Diversions Book 1 of 4 Fingal County Council; see Ballymun Sheet 9 of 11 (Plan Drawing No ML-UC 303 9-10) and adjacent drawings with a summary of Residual Infrastructure and Utility Impacts Post Mitigation provided in EIAR Chapter 22 (Infrastructure and Utilities) Table 22.12. The requirement for utility diversions and protection is noted in EIAR Chapter 5 (MetroLink Construction Phase), section 5.4.10. Utility diversions known to be required at this time have been agreed in principle with the relevant statutory undertakers and the designs are included within the RO application. Following the grant of any RO all utility diversions and protection measures will be finalised and agreed with the relevant utility stakeholders (and relevant agencies). The assessment methodology, impact assessment and proposed mitigation measures are contained in EIAR Chapter 22 (Infrastructure & Utilities).
11	Sillogue Green Road Re-alignment (page 6 of submission)	7	There are no details provided for the realignment of Sillogue Green Road that serves the subject lands. The Railway Order documents contain only a plan with no dimensions. The realigned road would appear to be on fill as it passes the subject lands. Our client requests further detail to ensure that the proposed road and junctions are sufficient to cater for the HGV movements that are generated by the existing activities on site.	Detailed design of the road will be undertaken at subsequent design stages subject to RO approval. The road will be designed in accordance with normal highway and junction standards, compatible with expected traffic use including HGVs. All road design will be subject to agreement with the relevant local authority and affected landowners where appropriate, as noted in EIAR Chapter 4 (Description of the MetroLink Project) Section 4.13.1.
12	Grounds of submission 4.7 (page 6 of submission)	7	There has not been adequate consideration of the potential Impacts from the construction and operational phases of the proposed development on the ABP Plant which is a very sensitive commercial receptor.	Please refer to response item (7) above.
13	Grounds of submission 4.8 (page 7 of submission)	8	The proposal does not outline potential access routes to the subject lands during construction stage of MetroLink. Our client must be able to maintain unimpeded operating capacity during construction with full 24/7 accessibility and operational capability. The WWTP must also be accessible at all times for maintenance.	Please refer to EIAR Chapter 4 (Description of MetroLink Project) Section 4.13.1. This states 'Where access to private or public property will be disrupted by the proposed Project, temporary/permanent alternative access is included in the design based on replacement on a like-for-like basis, subject to agreement with the affected landowners and the relevant local authority. The RO will apply for the replacement of any access arrangement extinguished on a like for like basis'. Typical construction details associated with both temporary and permanent roadworks are summarised in EIAR Chapter 5 (MetroLink Construction Phase) Section 5.5.1.

Submission No.			196	
Organisation Name or Name of Submitter			Mouna Unlimited Company (represented by Stephen Ward Town Planning & Development Consultants Limited)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
RE: RAILWAY (METROLINK-ESTUARY TO CHARLEMONT VIA DUBLIN AIRPORT) ORDER 2022 - LANDS AT SILLOGUE GREEN LANE AND BALLYSTRUAN LANE, SWORDS, CO. DUBLIN				
14	Grounds of submission 4.9 (page 7 of submission)	8	The preliminary construction management plan that forms part of the EIAR does not provide details relevant to our client's property. Appendix 5.3 Construction Sequence Report highlights that a "full temporary road diversion" is required for Sillogue Green Road (Section 6.2 p.46 of 195) but no details are provided. Drawing ML1-JAI-EIA-ROUT_XX-DR-Y-O5013 appears to include an access road through the adjacent construction area from the Naul Road via lands to the west but no description is provided of this intent. This access road crosses four separate sections of metro tracks and is also proposed as a haul route. A detailed construction management plan should identify how access will be maintained throughout the construction of the metro lines and the realigned Sillogue Road.	EIAR Chapter 9 Traffic and Transport, Appendix A9.5 Scheme Traffic Management Plan provide details of Phase 1 and 2 of the proposed Temporary Traffic Management plans at Dardistown, see Section 6.5.6.2, Figures 6-13 and 6-14. The contractor(s) to be subsequently appointed subject to future progression of the project will be required to prepare a more detailed Construction Environmental Management Plan (CEMP) for each specific package of works as required, building on the draft CEMP information contained in EIAR Appendix A5.1. There will thus be a specific CEMP prepared for the development of the depot and Dardistown station, which will include details of the construction programme and associated temporary works, including site haul routes, associated safety requirements and local diversions required to maintain access to properties while the works are progressed.
15	Grounds of submission 4.10 WWTP (page 7 of submission)	8	The route as illustrated alters the existing access to the WWTP and provides a new access road from Sillogue Green Road. The new access road and associated construction zone falls within the WWTP lands. We note the comment at Page 51 of Volume 2 Book 1 Chapter 7 (Consideration of the Alternatives) which states ' <i>At Dardistown required demolitions would be dependent on precise location of the depot location, but the only potential demolition and relocation of a private wastewater treatment plant</i> '. No part of the WWTP lands have been identified as necessary for the Metrolink project in the documents submitted with the Railway Order application.	It is correct that the RO application does not require the acquisition of any lands from the WWTP site. The comment in the text referred to relates to the initial comparison of depot locations as described in the Preferred Route Design Development Report, with the depot location preferred at that time potentially impacting on the WWTP. The subsequent more detailed appraisal of depot location options as described in EIAR Appendix A7.6 revised the depot location with the location as included in the RO application not impacting the WWTP. Please refer to response item (2) regarding continued access during the works, which will be either on the existing Sillogue Green road; a temporary road or via the permanent realignment of the access road.
16	Grounds of submission 4.11 (page 7 of submission)	8	Our client is concerned that proposals made as part of this Railway Order will result in the inclusion of ABP lands that are not Identified as part of the documents submitted and without its consent. As already stated above, our client does not consent to any measure proposing the loss of land occupied by the industrial plant and WWTP and/or associated infrastructure, pipelines or other buried services.	Please refer to response item (15) above.
17	Grounds of submission 4.12 Dardistown Depot (page 7 of submission)	8	The proposed depot to the north of our clients' lands has the potential to generate negative impacts with regard to dust and particulate matter, light, odour, noise and vibration that could result in a decline in the quality/quantity of product from the existing plant and loss of business which in turn would have a negative impact on the wider business of ABP and related companies. The depot is of a large scale and if approved would result in a material increase of traffic using the surrounding road network. The increase in traffic has potential to negatively impact on plant related traffic. There is potential for unacceptable noise levels at the lairage area from the trams being tested and also from the operation of the depot. The depot will likely operate on a 24/7 basis (as per para. 6.11.2 of the EIAR) and would clearly generate noise, dust, odours and light spill during hours of darkness.	The light impact of the Dardistown Depot was assessed in EIAR Chapter 27 (The Landscape). The proposed depot will include extensive lighting of the facility which will introduce a significant change to the night-time characteristics of the site, given the current virtual absence of lighting across the site. Overall, the potential effects on the visual environment and on visual amenity during the Construction Phase will be moderate and negative. Overall, the predicted effects on the visual environment and on visual amenity during the Operational Phase will be slight and negative. Appropriate mitigation measures will be taken to mitigate the visual effects as follows: - Details of fencing, mesh netting etc used within the project which includes the use of darktoned, neutral colours (dark grey/black) and non-reflective finishes (if appropriate/practical) in order to ensure these elements are visually recessive. This assists significantly in reducing visual impact; - The lighting strategy proposed for the public realm, particularly in respect of lighting intensity, timing control/periodicity, colour temperature and control of light spillage. This should include details of the lighting elements within the public realm associated with each station, particularly in respect of luminaire and column type, height, finish etc. Following mitigation measures the impact on visual effects will be Slight & Negative.

Submission No.			196	
Organisation Name or Name of Submitter			Mouna Unlimited Company (represented by Stephen Ward Town Planning & Development Consultants Limited)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
RE: RAILWAY (METROLINK-ESTUARY TO CHARLEMONT VIA DUBLIN AIRPORT) ORDER 2022 - LANDS AT SILLOGUE GREEN LANE AND BALLYSTRUAN LANE, SWORDS, CO. DUBLIN				
			Response (17) continued.	With regard to the Dardistown Depot and the area zoning see Response (26). Relating to traffic impact on the Mouna Unlimited Company’s operation during construction or operation period the assessment is detailed in Appendix 9.5 Scheme Traffic Management Plan. According to Appendix 9.5, access to Mouna Unlimited Company’s will be provided at all times due to a temporary access road whilst the permanent access road is not available. Traffic impact during construction, taking into consideration proposed traffic management, predicts an increase in HGV volume in the local area. This will be primarily on the R108 north of the M50 junction, of between 2% and 3% during the morning peak and with an increase of 3% in HGV volume along the R108 during the evening peak. Along Sillogue Green the predicted increase in HGV volume is higher, at 12% in the morning peak and 30% in the evening peak, however, this increase only equates to a minimal increase in actual HGV movements during both the morning and evening peaks. The impact on traffic during operation of MetroLink according to Chapter 9 Traffic and Transport, Table 9.136, will be Long-term Moderate and Slight Positive due to traffic reduction on the M50 and R108 Ballymun Road. Regarding the impact on Air quality, Noise and Vibration please refer to response item (19) below.
18	Grounds of submission 4.13 (page 8 of submission)	9	It is submitted that the proposal has not taken proper account of the plant as a very sensitive commercial receptor. The site is continually identified as 'FryLite' in the documentation submitted. The planning history detailed at section 4.4.2.5 of the Planning Report states the construction activities will not affect the temporary use of the site by Frylite but do not mentioned the abattoir.	Please refer to response item (7) above.
19	Grounds of submission 4.13 (page 8 of submission)	9	The construction and operational phase will cause a significant negative impact in terms of inter alia, air quality, noise, ground borne noise and vibration. The potential environmental and operational impacts have not been adequately considered as part of the public consultation document. It is submitted that without the relocation of the depot and with clear, specific, defined and acceptable mitigating measures, the proposed development would result in a decline in the quality/quantity of product from the plant and loss of business which in turn would have negative impacts on the wider business of ABP and related companies and the ability of the Plant to operate properly.	Please refer to response to item (7) above.
20	Grounds of submission 4.14 and 4.15 (page 8 of submission)	9	According to section 7.7.4.1.1 of the EIAR, the reasoning behind the location of a depot at Dardistown is it <i>"has potential for less significant environmental effects when compared to the proposed site at Estuary. It is also possible to mitigate the majority of the potential Impacts Identified utilising the proposed mitigation measures outlined In the relevant chapters of the EIAR"</i>. The location of the Depot cannot be justified on this basis as the abattoir has not even identified let alone assessed and therefore no appropriate mitigation measures are included.	Please refer to response items (3) and (7) above.
21	Grounds of submission 4.16 (page 8 of submission)	9	It is submitted that there is Inadequate Information submitted to support the assessment of alternatives contained within the EIAR. Documents are referred to in the EIAR that do not appear to form part of the application. For example, the Metrolink Preferred Route Design Development Report (TII, 2019) and the Preliminary Design Report (PDR) for Metrolink published by Jacobs/Idom In 2020 (Appendix 7.6-refers).	The MetroLink Preferred Route Design Development Report (TII, 2019) is a document that was part of the 2019 public consultation on MetroLink and the document remains available on the TII MetroLink website. It describes alternatives considered to the previously published Emerging Preferred Route (EPR) information. The present EIAR contains information for all relevant design alternatives assessed, and provides the evidence supporting the selected location of the depot as included in the RO application. Please refer to EIAR Chapter 7 (Consideration of Alternatives). Section 7.7.4 of Chapter 7 presents the assessment and identification of a preferred site for the depot for the proposed Project. It includes an assessment of an option to locate the depot at Estuary and an alternative site at Dardistown, and the assessment of localised alternative locations within the Dardistown area. Links to the aforementioned reports are also provided within the documentation. Appendix A7.6 also presents the Depot Location Options Report.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
RE: RAILWAY (METROLINK-ESTUARY TO CHARLEMONT VIA DUBLIN AIRPORT) ORDER 2022 - LANDS AT SILLOGUE GREEN LANE AND BALLYSTRUAN LANE, SWORDS, CO. DUBLIN				
22	Grounds of submission 4.17 (page 8 of submission)	9	According to the EIAR, a multi-criteria analysis was undertaken to review nine main options and various sub options. Diagram 7.7 illustrates alternative positions numbered 1-9 however the multi-criteria analysis does not appear to form part of the EIAR or have been submitted with the Railway Order application document. This Is a key document to understand why the position as proposed was selected.	Diagram 7.7 in the EIAR Chapter 7 (Consideration of Alternatives), shows all initial options considered for the depot location at Dardistown and justification is provided for the selection of Option 8a as the proposed depot location (Section 7.7.4.2 to 7.7.4.5). EIAR Appendix A7.6 provides further details on the assessment including comparison against a further depot option.
23	Grounds of submission 4.18, 4.19 and 4.20 (page 9 of submission)	10	Section 7.7.4.3 jumps straight to the fact that the preferred site is Option 8a and provides arguments for this position. The only other option considered in any detail was a further position, called Option 10 that was put forward by 'a major landowner in the Dardistown Area' and discussed at section 7.7.4.5 of the EIAR and assessed at appendix 7.6. It is submitted that without the detailed analysis presented to An Bord Pleanála it cannot be concluded that the position of the Dardistown Depot is the best available option. The previous position of the Dardistown Depot was approved in 2011 and demonstrates that a depot can be facilitated without access lines affecting our client’s lands. Our client notes that Option 10 would have a significant impact on its lands and operation of the existing and established industrial businesses on site and that would result in the demolition and relocation of the WWTP. Option 10 would clearly have severe detrimental impacts on the WWTP and by definition also on the factory.	Please refer to response item (21) and (22). Note that depot Option 10 was not progressed and does not form part of the RO application. Option 8A was identified as the preferred site option for the location of the Depot, following a detailed environmental analysis, presented in section 7.7.4.3 of Chapter 7 (Consideration of Alternatives). As detailed in section 7.7.4.5, following consultation with a major landowner in the Dardistown area, further analysis was undertaken to review whether an alternative site location proposed by that developer would be a feasible option for the proposed depot. This option is referred to as Option 10 and is at a similar location to Option 1 previously assessed. However, Option 10 is located approximately 200m further west than Option 1 and extends into the Dublin Airport Public Safety Zones (PSZs). It is important to note that Option 1, which is like Option 10 was not previously selected as the preferred option for key reasons relating to planning and the interface with the proposed alignment for the Greater Dublin Drainage (GDD) sewer. Nonetheless, a further multicriteria analysis was undertaken, which compared Option 10 to the previously identified preferred option (Option 8a).
24	Grounds of submission 4.21 (page 9 of submission)	10	When reviewing the documentation submitted with the Railway Order application, it appears that the map contained in the Railway Order Application Documentation relating to the Fingal Development Plan 2017-2023 zoning map 11 does not take account of Variation 1 which altered the noise zones around Dublin Airport adopted on the 9th of December 2019. We also note the LAP for Dardistown no longer applies and there is no objective to prepare a new LAP in the draft FDP 2023-2029.	The figures in the Planning Report relate specifically to the land use zonings that apply to lands along the alignment of the project in both the Fingal Development Plan 2017-2023 and the draft plan as of the date of lodgement of the Railway Order. For clarity, other mapped objectives, including Noise Zones were not shown. The Noise Zones incorporated into the plan in 2019 have been considered and are described in the text of the Planning Report where appropriate. The status of the Dardistown LAP and the requirements of the draft Fingal Development Plan 2023-2029 in this regard are noted in the Planning Report.
25	Grounds of submission 4.22, 4.23 and 4.24 (page 9 of submission)	10	According to the Report by Jacobs/Idom contained at Appendix 7.6 of the EIAR, the principal reason for the location of the Depot (Option 8a) "was that compared to other options. Option 8A was located mostly in the planning zone for "General Employment’ and it had no interface with the planned GDD Sewer project"(p31). When comparing the two options (Option 8A and Option 10), Option 8A was noted as being largely (c.70%) in the General Employment Zoning. Table 6-1 states, "<i>Connecting lines are in the "High Technology Zone" but should not restrict development because they are In retained cut and can be easily slabbed at ground level"</i> (Table 6-1 of Appendix 7.6). <i>30% of the land take required for the Dardistown Depot is zoned HT High Technology. This is a substantial area of high value land and will affect its future development both in terms of capacity and urban design. There are ample lands north of the proposed location that are zoned GE which would be more suitable for this land use.</i>	As detailed in section 7.7.4.3 of Chapter 7 (Consideration of Alternatives), land-take for Option 8a would be from agricultural land and sports pitches. The footprint of this option is large, as the railway access route into the site would sterilise a significant area of land between the Metrolink line and the depot lines and buildings. However, this option would be largely in the “General Employment” zoning area, leaving more of the land with higher development potential (High Technology). It should also be noted that the depot at this location would be in the “ Outer Public Safety Zones”, which restrict high density development in proximity to the Dublin airport runways. The depot development is appropriate for this restricted area. This proposed location for the Dardistown Depot has a number of advantages over alternative site locations including the following: * This site has more limited encroachment on lands zoned for “High Technology” development in the Dardistown Local Area Plan than other site options assessed. The majority of the proposed site occurs within areas designated for “General Employment” development. It is preferable that the site occupies the “General Employment” area as this area is more limited in terms of its future development potential than the “High Technology” zoned land as it is restricted by the presence of Outer Public Safety Zones which restricts the density of development allowed due to proximity to the runways at Dublin Airport. * The approach tracks to this option does not sterilise as much land when compared to other options. This means that there is a reduced land area required for this Depot site option including lands effected by the access tracks. This means that impacts on development land in the area is reduced (when compared to other options); * Operation of the depot is enhanced by allowing additional tracks and switches accessing the stabling area. Please refer to Depot Location Options Report in Appendix A7.6 for details of the full assessment.

Submission No.			196	
Organisation Name or Name of Submitter			Mouna Unlimited Company (represented by Stephen Ward Town Planning & Development Consultants Limited)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
RE: RAILWAY (METROLINK-ESTUARY TO CHARLEMONT VIA DUBLIN AIRPORT) ORDER 2022 - LANDS AT SILLOGUE GREEN LANE AND BALLYSTRUAN LANE, SWORDS, CO. DUBLIN				
26	Grounds of submission 4.25, 4.26 and 4.27 (page 10 of submission)	11	As acknowledged in the consideration of alternatives at section 7.7.4.1 of the EIAR, “Under the Fingal Development Plan 2017-2023, a metro depot is not Identified as “Permitted In Principle" or as “Not Permitted" under either of the zoning objectives. However it goes on to say, ‘in this regard, it is considered that a Depot is permissible at this location, particularly given the recognition of the depot within the Dardistown LAP." It is submitted that this statement does not in fact reflect the provisions of the zoning objective. The Use Classes related to the zoning objective of 'High Technology* as contained in both the current Fingal Development Plan 2017-2023 and the draft Fingal Development Plan 2023-2019 list the following as 'Not Permitted': • Vehicle Servicing/Maintenance Garage • Road Transport Depot In comparison, lands zoned General Employment permit these uses. According to the Planning Report ‘the proposed Depot is consistent with the Vehicle Servicing/Maintenance Garage, permitted in GE zoned lands’ (para. 4.4.2.6). It is submitted therefore that it cannot be consistent with the HT zoning objective.	The proposed depot comprises a number of related uses, including vehicle stabling, storage, maintenance, offices and administration. The depot is concentrated on the General Employment lands with some of the overall site extending to the High Technology zoned lands. The stabling, maintenance and servicing takes place on the General Employment lands. In this regard, the works on the General Employment zoned land comply with the permitted uses for this zoning objective. In respect of the High Technology zoning the proposed uses under the proposed Railway Order relate to track routing and ancillary works and not of the nature of maintenance or servicing. The works on the High Technology zoning are therefore, not specifically identified as Permitted or Not Permitted. The Fingal Development Plan notes that ‘Uses which are neither ‘Permitted in Principle’ nor ‘Not Permitted’ will be assessed in terms of their contribution towards the achievement of the Zoning Objective and Vision and their compliance and consistency with the policies and objectives of the Development Plan.’. The vision of the ‘HT’ zoning objective will be fulfilled by the proposed Project, as in the long term it will deliver a high quality and highly accessible station that opens the lands to higher intensity employment uses.
27	Grounds of submission 4.28 and 4.29 (page 10 of submission)	11	The overall conclusion of the Planning Report submitted with the Railway Order application states, ‘<i>in two locations, the proposed Project does not comply fully with the current zoning objectives of the lands through which, or under which, it passes. The two locations are at the Intervention Shaft at Albert College Park and St. Stephen’s Green, in both locations under the current DCDP 2016-2022.</i>’. No aspect of the project is found to be contrary to the zoning objectives of lands that fall within the FDP 2017-2023. <i>It is recognised that, whilst in certain circumstances An Bord Pleanála has the power to grant permission to a Railway Order even if it is in material contravention of a Development Plan this power is not unlimited. However, it is submitted that the applicant should accurately identify the aspects of the development plan, particularly the zoning objectives it will contravene.</i>	The Fingal Development Plan notes that ‘Uses which are neither ‘Permitted in Principle’ nor ‘Not Permitted’ will be assessed in terms of their contribution towards the achievement of the Zoning Objective and Vision and their compliance and consistency with the policies and objectives of the Development Plan.’ As set out in the Planning Report, the Proposed Project contributes towards the zoning objectives and vision of each of the areas through which it passes and, therefore, does not contravene the zoning objectives of the Fingal Development Plan 2017-2023 or the Fingal Development Plan 2023-2029.
28	Grounds of submission 4.31 (page 10 of submission)	11	Land take for this the chosen option 8A would sterilise a significant area of land between the Metrolink line and the depot lines and buildings due to Its circuitous alignment.	Please refer to response item (4).
29	Grounds of submission 4.32 (page 11 of submission)	12	The outer public safety zone has been deemed appropriate for the location of the Dardistown Depot. It is submitted that the entire depot should be located within lands zoned GE to allow for more sensitive land uses to be located on the more valuable lands zoned HT.	Please refer to response item (8).
30	Grounds of submission 4.33 (page 11 of submission)	12	The depot location adjacent to the Dardistown station limits the potential for the station to be centrally located in a highly valuable development area. The depot effectively cuts off 50% of the station’s development potential which is dominated by the depot. Any future commercial development would be one sided and offer poor urban integration.	Please refer to response item (8) and response item (26)
31	Grounds of submission 4.34 (page 11 of submission)	12	Architects Henry J. Lyons and Company has prepared an indicative masterplan attached at appendix C. The analysis of the potential impact of the depot on the proposed Metro station at Dardistown clearly demonstrates the missed opportunity that would result If the depot is located in Dardistown and the negative impact it would have on the future development of the High Technology zone and opportunities for placemaking. As identified in the EIAR, “the design of Dardistown Station is complicated by the need to provide rail links into the Depot”{4.16.3.3). By removing the depot from Dardistown a more efficient and successful masterplan can be achieved.	Assessment of the depot location between a site at Estuary and a site at Dardistown concluded that a location at Dardistown for the depot was preferable - see EIAR Chapter 7 (Consideration of Alternatives) Section 7.7.4 for details.

Submission No.			196	
Organisation Name or Name of Submitter			Mouna Unlimited Company (represented by Stephen Ward Town Planning & Development Consultants Limited)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
RE: RAILWAY (METROLINK-ESTUARY TO CHARLEMONT VIA DUBLIN AIRPORT) ORDER 2022 - LANDS AT SILLOGUE GREEN LANE AND BALLYSTRUAN LANE, SWORDS, CO. DUBLIN				
32	Grounds of submission 4.38 (page 12 of submission)	13	It is submitted that the detailed design of the Dardistown Station and lands required for its operation should have been considered as part of the Railway Order application.	The RO application provides for the detailed design of the station appropriate for its future use although initial use will be restricted for MetroLink access to the depot only. Pending future development of the Dardistown lands, the RO proposals provide for adjacent local landscaping and appropriate road access to the station, which could be enhanced as part of future development plans by others, subject to necessary planning approvals. Please refer to EIAR Chapter 4 (Description of the MetroLink Project), Section 4.16.3.
33	Grounds of submission 4.39 (page 12 of submission)	13	Dardistown is one of the 16no. stations listed as part of Metrolink. There has been no provision made for a public access road or car parking for passengers using this station in the future. It also would appear that there has been no assessment of the potential impact of this additional loading on the surrounding road network, including the M50. It is submitted that a sensitivity analysis of the future scenario should include Dardlstown as an operational station.	Please refer to response item (32). In addition, car parking is not proposed at any MetroLink station (including Dardistown) except for Estuary where an adjacent park and ride site is proposed. The station locations are intended to support pedestrian and cycle access together with public transport interchange. See also EIAR Volume 5 Appendix A9.2 Overall Project Traffic & Transportation Assessment, Section 2.7, Dardistown Depot.
34	Grounds of submission 4.40 (page 12 of submission)	13	The location of the depot at Dardistown station will curtail the options for a public access road and car parking in the future due to lands to the north being cut off and sterilized leaving a single sided station. Locating car parking on lands to the south or south east would represent an inefficient use of limited high value lands to the south zoned for High Technology uses.	Please refer to response item (33).
35	Conclusion, point 5.1 (page 14 of submission)	15	It is clear that the route as now proposed will have significant negative impacts on the submission lands during the construction and operational phases. It is submitted that the project does not take account of the plant as a very sensitive commercial receptor.	Please refer to response item (7).
36	Conclusion, point 5.2 (page 14 of submission)	15	The existing plant and its associated infrastructure should be a central consideration of the Environmental Impact Assessment Report for this part of the route as the results will be crucial in determining the potential Impact on the viability and operational capacity of this industrial facility. At this stage the preference of Mouna Unlimited/ ABP Ireland would be to reposition the line of the tracks and relocate the proposed depot elsewhere so the potential impacts on our client's business are removed, rather than attempt to mitigate such Impacts.	Please refer to response item (7).
37	Conclusion, point 5.3 (page 14 of submission)	15	ABP remain willing to engage in a constructive manner with MetroLink and Transport Infrastructure Ireland to reach an amicable position that accommodates the requirements of the permitted and established ABP facility and WWTP whilst at the same time accommodating the development of the MetroLink Project.	Please refer to response item (8) and (26) in relation to the compliance of the proposed Project with zoning objectives at this location.
38	Appendix B, Waterman Moylan Consulting Engineers Limited Submission, Engineering Related Concerns, Sillogue Green Road (page 2)	24	The details contained within the railway order provide plan images only of the proposed road with no details in terms of vertical profile, broad cross section or dimensions. The road is shown to be straight with a new priority junction to serve our Clients property. This road is used by Heavy Goods Vehicles (HGVs). There is no Information provided to demonstrate that the road is suitable for HGVs turning. Our Clients would seek to receive full details for the design of this access road so that it can be properly assessed in term of suitability to serve the existing facility on our Clients property and indeed to serve the future development of the property in accordance with the current land zoning contained within the Fingal County Council Development Plan.	Please refer to response item (11).

Submission No.			196

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
RE: RAILWAY (METROLINK-ESTUARY TO CHARLEMONT VIA DUBLIN AIRPORT) ORDER 2022 - LANDS AT SILLOGUE GREEN LANE AND BALLYSTRUAN LANE, SWORDS, CO. DUBLIN				
39	Appendix B, Waterman Moylan Consulting Engineers Limited Submission, Engineering Related Concerns, Construction Management (page 2 and 3)	24&25	There are limited details contained within the railway order which set out how access to our Clients property will be maintained. Details of our Clients property, which contains two parcels of land and which both require access are shown on Figure 2. It is imperative that access to our Clients property is maintained at all times. We would seek to receive full details of the proposed temporary access which should clearly demonstrate how access (vehicular/Pedestrian/Cycle) will be maintained at all times. This will enable us to properly assess the proposals for access to our Clients property during the construction stage of the project. Details of the proposed temporary junction onto the existing R108 together with an appropriate Road Safety Audit of the junction and the temporary access road should be provided. The temporary access road would also appear to be intended for use as one of the main access points for construction traffic. The safety issues associated with using this access to serve our Clients property, whilst also as a primary access for construction traffic, needs to be properly considered.	Please refer to response item (11) and (14).
40	Appendix B, Waterman Moylan Consulting Engineers Limited Submission, Engineering Related Concerns, Existing Services (page 3 to 5)	25 to 27	Existing services which currently serve our Clients property need to be maintained at all times. The current MetroLink proposals are likely to impact upon this foul water rising main which has been acknowledged in the Environmental Impact Assessment Report (EIAR). It is suggested in the EIAR that the rising ain can be decommissioned and diverted. No details are provided in respect of the decommissioning or diversion. Details should be provided so that the potential impact on the operation of our Clients property can be properly assessed. The Figures contained within the EIAR which illustrate the existing utilities with the Metro Line overlaid do not appear to have any regard for the proposed Dardistown Depot or for the rail lines which are required to access the depot. The proposed Depot and associated rail lines are likely to impact existing utilities which currently serve our Clients property.	Please refer to response item (10).
41	Appendix B, Waterman Moylan Consulting Engineers Limited Submission, Engineering Related Concerns, Noise & Air Quality (page 5 and 6)	27&28	Our Clients would have concerns regarding noise and air quality arising from the works and how they might impact upon to the operation of our Clients property, both during construction stage and during operational stage. In this regard there is an existing business operating from the property and the lands are zoned to facilitate future development, both of which need to be considered when assessing the noise and air quality impacts.	Please refer to response item (19).
42	Appendix B, Waterman Moylan Consulting Engineers Limited Submission, Conclusion (page 7)	29	a) Sillogue Green Road (also referred to as Ballystruan Lane) - Proper details for the proposed road realignment have not been provided and should include dimensioned road cross section, Longitudinal Section showing proposed levels, Auto tracking for HGV's and a Road Safety Audit.	Please refer to response item (11).
43	Appendix B, Waterman Moylan Consulting Engineers Limited Submission, Conclusion (page 7)	29	b) Construction Management/Temporary Road Access - Proper details for the proposed temporary road access have not been provided which should include details of road alignment and levels, pedestrian and cycle access, junction details onto the R108 and Road Safety Audit. The intended use of this temporary access for both our clients property and as a primary construction traffic access needs to be properly considered and the risks that this could pose to pedestrians and cyclists accessing our Clients property. Access to all of the property owned by our Clients' needs to be provided at all times. In this regard there are two parcels of land that require access to be maintained.	Please refer to response item (11) and (14).

Submission No.			196	
Organisation Name or Name of Submitter			Mouna Unlimited Company (represented by Stephen Ward Town Planning & Development Consultants Limited)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
RE: RAILWAY (METROLINK-ESTUARY TO CHARLEMONT VIA DUBLIN AIRPORT) ORDER 2022 - LANDS AT SILLOGUE GREEN LANE AND BALLYSTRUAN LANE, SWORDS, CO. DUBLIN				
44	Appendix B, Waterman Moylan Consulting Engineers Limited Submission, Conclusion (page 7)	29	c) Existing Services - It is imperative that the existing services to our Clients property are maintained at all times. Our Clients have concerns regarding the intention to decommission and divert their private foul water rising main which currently serves the property. No details of the decommissioning/diversion appear to be contained within the Railway Order documents submitted.	Please refer to response item (10).
45	Appendix B, Waterman Moylan Consulting Engineers Limited Submission, Conclusion (page 7)	29	d) Noise and Air Quality - Our Clients have concerns regarding noise and air quality arising from the works and how they might impact upon to the operation of our Clients property, both during construction stage and during operational stage.	Please refer to response item (19).
46	Appendix C, Colliers Report, Planning Recommendation	33&34	In consideration of land use, planning, and environmental impacts we do not consider that TII have presented a scheme that aligns with the zoning objectives contained in the Fingal Development Plan 2017-2023 and the emerging Draft Fingal Development Plan 2023-2029. Moreover, the proposed scheme will result in significant negative consequences for the proper planning and sustainable development in the area In which it is proposed to carry out the railway works. In particular, the proposed depot and ancillary service lines will negatively impact the surrounding lands.	Please refer to response item (8) and (26).
47	Appendix C, Colliers Report, Sustainability	34	We note reference to the Climate Action and Low Carbon Development (Amended) Act 2021 in the MetroLink Planning report. We note no comment regarding carbon emissions that relate to the construction phase, only references to the reductions into the future. The main sections in the planning report relating to Greenhouse Gases 1 .2.1 .2 page 5, Project Response 3.4.1. 1 page 24, Climate Action Plan 2021 3.4,7 page 31. All references are to the future Public Transport reduction in emissions. We note that no assessment has been included to have specific regard to emissions during the construction phase.	The assessment of emissions during the construction phase is presented (along with emissions for operation period) in Chapter 17 (Climate) of the EIAR. For more information regarding carbon emissions please refer to Section 17.7 Residual Impacts (17.7.1 Construction Phase). The proposed Project with mitigation measures will result in total Construction Phase GHG emissions of 1,1149Kt CO2eq over an 9.25-year period equivalent to an annualised total of 0.37% of Ireland’s non-ETS 2030 emissions target or 2.0% of the 2030 transport sector carbon budget. Over the predicted 60-year lifespan the annualised emissions due to the initial Construction Phase and ongoing maintenance of the proposed Project will reach at most 0.049% of Ireland’s non-ETS 2030 emissions target or 0.27% of the 2030 transport sector carbon budget. The significance criteria for impacts (IEMA 2022) states that the impact significance must be taken from the project as a whole over its lifecycle rather than individual phases. Over the predicted 60-year lifespan the annualised emissions due to the proposed Project will reach at most 0.013% of Ireland’s non-ETS 2030 emissions target or 0.071% of the 2030 Transport Sector Carbon Budget (Department of the Taoiseach 2022). The increase occurs due to the considerable Construction Phase embodied carbon, which will be further mitigated during detailed design, and is not as a result of operational emissions as this phase is beneficial with respect to carbon emissions.
48	Appendix C, Colliers Report, Depot Location	36	The TII state that the benefit of locating the depot at a central location on the network (Dardistown) rather than at the end of the route at Lissenhall enables efficient train operations limiting empty coach stock running. The location of the depot in Dardistown is not aligned with those policies of Fingal County Council and will have significant negative consequences on the proper planning and sustainable development in the area and will have a significant negative impact on proper planning and sustainable development of the area (see details of the concerns at page 34 and 35)	Please refer to response item (26) regarding compliance of the proposed Project with zoning objectives. The selection of location of the depot at Dardistown, rather than at Estuary, is described in the EIAR Chapter 7 (Consideration of Alternatives) Section 7.7.4. It was also initially presented in the 2019 Preferred Route public consultation, with assessment and recommendation for the depot to be at Dardistown rather than at the end of the line at Estuary described in the Preferred Route Design Development Report, Appendix C, and which is available on the TII website. In addition to the specific points in the Respondent’s letter, this report also noted that a depot at Dardistown: - will provide a better operational location, much more central to the overall MetroLink and thus providing easier and more efficient accessibility for addressing incidents on the line; - from a maintenance perspective it provides more flexibility and longer maintenance periods overnight than a depot at Estuary; and - The Depot’s location at Dardistown has less environmental impacts than the location at Estuary, with reduced potential for impacts on biodiversity and other sensitive receptors having regard to noise, air quality and water. Furthermore, there would be less impact on properties and a reduced potential for impact on traffic.

Submission No.			196	
Organisation Name or Name of Submitter			Mouna Unlimited Company (represented by Stephen Ward Town Planning & Development Consultants Limited)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
RE: RAILWAY (METROLINK-ESTUARY TO CHARLEMONT VIA DUBLIN AIRPORT) ORDER 2022 - LANDS AT SILLOGUE GREEN LANE AND BALLYSTRUAN LANE, SWORDS, CO. DUBLIN				
49	Appendix C, Colliers Report, Business Interruption	36	No Information has been provided regarding continuation of operation of the business during the scheme and into the future and an extinguishment of the business In those circumstances must be considered. (see details of the concerns at page 35)	Please refer to response item (3).
50	Appendix C, Colliers Report, Access and Egress	35	There are no details of the realigned Sillogue Green Road that serves the subject site. We would need to be able to ensure that the proposed road and junctions are sufficient to cater for the HGV movements during and post construction that are generated by the existing activities on the property.	Please refer to response item (11).
51	Appendix C, Colliers Report, Proposed Temporary & Permanent Acquisitions	35&36	The nature of both the Permanent Take and Temporary Take have not been provided and the method of implementing those acquisitions has not been provided. Lands identified as "Temporary Acquisitions" when returned may not be capable of development or use and may also have a negative impact on the adjacent lands. The proposed scheme will result in significant complications Into the future regarding provision of suitable access and services to the subject site which will require that any future upgrades to access or services will need to take into account the presence of the proposed depot rail line which will be in open-cut and subterranean construction. In the absence of satisfactory detail of mitigation measures and a method statement for the implementation of the proposed scheme of works that will ensure continuation of operations during the scheme and into the future then the extinguishment of the business will occur at this location based on the proposed scheme and a significant loss to the property owner / operator will occur.	Please refer to response item (3).
52	Appendix C, Colliers Report, Accommodation Works	35 & 36	No details of Accommodation Works have been provided for consideration of the Impacted parties to assess the potential impact of the scheme and suitability or otherwise of those works. We recommend that further clarification in this regard is requested from An Bord Pleanála.	Please refer to response item (10) and (11).
53	Appendix D, Henry J Lyons Report, Concerns regarding Depot Proposals (page 7 of the report)	45	The proposed depot location, by way of its mass, location and orientation severely hinders the orderly development of the subject site and the surrounding area. Whilst the benefits of the Metrolink mainline are noted and appreciated with regards to unlocking the full development potential of the site, the presence of spur lines within the redline and wider context substantially limits potential for development.	Please refer to response item (8) regarding depot location and response (4) regarding interface between spur lines and land use.
54	Appendix D, Henry J Lyons Report, Loss of development lands (page 8 of the report)	46	Dardistown causes a significant portion of the larger of the two sites to be impinged upon. 14% of the larger landholding will be subject to either temporary or permanent sterilisation. The corner of the site effected by this sterilisation is in a prominent position, with the revised proposal significantly impacting on a potentially high density portion of the site. In addition, the proposed combination of temporary landholdings (ML 3E T3, T19 & T21) along the front of the site risk denying access to either of the sites existing frontages. This will effectively landlock the site, making the existing uses inaccessible and jeopardising future development potential as the duration of control of these lands is not specified.	Please refer to response item (3).

RE: RAILWAY (METROLINK-ESTUARY TO CHARLEMONT VIA DUBLIN AIRPORT) ORDER 2022 - LANDS AT SILLOGUE GREEN LANE AND BALLYSTRUAN LANE, SWORDS, CO. DUBLIN				
55	Appendix D, Henry J Lyons Report, Zone Usage & Sterilised Areas (page 9 of the report)	47	Such significant areas of sterilisation may affect the economic viability of proposals within the subject site and adjoining lands under separate ownership to the extent that this entire area may fail to launch. We note significant lower value lands to the north, closer to the airport, may be more suited to such use cases and land consumption.	Please refer to response item (8).
56	Appendix D, Henry J Lyons Report, Maximising Opportunity (page 10 of the report)	48	However, the proposed siting of the depot consumes large quantities of this prime area, and serves to diminish the potential of the remainder.	Please refer to response item (8).
57	Appendix D, Henry J Lyons Report, Proposed Railway Design (page 12 of the report)	50	The 2022 Railway Order proposal includes additional areas of land acquisition on a variety of terms - terms that as yet seem to not be fully defined. It would be to the betterment of the entire development zone if the road provided as a replacement to the current access road be built in a manner that aligns with the LAP, and that benefits alt local land users. We have shown this shared 50/50 with the land owner to the north in our studies which follow.	The proposed access road from the R108 (realigned Sillogue Green) provides access to both the Dardistown Station and the existing industrial facilities in the area. This road could in the future development plans for the area be upgraded and incorporated as part of a main access to the development if required and approved through the planning process.
58	Appendix D, Henry J Lyons Report, Full development potential (page 17of the report)	55	We note that we do not have details on the ability to build on or close to the CPO lands, either during or after Metrolink construction, or the impact this may have on routing services to the site - which poses a serious viability risk for the entire scheme.	MetroLink will be a catalyst for and provide opportunity for future development and regeneration. While the MetroLink Railway Order does not include for future neighbouring or overhead development, the tunnels and stations are designed to support appropriate future imposed loads. TII will be required to make submissions in relation to planning applications for proposed future developments on or adjacent to MetroLink and there will necessarily be some engineering constraints (such as permissible loadings) required. However MetroLink is committed to engaging with known development proposals and new development proposals as they emerge with the intent of facilitating such developments as they emerge to the maximum extent consistent with the safe operation of the proposed Project. Again in common with other existing rail and tunnel projects, following grant of the Railway Order and development of detailed design, TII will produce “Guidance Note for Developers” that will be the subject of bye-laws following the grant of Railway Order and which is designed to facilitate future adjacent or over-site development while protecting the integrity and safety of the MetroLink works and operations. It is inappropriate and unworkable to produce this policy at this stage because it would have to be in broad terms that deal not only with the current RO proposal and any contingencies that might arise from the Board seeking revised designs or new conditionality as part of the RO application process. Therefore at this stage TII is dealing with known development proposals on a case by case basis, TII will work with parties in the future to assist with the wider development of sites over and above stations and tunnels. In this context TII has successfully engaged with a number of developers over the last two years to accommodate development over and in proximity to the alignment and there have been no material restrictions on development subject to the implementation of agreed design and mitigation measures and it is not anticipated that MetroLink will have a material impact on the development potential of sites above and in proximity to the alignment in future.
59	Appendix D, Henry J Lyons Report, Partial development potential (page 17of the report)	55	The identity of the development is partially diluted. One 10 storey HQ grade building lost. We have been advised by Mouna Unlimited that the CPO of and positioning within of mainlines in the red and orange areas would constitute a fair and balanced agreement between both sides - Mouna Unlimited noting that the introduction of Metrolink and the Dardistown stop has benefits to their landholding. Alongside this, the lands in yellow would need to be excluded from CPO and available for free and unencumbered development.	Please refer to response item (8) and (26).

Submission No.			196	
Organisation Name or Name of Submitter			Mouna Unlimited Company (represented by Stephen Ward Town Planning & Development Consultants Limited)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
RE: RAILWAY (METROLINK-ESTUARY TO CHARLEMONT VIA DUBLIN AIRPORT) ORDER 2022 - LANDS AT SILLOGUE GREEN LANE AND BALLYSTRUAN LANE, SWORDS, CO. DUBLIN				
60	Appendix D, Henry J Lyons Report, Restricted development potential (page 17of the report)	55	The potential of an ‘unfinished’ corner to the site makes it difficult to market to tenants and potentially serves as a risk to its commercial viability. A further 8 story HQ grade building lost. The loss of a further key building will have an impact on the economic viability of the scheme.	Please refer to response item (8) and (26).
61	Appendix D, Henry J Lyons Report, Conclusion (page 19 of the report)	57	The siting of a Depot and the associated spur lines in this area largely sterilises the ability of Mouna Unlimited and adjacent landholders to develop the area in an orderly, well considered and viable manner. The proposal will create in excess of 7ha of sterilised, vacant land within the High Technology zone, with further sterilised land in adjacent zones. Similarly, any collective ambitions of all landholders to create a meaningful sense of place are substantially curtailed by the construction of a single sided station. There is great opportunity here to create a destination on par with those currently being developed around the southern Luas Green Line extension, however the locating of the depot here would all but eliminate the potential for similar north of the MSO. By moving the depot out of the High Technology Zone, all stakeholders will have the freedom to create a critical area of national and global importance, supported by Metrolink, but not handicapped by same.	Please refer to response item (8) and (26).

Letter RE: NDA submission for Metrolink Railway Order				
1	Introduction	1	The NDA looks forward to being involved in future consultations on this project. We understand that TII is going to adopt a 3 pronged approach to consultation on this project and we welcome this approach. We would suggest for these consultations TII make use of the recently published <i>Participation Matters: Guidelines on implementing the obligation to meaningfully engage with disabled people in public decision making</i> as well as the CEUD’s <i>Customer Communications Toolkit for the Public Service - A Universal Design Approach</i> which will help to produce universally designed written, verbal and digital communications that can be easily accessed, understood and used by everyone. It is also vital that all information on websites is accessible. Public body websites must comply with the accessibility criteria laid out in the <i>EU Directive on Web Accessibility 2016/2102</i> . It should be noted that a textual description of technical drawings and proposed station designs should be provided as these are often inaccessible by persons who use screen reading technology.	TII is committed to following best practice in terms of consultation with disability groups, Disabled Persons Organisations and other relevant stakeholders, as well as to continued engagement with the National Disability Authority. TII undertake to make use of Participation Matters: Guidelines on implementing the obligation to meaningfully engage with disabled people in public decision making and to CEUD’s Customer Communications Toolkit for the Public Service – A Universal Design Approach. TII’s websites are regularly monitored for compliance with the EU Directive on Web Accessibility 2016/2102. Nevertheless, we acknowledge that textual descriptions of technical drawings and imagery pertaining to the project can be improved and enhanced and it is the intention of the project team to apply best practice in this regard to both the website and to ongoing consultation.
2	Introduction	1	The NDA has previously advised TII that a Universal Design approach needs to be adopted and implemented on transport projects to ensure the provision of services that are easy to access, easy to understand and easy to use by everyone regardless of age, size, ability or disability. We continue to advise the same for this project.	TII agree and have included within EIAR Chapter 4 (Description of the MetroLink Project) the overarching principle of universal design and aims to make the proposed Project accessible for everyone to use, regardless of their age, gender, physical capabilities or cultural background. Design measures considered the following seven principles: - Equitable Use – The proposed Project has been designed for use by people with diverse abilities, by providing the same means of use for all passengers without segregating or stigmatising any users. - Flexibility in Use – The design accommodates a wide range of individual preferences and abilities, providing choice in the methods of use and adaptability to the passenger’s pace of travel. - Simple and Intuitive Use – The layout of the facilities is easy to understand, regardless of the passenger’s experience, knowledge, language skills, or current concentration level. - Perceptible Information – Information is communicated effectively to the passenger, regardless of ambient conditions or the passenger’s sensory abilities. Information will be provided in different modes (pictorial, verbal, and tactile). - Tolerance for Error – The design minimises hazards and the adverse consequences of accidental or unintended actions by providing warnings of hazards. - Low Physical Effort – The design can be used efficiently and comfortably and with minimal fatigue. - Size and Space for Approach and Use – Appropriate size and space is provided for approach, reach, manipulation and use regardless of the passenger’s body size, posture, or mobility. The design provides a clear line of sight to important elements for any seated or standing passenger.
3	Delivering Universally Designed transport services	2	The NDA strongly advises that TII project should consider planning approaches that ensure that each element regarding the development and delivery of Metrolink includes accessibility as a key component to support all users to access transport services so they can participate in mainstream society. This includes persons with disabilities, older people and families with young children. As such, the NDA advises that TII adopt and implement a Universal Design approach for every aspect of the Metrolink project as set out in this submission.	Please refer to response item 1 and 2. Furthermore, Chapter 6 (MetroLink Operations and Maintenance) details how the proposed Project has been designed on the principle of Access for All. The design has been developed to meet all legislative requirements relevant to accessibility including the Disability Act 2005 and in turn the Sectoral Plan for Accessible Transport under the Disability Act 2005 (DTTAS 2012).
4	Delivering Universally Designed transport services	2	The NDA is aware that TII continues to consult with the Luas Disability User Group on the Metrolink project. The NDA welcomes this consistent engagement and recommends continuing this engagement. However, the NDA would also encourage consistent engagement with as wide a range of users as possible. The NDA would like to stress that user testing (piloting) is an important part of this sustained engagement process. This should be a key consideration for design of the interior and exterior of stations, car parks, cycle lanes and other infrastructure surrounding stations. User testing will also be key to assessing the design of the Metrolink carriages. Temporary infrastructure should be considered as well, for example as part of any shared spaces, to facilitate user testing and implementation of improvements.	Appendix A8.18 (in relation to Chapter 8 Consultation of the EIAR) summarises the questions raised by all stakeholders, including the National Disability Authority which requested 'Commitment in EIA Scoping Report that TII will have a sustained engagement process with a diverse set of users'. This led to the development of the Luas/MetroLink user Group, as identified in Appendix A8.18, with details of impacts assessed in Chapter 10 (Human Health) in the EIAR. Chapter 8 (Consultation) demonstrates the diverse range of users and stakeholders that TII have engaged throughout the Project. TII will continue to engage with the National Disability Authority, Luas/MetroLink Disability User Group, and all other stakeholders throughout the delivery of MetroLink to ensure a consistent engagement with as a wide a range of users as possible and include for user testing. As identified in response item 3, the design of the Project has been developed to meet all legislative requirements relevant to accessibility, however TII will undertake user testing (piloting) of all facilities prior to operation to ensure they are fit for purpose.

Organisation Name or Name of Submitter			The National Disability Authority (NDA)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter RE: NDA submission for Metrolink Railway Order				
5	Delivering Universally Designed transport services	2	Accessible services are one of the key criteria in the provision of universally designed services. Every aspect of the service including: the design of Metrolink stations; the location of Metrolink stations; the design and location of the proposed pedestrian level crossings; the pedestrian pathways; interchanges; way finders; tactile surfaces; the built environment; the number of transfers a person may need to make in one journey; and the exterior and interior design of the trains, need to be easy to access, easy to understand and easy to use for everyone regardless of age, size, ability or disability.	The overall project objective for the proposed Project, as established by the National Transport Authority (NTA) and Transport Infrastructure Ireland (TII) and as informed by planning policy context, MetroLink, is to: ‘<i>provide a sustainable, safe, efficient, integrated and accessible public transport service between Swords, Dublin Airport and Dublin City Centre</i>’. (National Development Plan 2021-2030, Box 9.1). Please refer to response item 1 and 2 regarding design principles. Chapter 6 (MetroLink Operations and Maintenance) details Passenger Movement and Wayfinding to the stations, within the stations, and at platform level.
6	Station and Infrastructure Design	3	Following a review of the available station design drawings there are a number of concerns which the NDA wishes to raise. The first concern is around access to stations for persons with disabilities. Many of the station designs provide details of proposed bollards outside of the front of the station where they are facing a road. It is unclear to the NDA the intended space between these bollards, and we would like clarification on the intended spacing, as bollards can present a barrier to access for wheelchair users, persons who use mobility aids, persons who are visually impaired as well as those who are pushing prams or travelling with luggage.	The provision of bollards (or a suitable equivalent) around the stations is part of an overall Hostile Vehicle Mitigation (HVM) strategy. HVM measures are necessary to reduce the risk of a terrorist attack and associated damage to MetroLink infrastructure. The design of HVM measures requires a balance between the technical requirements of any measures and the aesthetics, accessibility and functionality of the urban realm. The standards used as part of the design included: •PAS 68 Impact test specifications for vehicle safety barriers •PAS 69:2013 Guidance for the selection, installation and use of vehicle security barrier systems •Integrated Security – A Public Realm Design Guide for Hostile Vehicle Mitigation – Second Edition (CPNI) •Traffic Advisory Leaflet 02/13 (UK Department of Transport and CPNI) •Hostile Vehicle Guidelines for Crowded Places (ANZCTC) Based on these standards a secure perimeter was created made up of structural elements with a maximum spacing of 1200mm measured at a height of 600mm above ground level. This is in line with Irish Building Regulations and Irish Wheelchair Association guidance.
7	Station and Infrastructure Design	3	The NDA also notes with a great deal of concern that there is very little information in these technical drawings of ramp access, noting that ramps that are very long or very steep can lead to further barriers for disabled travellers, rather than promoting access. The NDA requests further detailed information on ramped access to stations where ramp access will be available as well as the proposed width and gradients of all ramps.	Please refer to response item 3. The detail referred to will be developed at detailed design. In line with the design principle of Access for All, the proposed Project will include (but is not limited to) the following features: * The floor of the train will be at the same level as the platform, mitigating the need for steep ramp access; * There will be a very narrow gap between the train and the platform, mitigating the need for a very long ramp; * Wheelchair users will be able to access each train; * All platforms incorporate ramps or lifts for access purposes; * Evacuation procedures include ramps at the front and rear of trains; and, * Suitable sized landings will be provided at the top and bottom of access ramps to stations. The minimum unobstructed width between handrails will not be less than 1.2m, and the shallowest possible gradient will be provided.
8	Station and Infrastructure Design	3	The NDA would also like further detail on how proposed pedestrian underpasses as detailed in the plans for Estuary station and the associated park and ride building will be accessible to wheelchair users for example, as the designs only seem to mention access via stairs and the proposed lifts detailed do not seem to grant access to the underpass level. The NDA would also like to stress the need for clear and controlled pedestrian access to the stations. As detailed in the guidance <i>Building for Everyone: A Universal Design Approach</i>, the provision and location of pedestrian crossing points in any road or street environment should be carefully considered and involve detailed consultation with the relevant road authority. Access to buildings is also detailed in the EU Standard and <i>IS EN 17210 Accessibility and usability of the built environment - Functional requirements</i>. The NDA would strongly advise that TII consult with this document when progressing with more detailed infrastructure and station designs in order to ensure universal design of both.	Chapter 4 (Description of the MetroLink Project) provides a detailed description of the Estuary Station and Park and Ride Facility, including pedestrian accesses. The underpass has been designed in line with accessible standards, with a gradient of 5% and landings every 9m. At the northbound access to the underpass, a passenger lift is provided to facilitate access for those with impaired mobility. The Park and Ride Facility will be linked with Estuary Station by a pedestrian bridge, steps and lift to the platforms, to ensure wheelchair access between the Park and Ride Facility and the station. 208 wheelchair accessible parking spaces will be provided in accordance with the guideline Building for Everyone A Universal Design Approach, exceeding the minimum percentage of accessible spaces required, and will be designed to ensure ease of access to and from the lifts. Each of the proposed stations has been designed to provide a high-quality environment at the station approach to ensure easy and safe access from the existing and future pedestrian footpath network surrounding the station. The Transport for London Pedestrian Comfort Guidance for London (Transport for London 2010) was used as a reference during the design development process to guide the design of access to each station to ensure that pedestrian footpaths and road crossings are appropriate to the volume and type of users accessing the stations. Table 6.6 from Chapter 6 (MetroLink Operations & Maintenance) outlines the pedestrian access available at each of the proposed station locations, including details of crossing types. TII will consult the EU Standard and IS EN 17210 Accessibility and Usability of the Built Environment- Functional Requirements when progressing to detailed design. Please refer to response item 2 and 3. Chapter 6 (MetroLink Operations and Maintenance) also presents details of passenger movement and wayfinding to the stations, within the stations, and at platform level.

Submission No.			198	
Organisation Name or Name of Submitter			The National Disability Authority (NDA)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter RE: NDA submission for Metrolink Railway Order				
9	Station and Infrastructure Design	4	Crossing points should be located where they are clearly visible and safe for all road users, including pedestrians, and where they provide convenient, understandable and useable access. In busy streets, controlled crossing points with traffic lights should be provided. Audible crossing signals such as pelican crossings help everyone, as well as being essential for people with visual difficulties. Pedestrian crossing points, including Zebra and controlled crossings, junctions at side roads and other locations such as access points to car parks, should incorporate level or flush access to enable easy passage by all pedestrians. Level or flush access can be achieved with the use of a dropped kerb or a raised road crossing.	Please refer to response item 8. The approaches to the station entrances are positioned to provide convenient access with minimal changes in level. Design features to facilitate safe access to the station entrance include signalised crossings with audible signals, ‘raised tables’ within the roadway to reduce traffic speed at pedestrian crossings and dropped kerbs on pavements on both sides of the crossing to remove a trip hazard and aid wheelchair users and people with wheeled luggage. Tactile paving surfaces will warn pedestrians with visual difficulties of the absence of a kerb and guide them in the direction of the crossing.
10	Station and Infrastructure Design	4	The NDA would strongly recommend when designing cycle paths and pedestrian crossings to consider the universal design guidance Getting to the Curb produced by Walk San Francisco (Walk SF). Safe bike infrastructure is imperative for protecting cyclists. Although cycle tracks create safer conditions for cyclists, their location next to the kerb has two major impacts: 1. It eliminates direct access to the kerb for people parking or being dropped off. 2. It often results in pedestrians having to cross an active cycle track to access parking and transit islands. While these changes may only be a minor inconvenience for able-bodied individuals, they are more problematic for persons with disabilities, older people and children who rely on easy access to the pavement.	The needs of pedestrians and cyclists have been considered in the choice of location for the stations and the connections with local footpaths and cycle paths. In the northern part of the proposed Project between Estuary and Malahide Roundabout, the proposals for the R132 Connectivity Project to improve the R132 for vehicles occupants, cyclists and pedestrians, have also been taken into consideration in developing the design. 1. A review of the demand for each station recommended the provision of taxi ranks and/or drop off facilities at a number of locations along the route, in compliance with the Transport Strategy for the Greater Dublin Area 2016-2035 which states the requirement to 'provide, outside of Dublin City Centre, drop-off facilities and taxi ranks at key train stations and Luas stops'. Where drop-off facilities have been provided, they have been incorporated into the design of stations to integrate access and minimise conflict with other modes. 2. Pedestrian crossings at station entrances will interrupt active cycle lanes, ensuring safe access to and from the pavements.
11	Station and Infrastructure Design	4	Pavements provide access from the kerb to buildings and open space, they provide access to bus stops, and they provide a safe space to get pedestrians where they need to go. Access to the pavement needs to be safe, direct, and as plentiful as possible. This is why controlled crossings and speed management infrastructure over cycle tracks are recommended.	Please refer to response item 8 and 9.
12	Station and Infrastructure Design	4	The NDA also notes with concern that shared spaces such as plazas are incorporated into many of the designs with unsegregated cycle lanes depicted. The NDA strongly advises against spaces designed to be used by both cyclists and pedestrians extensively as this can present significant safety issues to pedestrians, particularly those with disabilities, older people and children. This is best reflected by the Department of Transport in London redacting guidance associated with the design and implementation of shared spaces in July 2018, deeming that implementation is not inclusive and the potential risks outweigh the benefits of introducing such spaces. Where possible, pedestrian infrastructure should be kept separate to minimise risk of injury. It is also noted by the NDA that way finding could be difficult in these open areas without points of interest and tactile paving. The NDA recognises that these drawings are not representative of detailed plans but would encourage TII to incorporate tactile paving information and consideration of points of interest in consultations and subsequent detailed information.	The provision of shared space was avoided where possible however in certain locations due to space constraints, a shared space solution is required. The intention in these spaces is to give pedestrians priority over other users and this is reflected in appropriate signage, road markings and road surfaces. Chapter 6 (MetroLink Operations and Maintenance) presents details of passenger movement and wayfinding, including the use of accessible design features. The provision of tactile paving and points of interest will be considered in more detail at the next design stage in consultation with relevant bodies.
13	Station and Infrastructure Design	5	The NDA wishes to stress that active travel considerations must not eliminate accessible parking provision. Also contained in Building for Everyone Guidelines - External Environment and Approach, is information concerning the recommended specifications for design and provision of accessible parking bays as well as recommendations on the amount of accessible parking required. The NDA would strongly suggest consulting these guidelines for details on best practice of accessible parking provision, however, this is not a substitute for consultation and user testing with persons with disabilities and older people.	At Estuary Park and Ride, 208 accessible parking spaces are provided, making up 6% of the total, which exceeds the required standards. The disabled parking spaces will be clearly sign-posted. The size of the proposed 208 disabled parking spaces is compliant with the Disability Act 2005, Building for Everyone A Universal Design Approach (National Disability Authority, NDA, 2021), BS8300-1:2018 Design of an accessible and inclusive built environment (BSI 2018) and Technical Guidance Document part M Access and Use (Government of Ireland 2010). The allocated space will be a minimum of 2.4m x 5m, plus a 1.2m marked access zone to the rear and the side for access. Accessible parking is also provided at key interchange stations including Fosterstown, Glasnevin and Charlemont. Further consultation and user testing with relevant stakeholders on the provision of accessible parking will be undertaken at the next design stage.

Submission No.			198	
Organisation Name or Name of Submitter			The National Disability Authority (NDA)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter RE: NDA submission for Metrolink Railway Order				
14	Station and Infrastructure Design	5	Finally, the NDA notes that toilets are included in the station plans, however there is not much detail provided in terms of accessible toilet provision...The NDA would like to stress the importance of accessible toilet provision to ensure that the public toilets in each station are as accessible as possible for a wide range of users. Additionally, the NDA would like to stress the importance of the provision of changing places toilets in addition to accessible toilets. The lack of suitable toilet facilities greatly restricts the everyday lives of some persons with disabilities and their families. Having access to accessible and Changing Places Toilets can enable people to fully participate in all aspects of daily life including accessing education and employment. The NDA has been informed by Metrolink that changing places toilets are being planned, and we welcome this. We look forward to more detailed information on the plans and are happy to provide guidance and assistance in this matter as provision of changing places toilets is vital to ensuring that Metrolink is a truly accessible transport option.	Public welfare facilities will only be provided at the main interchange stations. The remaining non-interchange stations will not be provided with public welfare facilities for reasons of safety, deterring anti-social behaviour, maintenance and security. All toilets will be designed in line with current accessibility standards.
15	Station and Infrastructure Design	6	The NDA strongly supports continued consultations with the Luas Disability User Group, but would also like to recommend continued wide spread consultation with Disabled Persons Organisations (DPOs). The NDA also wishes to point out requirements under the Disability Act (separate to building regulations) which should be considered in designing transport infrastructure: - Section 25 of the Disability Act, 2005 states that public bodies should ensure that public buildings are, as far as practicable, accessible to persons with disabilities. And, - Section 26 of the Act states that integrated access be provided to services provided by public bodies by persons with and without disabilities.	Please refer to response item 2 and 3 regarding accessibility of design. TII will continue to engage with all relevant stakeholders throughout the Project, including the National Disability Authority, the Luas/MetroLink Disability User Group, and other identified parties.
16	Appendix 1 Previous Information and Advice	6 to 8	Previous Information and Advice - collated	TII thank you for collating the previous information and advice that either has been incorporated into the current plans or will be utilised further at the next stage of design.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: Railway Order Application- Metro North: Estuary through Swords, Dublin Airport, Ballymun, Glasnevin and City Centre to Charlemont, Co. Dublin				
1	Cover Letter	1	We are overwhelmingly supportive of the construction of the Metrolink project, it being one of the many public transport improvements the city needs.	TII welcome your support.
2	1.Local area liaison committees	2	We note the observation of District 7 Community Alliance with respect to the establishment of a Local Area Liaison Committee for the area. This would build on the commitment in “3.3.1 External Communication with the Public and Key Stakeholders” 1. We agree that the idea has merit. Given the scale of construction required and the potential for impacts on the local community a formal process for local community engagement along the line should be established. This would be preferable to any problems that may arise being directed through the various Local Authorities involved. Any Local Area Liaison Committees would need to be adequately resourced including the provision of independent expert advice. Mechanisms should be put in place to ensure that the Independent expert advice is truly independent of the NTA.	The services of the Independent Engineering Expert (RINA) are due to be concluded on completion of the Railway Order process (expected in 2024). The continuation of provision of independent engineering advice for residential stakeholder groups throughout the enabling works and main construction stages of the MetroLink project is currently being considered as part of an overall comprehensive community engagement plan, which will include amongst other initiatives, the appointment of dedicated MetroLink liaison representatives and local community forums which will provide detailed updates on construction activities in their areas. The EIAR Chapter 5, MetroLink Contruction Phase, Section 5.12.4.5 sets out TII Plans for Community and Engagement during the Contruction Phase. A Stakeholder and Community Engagement Plan has been developed which has guided the frequency and means of communication to date. The proposed Project will continue to progress community engagement by: • Regularly reviewing and updating stakeholder and community engagement plans; • Actively maintaining partnerships and design focus groups established with the community; and • Communicating in a timely and open manner. TII and its appointed contractor(s) will ensure that local residents, occupiers, businesses, local authorities and all other stakeholders affected by the proposed construction works, as outlined in the EIAR, will be informed in advance of work taking place. The notifications will detail the estimated duration of the works, the working hours and the nature of the works. In the case of works required in response to an emergency, the local authority, local residents and businesses will be advised as soon as reasonably practicable. All notifications will include a local helpline number. In addition, information on the works will also be available on the proposed Project website. TII will further develop the Community Engagement Plan to encompass the construction and operational phases of MetroLink.
3	2. Temporary land	2	Further clarity is required on the use of temporary land (e.g. Albert Park). While temporary land acquisition is undoubtedly required during the construction phase, more defined timelines on their use (start and end) would be appreciated. Many of the lands acquired are local green spaces. Given the length of the construction phase it is reasonable to ask that the use of the green spaces would be minimised.	Temporary land-take at this location is required to facilitate the construction of the intervention shaft within Albert College Park. The environmental impact has been assessed based on a construction phase that is expected to last 63 months as outlined in A5.2 Construction Programme of the EIAR. TII will seek to expedite the schedule to reduce impacts.
4	3. Trees	2	Where mature trees absolutely need to be removed any replacements should also be mature trees (or as close as is practicable in horticultural terms). Some areas will experience disruption during the construction phase. It is not unreasonable to expect that, insofar as possible, any replacement trees would be as close as possible to preconstruction maturity.	TII will seek to replace mature trees with relatively mature specimen trees where feasible. With regards to existing mature trees, an Arboricultural Impact Assessment was carried out (EIAR Appendix 27.3). This contains information on the existing tree conditions and the arboricultural impact of the proposed Project. EIAR Chapter 27 Landscape & Visual, section 27.6.1 includes for a number of mitigation measures to reduce the impact of MetroLink on these trees, including: • Identification and retention of existing mature trees of good quality, through the adjustment of the alignment, location of structures/buildings and the outline design of the proposed Project; • Comprehensive proposals for hard and soft landscape works, including tree and hedgerow planting to offset the effects of net loss due to the proposed Project; • Where cut and cover sections of track and/or station boxes underground are to be planted over, the inclusion of sufficient appropriate substrate and adequate drainage to allow tree planting and growth for posterity. There is a general requirement for a minimum depth of 1.5m growing medium in such circumstances. • In sensitive locations, residual landscape and visual effects will be significantly reduced through the inclusion in the proposed planting of relatively mature specimen trees.
5	4. Construction traffic and parking	3	One of the main impacts of the construction phase on local communities will be parking & traffic. While some traffic will be unavoidable, significant efforts need to be made by the construction firms to reduce the parking impact on local communities where parking is already at a premium. Targets should be included in any tender around the use of public transport, sustainable transport and the provision of company shuttle services to the various sites along the line.	As noted in A5.1 Outline Construction Environmental Plan, all construction staff and workforce will be encouraged to make their way to site and home from site by public transport, by project specific transport (e.g. minibuses), by bicycle or on foot. Limited parking spaces will be provided for vehicles required for the construction activity and for employees. The nominated contractor(s) may provide a transfer pick-up and drop off service from suitable public transport hubs. Targets are to be included in future contracts.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
NA29N. 314724. Name: Niall Lynch. Address: 84 Grosvenor Square, Rathmines, D06W2V5				
1	Letter	3	I have two grounds for observation • Charlemont is a quiet residential area, it is an unsuitable place for the terminus of the metro.	TII understand and are cognisant of, that the area surrounding the proposed Charlemont Station is a quiet residential area and therefore would like to provide the assurance that reinstatement and landscaping will be carried out to ensure the above ground elements of MetroLink integrate sympathetically with the existing environment as referenced in EIAR Chapter 4. During the operational phase, residual rail noise levels will not be above the significant thresholds for airborne noise and vibration. The streetscape/landscape around the Charlemont Station will be designed so that it is integrated with the public realm. The design will include pockets of planting, mature trees, and cycle parking which will benefit residents in the Charlemont area as well as MetroLink and Luas users. EIAR Chapter 4, Description of the MetroLink Project, section 4.7.12 provides further details on the design of Charlemont Station and the surrounding area. The addition of Charlemont Station will also benefit residents as it will provide an additional mode of public transport to Dublin City Centre and North Dublin. Should there be any concerns regards anti-social behaviour, this has been considered by the Project and is addressed by EIAR Chapter 6, MetroLink Operations and Maintenance. Section 6.6.5.8 specifically addresses how this will be managed, including how the architectural and urban realm design is designed to discourage anti-social behaviour, for example through the attractive setting, use of public lighting, open sight-lines, and avoidance of areas where individuals and groups of people can hide. CCTV will also be installed throughout the MetroLink system, including at station entrances and the public realm to provide general security and surveillance of all the public areas. It should also be noted that all the above ground elements of the Station are located within the lands zoned Z5 in accordance with the Dublin City Development Plan 2022 – 2027 meaning they have the objective “To provide for the creation and protection of enterprise and facilitate opportunities for employment creation”. The Station has been designed so that it is integrated with the proposed redevelopment of this site, and as such, demonstrates that the proposed Project is consistent with the zoning objective.
2	Letter		• We should be increasing urban green spaces rather than removing them. A large part of Stephen's green will be unusable for the duration of the build, it will also not be possible to return the green to its current state. This historical gem in the city will be irrevocably changed. The following paper outlines how important Urban green spaces are for its citizen's	TII recognise the importance of St Stephen's Green as a historic park and social / recreational facility, noting that it is also a designated National Monument. EIAR Chapter 27, The Landscape, section 27.5.4.23 identifies that there will be a very significant temporary impact on the Landscape due to the loss of trees in the area of St. Stephen's Green East if mitigation measures are not deployed. However, with the proposed mitigation measures relevant to this location in place, summarised below, this temporary impact can be mitigated by: (1) Development of site specific and comprehensive proposals for hard and soft landscape works, including for trees by ensuring the effective retention of mature trees where possible. These will include: details of the tree species mix, numbers, density and sizes proposed; the tree preparation, presentation, transportation, lifting and placement techniques proposed, as well as; the proposed ground preparation, root ball securing technique, backfill materials and methods, and the specific establishment maintenance proposals for each. These measures will minimise the risk to tree establishment and maximise their viability and future rates of growth. (2) In sensitive locations such as St. Stephen's Green, residual landscape and visual effects will be significantly reduced through the inclusion in the proposed planting of relatively mature specimen trees. Furthermore, while the removal of trees from the landscape will initially have a significant impact if left unmitigated, especially in the case of old and developed trees as the replacing material (saplings) and mature specimen trees can never have the same size and development as the mature original trees that have been removed, resulting in an initial, but temporary contrast between the original established area of trees and the new planted trees area. Over a period of time this contrast will reduce and eventually become imperceptible. TII will work with the OPW to ensure newly planted/ replanted areas contain a significant percentage of Mature Specimen Trees.

Submission No.			202	
Organisation Name or Name of Submitter			Niall Lynch	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
				While the temporary impact on trees is considered very significant, it is of note that it occurs over a localised area of the Park that amounts to only 5% of the total area of the Park and is confined to the east side (adjacent to the Park fence line) of the Park only. Of the 64 trees to be removed TII have identified 5 of those trees as being "A class" in accordance with BS 5837 (generally large, high-quality trees), the remainder are of class B and C, deemed to be of moderate to low quality specimens. TII would also like to provide the assurance that the design approach is to reinstate the existing surface landscape and to replicate as far as possible, the current condition. This means the monuments, railings, lamp standards and paving are to be reinstated on completion of the work, and as noted above, trees will be planted to replace those removed. Further information on the urban realm design of the St. Stephens Green Station can be found EIAR Chapter 4, Description of the Project, section 4.17.11.2. TII are therefore of the view that the construction of St. Stephen's Green Station will not have a significant impact on the overall amenity and function of the Park during construction, given only 5% of the Park area is taken during the Construction Phase, and that once construction is completed, this area is returned to the Park, with only 0.2% of the total Park area taken by MetroLink when operational, whilst providing further access to, and reinforcing that St. Stephen's Green is a key Dublin landmark and destination.
3	Letter		Extending the metro link further south from the Liffey does not provide proportional extra benefit when compared to the cost i.e. extra stations and destruction of Stephen's Green.	Progression to the south side of the Liffey is a key element of the MetroLink project, providing access to business and commercial areas of the city while also providing interchange with Dart (at Tara St) and Luas (at Charlemont) thereby providing a key element of the future integrated public transport network for Dublin. TII would further note that by progressing MetroLink south of the Liffey this will make a significant contribution to achieving the objectives of the Project and delivering the associated benefits. As explained by EIAR Chapter 3, Background to the MetroLink Project, MetroLink will provide significant benefits not only to those who choose to use it, but also to other transport network users, by generating a modal shift from private car use, thereby reducing the demand for road space and creating the opportunity for the road transport system to achieve optimum levels of efficiency and effectiveness. Also as outlined in Chapter 3, the proposed Project is part of an integrated transport network that also includes for BusConnects and DART+ which are all included under Project Ireland 2040. Together, these projects will result in a reliable, sustainable, affordable, integrated public transport network that will support the economy, help Ireland meet its climate change targets in line with Climate Action Plan 2023 and make Dublin a more liveable and sustainable city. Whilst MetroLink is a standalone project that is not dependent on any other projects for its delivery or effective operation, it is nonetheless a critical part of the proposed integrated transport network for the Greater Dublin Area. The passenger numbers contribute significantly to the overall benefits of the scheme and the effect of these benefits outweigh the additional costs that are associated with the delivery and operation of the section from south of the River Liffey to Charlemont station. With regards to the reference made by the observation to "cost". To ensure that public investment delivers value for money, the Public Spending Code sets out requirements for the evaluation, planning and management of public investment. The preparation of a Business Case is a key element of meeting these requirements. The Public Spending Codes requires that both the Preliminary Business Case and Final Business Case for public investment projects are published. In July 2022, the Government granted Approval in Principle to the NTA to enable the submission of a railway order application by TII to An Bord Pleanála in respect of the MetroLink project (Decision Gate 1). This approval was granted after the Preliminary Business Case (PBC) had undergone significant scrutiny and challenge by bodies that are independent of TII, including DoT and DPER review (including independent review by JASPERS and the Major Projects Advisory Group (MPAG)) of the PBC around timeline, costs and benefits that were updated to inform the Government decision. TII would also note that for the reasons set out by response (2) above, TII do not consider they are causing "destruction" to St Stephen's Green.
4	Letter		I believe the metro terminus should be in the city centre at Tara Street or O'Connell St. Either of these locations would be a more suitable terminus for the metro as there is a link with both the Luas (O'Connell St.) or the railway network (Tara Street).	Please refer to response (3) above.

Re: Railway (Metrolink - Estuary to Charlemont via Dublin Airport) Order 2022 Case number NA29N.314724				
1	Letter - introduction	1	I note that as the owner of no. 1 Dartmouth Square I have not been named in the Book of Reference. TII have details of my ownership. Ref letter to me TII Metrolink Ref ML0102 dated 01.02.22. I have been issued and have received the documentation issued by TII.	TII can confirm that your ownership is noted in the Book of Reference. Please see: MetroLink Book of Reference - Second Schedule Book 2 of 2 (ML70-A3 / ML70-A4)
2	Letter - introduction	1	Firstly, in general, I am favour of the broad aim of the MetroLink Project to connect Dublin's city centre to our national airport. However, as the owner of a residence in the Dartmouth/Charlemont area, I wish to set out a number of observations for the Board regarding the proposal to locate the Terminus station at Charlemont-Dartmouth. The property No. 1 Dartmouth Square, D.6 is a Protected Structure, a residential property, and is in the midst of the community where the Terminus station is proposed to be located.	Thank you for taking the time to make a submission and your overall endorsement of the MetroLink Project generally. We have reviewed your submission and responded to the observations made below.
3	Letter - Point 1	2	1. I understand that no Study has been completed by NTA/TII as part of the entire Metrolink project on the optimal location for a City centre terminus. Charlemont is the incorrect strategic location for a Terminus hub and spoke system as it is too far out along the Luas Green Line spoke and would prejudice future options for integration of networks and services.	TII do not agree that Charlemont is the incorrect location for an interchange with the Luas Green Line or that it prejudices future options for integration with the wider transport network for the reasons set out below. It is also not correct to say that no study has been completed by NTA/TII as part of the entire Metrolink project on the optimal location for a City centre terminus for the reasons explained below and by response (4). The Board is required to have regard to the likely consequences for proper planning and sustainable development in the area in which it is proposed to carry out railway works (section 43(1) of the 2001 Act) and as such the following matters are relevant. The connection from St Stephens Green to Charlemont / Ranelagh is supported by the current Transport Strategy for Greater Dublin Area (2022-2042). The Transport Strategies were prepared by the National Transport Authority, scrutinised by the Joint Oireachtas Committee on Transport and approved by the Minister for Transport. It notes in section 12.3.2, "Charlemont offers the optimal location for the primary interchange with the Green Line in response to growing demand in the longer term and is an appropriate location to facilitate any potential future metro extensions to serve the south west, south or south east of the city region should sufficient demand arise." The Transport Strategy is "a consideration material to the proper planning and sustainable development of the area or areas in question." Development Plans are required to be consistent with the Transport Strategy. The Dublin City Development Plan 2022-2028 envisages this station at Charlemont in policy SMT22 "To support the expeditious delivery of key sustainable transport projects so as to provide an integrated public transport network with efficient interchange between transport modes, serving the existing and future needs of the city and region and to support the integration of existing public transport infrastructure with other transport modes. In particular the following projects subject to environmental requirements and appropriate planning consents being obtained: ... MetroLink from Charlemont to Swords". Accordingly, the location of the Charlemont station was a strategic decision made at the highest levels of transport and land use planning and such is fully consistent with the proper planning and sustainable development of the area. The current Transport Strategy considers a range of options for the onward extension of MetroLink to meet the demand for travel over the period of the strategy. This includes consideration of the need for the upgrade of the Luas Green Line to metro with a metro extension to Dublin south west, south or south east. Whilst the strategy envisages that further extensions will be delivered after 2042, MetroLink which terminates at Charlemont allows for the possible extension of the metro in all any of the above directions.

Re: Railway (Metrolink - Estuary to Charlemont via Dublin Airport) Order 2022 Case number NA29N.314724				
			Response (3) continued.	The proximity of the metro to the Luas line at Charlemont provides for a positive customer experience for all users with short interchange distance and due to the proximity, clear wayfinding and high visibility of the interchange. The interchange arrangements at Charlemont provide for significantly better interchange arrangements compared to an alternative interchange at St Stephen's Green Station. Passengers wishing to interchange between Luas and metro at an alternative St Stephen's Green terminus would face a 500m-walk along a route either through St Stephen's Green park or along the footpath north of the park, which adds significantly to the time for interchange and therefore the overall journey time for passengers and a less positive customer experience for all interchange users. This passenger experience would be reduced further for those with mobility or visual impairments as well as those travelling to/from the airport with luggage. The detailed analysis done for the Railway Order application further confirms that the section of MetroLink route between St Stephen's Green and Charlemont Stations contributes significantly to the overall benefits of the scheme. It serves a significant area to the south city of Dublin and offers enhanced access from the local area to the city centre and a direct connection to Dublin Airport. It serves key trip attractors including residential areas and offices / workplace locations, with high passenger boarding and alighting figures in the peak hours. During the morning peak, at Charlemont station the flows include 1,800 passengers alighting, 2,300 boarding and 1,229 passengers alighting, 2,276 boarding during the evening peak. The passenger numbers contribute significantly to the overall benefits of the scheme and the effect of these benefits outweigh the additional costs that are associated with the delivery and operation of the section from St Stephen's Green to Charlemont station. Further information is available in Chapter 7: Consideration of the Alternatives, section 7.7.8 MetroLink Southern Terminus Location. The location of the interchange at Charlemont does not preclude onward extension south. An interchange at Charlemont is supported by policy including the Dublin City Development Plan 2022 - 2028 and the Transport Strategy for the Greater Dublin Area. By extending MetroLink to Charlemont it provides for future proofing of the Green Line, bypassing the capacity constrained Luas on-street running section, and ensures potential future connectivity options are enabled, either to the Green Line or for extensions of the metro. The Charlemont Station interchange provides for increased passenger utilisation of the MetroLink system, thereby increasing the benefits delivered by the Project, reflected by an improved Project Benefit Cost Ration (BCR).

Re: Railway (Metrolink - Estuary to Charlemont via Dublin Airport) Order 2022 Case number NA29N.314724				
4	Letter - Point 1 (continued)	3	1. (continued) - St. Stephens Green is the most appropriate location as it provides for interchange with bus, Luas and future DART underground. The project incorrectly dismisses St.Stephens Green West as an appropriate terminal station. It only considers St. Stephens Green East and Charlemont.	TII do not agree that St Stephen's Green is the most appropriate interchange location for the reasons set out by response (3) above. It is not correct to say that the Project "only considers St. Stephens Green East and Charlemont." A number of route options were considered in the process of identifying the Emerging Preferred Route (EPR). These route options included potential station locations on St. Stephen's Green West. St. Stephen's Green West was ruled out as the alignment between the proposed Tara Station and a station on St Stephen's Green West would result in an undesirable horizontal reverse curve and an alignment greater than a 1000m long that would necessitate an intermediate intervention shaft located somewhere between these stations to comply with the MetroLink Fire Strategy. Further, as a potential station location, St Stephen's Green West itself is a very constrained location due to the presence of buildings, Luas and St Stephen's Green Park. Maintaining the Luas operational during station construction would be complex and challenging with significant disruption expected, whilst the impacts on St Stephen's Green Park would be greater for a station in this location compared to the proposed location on St Stephen's Green East. This would be the result of; the likely need to place more of the station in the Park compared to the proposed station on St Stephen's Green East; it would impact an area of the Park that has greater amenity value than St Stephen's Green East due to the nearby Park entrance adjacent to the southern end of Grafton Street, and there would be a risk of impacting the existing Park lake. In summary, an alignment that links the proposed Tara, St Stephen's Green East and Charlemont stations is a more direct and economic alignment, does not require additional intervention infrastructure, avoids a complex engineering interface with the Luas Green Line, impacts the Park less and has less potential for disruption during the construction phase. As outlined by EIAR Chapter 3, Background to the MetroLink Project, one of the key objectives of the Project is the integration of it with the wider transport network that also includes for BusConnects and DART+ which are all included under Project Ireland 2040. Together, these projects will result in a reliable, sustainable, affordable, integrated public transport network that will support the economy, help Ireland meet its climate change targets in line with Climate Action Plan 2023 and make Dublin a more liveable and sustainable city. It is being argued argued that Charlemont station effectively becomes a terminus station in the short to medium term. The implication is that the activities normally associated with a terminus are incompatible with the proper planning and sustainable development of this location, in particular, travel to and from the location by car at the start and end of journeys. In this regard, it is true to say that the Metrolink trains will terminate and turn back at Charlemont station, However, Charlemont Station does not have the associated infrastructure and services associated with a terminus location and in fact has more in common with a “system turn back location”. Charlemont Station is located within an area of high public transport accessibility, linking with the Luas Green Line which offers reasonably similar levels of services and frequency for journeys to and from the south of Dublin. As such, public transport service offering is not considered to terminate, but transfers onto the similar service offered by the Luas Green Line, forming part of a transport corridor running from Cherrywood to Estuary. The associated environmental impacts for the turnback and station at Charlemont have been fully assessed in the EIAR. Additionally, there is a strong level of interchange offered throughout the corridor at locations such as Glasnevin, O'Connell Street, Tara Street and St Stephen's Green, where many journeys on the MetroLink will 'terminate'. The terminus station for MetroLink is located at Estuary where all of the activities normally associated with a terminus take place. Charlemont station itself was chosen on the basis of its interchange potential with Luas, as well as local bus services, as outlined above. The section of the line between St Stephen's Green and Charlemont generates considerable benefits for the scheme in terms of increased patronage. As noted in response item (3), during the morning peak, at Charlemont station the flows include 1,800 passengers alighting, 2,300 boarding and 1,229 passengers alighting, 2,276 boarding during the evening peak. The fact that the Charlemont Station is now being referred to and considered as a “terminus station” rather than an interchange station, does not change the environmental impacts the station has on its local environment, in terms of passenger demand, airborne noise. vibration and other environmental effects. Further information is available in Chapter 7: Consideration of the Alternatives, section 7.7.8 MetroLink Southern Terminus Location. If the scheme were to terminate at St Stephen's Green, it would be inconsistent with the GDA Transport Strategy 2022-2042 to locate the terminus at Charlemont.

Re: Railway (Metrolink - Estuary to Charlemont via Dublin Airport) Order 2022 Case number NA29N.314724				
5	Letter - Point 2	2	2. Expensive Duplication of Rail infrastructure - The inclusion of an expensive and costly section between St. Stephens Green and Charlemont is strategically weak and duplicates the existing Luas Green Line services. NTA's cost estimate for this 1km section at €650M is an expensive duplication and significant investment that deprives other parts of Dublin that are in immediate need of rail infrastructure to support housing and urban development.	The Board is not responsible for any decisions in relation to the funding the Project. It is solely responsible for assessing whether the Project is consistent with proper planning and sustainable development and that its effects on the environment are acceptable. The responsibility for funding the Project lies with the NTA, the Government and ultimately the Oireachtas. It has received all necessary approvals, including under the Public Spending Code for the making of a Railway Order. It will undergo further scrutiny and approvals, including under the Public Spending Code, before it is funded. It is not appropriate for the Board to make findings in relation to value-for-money that are outside its statutory functions and would cut across those arrangements. Members of the public are entitled to make representations to their TDs in relation to the value-for-money of any element of the Project. In any case, TII do not agree with this statement for the reasons set out by response (2) above, noting that infrastructure is not being duplicated given the capacity of the Luas south from St. Stephen's Green is restricted due to on-street running. There is a limit to the potential of the Luas to provide additional capacity in the on-street non-segregated section of the Luas Green Line from Charlemont northwards through the city centre. The nature of this route and the fact that it currently crosses several road junctions (Adelaide Road, Harcourt Street / Hatch Street upper and Harcourt Street / St Stephen's Green south) limit the service to a maximum of 24 trams per hour per direction. The projected demand for this section would require a higher frequency of up to 30 trams per hour and this demand cannot be met with on-street systems (Luas / bus). The interchange between Luas and MetroLink proposed at Charlemont will provide the necessary capacity to address the demand on this corridor and reduce overall travel time for passengers. There is also high passenger demand forecast for a Metrolink station at Charlemont, including from the Ranelagh area, which would be lost if St. Stephen's Green was the MetroLink southern interchange station. The additional fare revenues collected by the Charlemont Station interchange increase the benefits delivered by the Project, reflected by an improved Project Benefit Cost Ration (BCR). Further, to ensure that public investment delivers value for money, the Public Spending Code sets out requirements for the evaluation, planning and management of public investment. The preparation of a Business Case is a key element of meeting these requirements. The Public Spending Code requires that both the Preliminary Business Case and Final Business Case for public investment projects are published. In July 2022, the Government granted Approval in Principle to the NTA to enable the submission of a railway order application by TII to An Bord Pleanála in respect of the MetroLink project (Decision Gate 1). This approval was granted after the Preliminary Business Case (PBC) had undergone significant scrutiny and challenge by bodies that are independent of TII, including DoT and DPER review (including independent review by JASPERS and the Major Projects Advisory Group (MPAG)) of the PBC around timeline, costs and benefits that were updated to inform the Government decision.
6	Letter - Point 3	2	3. The station box at Charlemont, as constructed in 2021/22 by the Developer Hines, does not have the benefit of planning permission and has not been part of the EIA undertaken for this project. Processing the current Railway Order application, which is reliant on these preliminary and now constructed works, is legally unsafe and contravenes the provisions of the EIA Directive.	The MetroLink enabling works constructed as part of the Hines development was included in the planning application for the Hines Development and has the benefit of planning permission which was granted in April 2019.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Railway (Metrolink - Estuary to Charlemont via Dublin Airport) Order 2022 Case number NA29N.314724				
7	Letter - Point 4	2	4. The station box at Charlemont will result in only one possible future tie in with the Luas Green Line to the south, which would result in an option that was previously dismissed as part of the Tie-In study from March 2017. No alternatives to the station box at Charlemont were considered as it had been fixed through the design of the overhead Hines Grand Parade commercial development. The implications of this new alignment is very significant on our wider community as it will involve top down construction that will only be possible when many houses on Manders Terrace, Oakley Road and Charleston road are demolished.	The station box at Charlemont allows for a future tie into the Luas Green Line should it be determined in the future that through running metro services to Sandyford is the required solution to address the public transport needs to the south of the city. It is incorrect to say that the current proposal is based on an option that was previously dismissed as part of the March 2017 Green Line tie in study. The station design is in affect a modification to the preferred Green Line Tie Option 4B which was modified as result of the postponement of the upgrade of the Green Line to metro standard. The station box location was not fixed by the Charlemont Development. The preferred route for MetroLink was published in March 2019 following a comprehensive route options study. The preferred route was based on the emerging preferred route for the scheme which included a station at Charlemont. The Charlemont Metro Enabling Works were constructed to enable the Charlemont Development to proceed whilst simultaneously ensuring there was an option available to construct a station at Charlemont that avoided unnecessary demolition, took advantage of an available site, provided infrastructure that is integrated with planned development rather than necessitating later changes and retrospective adjustments to a new development or even possible demolition of the new development, whilst providing protected provision for the future extension of the scheme south, if required. It is also important to recognise that the station location at Charlemont is influenced by available vacant land and thus avoids unnecessary demolition. The submission seeks to portray the construction of the Metro Enabling Works as prejudicial to future decisions on proper planning and sustainable development of the area. It implies that the counterfactual would have had no effect on such decisions. That is not the case. There was a planning conflict between the EPR and the Grand Parade Development at the time the latter development was proposed. There was no resolution to that conflict that was free of implications for future decisions on the proper planning and sustainable development of the area. The Board could have refused permission for the Grand Parade Development, inevitably creating a underutilised and potentially vacant and idle site in a commercial hub location. The Board could have granted permission with no provision to facilitate a station at this location, resulting in a requirement for the railway order to provide for the demolition of a new office building. The Board's actual decision was reasonable and lawful in seeking to minimise the prejudice to an important office development and a critical piece of national infrastructure. It was also not particularly restrictive of future decisions in relation to the proper planning and sustainable development of the area. Of the three options open at the date of the Grand Parade planning application, two remain open: the Board can still require changes to the station design that require the demolition of the commercial building and it can grant an order that avoids demolition by using the Metro Enabling Works. It is agreed that the short-term implications for local residents will be significant as the scheme progresses through the construction stage, however the EIAR assesses the environmental impacts of the construction phase and commits to the implementation of appropriate mitigation measures that reduce the environmental impacts to not significant. The same is true of the operations phase for the project. TII will work closely with local residents to ensure the required mitigation measures are put in place. If in the future, the metro was extended south, this does not mean that inevitably open cut construction will be required or demolition of property will be necessary. In designing an extension, the promoter will seek to reduce the requirement for demolition by looking for tunnel launch sites at the southern extent of the scheme and, if one can be identified, driving the Tunnel Boring Machine northwards ultimately connecting into the existing tunnel. In that case, even if the new alignment were under the properties identified in the submission, the tunnel underneath them would be constructed by the Tunnel Boring Machine without the need for above ground works.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Railway (Metrolink - Estuary to Charlemont via Dublin Airport) Order 2022 Case number NA29N.314724				
8	Letter - Point 5	2	5. The Environmental Impact Assessment is inadequate in relation the description of development, alternatives, transport assessment, noise and the cumulative effects of the development on the Charlemont-Dartmouth Community. For a project of this size, scale, investment to date, it is inadequate to propose a Railway Order with so many important studies and analysis missing	TII do not agree that the Environmental Impact Assessment is deficient, inadequate or missing information. The Railway Order application comprises a very detailed environmental impact assessment that has identified and assessed the potential environmental impacts of MetroLink and proposed mitigations for these impacts where necessary. TII would also draw attention to the detailed project description, construction phase description and operational phase description provided in EIAR Chapters 4 and 5 and 6, and EIAR Chapter 7 and associated appendices that present details of alternatives considered. EIAR Chapter 9 and appendices provides a detailed analysis of transport and traffic effects, and EIAR Chapters 13 Airborne Noise & Vibration, and 14 Groundborne Noise & Vibration provide a detailed assessment of potential noise and vibration effects, while Chapter 29 outlines the assessment of interactions between various environmental aspects, and Chapter 30 covers the cumulative impacts with other projects. This assessment is carried out for the full length of the alignment including relative to potential significant effects on the Charlemont-Dartmouth Community.
9	Letter - Point 6	2	6. The development would result in noise and disturbance during the construction and operational phases and would result in a loss of amenities for the area.	The EIAR presents a comprehensive and detailed assessment of both groundborne and airborne noise and vibration in Chapter 13 and 14 of the EIAR. The assessments include for predictive modelling in order to identify the potential impacts on all sensitive receptors during both the construction phase and the operational phase. Noise and disturbance during construction: No profound impacts have been identified for residents and mitigation measures proposed will be effective at reducing the impacts on these properties and in general terms impacts will be associated with the construction phase only. Significant mitigation is proposed to include 4m high noise barriers and further proposed mitigation in line with the Airborne and Groundborne Noise Mitigation Policy. On the implementation of these measures the residual impacts are predicted to be moderate. However, as outlined in Transport Infrastructure Ireland (TII) Airborne and Groundborne Noise Mitigation Policy (Appendix A14.6) there is a process in place whereby further mitigation measures can be implemented at individual properties should this be merited. Noise and disturbance during operation: No residual noise impacts are identified at this location during operation. The calculated rail noise levels across the proposed Project are not significant in terms of any widespread community disturbance and results in a not significant to slight impact when added to the prevailing noise environment. Loss of amenity during construction: EIAR Chapter 11, Population & Land Use provides an assessment of effects on community amenity during construction and operation, which relates to the interaction of impacts on air quality; visual amenity; traffic and transport; and noise and vibration. At this location during construction as outlined in Section 11.5.2 of Chapter 11, no impacts are identified on the retail sector or community and social infrastructure (e.g. schools or hospitals). Any severance/disruption to transport will be limited by site mitigation measures such as alternative routes reducing impacts to not significant. Loss of amenity during operation: No significant residual negative impacts are anticipated on the Population and Land Use from the operation of the proposed Project, following the incorporation of the mitigation measures into the design of the proposed Project and implementation on an ongoing basis throughout the lifecycle. The residual effects that will arise during operation will be permanent and positive as detailed in EIAR Chapter 11, section 11.1.1.

Re: Railway (Metrolink - Estuary to Charlemont via Dublin Airport) Order 2022 Case number NA29N.314724				
			Response (9) continued.	The zoning under the Dublin City Development Plan 2022 - 2027 for the residential properties in question is "Z2 Residential Neighbourhoods (Conservation Areas)" with an objective to "protect them from unsuitable new developments or works that would have a negative impact on the amenity or architectural quality of the area (See Table 3.11 of the submitted Planning Report). As outlined in Section 4.5.18.6 of the Planning Report, the element of the Project within the Z2 zoning area will affect a below ground area only and as such will not compromise the land use objective for the lands overhead. The majority of the proposed Charlemont Station and all above ground elements are located within the lands zoned Z6 with the objective “To provide for the creation and protection of enterprise and facilitate opportunities for employment creation”. The Station has been designed so that it is integrated with the proposed redevelopment of this site by a third party development, and as such, demonstrates that the proposed Project is consistent with the zoning objective. The MetroLink station design does not result in any segregation of the area, with no surface barriers or walls proposed.
10	Letter - Point 6 (continued)	2	6. (continued) - The Traffic Study for the local Charlemont area is wholly inadequate as it omitted the modelling of the impact of Airport users coming to the only Dublin South MetroLink station at Charlemont. The Traffic Study uses a strategic, generalised regional model that does not take local factors into account. Extract from observation 7) - The EIA did not properly assess the impact of additional local traffic volumes, rather they used a generalised regional model that does not take local factors into account. A key local factor at a Terminus station in Charlemont that runs to the Airport is the huge volume of anticipated airport users from Dublin South and greater Dublin/Leinster that will come to Charlemont via car or taxi with baggage for onward destination to the airport. Grand Parade and the residential area around Charlemont-Dartmouth cannot sustain the significant additional traffic volumes associated with this development	The MetroLink forms part of an integrated public transport network. The system is designed in an integrated manner so that people travelling from the area south of Dublin to access locations north of Charlemont, such as Dublin Airport, Mater, Swords etc. will utilise public transport to interchange with the MetroLink, or will walk or cycle to access their local station. The system is not designed to encourage people to drive to stations within the City and TII actively discourage people from doing so other than the Park & Ride station at Estuary. TII therefore do not agree with the observation that there will be a “huge volume of anticipated airport users from Dublin South and greater Dublin/Leinster that will come to Charlemont via car or taxi with luggage for onward destination to the airport” as this is not borne out by our transport analysis. The Transport Assessment for MetroLink includes for people travelling to/from Dublin Airport from all areas within the extents of the GDA area, therefore it is incorrect to say "The Traffic Study for the local Charlemont area is wholly inadequate as it omitted the modelling of the impact of Airport users coming to the only Dublin South Metrolink station at Charlemont”. The NTA's Eastern regional Model (ERM) incorporates a wide range of data sources, including demographic data, land use data, transportation network data, and travel survey data. The system is designed to model a variety of transportation modes, including private vehicles, public transit, walking, and cycling, and to simulate the interactions between these modes. The ERM model has been validated and calibrated using a range of localised data sources to ensure that the model can accurately represent the transport network, these include public transport and vehicle counts from the canal cordon counts. The outputs from the model have been combined with local survey data to undertake the more localised modelling, such as the pedestrian impact assessments, or the local traffic signals. This does not support the observations made “The Traffic Study uses a strategic, generalised regional model that does not take local factors into account.” or “The EIA did not properly assess the impact of additional local traffic volumes, rather they used a generalised regional model that does not take local factors into account.” Regards the observation there will be a "huge volume of anticipated airport users from Dublin South and greater Dublin/Leinster that will come to Charlemont via car or taxi with luggage for onward destination to the airport. Grand Parade and the residential area around Charlemont-Dartmouth cannot sustain the significant additional traffic volumes associated with this development", this is covered by response (11) below.

Re: Railway (Metrolink - Estuary to Charlemont via Dublin Airport) Order 2022 Case number NA29N.314724				
11	Letter - Point 7	2	7. The development would have an adverse impact upon traffic during the construction and operational phase, and it has not been properly designed and there is poor integration with other modes of transport. Pedestrian movements in and around the station would be difficult. Grand parade is an already heavily congested orbital route.	MetroLink is designed to form part of an integrated public transport network with Charlemont selected as the preferred interchange location in order to maximise the potential interchange with the existing Luas Green Line. In overall terms, Charlemont Station will provide for improvements to the public transport network resulting in decreases in private car usage/trips, increases in public transport usages and will facilitate walking and cycling to the station, without significantly impacting on the operation of the road network in the area. Construction Phase: EIAR Appendix A9.5 Scheme Traffic Management Plan presents the analysis undertaken to assess the impact of the traffic management measures on the local road network surrounding the proposed Charlemont Station during the construction phase. At the local level the following parameters have been used to assess impacts on general traffic and on pedestrians: • Increase in walking distance/quality of service for pedestrians (through removal of footpath, reduction of quality of service, removal of a pedestrian crossing or relocation of crossing by more than 100m); • Increase in driver delays at junctions; • Changes in traffic flows on surrounding streets; and, • Additional distance travelled due to diversions. The analysis undertaken at this location indicates that the increased volume of traffic on Grand Parade and Northbrook Road does not translate into any significant increase in driver delay. The largest increase in driver delay of 12 seconds is registered on the westbound approach on Grand Parade to the Ranelagh Road signalised junction. During the construction phase, pedestrians will experience a reduction in quality of pedestrian infrastructure and space. The construction site boundary will encroach upon footways in the local area, including the northern side of Dartmouth Road, and the southern side of Grand Parade. However, a temporary signalised crossing will be provided west of the Luas to maintain pedestrian access to and from the Stop. Whilst there are partial closures on Dartmouth Road and Grand Parade, pedestrian movements will be maintained on appropriately sized footways through the area. Operational Phase: A microsimulation VisWalk model has been developed for the immediate area surrounding Charlemont Station during the operational phase. The model covers the full extent of the publicly accessible station area, including the immediate vicinity of the station entrance at street level, the Luas stop and nearby junctions at Charlemont Bridge. In order to accommodate the forecast demand from the proposed Charlemont Station, a new staircase with 2.4m stair width is proposed at the south east corner of Charlemont Luas stop. An elevator will also be provided at this location. Both are sized for MetroLink to Luas, and Luas to MetroLink passenger numbers. In addition, it is proposed that the pedestrian crossing on R111 Grand Parade will be repositioned to the front of the building being developed by Hines. With this infrastructure in place, the model indicates that the R111 Grand Parade will have an acceptable level of service overall, with some reductions in service seen at the pedestrian crossing where pedestrians are required to wait for a green phase at the signals. Overall, it is considered that the model displays an acceptable level of network performance. The proposed pedestrian crossing on Grand Parade will have minimal impact on the traffic flow along Grand Parade and can be programmed to operate in sync with the existing signalised junction at Grand Parade /Charlemont Street to maintain the flow of traffic movements. When the Project is operational, car mode share will decrease, with a reduction of up to approximately 830 car tips to and from the zones surrounding Charlemont Station over the 12hr period in 2065. In overall terms, the Charlemont Station will provide for improvements to the public transport network resulting in decreases in private car usage/trips, increases in public transport usages and will facilitate walking and cycling to the station, without significantly impacting on the operation of the road network in the area. Furthermore, TII have deliberately designed the Station with minimum set down space (with the exception of a drop-off on Grand Parade for persons of restricted mobility only) or room for taxi ranks so that it does not encourage the Station to be used for a significant volume of car or taxi trips.

Re: Railway (Metrolink - Estuary to Charlemont via Dublin Airport) Order 2022 Case number NA29N.314724				
12	Letter - Point 8	3	8. The development will have an adverse impact upon property values particularly during the construction phase. For many houses in the area there will be a long term and permanent adverse impact upon property values from noise of the operating rail infrastructure, vents, Tanoy systems, escalators and large traffic volumes - vehicular and pedestrian using the station 19 hours per day. The adverse impact also extends to the loss of amenity for the wider community changing a quiet residential neighbourhood into a noisy, busy, congested major transport hub.	Responses (9) above, and (13) and (18) below outline the predicted environmental impacts with regards to noise and vibration, and amenity, while responses (10) and (11) summarise the assessed traffic and pedestrian impacts. TII would note that as explained by response (11) above that in overall terms Charlemont Station will provide for improvements to the public transport network resulting in decreases in private car usage/trips. TII do not agree that the development will have a long term and permanent negative affect. In fact there is evidence to suggest that property values will in fact increase in close proximity to public transport infrastructure and that local residents will greatly benefit from having a world class metro system providing access to the city centre, airport and north city at their door step. The benefits of the project for all communities along the MetroLink route are described in Chapter 3: Background to the MetroLink Project, section 3.4 MetroLink Response to Challenges.
13	Letter - Point 8	3	Residential Properties on Dartmouth Square West, in particular, will be adversely affected by the location of a Terminus MetroLink station at Charlemont. The respondent's property will be affected by the location of the vast Southern Entrance Plaza and the Tunnel Ventilation Exhaust ducts located behind the boundary wall.	Based on the analysis and assessments undertaken by TII, with mitigation measures in place, there will not be a significant impact on the residents of Dartmouth Square West. The southern entrance plaza, acknowledged to be directly to the rear of No 1 Dartmouth Square West, will replace an industrial site that has existed previously at this location, noting it has been designed to the highest standards to create a high-quality urban environment. As outlined by response (11) above, there will be no long-term significant effects in terms of pedestrian movements in the area. Further it is noted that station entrances are transient areas for passengers entering and exiting the station. These activities are not the source of significant noise generation and form part of the existing soundscape in the existing prevailing environment. It is acknowledged footfall numbers will increase in the vicinity of the station entrance however this activity does not translate to significant noise impacts. EIAR Chapter 13, Airborne Noise and Vibration, section 13.2.6.2.4 explains that noise levels from all fixed installations (which includes ventilation plant from stations) will be limited to not exceed an operational noise level of 50 dB LAeq,16hr during daytime periods and 45 dB LAeq,8hr at noise sensitive buildings to achieve acceptable internal noise levels with windows open. It is also noted that where background noise levels (expressed using the LA90 parameter) are below the fixed noise limits above, there is potential for the operation of new noise sources at this level to be audible and to generate potential significant effects, depending on the magnitude above the background noise level. Therefore, when considering the potential impact of the noise emissions from operational plant associated with the proposed Project, consideration will also be given to the British Standard BS 4142 (BSI 2014 +A1 2019) to ensure noise does not breach acceptable levels. Background noise levels measured at Location UT52 to the rear gardens of Dartmouth Square are below the fixed limits above (Table 13.30, Chapter 9 of EIAR), and hence in line with the EIAR noise design criteria for fixed installations, the design of operational plant will also be undertaken in line with BS 4142: 2014 + A1 2019 to ensure no significant noise impact arises as a result of the operational phase plant items. The operational noise criteria for this source is therefore largely dependent on the most up to date and accurate prevailing background noise level. Given the fixed items of plant will not be installed until some 8 years post project commencement, the background noise environment will be resurveyed at the time of the design development to ensure the most up to date information informs the design, specific plant selection and mitigation to comply with the noise criteria set within the EIAR, which forms part of the Railway Order. Due to the requirement for updated baseline monitoring requirements closer to the time of installation and the likelihood that technology will improve between now and the installation of such plant, it is premature to define the specific attenuation measures for noise control. However, mitigation measures will include items such as low noise rated equipment, the use of in duct attenuators, orientation of grilles and louvres away from sensitive receptors, the installation of acoustic louvres and the use of anti-vibration mountings and couplings. EIAR Chapter 16, Air Quality, section 16.5.3.11 explains that the main emissions from the ventilation shafts will be warm air and as such are not considered significant.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Railway (Metrolink - Estuary to Charlemont via Dublin Airport) Order 2022 Case number NA29N.314724				
14	Metro Design:	3	Metro Design: The deep construction required immediately adjacent to residential houses is wholly inappropriate and will result in a very severe loss of amenity and devaluation of property	It is not uncommon for deep excavations to occur during construction works in urban areas. The excavation will be secured by hoardings for safety and to mitigate noise. As noted by response (16) below, TII have assessed the impact of the excavation on your property. TII would also like to assure you that at no time will the safety of this property and its occupants be placed at risk, noting that the construction of the station will be monitored, including surrounding ground and building movements, with predetermined trigger levels aligned with action plans to ensure movements do not exceed acceptable levels. This will be further supported by a vast suite of mitigation measures implemented at the site (as outlined in the Construction Environmental Management Plan (CEMP) in Appendix A5.1 of the EIAR to minimise all other impacts on residents. Responses (9) and (12) above explain that no significant loss of amenity is predicted or long-term devaluation of property.
15	Construction Phase	3	The construction noise impact assessment is wholly inadequate as it fails to consider the internal noise impact over a 9-year period, defers assessments to the design and construction stage, fails to properly assess night-time impacts, and incorrectly categorises impacts as very significant as opposed profound.	It is not correct to say "The construction noise impact assessment is wholly inadequate as it fails to consider the internal noise impact over a 9-year period, defers assessments to the design and construction stage, fails to properly assess night-time impacts, and incorrectly categorises impacts as very significant as opposed profound.". Responses (9) and (18) demonstrate this is not the case. The noise assessments, Airborne and Groundborne, EIAR Chapters 13 and 14 respectively, have been undertaken in line with best practice an all relevant guidelines and policy requirements. The assessment of noise levels at building facades is normal for this type of analysis noting the assessment criteria generated from best practice guidance all refers to noise levels at building facades.
16	Construction Phase	3	The EIAR fails to properly assess the settlement impacts of the tunnelling upon the houses on Dartmouth Square West and there may be settlement of between 10mm and 30 mm which would severely affect these protected buildings.	The approach taken by TII for assessing the impact of construction generated ground movements reflects the industry standard three-phased ground movement impact assessment process that is undertaken on tunnelling and underground projects around the world, that includes Channel Tunnel Rail Link (CTRL), Dublin Port Tunnel, Crossrail and High Speed 2. EIAR Appendix A 5.17 Building Damage Report, covers the assessed impacts of construction generated ground movements and settlement and includes for the assessed impact on the houses on Dartmouth Square West, with settlement in the range of 25 to 30mm. EIAR Appendix 5.17 refers. The Phase 2 assessment of the ground movement impact to this building is "slight" (an explanation for which can be found in Table 4-4), please refer building B150 (15 Dartmouth Square West) in table 5-2 of that appendix. As your property is a designated Protected Structure, it has been designated as “special”, and hence a further Phase 3 refined assessment, despite the impact only being assessed as ‘slight’ will be undertaken that will take account of final design and construction methodology details most likely utilising advanced numerical modelling techniques and further surveys of the building. The results of this refined assessment typically show that earlier assessments are conservative and overestimate the likely impact of construction generated ground movements. Monitoring instrumentation will also be installed in the area to monitor the performance of the works and potential environmental impacts, including those discussed above to ensure that acceptable limits are not breached. TII would also draw attention to the fact that residential property owners within 50m of the station excavation, or 30m of the tunnel are eligible to subscribe to the Property Owners Protection Scheme (POPs). The Property Owners’ Protection Scheme is in addition to the existing legal rights of property owners and is in place to provide a simple and prompt way of rectifying any damage caused under the project up to the ceiling of €45,000. If the sum should exceed this amount the normal claims process would be used with the insurance companies for TII and/or the contractor.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Railway (Metrolink - Estuary to Charlemont via Dublin Airport) Order 2022 Case number NA29N.314724				
17	Construction Phase	3	The hydrogeological impact assessment is inadequate as it has not been based upon local bore hole logs and no local impact assessment has been undertaken around the Charlemont station.	This statement is incorrect. Please refer to Figure 19.6 of the EIAR which identifies the location of a borehole at Charlemont. Pump tests were undertaken here and groundwater samples were taken (from 3 boreholes here) and analysed in order to inform the baseline conditions presented in the EIAR. Furthermore calculations were undertaken to estimate the effects of excavations on the groundwater for every station including Charlemont (refer to EIAR Chapter 19, Hydrogeology, Table 19.35, Table 19.41, and Charlemont subsection under section 19.5.3.6.)
18	Construction Phase	3	Construction of the intervention tunnel will give rise to significant noise and disturbance, 24/7 during the period of its construction.	TII have carefully assessed the impact of construction noise and vibration for all aspects of construction, including the construction of the intervention tunnel, which will be mechanically excavation. With the exception of the passage of the TBM which will operate on a 24/7 basis and take approximately 2-weeks to pass 1 Dartmouth Square, there are no predicted adverse residual impacts from any other activity once noise and vibration mitigation measures have been implemented. A summary of the predicted noise and vibration impacts is provided below. Construction Noise and Vibration Potential impacts identified due to airborne noise and vibration are presented in EIAR Chapter 13. Noise mitigation proposed for works at Charlemont Station are summarised in Section 13.6.1 of the EIAR and include for boundary hoarding around the working area, including a 4m high hoarding at the southern boundary, increasing to 7m high on the northern boundary. In addition, the above ground support works for sprayed concrete tunnelling works will be enclosed within an acoustically clad steel framed building to control noise breakout to surrounding receptors. With the proposed noise mitigation measures, the assessed residual impacts during the construction of Charlemont Station are set out in Table 13.90 that shows the noise impacts at receptors at 1 Dartmouth Square will be reduced to Moderate. EIAR Appendix A14.5, Groundborne Noise and Vibration and Blasting Modelling Results, 14.4 Section AZ4 Northwood to Charlemont presents the predicted vibration levels during TBM passage for various sensitive receptors and outlines the predicted VDV (Vibration Dose Value is a parameter that combines the magnitude of vibration and the time for which it occurs) for TBM Passage during the day and night. At 1 Dartmouth Square West this is predicted to be 0.204ms-1.75 (VDV day) and 0.171ms-1.75 (VDV night) respectively. Both of these values are lower than the VDV Threshold Levels of 1.0ms-1.75 (VDV day) and 0.5ms-1.75 (VDV night). Levels of vibration during mechanical excavation of Charlemont Station are predicted to be 0.002ms-1.75 and 0.001ms-1.75 for day and night-time respectively, which is lower than the VDV Threshold Levels of 0.8 ms-1.75 daytime and 0.4 ms-1.75 night-time, resulting in a not significant impact on the building and its occupants. The threshold levels have been set in relation to human response to vibration, and thresholds for building damage are much higher. As the predicted levels of vibration from TBM passage and mechanical excavation are below these thresholds, no impact is predicted for either the building or for residents of this address. Predictions of vibration during blasting at Charlemont Station have also been made. For 1 Dartmouth Square West where a vibration level of 3.5mm/s PPV (Peak Particle Velocity) is predicted compared to the threshold level for this building of 8mm/s resulting in no potential significant impact. Owing to the nature of the sprayed concrete intervention tunnel construction and to ensure a safe and stable method of excavation, and minimising settlement impact, the sprayed concrete intervention tunnel construction will be undertaken 24 hours per day, seven days per week. The groundborne noise and vibration arising from mechanical excavation of the tunnel will not exceed threshold limits. As noted above, it is proposed that during night-time support works at the surface, an acoustically clad steel framed building will be used within the compound to control airborne noise breakout to surrounding sensitive properties. The predicted level of groundborne noise during TBM passage is 45 dB LASmax at 1 Dartmouth Square West, which is at the 45 dB LASmax threshold, resulting in a significant impact on the occupants of this address for the relatively short 2-week duration of the TBM passage. Unfortunately there are no effective methods available to reduce groundborne noise from TBMs at source and therefore the principal mitigation measure is advance consultation and engagement to inform residents of the timing of the TBM passing to allow building occupants to prepare for the temporary elevated noise levels. As outlined in Transport Infrastructure Ireland (TII) Airborne and Groundborne Noise Mitigation Policy (Appendix A14.6) there is a process in place whereby further mitigation measures can be implemented at individual properties should this be merited.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Railway (Metrolink - Estuary to Charlemont via Dublin Airport) Order 2022 Case number NA29N.314724				
19	Construction Phase	3	The construction phase will last over 9 years. This is a medium-term effect which has not been properly considered in the EIAR.	It is not correct to say that the construction phase has not been properly considered in the EIAR. Please refer to EIAR Chapter 2, Methodology Used In Preparation of the EIAR, Table 2.3 where the durations of effect utilised in the analysis throughout the EIAR are referenced. Please also note that the assessment in EIAR Chapter 13, Airborne Noise and Vibration has allowed for noise and vibration impacts over shorter durations to reflect the duration of the actual activity i.e. excessive noise effects resulting from the construction will not last 9 years, but will last as long as the "noisy activity" lasts. These durations are outlined in EIAR Chapter 13.
20	Construction Phase	3	The hours of construction proposed include 12 hour working days and significant element of 24 hour working during certain periods of the contract.	Proposed Working Hours are outlined in EIAR Chapter 5, MetroLink Construction Phase, section 5.2.4. Standard working hours will generally be the norm for all above ground works i.e. Monday to Friday 07:00 to 19:00 and Saturday 07:00 to 13:00. Only tunnelling and other works underground will be undertaken 24 hours a day. The only exception to this is the requirement for work outside standard working hours for events (Refer to Chapter 5, section 5.2.4.2 Additional Working Hours) such as concrete pours, and abnormal deliveries (refer to section 5.3.2.1.). In planning the Works, the contractor will engage with the local community and seek local authority approval of the Construction Environmental Management Plan (CEMP) before such works are undertaken. Details of the requirements for the CEMP are provided in Chapter 5, Appendix A5.1 Outline CEMP. All planned night-time work activities will have to be undertaken, controlled and mitigated under the detailed Construction Environmental Management Plan to maintain impacts below the agreed construction noise thresholds. Examples of mitigation measures that can be used to reduce impact are detailed within Chapter 13, section 13.6, including the use of enclosure structures for planned activities outside of the standard working hours. The rationale for 24/7 working on activities such as Mechanical Electrical Power (MEP) installation, TBM strip out, and tunnel clean and track laying, is that they can be managed underground without causing disturbance at night. While activities below ground are progressed on a 24/7 basis, site level activities such as deliveries etc will be limited to standard working hours (Chapter 5, Section 5.5.17.3 refers). As explained by response (18) above, there will be some temporary disturbance (c. 2 weeks) resulting from the TBM passing. All other activities are not predicted to cause significant impact.
21	Construction Phase	4	The alternative construction compound has not been properly assessed and given the impacts of that proposed, it is incumbent upon TII to properly assess this and propose it as a mitigating measure.	There is no alternative for the Station construction compound as it needs to encompass the proposed location / construction of the Station. All environmental impacts associated with this construction compound have been assessed and mitigated where practicable.

Re: Railway (Metrolink - Estuary to Charlemont via Dublin Airport) Order 2022 Case number NA29N.314724				
22	Construction Phase	4	Additional traffic will be generated during construction and the rediverting of traffic will have an adverse effect upon the local road network. HGV traffic on quiet residential roads will have a severe impact upon amenities. No local traffic modelling has been undertaken as part of the assessment and the impact upon pedestrians has not been properly assessed.	It is not correct to say that "No local traffic modelling has been undertaken as part of the assessment and the impact upon pedestrians has not been properly assessed.". Appendix A9.5 Scheme Traffic Management Plan details the proposed HGV routing associated with the construction works at Charlemont Station. Routing from the site is mainly via the R111 and R110, and routing to the site is via the R810 and R110. Alternative routing options via the R110/Kildare Road and the R110/R811 are also considered, all of which are part of the regional road network. Only when the full closure on Dartmouth Road is in place will construction traffic route via Dartmouth Road. Local modelling undertaken at this location indicates that the increased volume of traffic on Grand Parade and Northbrook Road does not translate into any significant increase in driver delay. The longest delay occurs eastbound on Dartmouth Road during the AM peak of 14 seconds. Model outputs indicate that there will be a moderate increase in HGV movements during construction at this location. The most significant increase, of just over 2%, will be in both directions along Ranelagh Road/Charlemont Street, which is part of the regional road network. Elsewhere in the area, including local residential streets, increases are significantly lower. Please also refer to response (11) above.

Submission No.			203

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Railway (Metrolink - Estuary to Charlemont via Dublin Airport) Order 2022 Case number NA29N.314724				
23	Construction Phase	4	There will a severe impact upon human health which has not been properly assessed.	It is not correct to say "There will a severe impact upon human health which has not been properly assessed." EIAR Chapter 10, Human Health has identified that there may some residual effects after mitigation measures due to the noise and vibration arising from mechanical excavation, TBM advancement and proposed blasting resulting in "annoyance to users, but no health effects".
24	Construction Phase	4	Overall, the proposed mitigation measures do not mitigate the profound impact that the proposed scheme will have on residents of Dartmouth Square given the associated scale and time period of the proposed development.	The analysis presented in the EIAR does not support the observation "Overall, the proposed mitigation measures do not mitigate the profound impact that the proposed scheme will have on residents of Dartmouth Square given the associated scale and time period of the proposed development." No profound impacts have been identified for the residents of Dartmouth Square and mitigation measures proposed will be effective at reducing the impacts on these properties and in general terms impacts will be associated with the construction phase only for the reasons summarised below. (1) EIAR Chapter 9 Traffic and Transport outlines that after mitigation measures have been implemented there will be a residual long term slight impact on pedestrians as there will be more pedestrians in the area. However the use of existing footpaths will be at "acceptable comfort levels". There will be no other residual impacts either in the construction or operational phase related to traffic or transport. (2) EIAR Chapter 10 Human Health has identified that there may some residual effects after mitigation measures due to the noise and vibration arising from mechanical excavation, TBM advancement and proposed blasting resulting in "annoyance to users, but no health effects" (3) EIAR Chapter 13, Airborne Noise and Vibration outlines that mitigation measures proposed include 4m high noise barriers and further proposed mitigation in line with the Airborne and Ground borne Noise Mitigation Policy at 10 & 11 Dartmouth Square. On the implementation of these measures the residual impacts are predicted to be reduced to moderate. (4) EIAR Chapter 14 Groundborne Noise and Vibration identifies a significant residual impact on Dartmouth Square West as a result of the passing of the TBM. (see response (18) above. However, this will be for a limited duration and residual effects from other construction phase activities are not considered significant following the implementation of mitigation measures. (5) EIAR Chapter 16 Air Quality identifies that there will be no significant effects once mitigation measures are implemented. (6) EIAR Chapter 21 Land Take has identified a significant effect on Dartmouth Square properties due to the requirement for temporary land take for construction and for the erection of noise barriers. However this land will be reinstated following the completion of the construction phase in accordance with response (27) below. (7) EIAR Chapter 26 Architectural Heritage identifies the potential for impacts on Dartmouth Square ACA due to enabling works entailing the redirection of utilities. These works will be managed in accordance with a method statement prepared by the Project Conservation Architect in order to minimise any effects on the historical granite steps, kerbing and lamp standards. The impacts following the implementation of these mitigation measures is considered to be slight. (8) EIAR Chapter 27 The Landscape identifies potential landscape and visual effects after mitigation associated with the construction phase. These are assessed to be moderate and negative for the effects on the landscape amenity, and slight and negative for the visual effects.

Re: Railway (Metrolink - Estuary to Charlemont via Dublin Airport) Order 2022 Case number NA29N.314724				
25	Operational Phase	4	The operation of the trains and associated ventilation systems has the potential to adversely affect the amenities of the residents and has not been properly assessed. The post completion permanent arrangement will result in significant rat-running between Ranelagh Road and Grand Parade to the detriment of the residents on Dartmouth Square West. No adequate drop-off, pick-up facilities, taxi ranks, or interchange with other services are proposed.	The analysis of the operational phase presented in the EIAR does not support the observation "The operation of the trains and associated ventilation systems has the potential to adversely affect the amenities of the residents and has not been properly assessed." In terms of noise arising from the ventilation systems, please refer to EIAR CHAPER 13 Airborne Noise and Vibration, section 13.5.3.2.3 where potential impacts associated with ventilation systems are presented. It is identified that during night time, ventilation could have potential to exceed acceptable limits and as a result mitigation measures as proposed in Section 13.6.2.3 are proposed to ensure that noise limits can be achieved at the nearest sensitive receptors. Please also refer to responses (9) and (13) above. Regards the observation that the "The post completion permanent arrangement will result in significant rat-running between Ranelagh Road and Grand Parade". As presented in EIAR Chapter 4, Description of the MetroLink Project, the internal street between Grand Parade and Dartmouth Road will be treated as a shared vehicular pedestrian space, with access only to the site and no through access. The access will also be barriered, speed restricted and traffic calmed. This will mean that there is no potential for this route to be used as a "return". As noted above, TII have deliberately designed the Station with minimum set down space (with the exception of a drop-off on Grand Parade for persons of restricted mobility only) or room for taxi ranks so that it does not encourage the Station to be used as a terminus. TII would also note that the interchange is provided with other elements of the transport network as explained by responses (3) and (4) above.
26	Operational Phase	4	The overall impact of the both the construction and operational phases of the project, in terms of noise, vibration, visual impacts, traffic, HGV movement, construction activity, operational emissions, anti-social behaviour and general activity around the station will be such as to severely and permanently adversely affect the residential amenities of the residents listed in this submission. The impacts will be so severe as to evidently be in material contravention of the Dublin City Development Plan zoning objective for the area, which is Z2: "to protect and/or improve the amenities of residential conservation areas." The mitigation measures proposed do not meaningfully mitigate the significant adverse impacts during operation for residents of Dartmouth Square West.	As explained by the above responses to the observations made, TII consider that the impacts for both the construction and operational phases of the Project have been adequately assessed and where necessary mitigated, and that the above responses to the observations made have addressed "noise, vibration, visual impacts, traffic, HGV movement, construction activity, operational emissions.....", noting that no profound impacts are predicted after mitigation. The risk of anti-social behaviour has also been considered by the Project and is addressed by EIAR Chapter 6, MetroLink Operations and Maintenance. Section 6.6.5.8 specifically addresses how this will be managed, including how the architectural and urban realm design is designed to discourage anti-social behaviour, for example through the attractive setting, use of public lighting, open sight-lines, and avoidance of areas where individuals and groups of people can hide. Subject to data protection impact assessment and compliance with the General Data Protection Regulation (GDPR) CCTV will also be installed throughout the MetroLink system, including at station entrances and the public realm to provide general security and surveillance of all the public areas. TII would also note Charlemont Station has been deliberately designed without drop-off (with the exception of a drop only for persons of restricted mobility on Grand Parade) and taxi pick-up areas. TII would also note that while the interchange will certainly increase the number of people passing through the area, it is important to note that people will be using MetroLink, similar to Luas as a transport hub, moving quickly in and out of the area. The station will not be a destination attracting people to remain in the area. TII do not agree that the Project is "in material contravention of the Dublin City Development Plan zoning objective for the area, which is Z2: "to protect and/or improve the amenities of residential conservation areas." for the reason explained by response (9) above. As noted by response (3), Dublin City Development Plan 2022-2028 supports the Charlemont interchange.
27	Property Issues	4	The permanent acquisition of part of the rear laneway will legally impede rights of access to the rear of properties. The permanent loss of part of the laneway will inevitably impact upon the amenity and value of retained land/property.	Access to the laneway to the rear of Dartmouth Square West will be maintained, apart for a 33 metre section of the lane to the rear of N0 11-15 which will be occupied by the contractor for a period of 6 months to facilitate construction of part of MetroLink station box. Accordingly 1 Dartmouth Square will not permanently lose access to the laneway.

Re: Railway (Metrolink - Estuary to Charlemont via Dublin Airport) Order 2022 Case number NA29N.314724				
28	Property Issues	4	The development will inevitably impact upon the value of retained land/property. There will be a significant devaluation in property and the Board must refuse this element of the railway order. Owners' costs of engaging in the process should be borne by TII.	TII do not agree that the development will have a long term and permanent negative affect. There is evidence to suggest that property values will in fact increase in close proximity to public transport infrastructure and that local residents will greatly benefit from having a world class metro system providing access to the city. The benefits of the project for all communities along the MetroLink route are described in Chapter 3: Background to the MetroLink Project, section 3.4 MetroLink Response to Challenges. Where a property owners interests is required either permananetely or temporarily for the MetroLink Project, compensation will be paid in accordance with the compensation code. The compensation includes for all reasonable fees and costs properly incurred in consequence of the purchase from TII. Further details on the MetroLink Compulsory Purchase Order (CPO) Guideline can be found at: https://metrolink.ie/media/0jlpbyso/metrolink_cpoguideline_final_september-2022
29	Letter - concluding statement	5	Furthermore I request the following amendments to the proposal : 1. Omit from the Railway Order the section from Tara Street Station to Charlemont Station and associated onward tunnel extension and intervention tunnel Specifically the Charlemont station should not form part of the rail order as it will severely and demonstrably adversely affect the residential amenities of the Dartmouth Square residents both during the construction phase and the operational phase. 2. Require the submission of a railway order for a section from Tara Street Station to St. Stephens Green which would effectively provide for a terminal hub station that can integrate with the Luas Green Line, multiple bus routes and future DART underground. 3. The deep construction proposed to construct the Charlemont Terminus Station immediately adjacent to residential houses is wholly inappropriate and will result in a very severe loss of amenity and devaluation of property.	The above responses to the observations made explain why TII do not consider it is correct or appropriate that the MetroLink alignment south of the proposed Tara Station should be omitted, and also demonstrates why the proposed Charlemont Station has been selected by TII as the preferred interchange with the Luas Green Line A scheme which terminates at Tara Street would not be consistent with the Transport Strategy for Greater Dublin Area (2022-2042). In addition any decision to terminate the scheme at Tara will significantly impact on the overall viability and benefits of scheme. Regards the observation and concern with respect to deep excavation, response (14) above addresses this observation.

RE: Strategic Infrastructure Development (SID). Type: Railway Order Application. ABP Case Reference: NA29N.314724 Estuary to Charlemont via Dublin Airport) Order 2022 Case number NA29N.314724				
1	Point 1	1	I am fully supportive of public infrastructure, the Green Line Luas and the proposed MetroLink project on the Northside of Dublin. However, I am not in agreement with what is being planned for the Southside of Dublin and the change in transport strategy from a North-South spine to a single Central Hub terminating on the Southside at Charlemont. The justification for a terminus station at Charlemont is weak. MetroLink requires a city centre Terminus.	Thank you for taking the time to make this submission and your endorsement of the MetroLink Project in general. TII also note your concerns regards “the change in transport strategy from a North-South spine to a single Central Hub” and MetroLink extending to Charlemont. TII do not agree that the justification for Charlemont Station as the preferred interchange with the Luas Green Line is weak for the reasons set out below. The Board is required to have regard to the likely consequences for proper planning and sustainable development in the area in which it is proposed to carry out railway works (section 43(1) of the 2001 Act) and as such the following matters are relevant. The connection from St Stephens Green to Charlemont / Ranelagh is supported by the current Transport Strategy for Greater Dublin Area (2022-2042). The Transport Strategies were prepared by the National Transport Authority, scrutinised by the Joint Oireachtas Committee on Transport and approved by the Minister for Transport. It notes in section 12.3.2, "Charlemont offers the optimal location for the primary interchange with the Green Line in response to growing demand in the longer term and is an appropriate location to facilitate any potential future metro extensions to serve the south west, south or south east of the city region should sufficient demand arise." The Transport Strategy is "a consideration material to the proper planning and sustainable development of the area or areas in question." Development Plans are required to be consistent with the Transport Strategy. The Dublin City Development Plan 2022-2028 envisages this station at Charlemont in policy SMT22 "To support the expeditious delivery of key sustainable transport projects so as to provide an integrated public transport network with efficient interchange between transport modes, serving the existing and future needs of the city and region and to support the integration of existing public transport infrastructure with other transport modes. In particular the following projects subject to environmental requirements and appropriate planning consents being obtained: ... MetroLink from Charlemont to Swords". Accordingly, the location of the Charlemont station was a strategic decision made at the highest levels of transport and land use planning and such is fully consistent with the proper planning and sustainable development of the area. The current Transport Strategy considers a range of options for the onward extension of MetroLink to meet the demand for travel over the period of the strategy. This includes consideration of the need for the upgrade of the Luas Green Line to metro with a metro extension to Dublin south west, south or south east. Whilst the strategy envisages that further extensions will be delivered after 2042, MetroLink which terminates at Charlemont allows for the possible extension of the metro in all any of the above directions. The proximity of the metro to the Luas line at Charlemont provides for a positive customer experience for all users with short interchange distance and due to the proximity, clear wayfinding and high visibility of the interchange. The interchange arrangements at Charlemont provide for significantly better interchange arrangements compared to an alternative interchange at St Stephen's Green Station. Passengers wishing to interchange between Luas and metro at an alternative St Stephen's Green terminus would face a 500m-walk along a route either through St Stephen's Green park or along the footpath north of the park, which adds significantly to the time for interchange and therefore the overall journey time for passengers and a less positive customer experience for all interchange users. This passenger experience would be reduced further for those with mobility or visual impairments as well as those travelling to/from the airport with luggage.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
RE: Strategic Infrastructure Development (SID). Type: Railway Order Application. ABP Case Reference: NA29N.314724 Estuary to Charlemont via Dublin Airport) Order 2022 Case number NA29N.314724				
			Response (1) continued.	The detailed analysis done for the Railway Order application further confirms that the section of MetroLink route between St Stephen's Green and Charlemont Stations contributes significantly to the overall benefits of the scheme. It serves a significant area of the south city of Dublin and offers enhanced access from the local area to the city centre and a direct connection to Dublin Airport. It serves key trip attractors including residential areas and offices / workplace locations, with high passenger boarding and alighting figures in the peak hours. During the morning peak, at Charlemont station the flows include 1,800 passengers alighting, 2,300 boarding and 1,229 passengers alighting, 2,276 boarding during the evening peak. The passenger numbers contribute significantly to the overall benefits of the scheme and the effect of these benefits outweigh the additional costs that are associated with the delivery and operation of the section from St Stephen's Green to Charlemont station. Further information is available in Chapter 7: Consideration of the Alternatives, section 7.7.8 MetroLink Southern Terminus Location. The location of the interchange at Charlemont does not preclude onward extension south. An interchange at Charlemont is supported by policy including the Dublin City Development Plan 2022 - 2028 and the Transport Strategy for the Greater Dublin Area. By extending MetroLink to Charlemont it provides for future proofing of the Green Line, bypassing the capacity constrained Luas on-street running section, and ensures potential future connectivity options are enabled, either to the Green Line or for extensions of the metro. The Charlemont Station interchange provides for increased passenger utilisation of the MetroLink system, thereby increasing the benefits delivered by the Project, reflected by an improved Project Benefit Cost Ration (BCR). With regards “the change in transport strategy from a North-South spine to a single Central Hub terminating on the Southside at Charlemont” referred to by the observation. The proposed MetroLink alignment has not been extended south of Charlemont for the reasons set out by the GDA strategy , section 12.3.10, "The challenges associated with the upgrading of the Luas Green Line to a metro standard of service have led to the emergence of an alternative proposal which seeks to meet travel demand from south of Sandyford along a new light rail corridor which serves UCD post-2042. As such, the upgrading of the Green Line to metro standard is not being pursued as part of this strategy. Instead, for this strategy period, the capacity and frequency on the current Green Line from Sandyford northwards to the city centre will be incrementally increased through the provision of additional tram fleet and services and associated turnback arrangements to meet forecast passenger demand." For this reason it has been necessary to determine the most appropriate interchange and termination location for MetroLink.
2	Point 2	2	I understand that the NTA-TII have Government approval to provide an Airport Northside Metrolink terminating at a City centre location that will form part of a Transport Hub for differing modes of transport. The proposed Charlemont Terminus station does not meet this criteria and cannot act as a Transport Hub. Charlemont is not currently served by multiple current modes of transport. While there is a Luas stop, there are no bus stops, coach stops, or taxi ranks on any of the boundary roads. Grand Parade and Dartmouth Road are already at capacity in terms of car traffic.	The rationale for locating the MetroLink interchange with the Luas Green Line at Charlemont is explained by response (1) above. Charlemont station itself was chosen on the basis of its interchange potential with Luas, as well as local bus services, as outlined above. The section of the line between St Stephen's Green and Charlemont generates considerable benefits for the scheme in terms of increased patronage. The proposed route alignment from Estuary to Charlemont is consistent and compliant with the GDA Transport Strategy 2022-2042 (published in January 2023) in which states that the south city terminus at Charlemont offers the optimal location for interchange with the Green Line in response to growing demand in the longer term and is an appropriate location to facilitate any potential future metro extensions to serve the south west, south or south east of the city region should sufficient demand arise. TII have deliberately designed the Station with minimum set down space (with the exception of a drop-off on Grand Parade for persons of restricted mobility only) or room for taxi ranks so that it does not encourage the Station to be used as a terminus. The station is an interchange with Luas, with existing bus stops accessible a short walk away. Please also refer to response (6) below that addresses the road capacity concerns raised.

Submission No.			204		
Organisation Name or Name of Submitter			Niall Parsons		
Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
RE: Strategic Infrastructure Development (SID). Type: Railway Order Application. ABP Case Reference: NA29N.314724 Estuary to Charlemont via Dublin Airport) Order 2022 Case number NA29N.314724					
3	Point 3	2	I believe that other options for the Southern MetroLink Terminus station should be examined by NTA- TII. An Independent Study should have been carried out to determine the most suitable location for a City Centre Terminus. No Study was ever completed to select Charlemont as a terminus end of line major interchange station. NTA-TII should substantiate with evidence the facts that Charlemont is the 'optimal' location when compared to other potential locations eg St Stephens Green.	TII have examined the options for the MetroLink interchange with the Luas Green Line as explained by response (1) above and consider that this evidences that Charlemont is the optimal location when compared to St Stephen's Green. TII would also note that a number of route options were considered in the process of identifying the Emerging Preferred Route (EPR). Please refer to "New Metro North Alignment Options Report, Volume 1: Main Report, Section 5.2 Route Options Identification, 5.2.1 Study Area A. https://data.tii.ie/metrolink/alignment-options-study/study-1/metrolink-volume-1-main-report.pdf	
4	Point 3	2	It would be better to terminate the MetroLink at St. Stephen's Green Dublin 2 and not at Charlemont Ranelagh Dublin 6. Within the NTA -TII application it is proposed to provide an interim station on St. Stephens Green East . This station would be a better MetroLink Terminus as it is a more central location than Charlemont. An underground passageway would be the Interchange linking the SSGE Terminus station to the existing Luas line at St Stephens Green West. The Metro line could still be extended to the South and to Charlemont as an interim station within a subsequent proposed Phase 2 development of the MetroLink to Cherrywood etc. MetroLink Terminus Station will require a track projection of the terminus tunnel 360m beyond the Terminus itself. Should the terminus be at St Stephens Green East then the track projection could be located below the Iveagh Gardens to the South where it can be easily accommodated with a lower level of impact. (The Charlemont track projection requirement is not shown in detail in the TII MetroLink Non Technical Summary but it is described briefly on P.24 of the document).	Response (1) explains why Charlemont has been assessed overall to provide a better interchange with the Luas Green Line taking account of a number of considerations. Regards the observation of “an underground passageway”, notwithstanding the feasibility / space constraints and economics associated with providing a tunnel with additional lifts, escalators and stairs to those already provided for at the proposed St Stephen’s Green Station, the travel distance between the St. Stephen’s Green and the Luas Green Line remains the same. Response (1) also explains why it is considered that creating the turnback at St Stephen’s Green has a greater impact than at Charlemont. Further details of the Charlemont turnback structure is provided by the submitted Railway Application drawings, “Estuary to Charlemont Plans of Proposed Railway Works Alignment Details Dublin City Council AREA ML304 - ML307 Balbutcher Lane to Ranelagh Road Book 2 of 2, drawing ML1-JAI-ARD-ROUT_XX-DR-Y-03097”	
5	Point 3	2	I believe that NTA -TII should examine whether the MetroLink Terminus station could be located below the Iveagh Gardens itself with the main entrance -exit onto Clonmel street off Harcourt Street. Other ancillary entrances -exits from this station could be provided onto Earlsfort Terrace, St Stephens Green South and Hatch Street. The Iveagh Gardens site is a city centre location and there are good transport services on the adjoining roads. A new Luas platform could be made on Harcourt St. adjoining Clonmel Street if required. Furthermore the former Harcourt Street Station could even be repurposed as the MetroLink Terminus station. The Metro line could still be extended to the South and to Claremont as an interim station within a subsequent Phase 2 development of the MetroLink to Cherrywood etc.	As noted by response (1),the Metrolink interchange at Charlemont is supported by the Transport Strategy for Greater Dublin Area (2022-2042). and Dublin City Development Plan 2022-2028. Additionally, the capacity of the Luas south from St. Stephen's Green is restricted due to the on-street running, restricting the service to a maximum of 24 trams per hour per direction. The projected demand for this section would require a higher frequency of up to 30 trams per hour which cannot be met by an on-street systems (Luas / bus). Locating the interchange at Iveagh Gardens does not mitigate this constraint. The constrained site and logistics challenges in terms of constructing a station at Iveagh Gardens do not make it a feasible site for a MetroLink station.

RE: Strategic Infrastructure Development (SID). Type: Railway Order Application. ABP Case Reference: NA29N.314724 Estuary to Charlemont via Dublin Airport) Order 2022 Case number NA29N.314724				
6	Point 4	3	The site is a cramped residential urban site with limited space for such a development. The site has no bus links, no space for vehicular set down or room for taxi ranks at either of the Grand Parade or Dartmouth road entrances. The proposed Interchange for Metro and Luas passengers is poor. It will be above ground using stairs and a lift with a 400m walk in the open air and may not be adequate in size for the projected passenger numbers. It is very likely that this function will be relocated / extended from Grand Parade to Dartmouth road which will then become the main entry point to the station and not Grand Parade as shown in the application.	TII agree the Charlemont site is constrained, however a Station design has been developed that fits and works within this constrained site, and is adequately sized for projected passenger numbers. The MetroLink is designed to form part of an integrated public transport network with Charlemont selected as the preferred interchange location in order to maximise the potential interchange with the existing Luas Green Line. In overall terms, the Charlemont Station will provide for improvements to the public transport network resulting in decreases in private car usage/trips, increases in public transport usages and will facilitate walking and cycling to the Station, without significantly impacting on the operation of the road network in the area. Furthermore, TII have deliberately designed the Station with minimum set down space (with the exception of a drop-off on Grand Parade for persons of restricted mobility only) or room for taxi ranks so that it does not encourage the Station to be used as a terminus As previously stated above (2), the station is an interchange with Luas, with existing bus stops accessible a short walk away. TII do not agree the interchange is poor or that as stated by the observation that this interchange will be relocated to Dartmouth Road. TII also do not recognise the 400m walk quoted by the observation. The distance between the proposed MetroLink Charlemont Station Grand Parade entrance and proposed Luas Green Line stairs and lift is considerably less than this at c.60m. A microsimulation VisWalk model has been developed for the immediate area surrounding Charlemont Station during the operational phase. The model covers the full extent of the publicly accessible station area, including the immediate vicinity of the station entrance at street level, the Luas stop and nearby junctions at Charlemont Bridge. In order to accommodate the forecast demand from the Project station, a new staircase with 2.4m stair width is proposed at the south east corner of Charlemont Luas stop. An elevator will also be provided at this location. Both have been sized for Metro to Luas, and Luas to Metro passenger numbers. Please refer to Chapter 9: Traffic & Transport, Appendix A9.2-B Traffic and Transport Assessment Charlemont Station, section 6.1.3. Pedestrian Impact Assessment.
7	Point 5	3	The plan will turn Charlemont into "the" single central access point for MetroLink for the whole of the Southside. It does not make strategic sense to bring all southside MetroLink passengers to a Charlemont location that is less accessible than a location such as St. Stephen's Green. It will result in a vast increase in pedestrian and vehicular traffic congestion particularly by those travelling to & from the Airport in what is a residential area and cultural heritage area.	TII do not agree, as evidenced by the modelling carried out, that "The plan will turn Charlemont into "the" single central access point for MetroLink for the whole of the Southside" or that "It will result in a vast increase in pedestrian and vehicular traffic congestion particularly by those travelling to & from the Airport in what is a residential area and cultural heritage area. The MetroLink forms part of an integrated public transport network. The system is designed in an integrated manner so that people travelling from the area south of Dublin to access locations north of Charlemont, such as Dublin Airport, Mater, Swords etc. will utilise public transport to interchange with the MetroLink, or will walk or cycle to access their local station. The system is not designed to encourage people to drive to stations within the City and TII actively discourage people from doing so other than the Park & Ride station at Estuary. Please also refer to response (6) above.

RE: Strategic Infrastructure Development (SID). Type: Railway Order Application. ABP Case Reference: NA29N.314724 Estuary to Charlemont via Dublin Airport) Order 2022 Case number NA29N.314724				
8	Point 5	3	This long-standing residential and Architectural Conservation Area has never been envisaged or proposed as a suitable location for a major Transport Hub in any Development Plan for Dublin City.	The Dublin City Development Plan 2022-2028 envisages this Metrolink station at Charlemont in policy SMT22 "To support the expeditious delivery of key sustainable transport projects so as to provide an integrated public transport network with efficient interchange between transport modes, serving the existing and future needs of the city and region and to support the integration of existing public transport infrastructure with other transport modes. In particular the following projects subject to environmental requirements and appropriate planning consents being obtained: ... MetroLink from Charlemont to Swords" However, TII recognise the importance of Dartmouth Square and its designated status as an Architectural Conservation Area (ACA). Mitigation measures for Architectural Heritage can be found in Table 26.66 of EIAR chapter 26 (Architectural Heritage). The only potential for direct impacts on the Architectural Heritage Areas (ACA) is related to the diversion of utilities on Dartmouth Square West. To minimise the impact on protected structures in Dartmouth Square such as historic granite steps, kerbing and lamp standards, works within the Dartmouth Square ACA will be overseen by the Project Conservation Architect (PCA) and carried out in accordance with a method statement prepared by PCA. Details of proposed management plans in areas of Architectural Conservation such as Dartmouth Square, including the appointment of the PCA are referred to in Chapter 25 Archaeology & Cultural Heritage, section 25.6 Mitigation Measures. The impact on Architectural Heritage in Dartmouth Square has been assessed to decrease to slight following mitigation. The baseline information for Dartmouth Square is referred to in Chapter 25 Archaeology & Cultural Heritage, Table 25.6: Characterisation of Baseline Environment (Architectural Constraint reference ACH223), with mitigation planned referred to in Chapter 26 Architectural Heritage, section 26.7.1 Proposed Mitigation, Table 26.66 Proposed Mitigation (Impact reference AHI-99)..

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
RE: Strategic Infrastructure Development (SID). Type: Railway Order Application. ABP Case Reference: NA29N.314724 Estuary to Charlemont via Dublin Airport) Order 2022 Case number NA29N.314724				
9	Point 6	3	In terms of construction, the current TII proposal for the Charlemont station will potentially have a devastating impact on the houses of Dartmouth Square West, Cambridge Terrace and Dartmouth Road. It will see the gardens, the laneway to the rear of Dartmouth Square West and potentially some of our homes acquired, demolished and excavated to build a station that is only 1.5 meters from some of the residential homes. These homes are all Protected Structures within the Architectural Conservation Area of Dartmouth Square. Many homes may be seriously damaged during construction particularly due to tunnelling. Dartmouth Road and Square may require to be closed for circa 10 years while the work is in progress.	There will be no devastating impact on the houses of Dartmouth Square West, Cambridge Terrace and Dartmouth Road, and there is no requirement for homes or gardens to be acquired, demolished or excavated to construct Charlemont Station. The only demolition occurring at Dartmouth Road will be of 19 and 19a which is a two-storey commercial building. A laneway wall west of Dartmouth Square west will also be demolished but will be reinstated after construction. Access to the laneway to the rear of Dartmouth Square West will be maintained except for a short period to enable the installation of acoustic barriers to mitigate noise impacts to the properties on Dartmouth Square. Homes are not predicted to be seriously damaged and TII can confirm that Dartmouth Road and Square will not be closed while the work progresses. Further detail of the environmental impact assessments undertaken by TII is provided below. The proximity and impact of the station excavation and tunnel construction to property has been carefully assessed by TII, including recognising many of the properties are designated Protected Structures, to ensure unacceptable impacts are mitigated. This includes the impact of vibrations from; the tunnel boring machine (TBM), mechanical excavation and blasting, and also construction generated ground movements leading to settlement and possible building and property movement. All of which have been assessed and reported in the EIAR and are summarised below. EIAR Chapter 14.4.1.9 AZ4 – Groundborne Vibration during Construction. Tables 14.32 and 14.33 present predicted vibration levels for selected receptors during TBM passage and mechanical excavation compared to the impact threshold values for vibration for various sensitive receptors. Predictions for more locations are presented in Appendix 14.5 Groundborne Noise and Vibration Blasting Modelling Results. The predicted vibration presented in Table 14.32 and 14.33 outline the VDV (Vibration Dose Value is a parameter that combines the magnitude of vibration and the time for which it occurs) for TBM Passage at Charlemont. The VDV Threshold Level for residential buildings during TBM passage is 1.0 ms-1.75 day and 0.5ms-1.75 night, based on human response, with thresholds for building damage being much higher. The predicted level of VDV during TBM passage is around 0.265 m/s-1.75, and for Mechanical Excavation is around 0.004 m/s-1.75. Both of these values are lower than the VDV Threshold Level for properties in the area of the Charlemont Station and tunnel construction, meaning that properties will not be damaged by vibration. EIAR Chapter 14.4.1.10 AZ4 – Blasting. Table 14.34 presents the predicted vibration levels during blasting compared to the threshold values for vibration for various sensitive receptors. According to the calculations presented by Table 14.34, for properties in the area of the Charlemont Station an exceedance vibration level of 10.7mm/s PPV (Peak Particle Velocity) is predicted compared to the Threshold Level for properties of 8mm/s. Mitigation measures will therefore be implemented to reduce the risk to property from blasting as outlined in Chapter 14, section 14.5.1.2. Mitigation will include preparation of site specific blast designs that take account of sensitive receptors, including minimisation of the maximum instantaneous charge weight, or if necessary, alternative methods to blasting being employed. With the implementation of mitigation measures, vibration from blasting will be sufficiently reduced such that the residual vibration will not cause damage to property. EIAR Appendix A 5.17 Building Damage Report, covers the assessed impacts of construction generated ground movements and settlement on property. No properties are predicted to exceed the Damage Category 2. Damage Category 2 means that the degree of damage will be ‘slight’ (refer to Table 4-4), and any repair works would constitute activities similar to standard maintenance work. With particular regards to Protected Structures, these properties have been designated as "special" and hence a further Phase 3 refined assessment will be undertaken that will take account of final design and construction methodology details most likely utilising advanced numerical modelling techniques and further surveys of the building. The results of this refined assessment typically show that earlier assessments are conservative and overestimate the likely impact of construction generated ground movements. Monitoring instrumentation will also be installed to monitor the performance of the works and potential environmental impacts, including those discussed above to ensure that acceptable limits are not breached. TII would also draw attention to the fact that residential property owners within 50m of the station excavation, or 30m of the tunnel are eligible to subscribe to the Property Owners Protection Scheme (POPs) which includes for pre and post-construction condition surveys and the repair of damage attributed to the scheme. The Property Owners’ Protection Scheme is in addition to the existing legal rights of property owners and is in place to provide a simple and prompt way of rectifying any damage caused under the project up to the ceiling of €45,000. If the sum should exceed this amount the normal claims process would be used with the insurance companies for TII and/or the contractor.

10	Point 7	3	Ventilation shafts, Extract fans and fixed plant will be located at Ground level at the rear of Dartmouth Square West and will generate noise. As these will operate 24/7 they will be a nuisance and will affect the quality of life of the residents. Escalators will be in operation when the MetroLink station is in operation. As these will operate when the trains are running 5.30-Midnight they will be a nuisance and will affect the quality of life of the residents.	EIAR Chapters 13 and 14 present a comprehensive and detailed assessment of groundborne and airborne noise and vibration. The assessments include for predictive modelling in order to identify the potential impacts on all sensitive receptors during the operational phase. No residual noise impacts are identified at this location during operation. The calculated rail noise levels across the proposed Project are not significant in terms of any widespread community disturbance and results in a not significant to slight impact when added to the prevailing noise environment. Chapter 13, sections 13.2.3.2 and 13.5.3.2.3 recognise that ventilation systems if not designed and mitigated effectively are potential noise sources. Section 13.6.2.3 outlines the detailed considerations that will be included in the design to ensure that the ventilation systems do not exceed limits as per BS 4142, including: • Reduction of induct flow rates; • Reduction of elements in the airflow; • In duct attenuators; • Orientation of grilles and louvres away from sensitive receptors; • Acoustic louvres; and • Anti-vibration mountings and couplings will be incorporated into the design to control vibration.
11	Point 7	4	The stations will require to be floodlit 24/7 and will affect the quality of life of the residents.	TII confirm that stations will not be "floodlit". EIAR Chapter 4, Description of the MetroLink Project, section 4.12.8.3 explains the lighting class (and therefore the light level and uniformity targets) for each area to be lit, and has been selected using BS5489-1:2020 with account made for the local ambient lighting and environmental zones. The following measures will be undertaken to ensure the quality of life of residents will not be effected by station lighting: • LED lights will be used instead of traditional lights to control light spill, in compliance with the Institute of Lighting Profession 'GN01 Guidance Notes for the Reduction of Obtrusive Light' document; • The use of luminaires will ensure that zero upward light is emitted; and • Lighting will be adjusted depending on a stations setting for example lighting columns on highways will be 12m high but lighting columns in or near residential areas will be 8m high.
12	Point 7	4	Antisocial behaviour, law and order, graffiti and extensive litter are very likely to increase in the area due to the high volume of passengers using the Terminus station particularly at night.	The risk of anti-social behaviour has been considered by the Project and is addressed by EIAR Chapter 6, MetroLink Operations and Maintenance. Section 6.6.5.8 specifically addresses how this will be managed, including how the architectural and urban realm design is designed to discourage anti-social behaviour, for example through the attractive setting, use of public lighting, open sight-lines, and avoidance of areas where individuals and groups of people can hide. Subject to data protection impact assessment and compliance with the General Data Protection Regulation (GDPR) CCTV will also be installed throughout the MetroLink system, including at station entrances and the public realm to provide general security and surveillance of all the public areas. TII would also note Charlemont Station has been deliberately designed without drop-off (with the exception of a drop only for persons of restricted mobility on Grand Parade) and taxi pick-up areas.

Submission No.			204	
Organisation Name or Name of Submitter			Niall Parsons	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
RE: Strategic Infrastructure Development (SID). Type: Railway Order Application. ABP Case Reference: NA29N.314724 Estuary to Charlemont via Dublin Airport) Order 2022 Case number NA29N.314724				
13	Point 7	4	The expected increase in pedestrian and vehicular traffic to the station, and to the Dartmouth Road end will cause congestion and will destroy a residential area and cultural heritage area. My house No.1 Dartmouth Square West is located at the corner of the Square and Dartmouth Road. The proposed MetroLink Terminus station will have a major negative impact on my property with the entire above non exhaustive list of factors.	TII do not agree that “will cause congestion and will destroy a residential area and cultural heritage area” as explained by the responses made to your observations above, including responses (6) and (7) that address pedestrian and vehicular traffic, and response (8) with regards to the impact on property.
14	Point 8	4	The proposed MetroLink + Luas to Charlemont stations equate to a duplication of two railway lines of circa 1 Km with a projected cost of €650 million. This is bad planning and a waste of Public money. The logical Southside terminus is in a city center location e.g. St. Stephen's Green. The proposed tunnelling to and building of a Southside terminus at Charlemont will add very significant costs to the MetroLink Project. The justification for a terminus station at Charlemont has been proven to be weak.	The Board is not responsible for any decisions in relation to the funding the Project. It is solely responsible for assessing whether the Project is consistent with proper planning and sustainable development and that its effects on the environment are acceptable. The responsibility for funding the Project lies with the NTA, the Government and ultimately the Oireachtas. It has received all necessary approvals, including under the Public Spending Code for the making of a Railway Order. It will undergo further scrutiny and approvals, including under the Public Spending Code, before it is funded. It is not appropriate for the Board to make findings in relation to value-for-money that are outside its statutory functions and would cut across those arrangements. Members of the public are entitled to make representations to their TDs in relation to the value-for-money of any element of the Project. In any case, TII do not agree with this statement for the reasons set out by response (1) above, noting that infrastructure is not being duplicated given the capacity of the Luas south from St. Stephen's Green is restricted due to on-street running. There is a limit to the potential of the Luas to provide additional capacity in the on-street non-segregated section of the Luas Green Line from Charlemont northwards through the city centre. The nature of this route and the fact that it currently crosses several road junctions (Adelaide Road, Harcourt Street / Hatch Street upper and Harcourt Street / St Stephen's Green south) limit the service to a maximum of 24 trams per hour per direction. The projected demand for this section would require a higher frequency of up to 30 trams per hour and this demand cannot be met with on-street systems (Luas / bus). The interchange between Luas and MetroLink proposed at Charlemont will provide the necessary capacity to address the demand on this corridor and reduce overall travel time for passengers There is also high passenger demand forecast for a Metrolink station at Charlemont, including from the Ranelagh area, which would be lost if St. Stephen's Green was the MetroLink southern interchange station. The additional fare revenues collected by the Charlemont Station interchange increase the benefits delivered by the Project, reflected by an improved Project Benefit Cost Ration (BCR). Further, to ensure that public investment delivers value for money, the Public Spending Code sets out requirements for the evaluation, planning and management of public investment. The preparation of a Business Case is a key element of meeting these requirements. The Public Spending Code requires that both the Preliminary Business Case and Final Business Case for public investment projects are published. In July 2022, the Government granted Approval in Principle to the NTA to enable the submission of a railway order application by TII to An Bord Pleanála in respect of the MetroLink project (Decision Gate 1). This approval was granted after the Preliminary Business Case (PBC) had undergone significant scrutiny and challenge by bodies that are independent of TII, including DoT and DPER review (including independent review by JASPERS and the Major Projects Advisory Group (MPAG)) of the PBC around timeline, costs and benefits that were updated to inform the Government decision.

RE: Strategic Infrastructure Development (SID). Type: Railway Order Application. ABP Case Reference: NA29N.314724 Estuary to Charlemont via Dublin Airport) Order 2022 Case number NA29N.314724				
15	Conclusion	4	I would be glad if ABP could consider the above non exhaustive list of observations and that approval is refused for this application and that the MetroLink Station at Charlemont, be reconsidered and Terminus be relocated in a city centre location.	The responses to the observations made above explain why TII do not consider it is correct or appropriate that approval is refused for this application and that the proposed MetroLink interchange with the Luas Green Line at Charlemont be relocated. A scheme which terminates ain the city centre would not be consistent with the Transport Strategy for Greater Dublin Area (2022-2042). In addition any decision to terminate the scheme in the city centre will significantly impact on the overall viability and benefits of scheme.

Metrolink submission: Observation on Railway (Metrolink - Estuary to Charlemont via Dublin Airport) Order, 2022 (case reference; NA27N.314724)					
1	Letter	1	The purpose of this observation is to draw attention to the flawed manner in which the option which developed into Metrolink was selected by the Fingal/North Dublin Transport Study (AECOM, 2014, 2015). In the 'alternatives considered' section of the EIAR (volume 2, chapter 7), this study is put forward as the process by which the metro option was selected from a list of 25 alternatives. It was the point at which a metro proposal was readopted, and other light or heavy rail or BRT-based alternatives rejected, and subsequent development of the Metrolink project has developed from that recommendation. Of the 25 possible schemes examined in the first stage of this study, four survived for appraisal in the second stage. The cost of the option derived from Metro North, having initially been costed at €2.5-3 billion, was then 'optimised' by reducing capacity to 12,000 per hour in each direction, shortening platforms, and bringing a previously tunnelled section between DCU and Dublin Airport above ground.	The selection of the option which was developed into MetroLink was part of the Fingal/North Dublin Transport Study (AECOM, 2014, 2015), and is therefore outside of the EIAR and Railway Order application. As indicated, Chapter 07 (Consideration of Alternatives) presents the decision-making process that has led to the proposed Project, including the main reasons for choosing the proposed Project. The assessment includes alternative options using heavy rail, light rail, Bus Rapid Transit (BRT) as well as combination options. The assessment identified an Optimised Metro North (LR7) as the best medium- and long-term transport project for the Greater Dublin Area for the following reasons: * It was the most economically advantageous scheme when compared to other options, delivering the highest benefit to cost ratio (BCR of 1.5), almost double the BCR of the next best scheme (Tunnelled Luas); * It generated the highest level of transport benefits when compared to other options, with the highest number of additional public transport benefits generated in morning peak travel period; * It provided a new strategic public transport corridor, avoiding reliance on either the existing heavy rail lines or the Luas Cross City line; * It delivered a connection right into the centre of the city, serving O'Connell Street and St Stephen's Green; * It retained the opportunity to extend Luas Cross City to Finglas, which would not be feasible if the tunnelled Luas options were selected, and it avoided reducing the service level on Luas Cross City to Cabra and Broombridge; * Due to the high level of segregation, it was considered to significantly increase capacity to allow for potential future growth along the corridor, when compared to other options; * It could potentially be extended southwards in the longer term to alleviate high travel demand on the Luas Green Line, and ultimately form a complete north south metro corridor traversing both the north and south city; and, * This option delivered the highest safety benefits when compared to other options.	
2	Letter	1	By contrast, its light and heavy rail competitors, initially costed at €0.5-1.05 and €1.2-1.5 billion respectively, had become more expensive in the second stage, at €2.24 and €1 .83 billion, and similar to the optimised metro (€2.33bn). Their cost advantage having largely been removed, cost benefit analysis showed they had negative net benefits, while the optimised metro one had strongly positive ones (AECOM, 2015, p.49, 51, 55, 124, 134, 157, 164) The light rail option ('LR3') followed much the same route as the metro north of the city centre, before connecting into the recently extended LUAS Green Line in Cabra. Its cost doubled between stages one and two of the study, mainly because it was decided that a 2.5 km section would need to be in tunnel in the city centre. Leaving it on street would limit trams to a three minute maximum frequency, which would leave no spare capacity by 2033 (AECOM, 2015, p. 108- 122).	Please refer to response item (1) in relation to the Fingal North Dublin Transport Study. As noted in Chapter 07 (Consideration of Alternatives), the options were subject to a Multi-Criteria Analysis (MCA) having regard to Environment, Economy, Safety, Accessibility and Social Inclusion and Integration. Therefore, the preferred option was identified for several reasons, not simply the cost, as noted in response item (1) above.	
3	Letter	1	However, if the preferred option is optimised, then so should competing alternatives, on the principle of comparing like with like. The light rail alternative can be used to illustrate how this might have been done. As with the metro option, it could have involved aligning economically achievable capacity more closely with demand. The light rail option had barely adequate capacity in city centre sections, but this could have been coped with by several different forms of load sharing:	Please refer to response item (1) in relation to the consideration of alternatives, including alternative light rail options, and the reasons why the proposed Project was selected as the preferred option.	
4	Letter	2	a) A segregated, limited access route between Swords, the Airport and the city centre already exists - the Port Access tunnel - and is already well used by buses connecting them. It would not be difficult to balance use of this existing route with that on a LUAS one, by periodically adjusting services and access controls on the tunnel.	Please refer to response item (1) in relation to the consideration of alternatives, including bus and light rail options, and the reasons why the proposed Project was selected as the preferred option.	
5	Letter	2	b) The reduction in the interval between trams from one every 2 minutes possible in largely segregated suburban sections to one every 3 minutes in largely on-street city centre ones could be avoided, by splitting the line at the point where it enters the latter, with the second line running a short distance into the centre. Many urban rail services work on the terminus principle, with some passengers walking further to reach their final destination. Unlike a rail terminus, a light rail one need not take up any more space than a normal stop. In Dublin, the green line served such a terminus (at St. Stephen's Green) from 2003 to 2017. While the difference between 2 and 3 minute frequencies may seem minor, it represents a 50% increase in capacity (30 trams per hour instead of 20). Splitting the proposed line could avoid the need to put it into a tunnel under the city centre.	Please refer to response item (1) in relation to the consideration of alternatives, including alternative light rail options, and the reasons why the proposed Project was selected as the preferred option.	

Submission No.			205	
Organisation Name or Name of Submitter			Nicholas Mansergh - The Cottage, Wellington Square, Cork	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
6	Letter	2	(c) Direct interchange between the light rail option and the rail lines to Connolly and Docklands could have been provided for. AECOM's LR3 option required a double change at Broombridge and Cabra (2015, p.101), but few passengers would do this. More would do so with a direct interchange, diverting some passengers from trams in the city centre.	Please refer to response item (1) in relation to the consideration of alternatives, including light rail options, and the reasons why the proposed Project was selected as the preferred option.
7	Letter	2	(d) The proposed 3000 space park and ride garage on the M1 north of Swords is large enough to affect the balance between capacity and demand on a light rail line, and could be scaled back. Arguably this should be done anyway, as it will encourage 'rail heading' - making those living north of Dublin more inclined to drive down the motorway to the park and ride facility, and less inclined to use existing rail stations closer to their homes.	As noted in Chapter 09 (Traffic and Transportation), with the increased use of public transport in the Operational Phase of the proposed Project, the strategic road network will experience an overall reduction in AADT and delays. The M50 Motorway, R132 Swords Bypass and M50 Port Tunnel see reductions in total traffic flow from the Do Minimum to the Do Something scenario, however the M1 and other local roads north of the Park and Ride Facility see an increase in traffic flow due to people accessing the Park and Ride. As outlined in Chapter 31 (Summaries of the Route Wide Mitigation & Monitoring Proposed) item TT19, the use of the Park and Ride Facility at Estuary Station will be monitored through the Operational Phase. Data on the origins and destinations of users, and their trips will be required to determine what impact the Park and Ride Facility is having on local and strategic level trips. Further demand management measures may be required in order to increase the number of spaces available to the wider catchment.
8	Letter	2	The AECOM study might have optimised the three alternatives to the metro option, or found some other way of treating them more equally, and have then still recommended the metro, so their failure to do so does not demonstrate that their conclusion was wrong. It does however show that it was arrived at in an unsafe and unsatisfactory manner. Subsequent massive increases in the estimated costs of Metrolink cast further doubt on the study, as they imply the cost of the metro was seriously underestimated, even at 2015 costs, and that its cost estimates for the different options may be unreliable even in relative terms.	Please refer to response item (1) in relation to the Fingal North Dublin Transport Study. As noted in Chapter 07 (Consideration of Alternatives), the options were subject to a Multi-Criteria Analysis (MCA) having regard to Environment, Economy, Safety, accessibility and Social Inclusion and Integration. Therefore, the preferred option was identified for several reasons, not simply the cost, as noted in response item (1) above. Additionally, the Preliminary Business Case for the proposed Project details the range of cost estimates associated with the proposed Project, and has been granted Approval in Principle by Government, enabling the submission of the Railway Order.
9	Letter	2	While inclusion of a statement of the alternatives considered in an EIAR is a requirement under Irish and European Law, there is no explicit requirement that they be evaluated, or that this be done in an unbiased and reliable manner. The main purpose of an EIAR is to demonstrate the environmental acceptability of a project, rather than its superiority to alternative options. Defects in the way alternatives were considered would not necessarily preclude approval for an infrastructure project of moderate scale with limited interaction with other projects. However, Metrolink is of a different order of magnitude to a normal infrastructure project for which an EIAR would be required. Apart from the numerous large-scale effects on the development of Dublin and its public transport system, its sheer cost is likely to have a nationwide impact, by pre-empting funding for other projects. It is difficult to see how approval of such a large megaproject with such pervasive effects, developed on the basis of such a flawed selection process, can be considered consistent with proper planning and sustainable development.	Please refer to response item (1) in relation to the Fingal North Dublin Transport Study and in relation to the decision making process that has led to the proposed Project, and the reasons why it has been selected as the Preferred Option. As noted in Chapter 07 (Consideration of Alternatives), the options were subject to a Multi-Criteria Analysis (MCA) having regard to Environment, Economy, Safety, accessibility and Social Inclusion and Integration. Having regard to the environmental assessment that informed the choice of the proposed Project, some of the findings were: * Some noise impacts were identified during the construction and operational phases, that could be minimised by design development and the implementation of mitigation measures; * This option has the highest positive environmental impacts through the improvements in air quality and the highest reduction in greenhouse gas emissions when compared to other options; * Some potential for impacts associated with construction compounds, hoarding and the removal of landscape features. However mitigation measures could be adopted to reduce impacts. The assessment also identified some impacts associated with the tunnel portals as well as the surface sections in rural areas south of Swords; * Some temporary loss of habitat of low conservation value was expected during the construction phase. This option was the preferred option from a Biodiversity perspective. Once operational, the proposed Project will have no significant impacts on habitats and surrounding wildlife. * The proposed Project could result in temporary removal or relocation of monuments during the construction phase, with the potential for the removal of the curtilage of some buildings of architectural merit. Overall, this was the preferred option from a cultural heritage perspective. * Potential impacts due to land take and severance in addition to potential impacts on soils due to soil usage and degradation during the construction phase. * The assessment identified potential for residual impacts on groundwater of low significance, with residual impacts on surface water resources considered to be of a low magnitude with negligible to low significance. * The preferred option scores well by providing the most benefit as it passes through 12 deprived areas along the route. As noted in response item (8), the Preliminary Business Case for the proposed Project details the range of cost estimates associated with the proposed Project, and has been granted Approval in Principle by Government, enabling the submission of the Railway Order.

10	Letter	2	One possible way of resolving this problem would be to revisit the AECOM report. The Board could ask for further information on a limited number of specified options considered in that report, in the form which best reflected the strengths of each specific option. For each such option, the expected benefit-cost ratio could be required, with supporting calculations and up- to-date costs, for comparison with those for Metrolink.	Please refer to response item (1) in relation to the Fingal North Dublin Transport Study. As noted in Chapter 07 (Consideration of Alternatives), the options were subject to a Multi-Criteria Analysis (MCA) having regard to Environment, Economy, Safety, accessibility and Social Inclusion and Integration. Therefore, the preferred option was identified for several reasons, not simply the cost, as noted in response item (1) above. As noted in response item (8), the Preliminary Business Case for the proposed Project details the range of cost estimates associated with the proposed Project, and has been granted Approval in Principle by Government, enabling the submission of the Railway Order.

Submission No.			208		
Organisation Name or Name of Submitter			Nigel Clerkin (168 Rathgar Road, Dublin, D06 RW72)		
Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
Re: Metrolink					
1	Letter	1	Extending the proposed underground metro from the city centre to Tallaght, also serving Rathmines, Rathgar, Terenure and Templeogue, would be a much superior option allowing for a greater population catchment.	The overall project objective of MetroLink, as established by TII and as outlined in the National Development Plan 2021-2030 (Government of Ireland, 2021) is 'to provide a sustainable, safe, efficient, integrated and accessible public transport service between <u>Swords, Dublin Airport and Dublin City Centre</u>'. The extension of the alignment to Tallaght, via Rathmines, Rathgar, Terenure and Templeogue does not align with this objective with regards to the areas to be served by the Project. The current Transport Strategy for Greater Dublin Area (2022-2042) considers a range of options for the onward extension of MetroLink to meet the demand for travel over the period of the strategy. This includes consideration of the need for the upgrade of the Luas Green Line to metro with a metro extension to Dublin south west, south or south east. Whilst the strategy envisages that further extensions will be delivered after 2042, MetroLink which terminates at Charlemont allows for the possible extension of the metro in any of the above directions.	
2	Letter	1	An underground metro to Tallaght would meet the transport demands of a growing population of commuters unlike the Busconnects Project, which proposes to remove trees, increase road widths, and cause loss of or damage to heritage, village character and communities along its route.	Please refer to Response (1) above. BusConnects is not part of the MetroLink scope and does not fall within the remit of TII.	
3	Letter	1	Extending MetroLink to Tallaght would take a large volume of motor vehicle traffic out of the road system. It would reduce the pressure on villages and communities inside the M50 limits and allow for safer commuting for cyclists and pedestrians. It is the most sustainable way to ensure the character of villages like Rathmines, Rathgar and Terenure survives and thrives for future generations.	Please refer to Response (1) above.

1	Noise	2	I object to the granting of planning permission because of the noise levels, both groundbourne and airborne, that will be generated during the construction/tunnel boring phase of the construction and during the ongoing operation of any metro trains thereafter.	TII understand the reasons for your concerns and would like to provide the assurance that the potential disturbance impact on your property as a result of the proximity of the proposed tunnel and station has been carefully assessed. This includes the impact of noise and vibrations from: the tunnel boring machine (TBM) and the operation of MetroLink. All of which have been assessed and reported in the EIAR and are summarised below. With the exception of a temporary disturbance when the TBM passes your property, TII are predicting a 'not significant' impact to the building occupants and your building, or risk to the integrity of your house. Construction Phase – Airborne Noise and Vibration EIAR Chapter 13 Airborne Noise and Vibration, Table 13.61 summarises the potential significant construction noise impacts from the construction of the proposed Griffith Park Station. With your address being in excess of 200m from works at Griffith Park Station no significant impact from airborne noise is predicted. Construction Phase – Groundborne Noise and Vibration EIAR Chapter 14 Groundborne Noise and Vibration, Appendix A14.5 presents the predicted groundborne noise levels during the construction phase of the project for 23 Daneswell Road: • The predicted level of groundborne noise during TBM passage is 51 dB LASmax, which is above the 45 dB LASmax threshold resulting in a significant impact on the occupants of the building for the relatively short 2-week duration of TBM passage. • The predicted level of groundborne vibration during TBM passage is 0.3 ms-1.75 day and 0.252 ms-1.75 night, below the VDV (Vibration Dose Value is a parameter that combines the magnitude of vibration and the time for which it occurs) Threshold Level of 1.0 ms-1.75 day and 0.5 ms-1.75 night, resulting in a not significant impact on the building and its occupants. Unfortunately, there are no effective methods available to reduce groundborne noise from the TBM at source but noting that the duration of this impact will be temporary and of the order of up to two-weeks as the TBM passes. TII will undertake advanced consultation and stakeholder engagement to prepare people for the passing of the TBM and ensure the timing of these impacts are known as detailed in EIAR Appendix 5.1 - Outline Construction Environmental Management Plan (CEMP), Section 6.2, Table 6.2. TII's contractor(s) will prepare a Construction Noise and Vibration Management Plan (CNVMP) for the proposed Project as referred to in EIAR Appendix A5.1. The CNVMP will be a live document and will include a full monitoring and auditing programme which will be agreed with the Local Authorities prior to the commencement of the Construction Phase. The Transport Infrastructure Ireland (TII) Airborne Noise and Ground-borne Noise Mitigation Policy (Appendix A14.6 of EIAR Chapter 14) also sets out the construction noise insulation and temporary rehousing measures to be implemented where required. Operational Noise and Vibration During railway operation the predicted groundborne noise at 23 Daneswell Road is 40 dB LASmax, as shown in EIAR Appendix A14.5, Section 14.4 (pg29) which does not exceed the threshold level of 40 dB LASmax, indicating no significant impact to building occupants during railway operation. However, as the output value of the model is borderline, between two assessment criteria, TII are happy to engage with the residents to identify suitable mitigation mesasures in the context of those outlined in the EIAR Chapter 14 and the Airborne Noise & Groundborne Noise Mitigation Policy. The predicted VDV during railway operation is 0.014 ms-1.75 (VDV day) and 0.008 ms-1.75 (VDV night). Both of these vibration values are well below the VDV Threshold Levels of 0.8ms-1.75 (VDV day) and 0.4ms-1.75 (VDV night) indicating no significant impact for the building or for residents of this address.	
2	Vibration	2,3	I object to the granting of planning permission because of the vibration levels, both groundbourne and airborne, generated during the construction phase and the ongoing operation of any metro trains thereafter.	Please refer to Response (1) above related to noise and vibration.	

Submission No.			209	
Organisation Name or Name of Submitter			Nigel Mallen (23 Daneswell Road, Glasnevin)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Email: MetroLink-Estuary to Charlemont Case number ABP-314724-22				
3	Potential damage to my home	3	I object to the granting of planning permission for this project due to the potential damage to my home during the construction phase and during the ongoing operation of any metro trains thereafter. There is the potential for considerable damage to my home during the construction phase and ongoing operation of metro trains.	Excavation for the tunnels and other below ground structures could potentially lead to ground movements at the surface and below ground. An assessment of the effects of ground movements and potential impacts on existing buildings has been carried out as part of the Scheme Design with information included in EIAR Appendix A5.17 Building Damage Report. The EIAR Appendix A 5.17 Building Damage Report, covers the assessed impacts of construction generated ground movements and settlement on property. The assessments include for some specific buildings and representative assessments for other general types of buildings along the route and Section 5.2 of this report sets out the rationale for the assessment of properties similar to yours. The results of the assessment provided in Table 5.2 shows that property Ref B - 244, as one of the representative properties selected similar to your property, has been assessed as falling within the '<i>Very Slight</i>' category. The building risk categories shown in Table 4-4 of the aforementioned report are used to define the degree of building damage related to the Risk Category. The Property Owner Protection Scheme (POPS), committed to by TII, allows residential property owners to register with TII if their residential property is within thirty (30) metres of the edge of the MetroLink alignment or fifty (50) metres of station structures. The POPS comprises condition surveys of residential properties along the route of the proposed Project. The purpose of the condition surveys is to ascertain the condition of the properties before, during (if deemed necessary), and after the completion of the proposed Project to determine whether there has been any deterioration of any of the properties surveyed and whether same may be attributable to the proposed Project, and subsequently to recommend repairs as appropriate. Condition survey data gathered pre and post construction, and possibly during construction, will be used to assist the property owner and TII in swift and accurate verification of any property damage claims which may be received from property owners. The POPS is designed to cater for / address repair work which may be necessary for any damage (attributable to the proposed Project) to a qualifying residential property up to a threshold of €45,000. The POPS will be introduced by TII through public consultation and will be formally advised to eligible property owners by the Public Relations Department. Further information on POPS is available in Chapter 11 (Population & Land Use). Useful information can also be found in the MetroLink Frequently Asked Questions document which can be found online at: https://www.metrolink.ie/en/your-property/property-owners-protection-scheme/ , and this is where useful updates will be made available as the proposed Project progresses. . Useful information on POPS can also be found in the MetroLink Frequently Asked Questions document which can be found on-line at: https://www.metrolink.ie/en/your-property/property-owners-protection-scheme/
4	Substratum	3	I object to any acquisition of the substratum of land under my home. I do not consent to the acquisition of the substratum of land under my home.	The EIAR Chapter 21 (Land Take), Section 21.6.1.2, outlines the Compensation for Compulsory Purchase process. Under the Transport (Railway Infrastructure) Act 2001 (as amended) (the 'Act') upon commencement of the Railway Order (RO), TII will be authorised to acquire compulsorily any land or rights in, under or over land or any substratum of land specified in the RO, and, for that purpose, the RO shall have effect as if it were a compulsory purchase order (as referred to in Section 10(1) of the Local Government (No.2) Act 1960 (as inserted by Section 86 of the Housing Act, 1966) which has been duly made and confirmed) with modifications. Accordingly, TII is authorised to serve a notice to treat pursuant to the provisions of the Housing Act, 1966, including Section 79 thereof. TII also has the right to enter onto other lands for the purposes of carrying out the works permitted under the RO in certain circumstances. The acquisition of the various specified rights and interests in land and property, is necessary in order to ensure the delivery of the MetroLink project in its entirety. Where a property owners interest is acquired compulsorily, compensation will be provided in accordance with the compensation code. Further information can be obtained from the MetroLink Compulsory Purchase Order Guideline document (September 2022) which can be found on-line at: https://www.metrolink.ie/media/0jlpbyso/metrolink_cpoguideline_final_september-2022.pdf

Email: MetroLink-Estuary to Charlemont Case number ABP-314724-22				
5	Electromagnetic and stray current	3	I object to the granting of planning permission due to electromagnetic and stray current effects of the operation of an electric metro train system under my home.	Elements of MetroLink can act as sources and propagators of EMI (Electromagnetic interference). However the levels of EMI generated will not in any way impact on residential properties as MetroLink will comply with the requirements of the European Directive on Electromagnetic Compatibility (2014/30/EU) (European Union, 2014b), and European Standards EN 50121 (Parts 1-5) (CENLEC, 2017), which address railway EMC. In addition, all electrical and electronic products (that would be typically used in the home) in the EU must comply with all applicable directives which include the above EMC Directive, the Low Voltage Directive (2014/35/EU)(European Union, 2014e) and the Radio Equipment Directive (2014/53/EU) (European Union, 2014d). This means that EMI levels generated by MetroLink will be controlled and will not occur at levels that effects standard electrical appliances. Refer to EIAR Chapter 12: Electromagnetic Compatibility and Stray Current for details (section 12.4.1). Having regard to stray current, the proposed Project will be designed to ensure that there is no potential for significant effects arising on nearby buried utilities. These available measures include the use of a stray current collector system, adjustment of the power supply system, improvement of the return circuit (high conductivity in the rails) and isolation of the return circuit from ground (rail-to-earth resistance). Refer to EIAR Chapter 12: Electromagnetic Compatibility and Stray Current Section 12.10.5.
6	Hydrology and hydrogeology	3,4	I object to the granting of planning permission for this project due to the potential effects on the hydrology and hydrogeology under my home.	The closest surface water resource (River/stream) to your property is the Tolka river. The proposed MetroLink route crosses beneath the Tolka River at St Mobhi Road in tunnel approx. 6m beneath the river, between Griffith Park and Glasnevin stations. Chapter 20 Hydrology of the EIAR assesses potential impacts on surface water resources i.e. rivers and streams. As outlined in Table 18.24 of Chapter 18, there are not predicted to be any impacts during the construction or operational phase. As a result, there is no effect on hydrology that would impact your property. Having regard to Hydrogeology (groundwater) a full assessment of the potential effects of the construction and operation of MetroLink are presented in Chapter 19 of the EIAR. Potential effects in this area during the Construction Phase is dewatering (from either drawdown or water quality effects) during the station construction at Griffith Park. However, the analysis presented within this chapter has identified this potential effect as 'Temporary Imperceptible to Not Significant' in this area. It is considered that there is no perceptible effect on groundwater body status or habitat requirements here. Dewatering at the Griffith Park Station during works will be temporary only with the anticipated radius effect of dewatering reducing as the station construction progresses towards full perimeter and base seal (i.e. full watertight conditions). Refer EIAR Chapter 19, Hydrogeology, Table 19.33 and 19.4 and section 19.5.3.5.2, Griffith Park.
7	Topography	4	I object to the granting of planning permission for this project due to the topography of the area in which my home is located and under which it is proposed to tunnel for the proposed Metrolink. The topography of the land in the area is such that the land slopes downwards from the Phibsboro area towards Glasnevin. I live at the aforementioned address on Glasnevin which is at the lower end of the slope. All of the issues that I have mentioned would be exacerbated by my home being so close in depth to the tunnel for the proposed Metrolink.	The assessments undertaken are based on the cover from the top of the tunnel to ground level at your location, as indicated on the MetroLink Alignment Long Section drawing for this part of the route (see Railway Order Plans\Drawings, Alignment Drawings, Alignment Details Book 1 of 2). Please also refer to Response (3).

Re: Case reference NA29N.314724 - Description: Railway (Metrolink Estuary to Charlemont via Dublin Airport) Order [2022]				
1	Letter	1	I welcome the extension of the deadline for making observations to An Bord Pleanála on MetroLink's Railway Order application.	Noted
2	Letter	1	I welcome, also, the principle of developing a high frequency metro railway for Dublin city.	TII wish to thank you for your submission and stated support for the delivery of MetroLink.
3	Letter	1	It makes some sense in the long-term sense to develop a high frequency metro line through the city of Dublin, however, the 'MetroLink' project seems to be one of those projects that keeps being stalled for a variety of reasons and then amended in following iterations in ways that do not always make sense from an environmental, social, cost or design perspective.	Chapter 07 (Consideration of Alternatives) details the decision-making process that has led to the proposed Project. (Old) Metro North identified a preferred route alignment for the Project, and a subsequent Railway Order application was granted in 2011. However, following the economic downturn that commenced in 2008, The Infrastructure and Capital Investment 2012-2016: Medium Term Infrastructure Framework (DPER, 2011) laid out a plan to defer a number of major infrastructural projects including the (Old) Metro North project in order to achieve fiscal consolidation. Through a multi-criteria assessment of alternative transport options, an Optimised Metro North was identified as the preferred option under all relevant headings of Environment, Safety, Economy, Accessibility and Social Inclusion and Integration. This option follows the same alignment as Old Metro North but includes a number of significant variations such as shorter platforms, smaller stations, reduced rolling stock, fewer stations and vertical alignment changes. TII as the Government Agency responsible for delivering MetroLink, are committed to expediting the delivery of this transformative project on receipt of an Enforceable Railway Order.
4	Letter	1	While I have concerns about some of the proposed route plans, e.g. in relation to Phibsborough / Cross Guns area, I want to concentrate in this submission on the proposals for Metrolink route in the vicinity of Tara Street Station.	As noted in response item (3), Chapter 07 (Consideration of Alternatives) details the decision-making process that has led to the development of the proposed Project, including alternative route alignments and station locations. A station at Tara Street provides good interchange opportunities, serves important key trip attractors in the study area with high potential passenger trips. This option also takes a direct and short route through areas of high demand in the centre of the study area. As Dublin's public transport network grows through the implementation of higher capacity bus routes, more frequent heavy rail services and coverage, and the expansion of the light rail network it is critically important that to achieve the full benefits and capitalise on these investments that they are integrated fully where appropriate to attain "the network effect". High quality interchanges can significantly broaden the transport offer for their catchment and add to the appeal and attractiveness of sustainable transport by ensuring that people can easily change services to access a wider range of places by these modes, and each scheme should be designed to ensure that these are as seamless as possible.
5	Letter	1	In this regard, I wish to note my objection to the proposed demolition of Dublin City Council's Markievicz sport and leisure centre, to facilitate a Tara Street interchange, for the following reasons:	TII acknowledge your concerns around the demolition of Markievicz Leisure Centre. Please refer to the below responses around the proposed mitigation measures for Markievicz Leisure Centre.

Submission No.			210	
Organisation Name or Name of Submitter			Nuala Kelly (64 Shandon Park, Phibsborough)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
6	Letter	1	Loss of the only publicly accessible swimming pool / leisure centre in city centre The Markiewicz sport and leisure centre managed by Dublin City Council is a vitally important facility for local people, for people working nearby, for tourists and more recently for schools and community groups. It is astonishing to think it might be demolished to facilitate a line that could be moved, with some thought and consideration, to a less intrusive or impactful location nearby. If such specific space is required, could a bank or business be removed instead of a community facility and, crucially - many homes?	Please refer to response item (4) above in relation to the strategic need for a station at Tara Street. Concerns had been raised during the public consultation on the Emerging Preferred Route (EPR) regarding the demolition required for the station in the location proposed, and concerns were again raised during the consultation on the Preferred Route. A number of alternative station locations were considered to try and address these concerns. Option 0 is the proposed station location, with a further 11 options assessed. Three options as submitted by College Gate residents, with the station relocated either to the north or south of the EPR proposed location, have been reviewed in detail. In addition, other options developed through the Preferred Route design process including a mined option and realignment of the route to the east of Tara Street Station have also been reviewed. All were assessed against the EPR proposed station location (Option 0) as a base case, adjusted to suit the single bore and reduced station box length. The various options were taken through a Mutli Criteria Analysis to compare aspects of each different option. Assessment of options considered the viability of the rail alignment, the quality/ease of interchange with Tara DART Station (a key requirement given that this will be one of the busiest stations on MetroLink with high passenger interchange with the DART), demolition/construction impacts (including minimising impacts on the existing DART infrastructure/operations), other environmental and planning issues, including traffic and utility impacts, and urban integration, health and safety issues, and potential construction costs. A mined station option at Tara was considered as a solution to avoid the demolition of the College Gate building. The option comprises the construction of two deep shafts either side and immediately adjacent to the College Gate apartments to provide construction access for mining the tunnel under College Gate apartments and to subsequently provide permanent access, ventilation and back of house facilities for the operation of the station. It was established that 24 hour working would be the only realistically feasible approach to construct the cavern. Therefore, the nature of the work, drill and blast and mechanical excavation would generate a level of groundborne noise and vibration would mean it would not be possible to inhabit the College Gate apartment block due to the disturbance caused, leading to a relocation of residents for a minimum of two years. However, there are possible risks that could extend the duration further, and therefore this option has a similar impact on College Gate residents as the cut and cover preferred option. TII consider that when balanced against the significant direct construction cost increase compared to the preferred cut and cover option, that demolition and redevelopment of the area around the site of the proposed Tara Station as part of the wider integrated development and regeneration of the site provides a better option. The mined option economically performs worse with a much greater risk allowance required compared to the preferred cut and cover option, and the preferred proposed cut and cover station provides a higher quality operational station that is consistent with the MetroLink architectural vision and operational and maintenance strategy. This assessment has identified that for a number of reasons including constructability, cost, and retention of a good interchange facility, that Option 0, including demolition of College Gate and Markiewicz Centre, remains the preferred station location: * This location retains a good interchange facility with Tara DART Station; * It reduces risk to the overall construction programme; * It offers cheaper overall construction cost; * It retains opportunity for future adjacent development by others; * TII will continue to work with DCC in relation to the development of an alternative sports and recreational facility to replace the Markiewicz leisure centre and intends to fund the alternative. However, TII does not have control over that development, which is part of DCC's function to provide public sport and recreational facilities in its function area. DCC may or may not be in a position to deliver it in parallel with the MetroLink project. Accordingly, the Board should assess the MetroLink project on the basis that the alternative may not be available. The impact would then be significant, but nonetheless one that would not outweigh the strategic scale long term benefits that MetroLink will deliver.

Organisation Name or Name of Submitter			Nuala Kelly (64 Shandon Park, Phibsborough)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
7	Letter	1,2	Loss of vital homes in the vicinity of Tara Street To demolish seventy-eight housing units in the College Gate apartment block, in addition to a terrace of social housing, is totally unacceptable during a time of severe housing shortage, homelessness and increasing costs of construction. This aspect of the proposal, in my view, runs counter to modern European (and Dublin) urban planning vision to create a thriving, living city with an appropriate housing mix, businesses, shops and social amenities. Notwithstanding the need for an urban Metrolink from the airport, this must be achieved with minimum impact on other human rights provisions e.g. housing, environmental, social and cultural.	Please refer to response item (6) above in relation to the assessment of alternative options, and the reasons why the proposed location has been identified as the preferred option. As noted in Appendix A7.2 Tara Street Report (appendix to Chapter 07 Consideration of Alternatives), one of the reasons, among others, for the selection of the preferred location is that it provides opportunity for future oversight development by others as part of an urban integration plan. As detailed in Chapter 04 (Description of the MetroLink Project), as part of the station and urban realm design, Luke Street will be converted into a shared space for cyclists and pedestrians, including provision of a two-way cycle track between its junctions with Poolbeg Street and George's Quay. Poolbeg Street will be reduced to one lane to accommodate more space for pedestrians and cyclists, and reduced space for general traffic. This newly created public realm will consist of outdoor seating and scope for ephemeral events, with the possibility of retro-fitting the adjacent rail arches to provide retail or food and beverage opportunities. High quality natural stone paving, seating used as directional wayfinding and space-making devices and large mature tree planting are used to create open space and enhance green infrastructure within the city centre. As noted in Chapter 03 (Background to the MetroLink Project), MetroLink will provide a high-quality urban environment at station locations that will benefit the community as a whole by enhancing the urban realm directly and also by encouraging further high quality development which will stimulate the local economy. This will provide an opportunity for the development of a sustainable high quality urban environment along the alignment of the proposed Project.

Submission No.			210

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
8	Letter	2	Environmental, Social and Cultural impact The area around Pearse Street and Tara Street will become impossible for people to navigate as the proposed plans do not seem to have included any measures to facilitate active travel, green space or traffic calming - this is indeed surprising given the stated vision in the Climate Action Plan 2022 to create sustainable, green, and carbon neutral infrastructure and space for communities and visitors in a living city. Instead, the real risk, should the plan go ahead for this section, is that the area will have little commercial or cultural attractions, reduced footfall and loss of amenity for the remaining residents in the area.	Please refer to response item (7) above in relation to the active travel provisions as part of the public realm at Tara Street Station, and the creation of a public plaza at this location. As noted in Chapter 03 (Background to the MetroLink Project), the Project will contribute to the transition to a low carbon and climate-resilient society. Private vehicles are a significant contributor to Ireland's GHG emissions, and providing an alternative to private vehicle-based journeys is a key benefit of the proposed Project. Demand modelling suggests a diversion of 6.8 million private vehicle journeys per annum in the early years of operation and approximately 360 million car trips diverted by 2055. Accordingly, traffic volumes will be greatly reduced, supporting the reduction of GHG emissions which are critical to meeting the targets of the Climate Action Plan 2023 (updated to 2023).
9	Letter	2	Learn from good practice in other cities In other cities metros have been constructed underground without impacting on the buildings above. It is not too late for underground construction to be considered for at least this section. Local and indeed citywide consultation would have prevented demolition without considering or proposing alternatives.... for example, at minimum, to build and provide an alternative publicly owned and accessible swimming pool and apartment block nearby in the city centre. The proposals for the nearby Georges Dock outdoor swimming pool do not compensate for the loss of an all-year-round indoor facility that people of all ages, abilities, social class can enjoy. In a post pandemic society, this type of facility is essential for health and well-being (in line with Healthy Ireland Strategy) as it requires little other resources or capacities to participate. For me and for the many other diverse users of the pool, it is a lifeline. I hope that my observations will not seem trite. Having witnessed the many able bodied, disabled (intellectually and physically), elderly, young, men, women and children using the pool, it is not imaginable to think that it is dispensable. And Dublin City Council do a wonderful job in managing it efficiently and inclusively	Please refer to response item (6) above in relation to the options considered for Tara Street, and the reasons for the selection of the proposed station location. As part of the options assessed, a mined option (Option 4) was considered. This option would reduce the demolition involved, retaining the College Gate apartment block and the leisure centre, compared to Option 0 (the proposed location). Additionally, the option retains similar benefits to Option 0 in terms of interchange opportunity, traffic impacts, utility impacts, rail alignment and future development opportunities. The mined option comprises the construction of two deep shafts either side and immediately adjacent to the College Gate apartments to provide construction access for mining the tunnel under College Gate apartments and to subsequently provide permanent access, ventilation and back of house facilities for the operation of the station. There are two things in particular note with regard to this alternative (Option 4) : (i)a mined tunnel / cavern of this size would need each advance to be excavated in stages with a combination of side drifts and headings. This is time consuming and costly when compared to cut and cover construction. It is also of note that a mined tunnel option still requires extensive cut and cover works at both ends of the station for vertical access (including emergency access), ventilation and to accommodate necessary back of house plant and equipment, and may require smaller temporary construction shafts constructed initially so that mining of the cavern can be commenced as earlier as possible to avoid delaying the completion of the MetroLink Project. (ii)the tunnelling operation would need to progress 24 hours a day, 7 days per week. This would be necessary to ensure the safety and security of the works. As the tunnelling would be by "open faced " non pressurised tunnelling techniques (i.e. excavation in advance of the installation of the subsequent sprayed concrete tunnel lining) it would be critical to advance and support the excavated face continuously - particularly as the excavation would be below the water table. If a face was left unsupported for a period, ground movements become more challenging to manage and hence increase the likelihood of tunnel instability and surface settlement. This would add increased risk of damage to third party property. To not mine the tunnel 24 hours day would mean that the face would need to be secured at the end of every day shift, and the timing of blasting would need to adhere to a strict predetermined schedule so that the tunnel face is always secured at the end of each shift. In simple terms if such an approach was adopted, the impact on the programme would more than double the duration of cavern construction as a result of the constraint of day time working together with the inefficiencies in working this way. The sequence of working would also import significant cost escalation. Therefore 24-hour working is essential for constructing the mined cavern. It was established that 24 hour working would be the only realistically feasible approach to construct the cavern. Therefore, the nature of the work, drill and blast with mechanical excavation would generate a level of groundborne noise and vibration would mean it would not be possible to inhabit the College Gate apartment block due to the disturbance caused, leading to a relocation of residents for a minimum of two years. However, there are possible risks that could extend the duration further, noted above, and therefore this option has a similar impact on College Gate residents as the cut and cover preferred option. TII consider that when balanced against the significant direct construction cost increase compared to the preferred cut and cover option, that demolition and redevelopment of the area around the site of the proposed Tara Station as part of the wider integrated development and regeneration of the site provides a better option. The mined option economically performs significantly worse with a much greater risk allowance required compared to the preferred cut and cover option, and the preferred proposed cut and cover station provides a higher quality operational station that is consistent with the MetroLink architectural vision and operational and maintenance strategy.

Organisation Name or Name of Submitter			October Investments Limited (represented by Brock McClure Planning and Development Consultants)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Submission on Railway (Metrolink-Estuary to Charlemont via Dublin Airport) Order [2022] - on behalf of October Investments Limited, for lands at Pinnock Hill, Swords				
1	Introduction	3	The main objective of this submission is to highlight that whilst our client welcomes and supports the Metrolink Project, there are concerns relating to their lands and the specific details included in the Railway Order [2022] relating to the temporary works.	Thank you for your submission. Your support for the MetroLink project is greatly appreciated. We have reviewed the observations and concerns raised and have provided detailed responses below.
2	Introduction (objective 1)	3	The estimated construction duration for the Pinnock Hill Roundabout Satellite Site is 51 months (4 years and 3 months) for the use of the construction compound, but the Project may not start until 2025, which equates to over 8 years sterilisation of the subject site.	While the progress of MetroLink is essential, we acknowledge the concerns about potential losses in development opportunities. Our primary focus is to proactively mitigate these challenges and ensure that the benefits of the MetroLink project are maximised while minimising any adverse impacts on the community. We will work closely with businesses in the affected areas to minimise disruptions during the construction phase. Ultimately, our commitment is to strike a balance between the progress of MetroLink and the preservation of development opportunities. By working collaboratively with stakeholders and adopting innovative solutions, we are confident that we can address these challenges effectively.
3	Introduction (objective 4)	4	The Railway Order's [2022] satellite construction and compound area will obstruct the delivery of a much more appropriate mix of uses that would maximise the use of scarce development land within the Metropolitan Area, which is consistent with national and regional policy objectives.	Metrolink is of central importance to the overall strategic planning of the city and its wider region and for the long-term potential for the lands to which this submission relates. When completed Metrolink enhances the accessibility and attractiveness of lands within its catchment and its delivery strengthens the potential to deliver higher density, mixed-use, transport-led development in the long term. The specific construction compound at Pinnock Hill is required only for the duration of the construction period (approximately four and a quarter years) after which it will be reinstated back to its original condition. See Chapter 5: MetroLink Construction Phase, Table 5.12: Estimated Construction Durations AZ1.
4	Introduction (objective 5)	4	Temporary severance of our clients lands with no suitable/fair compensatory arrangement being provided will effectively render the entire remainder of our client's lands unusable for 4 years and 3 months, or more, considering delays.	Please see response (2)
5	Introduction (objective 6)	4	The remaining parcel of land to the south eastern side of the site cannot be developed on as it will be landlocked due to surrounding lands being used for permanent and temporary works.	Your observation is noted, however access to land to the east and southeast of the land proposed for temporary CPO by NTA appears to be freely available and directly from the R132. Should the development of this land (excluding the proposed permanent CPO strip) commence prior to MetroLink, TII will commit to maintain access to this land during the works. TII also note that the permanent structure of the MetroLink alignment through this land is a cut & cover structure to facilitate future land access across the alignment at this location.
6	Introduction	4	We request that An Bord Pleanála gives consideration to the issues raised in this submission and we would welcome the opportunity to address matters with the applicant directly by way of an Oral Hearing.	Thank you for this observation. For your information, an overview of the Oral Hearing process is provided in the EIAR Chapter 8.9.2. An Bord Pleanála have now confirmed an Oral Hearing will be held. The purpose of the oral hearing will be to allow issues relevant to an application for approval be examined. The oral hearing can be attended by anyone, but only those that have made a written application may make an oral submission at the oral hearing. The oral hearing is managed by An Bord Pleanála.
7	Zoning	6	Under the 2017-2023 County Development Plan, the subject lands were zoned HT- High Technology. Fingal County Council has made material alterations to the Draft County Development Plan which are now out for public consultation. The material amendments show the subject site as being zoned MRE - Metro and Rail Economic Corridor, as illustrated in Figure 2. The Landowner supports the rezoning of the subject lands to a more appropriate zoning for the purpose of allowing an integrated mixed use development to be brought forward at a well-located site that complies with relevant compact development and infill/brownfield development objectives. It is envisaged that a mix of uses would be complimentary to the location proximate to two future Metro Link stations, which would be incorporated into the overall development strategy for the lands that would maximise the provision of an appropriate quantum of residential development within the Metro Economic Corridor, now the Metro and Rail Economic Corridor.	Metrolink is of central importance to the overall strategic planning of the city and its wider region and for the long-term potential for the lands to which this submission relates. Metrolink enhances the accessibility and attractiveness of lands within its catchment and its delivery strengthens the potential to deliver higher density, mixed-use, transport-led development in the long term.

Submission No.			211

Re: Submission on Railway (Metrolink-Estuary to Charlemont via Dublin Airport) Order [2022] - on behalf of October Investments Limited, for lands at Pinnock Hill, Swords				
8	2.1 Proposed Land Take in Railway Order (Temporary Works)	6	The National Roads Authority (operating as Transport Infrastructure Ireland) are proposing to temporarily acquire 3.8 ha (38,000 m2) of the north western portion of our client's lands for the construction and logistics site, as illustrated in Figure 3-6. This is in addition to the 0.9 ha (approximately) shaded grey portion of our clients lands which shall be taken over for permanent railway works. We confirm that the Landowner has no objection to the proposed permanent land take required, subject to appropriate compensation. It is fully acknowledged that the Metrolink Project is a significantly positive piece of transport infrastructure that will greatly improve connectivity throughout the city.	Your positive support is gratefully appreciated, and TII are committed to delivering the benefits that MetroLink will bring.
9	2.1 Proposed Land Take in Railway Order (Temporary Works)	8	As illustrated in Figures 5-6, the site is split across two drawings sheets. As Figure 7 illustrates, the full extent of the northern site boundary shall be permanently landscaped including a series of connecting footpaths and tree and shrub planting.	The proposed landscape, as depicted in Landscape drawings sheet 7 of 13, falls entirely within the designated permanent landtake area. This ensures the retention of two access points into your land, which are aligned with the positions of cut & cover structures along the metro alignment. The landscape design has been carefully prepared in close coordination with Fingall County Council to align with their draft development plan. However, if adjustments are required to accommodate these access points while maintaining the proposed landscape, they can be made accordingly.
10	2.1.1 Impact of Satellite Construction Compound	9	As detailed on the submitted drawings, 3.8 ha (38,000 m2) of the north western portion of our client's lands are to be used fora temporary construction and logistics site for the development. It is set out that construction of the proposed Metrolink will take at least 4 years and 3 months or more, and there will be no opportunity for the Landowner to develop the site to its full potential in this time. It is simply not acceptable for the proposed construction compound to be permitted to sterilise the site for this extent of time.	As outlined with Chapter 5: MetroLink Construction Phase sections 5.3.1 and 5.7.12, this site at Pinnock Hill has been designated a Satellite Construction and Logistics Compound to support the delivery of MetroLink through assessment zones AZ1 and AZ2. Such sites are a necessary component of the construction of MetroLink and the proximate locations to the line are fundamental to the overall construction programme as planned. Satellite construction compounds will generally provide: ▪ Local office and welfare facilities; ▪ Local storage for plant and materials; and ▪ Limited parking for construction vehicles. As a consequence of its location, size, proximity to the work site and access to the R132, the Pinnock Hill site has been designated a Logistics centre including lorry holding, material storage and distribution area. It is located centrally between MetroLink assessment zones AZ1 and AZ2 to meet the delivery needs in these areas, including traffic and vehicle movement management. The programme duration set out in Chapter 5: MetroLink Construction Phase, Table 5.12: Estimated Construction Durations AZ1 is based on the assumption that facilities such as the logistic compounds at Estuary and Pinnock Hill are available for the works to be delivered within those timeframes.
11	2.1.2 Site Access (paragraph 1)	9	If permitted in its current form, it is considered impossible for the Landowner to develop on the remaining parcel of land to the south eastern side of the site because the surrounding lands will be used for permanent and temporary works. This will create an inadequate amount of space available for stockpiling of excavated material and machinery etc.	See response (5) and (10) above

Organisation Name or Name of Submitter			October Investments Limited (represented by Brock McClure Planning and Development Consultants	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Submission on Railway (Metrolink-Estuary to Charlemont via Dublin Airport) Order [2022] - on behalf of October Investments Limited, for lands at Pinnock Hill, Swords				
12	2.1.2 Site Access (paragraph 2)	9	The construction compound may also cause for this section to be restrictive in terms of the quantum and nature of traffic that may be allowed travel through our clients site, taking into consideration there will be temporary and permanent works in potential conflict with one another.	EIAR Chapter 5, MetroLink Construction Phase, explains that traffic management plans for the construction phase of the Project have been developed to minimise the impact on road users, and to maintain access to property, businesses and other premises. In your case, TII will maintain access to land to the east and southeast of the land proposed for temporary CPO by NTA that is currently freely available directly from the R132. Prior to implementation, all traffic management measures will be agreed with the relevant Fingal County Council and where relevant, consultation with An Garda Síochána and other statutory stakeholders will be undertaken. The design of traffic management measures and highways works is based on achieving the key objective of maintaining continual access to all properties during the works. Where necessary, a safe alternative route will be provided for pedestrians and vulnerable road users, such as children, and persons with restricted mobility, to maintain pedestrian access to premises. Where detour routes are required, these will be kept as short as possible and detour signage will be clear and easy to understand. EIAR Chapter 9, Traffic and Transport, section 9.7.1.2 includes for a Scheme Traffic Management Plan (STMP) to manage traffic movements during the construction phase to ensure traffic congestion is minimised. The Plan will include measures such as the establishment of Local Community forums which will cover areas local to each station, where stakeholders will have an opportunity to inform the traffic management element of the project. Other measures include the control of construction vehicles in terms of their hours of operation and restrictions on vehicle size and weight.
13	2.1.2 Site Access (paragraph 3)	9	In addition to this, the access to the site will now only serve the lands of the site which are proposed to be acquired by the National Roads Authority (operating as Transport Infrastructure Ireland) permanently and temporarily, which will leave the remainder of our clients lands landlocked and inaccessible. As illustrated in Figure 8, the remainder of our clients lands (outlined blue) cannot be accessed, due to the only available entryway at the north west side of the site, indicated by the yellow arrow.	See responses (5), (10) and (12) above
14	2.1.2 Site Access (paragraph 4)	10	The Metrolink Environmental Impact Assessment Report states that there will be cut and cover sections at Fujitsu (circled orange) “and at an access into a greenfield area. The alignment then continues into a cut and cover tunnel under the Pinnock Hill Roundabout. This section of works is supported by the Pinnock Hill Satellite Compound. This site will also include a lorry holding and logistics area that will service the whole of AZ1 and AZ2. A temporary access junction to the Pinnock Hill Satellite Compound via the R132 will reduce the need for construction traffic to use local roads. This junction would be subject to agreement with FCC”. Considering this, such access has not been made clear.	See responses (5), (10) and (12) above
15	2.1.3 Communication with the National Roads Authority (paragraph 1-2)	10	As a landowner party to this project, our client is extremely disappointed that the issues identified in this submission have not been addressed in the material lodged to An Bord Pleanála.	We regret any misunderstanding regarding the your awareness of the proposed landtake. However, our records indicate that various meetings were held in the past where the extend of the proposed Compulsory Purchase Order (CPO) was presented and discussed .
16	2.1.3 Communication with the National Roads Authority (paragraph 3)	10	The Landowner had no engagement with the Authority prior to the publication of this Railway Order and was not made aware of the significant temporary works that would affect the subject site. Our client had been aware that permanent works would impact on the site, and there is no issue with this element of the project.	Please see response (15)
17	3 Request for Consistency with Policy Context	11	It is submitted that the Railway Order as lodged would prevent the subject site being developed over the lifetime of the next Fingal Development Plan. This would represent a missed opportunity for a viable development site to provide much needed housing and other land uses.	MetroLink is of central importance to the overall strategic planning of the city and its wider region and for the long-term potential for the lands to which this submission relates. Metrolink enhances the accessibility and attractiveness of lands within its catchment and its delivery strengthens the potential to deliver higher density, mixed-use, transport-led development in the long term. The specific construction compound at Pinnock Hill is required only for the duration of the construction period (approximately four and a quarter years) after which it will be reinstated back to its original condition. See Chapter 5: MetroLink Construction Phase, Table 5.12: Estimated Construction Durations AZ1.

Submission No.			211	
Organisation Name or Name of Submitter			October Investments Limited (represented by Brock McClure Planning and Development Consultants)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Re: Submission on Railway (Metrolink-Estuary to Charlemont via Dublin Airport) Order [2022] - on behalf of October Investments Limited, for lands at Pinnock Hill, Swords				
18	3.1 Draft Fingal County Development Plan 2023-2029	11	We now set out Development Plan objectives that appear in Fingal County Council's relevant statutory planning policy below. Section 3.5.13 of the Draft Fingal County Development Plan notes a number of national and regional policy objectives that are relevant to the subject site and the future development of these lands: Policy SPQHP37 in relation to compact growth, consolidation and regeneration is specifically noted: "Encourages infill/brownfield development, Focus growth on the County's designated strategic development areas identified in the Metropolitan Area Strategic plan, Promote increased densities along public transport corridors." This policy context is directly applicable to the subject site. Objective SPQH036 promotes "residential consolidation and sustainable intensification at appropriate locations, through the consolidation and rejuvenation of infill/brown-field development opportunities in line with the principles of compact growth and consolidation to meet the future housing needs of Fingal." This policy context is directly applicable to the subject site. Objective SPQHO37 promotes "residential development at sustainable densities throughout Fingal in accordance with the Core Strategy, particularly on vacant and/or under-utilised sites having regard to the need to ensure high standards of urban design, architectural quality and integration with the character of the surrounding area." Policy SPQHP38 relates to co-ordinated development: "Promote residential development addressing shortfalls in housing provision and meeting target guidance figures through a co-ordinated planned approach to developing appropriately zoned lands at key locations including regeneration areas, vacant and underutilised sites." This policy context is directly applicable to the subject site. A comprehensive, sensitive and high-quality mixed use redevelopment of the subject site can be accommodated at our clients lands and will allow the Local Authority to meet these key policy objectives by providing a well located, high quality placemaking solution that is accessible to surrounding employment locations, services, public transport and the City Centre. We respectfully submit that the proposed temporary construction compound will hinder such policies relating to compact growth, consolidation and regeneration. This policy context is directly applicable to the subject site. Ultimately, we seek An Bord Pleanála to consider alternatives for a temporary construction compound other than at our client's site to facilitate both the National Roads Authority (operating as Transport Infrastructure Ireland) objectives and the Fingal County Council Development Plan; in a joined up and integrated manner, in accordance with the principles of proper planning and sustainable development.	As noted in the submission, the planning policy framework for the lands supports compact growth , regeneration and consolidation, including on the subject lands. As outlined with Chapter 5: MetroLink Construction Phase sections 5.3.1 and 5.7.12, this site at Pinnock Hill has been designated a Satellite Construction and Logistics Compound to support the delivery of MetroLink through assessment zones AZ1 and AZ2. Such sites are a necessary component of the construction of MetroLink and the proximate locations to the line are fundamental to the overall construction programme as planned.
19	4 Conclusion (paragraph 3)	12	We ask An Bord Pleanála and the National Roads Authority (operating as Transport Infrastructure Ireland) to consider an alternative location for the proposed construction compound, in view of the fact that the subject lands are a viable development site which will be developed before the Metrolink project.	See responses (10) above and further details in responses (5) and (12)

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
Letter Re: Case reference: NA29N.314724: Estuary through Swords, Dublin Airport, Ballymun, Glasnevin and City Centre to Charlemont, Co. Dublin (Metrolink)				
1	Letter	1	There are a number of issues that need further clarification as this directly impacts my house: Airborne noise from construction works and railway operation (also referred to as "environmental noise");	TII understand the reasons for your concerns and would like to provide the assurance that the potential disturbance impact on your property as a result of the proximity of the proposed tunnel and station has been carefully assessed. This includes the impact of noise and vibrations from: the tunnel boring machine (TBM) and the operation of MetroLink. All of which have been assessed and reported in the EIAR and are summarised below. With the exception of a temporary disturbance when the TBM passes your property, TII are predicting a 'not significant' impact to the building occupants and your building, or risk to the integrity of your house. This is based on similar properties on Nelson Street, as presented in Appendix A13.7 Construction Phase Modelling (Chapter 13 Airborne Noise and Vibration). Construction Phase – Airborne Noise and Vibration The EIAR Chapter 13 Airborne Noise and Vibration, Table 13.64 summarises the potential significant construction noise impacts from the construction of the proposed Mater Station. The predicted impact without additional noise mitigation is Significant to Very Significant during some of the work phases. Noise mitigation measures are detailed in section 13.6.1 and include a proposed 4m high acoustic noise screen along the mid-east, south & south-west boundaries of Mater construction compound. As outlined in section 13.6.1.2 of Chapter 13 (Airborne Noise and Vibration), the key principles relating to noise mitigation will be applied across all construction areas for the proposed Project: * Noise control at Source: Selection of quiet plant, site layout, attenuation at source, operational control (hours and periods); * Noise control along pathway: Localised screening to plant items on site, enclosures site buildings, site hoardings and noise barriers; and, * Noise control at receiver: Noise Insulation (NI) and Temporary Rehousing) Following the implementation of noise mitigation measures, noise receptors in the vicinity of your property are calculated to be controlled to within the noise thresholds, as set out in section 13.7 of Chapter 13 (Airborne Noise and Vibration). Operational Noise and Vibration EIAR Chapters 13 and 14 present a comprehensive and detailed assessment of operational airborne and groundborne noise and vibration, respectively. No residual noise impacts are identified at this location during operation, as presented in section 13.7.2 Operational Noise in Chapter 13 (Airborne Noise and Vibration). The calculated rail noise levels across the proposed Project are not significant in terms of any widespread community disturbance and results in a not significant to slight impact when added to the prevailing noise environment, as detailed in section 13.7.2.2. of Chapter 13. EIAR Chapter 13, sections 13.2.3.2 and 13.5.3.2.3, details that ventilation systems, if not designed and mitigated effectively are potential noise and vibration sources. Section 13.6.2.3 outlines the detailed considerations that will be included in the design to ensure that the ventilation systems do not exceed limits as per BS 4142, including: • Reduction of induct flow rates; • Reduction of elements in the airflow; • In duct attenuators; • Orientation of grilles and louvres away from sensitive receptors; • Acoustic louvres; and • Anti-vibration mountings and couplings will be incorporated into the design to control vibration. Measures to mitigate noise from the use of public address systems is also detailed in Chapter 13 (sections 13.5.3.2.4 and 13.6.2.4). Best practice design principles will be employed to minimise noise breakout at the surface from these systems via escalators, lift shafts and stairwells.

2	Letter	1	Vibration and groundborne noise from metro construction and operation;	Construction Phase – Groundborne Noise and Vibration The EIAR Chapter 14 Groundborne Noise and Vibration, Appendix 14.5 presents the predicted groundborne noise levels during the construction phase of the project for 66 Saint Joseph's Place: • The predicted level of groundborne noise during TBM passage is 49 dB LASmax, which is above the 45 dB LASmax threshold resulting in a significant impact on the occupants of the building for the relatively short duration of TBM passage. • The predicted level of groundborne vibration during TBM passage is 0.262 ms-1.75 day and 0.22 ms-1.75 night, below the VDV (Vibration Dose Value is a parameter that combines the magnitude of vibration and the time for which it occurs) Threshold Level of 1.0 ms-1.75 day and 0.5 ms-1.75 night, resulting in a not significant impact on the building. Unfortunately, there are no effective methods available to reduce groundborne noise or vibration from the TBM at source but noting that the duration of this impact will be temporary and in the order of up to two-weeks as the TBM passes. TII will undertake advanced consultation and stakeholder engagement to prepare people for the passing of the TBM and ensure the timing of these impacts are known. Details of the residual effects associated with tunnel boring are presented in section 14.6.1.1 of Chapter 14 (Groundborne Noise and Vibration). TII's contractor(s) will prepare a Construction Noise and Vibration Management Plan (CNVMP) for the proposed Project as referred to in EIAR Appendix A5.1, Outline Construction Environmental Management Plan (CEMP). The CNVMP will be a live document and will include a full monitoring and auditing programme which will be agreed with the Local Authorities prior to the commencement of the Construction Phase, including predetermined monitoring trigger levels to ensure noise and vibration limits are not breached, noting that it is not possible to mitigate TBM groundborne noise and vibration at the source. Table 6.2: Noise and Vibration Measures of the Outline CEMP outlines the monitoring programme requirements. The Transport Infrastructure Ireland (TII) Airborne Noise and Groundborne Noise Mitigation Policy (Appendix A14.6 of EIAR Chapter 14) also sets out the construction noise insulation and temporary rehousing measures to be implemented where required. Operational Phase - Groundborne Noise and Vibration. As detailed in section 14.6.2 of Chapter 14 (Groundborne Noise and Vibration), there will be no residual significant effects with regard to groundborne noise following the implementation of mitigation measures such as enhanced track isolation systems such as floating track slab at select locations. Only in the case of highly sensitive laboratory equipment is it likely to prove difficult to avoid exceeding manufacturers' specification for ambient vibration, which will necessitate receptor-specific mitigation, as detailed in section 14.6.2.2. of Chapter 14 (Groundborne Noise and Vibration). As listed in EIAR Volume 5 Appendix 14.5, the predicted level of groundborne noise during operation at your property is 30 dB LASmax, which is below the 40 dB LASmax threshold resulting in no significant impact on the occupants of the building.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
3	Letter	1	Influence of proposed works on surface water;	The Mater Station main construction site is located 1.4km from the River Liffey and 1.20km from the Tolka river and therefore there is considered to be no risk of flooding. The Royal Canal is approximately 500m north of the Mater Station location. However, as detailed in section 18.5.3.4 of Chapter 18 (Hydrology), there are no proposed discharges to nearby watercourses. All water from the construction phase will be discharged to sewer where appropriate. All water discharges (combined surface water and groundwater) from construction site areas are initially likely to be high in sediment, with potentially elevated alkalinity where cement works are on-going and will require adequate attenuation and treatment prior to approved discharge to the respective defined sewer. Each site compound will be established with an emphasis on the protection of existing surface water infrastructure. As stated in Chapter 18 (Hydrology) section 18.4.9.4.1, all station drainage is designed to ensure that there is no net increase in runoff as a consequence of the proposed Project. The works at Mater will impact on existing highway drainage particularly at the northern end of the proposed station, at the junction between Eccles Street and Berkeley Road. The existing infrastructure will be surveyed and alternative diversions of surface water infrastructure made if required and approved by DCC as part of the preparation for the commencement of the works. As indicated in Chapter 22 (Infrastructure and Utilities), all impacted utilities will be reinstated in accordance with current standards and specifications for the relevant utility. The EIAR Volume 5, Appendix 5.1 provides an outline Construction Environmental Management Plan (CEMP), that includes the requirement to develop a Water Management Plan for each site. The appointed contractor will be required to operate in compliance with a project-specific detailed CEMP. Section 6.4 of Appendix A5.1 Outline CEMP details the minimum mitigation measures to be implemented with regards to water. All construction sites will be installed with water treatment systems and will be monitored weekly to ensure no impact to the surrounding hydrological environment. The proposals for the control and management of water within each site compound are set out within EIAR Volume 5, Appendix 5.11 - Water Management.
4	Letter	1	Influence of proposed works on ground water;	As outlined in the EIAR Chapter 19, Hydrogeology, petroleum hydrocarbons and PAHs were identified in several locations in the groundwater at the proposed Mater Station location which may be reflective of the hydrocarbon content associated with Made Ground present. Nitrogen species (ammoniacal nitrogen, nitrite) and some metals (manganese, iron, boron and arsenic) are also reported here. The predicted effect of Construction Phase dewatering (from either drawdown or water quality effects) on identified water features in the wider area is considered Imperceptible. The calculated drawdown does not extend as far as the protected habitat Dublin Bay nor does the modelled ZOI (Zone of Influence) intercept any watercourses that potentially receive baseflow and which ultimately discharge to this habitat feature. This is detailed in section 19.5.3.5.6 of Chapter 19 (Hydrogeology). Modelling has indicated that where groundwater flow is in parallel to the MetroLink alignment, the potential barrier effect will be less significant. In contrast, if the groundwater flow is more acute or perpendicular to the structure alignment the potential for groundwater damming is more significant. In addition, the modelled trajectories show how groundwater flow is able to 'overcome' the interference imposed by D-walls at stations which indicates less significance in the long-term (Operational Phase). This is detailed in section 19.5.3.6.5 of Chapter 19 (Hydrogeology).

Submission No.			212	
Organisation Name or Name of Submitter			Olan O'Brien (66 Saint Joseph's Place)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
5	Letter	1	Settlement of ground around tunnels and excavations;	Excavation for the tunnels and other below ground structures could potentially lead to ground movements at the surface and below ground. An assessment of the effects of ground movements and potential impacts on existing buildings has been carried out as part of the Scheme Design in Appendix A5.17 Building Damage Report. EIAR Appendix A 5.17 Building Damage Report, covers the assessed impacts of construction generated ground movements and settlement on property. Section 5.2 of this report sets out the rationale for the assessment of properties similar to yours. The results of the assessment provided in Table 5.2 shows that properties Ref B-95 to B-100, in the vicinity of your property but closer to the tunnel alignment, have been assessed as falling within the 'Slight' and below category. The building risk categories shown in Table 4-4 of the aforementioned report are used to define the degree of building damage related to the Risk Category. As your property is within 30m of the alignment, you can register for inclusion in a Property Owner Protection Scheme (POPS) which TII are committed to having in place prior to construction works commencing. The scheme allows residential property owners to register with TII if the property is within thirty metres of the edge of the MetroLink alignment or fifty metres of station structures. The POPS comprises condition surveys of private properties and other selected properties along the route of the proposed Project. The purpose of the condition surveys would be to ascertain the condition of the properties before, during (if deemed necessary), and after the completion of the proposed Project to determine whether there has been any deterioration of any of the properties surveyed and whether the same may be attributable to the proposed Project and recommend repairs as appropriate. Further details on POPS can be found in section 21.6.1.4 Property Protection, EIAR Chapter 21: Land Take. Condition survey data gathered pre and post construction, and possibly during construction, will be used to assist the property owner and TII in the swift and accurate verification of any property damage claims which may be received from property owners. The POPS would be introduced by TII through public consultation and will be formally advised to eligible property owners by the Public Relations Department. Useful information on POPS can also be found in the MetroLink Frequently Asked Questions document which can be found on-line at: https://www.metrolink.ie/en/your-property/property-owners-protection-scheme/

Submission No.			212	
Organisation Name or Name of Submitter			Olan O'Brien (66 Saint Joseph's Place)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
6	Letter	1	Temporary and permanent traffic impacts.	<u>Construction Phase</u> The EIAR Chapter 5, MetroLink Construction Phase, explains that traffic management plans for the construction phase of the Project have been developed to minimise the impact on road users, and to maintain access to residential and other premises. Prior to implementation, all traffic management measures will be agreed with the relevant local authority (FCC or DCC) and where relevant, consultation with An Garda Síochána and other statutory stakeholders will be undertaken. The design of traffic management measures and highways works is based on achieving the key objective of maintaining continual access to all properties during the works. Where necessary, a safe alternative route will be provided for pedestrians and vulnerable road users, such as children, and persons with restricted mobility, to maintain pedestrian access to premises. Where detour routes are required, these will be kept as short as possible and detour signage will be clear and easy to understand. Further details on proposed mitigation measures for traffic and transport can be found in Appendix A5.1 Outline CEMP. EIAR Chapter 9, Traffic and Transport, section 9.7.1.2 includes measures such as the establishment of Local Community forums which will cover areas local to each station, where stakeholders will have an opportunity to inform the traffic management element of the project. Other measures include the control of construction vehicles in terms of their hours of operation and restrictions on vehicle size and weight. A summary of Mitigation Measures in Construction Phase are presented in Table 9.147 of the EIAR Chapter 9 (Traffic & Transport). The mitigation measure for Berkeley Road for general traffic, parking and loading is to monitor if closures are required at all stages of the construction phase, or if spaces can be reinstated temporarily throughout the works. <u>Operational Phase</u> The assessment indicates that overall, the proposed Project will result in long-term, Significant, positive impacts on all users, as indicated in Chapter 9 (Traffic and Transport) section 9.6.2.3 Operational Phase Summary. At Mater Station the future street level layout will maintain the existing road network on Berkeley Street. Once MetroLink is operational, to accommodate the station entrance, the current footways and traffic lanes on Eccles Street will be realigned as part of the proposed Project. The realignment of Eccles Street, and the widening of the footway on Berkeley Road will result in the loss of on-street parking at both locations. Approximately 20 on-street parking spaces will be lost on Eccles Street, while approximately 14 spaces will be lost on Berkeley Road, due to the provision of a signalised crossing in proximity to the Station entrance. While there will be a loss of commercial and residential parking and loading infrastructure as a result of the proposed Project, the modal shift from road to public transport when the proposed Project is in place will reduce the overall demand on parking and loading facilities, thus reducing the severity of the impact. The proposed mitigation measure during the operational phase for Mater Station is to consider placement of street furniture to maximise available width and to monitor impacts to determine if further width is required. These details can be found in Chapter 9 (Traffic and Transport) section 9.7.2. Overall, the Mater Station will provide for improvements to the public transport network resulting in decreased private car usage/trips and increased public transport usages, and will facilitate walking and cycling to the station, without significantly impacting on the operation of the road network in the area. Further details can be found in Appendix A9.2-I Traffic and Transportation Assessment - Mater, section 7.

Submission No.			213	
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 1 Georges Quay and others.				
1	Downey Report Executive Summary	1	With respect to these properties, the OPW is seeking: 1) To ensure no disruption to the public access of these buildings and their day-to-day uses and functions, as well as no damage to the buildings, their historical profile in terms of being listed as Protected Structure and/or their Conservation Area setting (if there is any), resulting from the implementation of the Project." 2) To ensure pre- and post-construction surveys are carried out and that these should relate to but not limited to ground movement, noise and vibration, blasting and water lowering, as well as construction traffic impacts, also including traffic diversions. 3) To ensure that the following specific assessments of the impacts on 1GQ, 1 George's Quay and Corn Exchange are provided, with precedents applied to ensure best industry practice: a. Ground movement impact (Stage 2 and 3 Assessment). b. Ground borne noise and vibration, including the application, and monitoring of threshold limits, pre- and post-construction surveys. c. The impact of blasting given the proximity of these properties to the Station." 4) To ensure acceptable levels of dewatering for construction of Tara Station are provided as there is a potential for ground water lowering which can adversely impact the 1GQ, George's Quay and Corn Exchange. 5) To ensure an assessment of traffic impact on the accessibility of 1GQ, George's Quay and Corn Exchange for both personnel and clients during construction of Tara Station due to traffic diversions. 6) Once the railway is in operation it is possible that there will be residual impacts arising from the above assessments and TII should seek assurance that a detailed evaluation will be performed. 7) To ensure no conflicts between the construction and operation of the Project and the future development of the properties. 8) Precedents to be applied to the risk assessments to ensure utilising best industry practice within implementation of the Project.	TII thank you for your comments. Further to TII's response to the OPW Covering letter, the matters raised by OPW specific to these buildings are addressed in responses (2) through to (51) below.
2	Downey Report Introduction 1.0	2	■ 1 George's Quay, Dublin 2 ■ Corn Exchange, Burgh Quay, Dublin 2 ■ Nos. 13-15 Hatch Street Lower, Dublin 2 ■ Trinity Point, Nos. 10-11 Leinster Street, Dublin 2 ■ Earlsfort Development Centre, Earlsfort Terrace, Dublin 2 ■ INTREO Office & Parkrite Parking, Parnell Street/King's Inn Street, & Loftus Lane, Dublin 1	TII have undertaken a Phased Ground Movement Impact Assessment and the results of the assessments are included in the RO documentation within Appendix 5.17 of the EIAR. Appendix B2 of that document indicates the list of special buildings that would be subject to a subsequent Phase 3 assessment irrespective of the engineering need to do so. Many OPW buildings are in this category. It should be noted that the further assessments that will be done by the contractor if the RO is granted will likely reduce the impacts on the buildings as the Phase 2 assessment is a conservative assessment whose results are generally more significant than the results of a Phase 3 assessment. As such, the Phase 2 assessment does take account of the details referred to in OPW's submission, because it proceeds on conservative assumptions. This point was discussed with OPW and their consultants in January 2023. That said, subsequent to the granting of the RO, TII will consult with OPW in relation to the results of any Phase 3 assessments and any requirements for monitoring and / or other mitigations that eventuate. Specific details on assessment undertaken in relation to the buildings referred to in this responses are considered in response number (22) through to (34) below.
3	Downey Report- 3.0 Overview of the Draft Railway Order	Page 8, 9	While extensive pre-planning consultations also took place between Til and the OPW, a detailed assessment of the individual properties affected has not yet taken place. The Draft Railway Order application 2022 is a Draft Order, and should the route be approved by An Bord Pleanála, further detailed design will be submitted which will require further consideration and approval. Factors such as the internal uses of the properties, their construction methods, age and historical importance and the effect of construction on these sensitivities has not been assessed as part of the Project thus far. Additional consideration needs to be given to the potential effects on the built environment before a route and construction method can be confirmed. The OPW reserves the right to make further commentary, pending more detailed design proposals.	Please refer to response number (2).
4	4.4 Planning context	14	In relation to the Draft Railway Order's consistency with planning policy and planning guidelines, a non-exhaustive list of planning policy and legislation at National, Regional, and Local levels, is included in Appendix 1 of this submission and the Board is invited to refer to this for further details. We would respectfully request that An Bord Pleanála ensure that TII have fully assessed the Project regarding existing planning policy, as well as adherence to the relevant local policies and guidelines pertaining to each individual property.	TII have undertaken a full assessment of the planning policy and planning guidelines in the Planning Report that was submitted as part of the Railway Order Application.

Submission No.			213		
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW		
Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 1 Georges Quay and others.					
5	4.4 Planning context	14	DOWNEY note that this proposed Draft Railway Order is a strategic long-term development and An Bord Pleanála may consider Draft Development Plans in assessing the Project. It is also crucial to note that on foot of a granted Order and during the detailed design stage, a revision to planning policy is expected, whereby adopted plans and legislation may have to be adhered within this stage. This may require an amendment to the Draft Railway Order and further assessment, including public consultation.	The only policy relevant to the decision on whether to grant the Railway Order and the necessary conditionality is the policy in force at the date of the grant of the Railway Order, as has been made clear in numerous High Court decisions including Element Power v An Bord Pleanála [2017] IEHC 550 and the Railway Order cannot be made conditional on compliance with future, yet to be developed policy. As planning and policy and strategy are being updated constantly, TII will undertake a further review of planning policy in advance of any oral hearing to allow for an updated presentation on the projects consistency with active policy requirements to be presented to An Bord Pleanála.	
6	4.1.5 Potential Development of the Property	14	The OPW lease offices within the 1 GQ building, which is a multi-lease property. The OPW reserves the right to develop the subject property in the future, this includes property above and below ground, subject to normal planning criteria. It is important that the development of the MetroLink does not interfere with extant planning permissions pertaining to the subject property and the right of the applicant to develop these, in advance, in tandem or post operation of the MetroLink Project.	MetroLink will be a catalyst for and provide opportunity for future development and regeneration. While the MetroLink Railway Order does not include for future neighbouring or overhead development, the tunnels and stations are designed to support appropriate future imposed loads. TII will be required to make submissions in relation to planning applications for proposed future developments on or adjacent to MetroLink and there will necessarily be some engineering constraints (such as permissible loadings) required. However MetroLink is committed to engaging with known development proposals and new development proposals as they emerge with the intent of facilitating such developments as they emerge to the maximum extent consistent with the safe operation of the proposed Project. Again in common with other existing rail and tunnel projects, following grant of the Railway Order and development of detailed design, TII will produce “Guidance Note for Developers” that will be the subject of bye-laws following the grant of Railway Order and which is designed to facilitate future adjacent or over-site development while protecting the integrity and safety of the MetroLink works and operations. It is inappropriate and unworkable to produce this policy at this stage because it would have to be in broad terms that deal not only with the current RO proposal and any contingencies that might arise from the Board seeking revised designs or new conditionality as part of the RO application process. Therefore at this stage TII is dealing with known development proposals on a case by case basis, TII will work with parties in the future to assist with the wider development of sites over and above stations and tunnels. In this context TII has successfully engaged with a number of developers over the last two years to accommodate development over and in proximity to the alignment and there have been no material restrictions on development subject to the implementation of agreed design and mitigation measures and it is not anticipated that MetroLink will have a material impact on the development potential of sites above and in proximity to the alignment in future.	
7	5.0 MATERIAL CONSIDERATIONS	28	The alignment drawing ML1-JAI-EIA-ROUT_XX-DR-Y-04025 and the Contour drawing ML1-JAI-E1A-ROUT_XX-DR-Y-21148 show different alignments. This error has resulted in deficient information within the SID application submitted under Section 2 of the Planning and Development Act 2000 (as amended), to assess the vulnerability of damage due to vibration cause by both tunnelling and operation of underground train on this section of the alignment. This affects several buildings under the management of the OPW particularly within the Kildare Street, Merrion Square and St. Stephen's Green areas.	On two drawings (Figures 20.16 Settlement Contours, sheets 27 and 28 of 30) in EIAR Appendix 5.17 Building Damage Report, the tunnel centreline is plainly incorrect as it is deviates from the centre of the settlement contours between Tara and St. Stephen's Green stations. The settlement contours are correct and reflect the proposed Railway Order alignment and as such the drawing serves its core purpose, which is to identify, describe and assess the settlement impact of the railway works. In any event, revised drawings will be submitted to the Board to rectify the error. The correct alignment has been used for all environmental impact assessments including tunnel induced settlement, and construction and operational noise and vibration impact assessments.	
8	6.0 LEGAL CONSIDERATIONS	28	The Commissioners of Public Works would seek to enter into appropriate, property-specific legal agreements with TII, to ensure the protection of key State property and of the State's activities undertaken within those and other properties. Given the importance of such properties and activities, the Commissioners of Public Works consider it appropriate that An Bord Pleanála would make the Railway Order conditional on such legal agreements being in place between TII and the OPW. Creating such legal agreements between TII and the OPW would be possible only after TII make available the more detailed design and risk-mitigation measures for the construction and operational phases of the MetroLink project, and before any development begins. Therefore, the Commissioners of Public Works would request that this aspect be reflected in the conditions set out by An Bord Pleanála to TII, as this would provide assurances to the Commissioners of Public Works relating to future legal agreements that protect and secure State property and activities from risks associated with the construction or operations of the MetroLink.	TII's preference is carry out all of the permitted railway works with the agreement of affected landowners and prescribed bodies. However, it should not be condition of the railway order that TII reach such agreement with OPW. In the event that agreement cannot be reached with OPW, TII should be entitled to carry out the railway works over their objections provided that it complies with the terms and conditions of the Railway Order. The Board's function is to satisfy itself that those terms and conditions are adequate to ensure that the construction and operation of the railway works will be consistent with proper planning and sustainable development and have acceptable impacts on the environment. TII believes that the RO application and the EIAR in particular sets out mitigation and monitoring measures that are sufficient for that purpose

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 1 Georges Quay and others.				
9	7.1.1 Route Alignment	29	7.1.1 1GQ, GEORGE'S QUAY 7.1.1.1 Route Alignment Tara Station is approximately 85m southwest of this property. The alignment drawing ML1-JAI-EIA-ROUT_XX-DR-Y-05025 and the Contour drawing ML1-JA1-EIA-ROUT_XX-DR-Y-2U47 show the alignment and the predicted ground movement. Adjacent to the 1GQ, the proposed MetroLink will be excavated through Argillaceous Limestone rock (CLU) underlying Weathered Rock (QTR) underlying Brown Boulder Clay (Q.BR), containing extensive fluvio-glacial sands and gravels. Cover to the tunnel crown is approximately 17m comprising Brown Boulder Clay. The invert will be excavated through both weathered and unweathered limestone. This will present a significant challenge to ground movement mitigation using tunnel management.	OPW's observation with regard to the alignment and geology below 1GQ is noted and is the reason for the selection of the proposed TBM and the mixed face conditions identified have been used to conservatively predict the impacts on overlying buildings and infrastructure. TII will develop both TBM operational Specifications and Ground Movement and Monitoring Specifications to ensure that residual risks are appropriately managed.
10	7.1.3 13/15 HATCH STREET 7. 1.3.1 Route Alignment	32,33	7.1.3 13/15 HATCH STREET 7. 1.3.1 Route Alignment The tunnel alignment does not pass beneath 13/15 Hatch Street, and the building is approximately 75m to the east of the alignment. The alignment drawing ML1-JAI-EIA-ROUT_XX-DR-Y-05026 and the Contour drawing ML1-JAI-EIA-ROUT_XX-DR-Y-21147 show the alignment and the predicted ground movement. Many of the reports refer to chainages along the alignment. However, there are no plans that indicate these chainages, and this makes reviewing the Draft Railway Order and EIAR difficult.	TII disputes OPW statement that no chainage drawings have been provided. Reference to chainages along the alignment are provided within the Railway Order Plans\Drawings under Alignment Drawings.
11	7.1.4 TRINITY POINT 7.1.4.1 Route Alignment	33	7.1.4 TRINITY POINT 7.1.4.1 Route Alignment The tunnel alignment passes directly beneath the Trinity Point. However, there is inconsistency in the alignment between Tara Station and St. Stephen's Green. The alignment drawing ML1-JA1-EIA- ROUT_XX-DR-Y-05025 and the Contour drawing ML1-JAI-EIA-ROUT_XX-DR-Y-21148 show different alignments. Many of the reports refer to chainages along the alignment. However, there are no plans that indicate these chainages, and this makes reviewing the Draft Railway Order and EIAR difficult.	Please refer to response number (7) and (10).
12	7.1.5 EARLSFORT DEVELOPMENT CENTRE 7.1.5. 1 Route Alignment	35	7.1.5 EARLSFORT DEVELOPMENT CENTRE 7.1.5. 1 Route Alignment The tunnel alignment passes beneath the Earlsfort Centre. The alignment drawing ML1-JAI-E1A-ROUT_XX-DR-Y-05026 and the Contour drawing ML1-JAI-EIA-ROUT_XX-DR-Y-21148 show different alignments. Many of the reports refer to chainages along the alignment. However, there are no plans that indicate these chainages, and this makes reviewing the Draft Railway Order and EIAR difficult.	Please refer to response (7) and (10).
13	7.1.6 INTREO OFFICE & PARKRITE PARKING 7. 1.6.1 Route Alignment	36	As can be seen in the figure below, the MetroLink 8.5m ID running tunnel does not pass close to this property. The alignment drawing ML1-JAI-EIA-ROUT_XX-DR-Y-05023 and the Contour drawing ML1-JAI-EIA-ROUT_XX-DR-Y-21146 show the alignment and the predicted ground movement. Many of the reports refer to chainages along the alignment. However, there are no plans that indicate these chainages, and this makes reviewing the Draft Railway Order and EIAR difficult.	Refer to response number(7) and (10).
14	7.1.6 INTREO OFFICE & PARKRITE PARKING 7. 1.6.1 Route Alignment	37	The proposed MetroLink will be excavated through Argillaceous Limestone rock (CLU) underlying Weathered Rock (QTR) underlying Brown Boulder Clay (QBR), containing extensive fluvio-glacial sands and gravels. Cover to the tunnel crown is approximately 23m comprising Brown Boulder Clay. The invert will be excavated through both weathered and unweathered limestone. This will present a significant challenge to ground movement mitigation using tunnel management.	OPW's observation with regard to the alignment and geology below Intreo Office and Parkrite Parking is noted and is the reason for the selection of the proposed TBM and the mixed face conditions identified have been used to conservatively predict the impacts on overlying buildings and infrastructure. TII will develop both TBM operational Specifications and Ground Movement and Monitoring Specifications to ensure that residual risks are appropriately managed.
15	7.3 Contractual Arrangement	38	The contractor(s) appointed will be responsible for the organisation, direction, and execution of environmental related activities during the detailed design and construction of the proposed Project. The contractor(s) is required to undertake all activities in accordance with the relevant environmental requirements including the consent documentation and other regulatory and contractual requirements.	TIIs contractors will be bound by the Railway Order, further agreements entered into by TII and other relevant statutory or MetroLink specific regulation. An Bord Pleanála's statutory responsibility includes satisfying itself that the terms and conditions of any railway order will ensure that the railway works are consistent with the proper planning and sustainable development of the area and will not have unacceptable impacts on the environment regardless of the contractual structure.

Submission No.			213	
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 1 Georges Quay and others.				
16	8.0 POTENTIAL IMPACTS ON THE PROPERTY	38	DOWNEY and Gall Zeidler have carried out a detailed examination of the property subject to this submission. Having regard to the status and current use of the property and identified constraints, the following raises concerns regarding potential impacts of the MetroLink on the property. This has been elaborated to include potential impacts during the construction and operation phases of developing MetroLink, as well as any impediments and/or implications for future development of the property.	Please refer to response numbers (17) through to (41) below.
17	8.1 Monitoring	15	Given the public service uses within this property, we request that An Bord Pleanála attach a condition to the Draft Railway Order that ensures continuous monitoring of the property to prevent any negative impacts. Access to all properties must be agreed in advance with the OPW and its clients. It is recommended that this monitoring takes place at least 3 months in advance of the construction of the Project and at least 6 weeks post the operational stage of the MetroLink.	TII will procure its contractors to develop Instrumentation and Monitoring Plans in tandem with Monitoring Action Plans. These plans will help assure that the risks associated with tunnelling and station excavations impacting OPW property are appropriately managed and controlled. TII will provide details of any monitoring proposed by the contractor at detailed design stage and agree the methodology of installation to the OPW property. TII will provide advance notice of any attendance that the monitoring contractor may require. With regard to the timing of monitoring specific to ground movement TII will ensure that it is commenced 3 months prior to the construction activities that would give rise to the settlement. However, as these construction activities may complete years prior to the MetroLink operational phase the termination of monitoring will be linked to a determination that settlement has effectively ceased, allowing a removal of the instrumentation.
18	8.2 Security Issues	39	Given the nature of the State properties affected by the Project, we would respectfully refer An Bord Pleanála to Part XI of the Planning & Development Act 2000 (as amended), which states that: "Development by State authorities. 181.— (1) (a) The Minister may, by regulations, provide that, except for this section F902[and sections 181 A to 181C], the provisions of this Act shall not apply to any specified class or classes of development by or on behalf of a State authority where the development is, in the opinion of the Minister, in connection with or for the purposes of public safety or order, the administration of justice or national security or defence and, for so long as the regulations are in force, the provisions of this Act shall not apply to the specified class or classes of development. b(iii) the making available for inspection by members of the public of any specified documents, particulars, plans or other information with respect to the proposed development;"	This provision allows the Minister for Housing to provide that certain State developments do not require planning permission. It is not relevant to the MetroLink project. The MetroLink project is authorised by railway order and does not require planning permission. In that regard, we refer to section 38 of the Transport (Railway Infrastructure) Act 2001, which provides that "Each of the following shall be exempted development for the purposes of the Act of 2000: (a) development consisting of the carrying out of railway works, including the use of the railway works or any part thereof for the purposes of the operation of a railway, authorised by the Board and specified in a railway order or of any incidental or temporary works connected with such development; (b) development consisting of the carrying out of railway works for the maintenance, improvement or repair of a railway that has been built pursuant to a railway order."
19	8.2 Security Issues	39	All employees contracted to work on behalf of the TII on this Project, and any associated works, must adhere to the properties protocol around access, security, and safety. This applies to all persons entering or working in proximity of the property.	TII will ensure that contractors working on its behalf on OPW property comply with property protocols around access, security and safety.
20	8.2 Security Issues	39	The day-to-day operations of the property cannot be interrupted by disruptions to any utilities.	There is no intent to disrupt the day to day activities. If subsequently, it is found that a disruption to utility provision is inevitable this will be discussed and agreed with OPW and the timing and duration of any disruption optimised to minimise said disruption.
21	8.2 Security Issues	39	The design and operation of the MetroLink should be in line with best international practice, in relation to anti-terrorism and security measures.	Safety and security are two priorities for the MetroLink in operation and hence the design will be developed cognisant of the risk in relation to terrorism and best practice applied. Further dialogue with OPW will be undertaken throughout the design and construction stages to ensure suitable provisions are in place.
22	8.3.1 Ground Movement -1GQ, GEORGE'S QUAY	39, 40	8.3.1 Ground Movement Key points of the staged analysis for ground movements impacts on structures is provided for each property. However, an extended version of these stages has been provided in Appendix 2 enclosed with this submission, which we respectfully invite the Board to refer to. 1GQ, GEORGE'S QUAY. Stage 1: Defines extent of ground movement using Moderately Conservative parameters. The extent of the zone of influence from the station excavation is defined by the 1mm contour line (Dark Red) and 1 George's Quay lies outside the zone of influence. The ground movement impact on the 1 George's Quay is not specified in the report and the OPW seeks to ensure that this building has its own assessment.	1GQ, Georges's Quay: This property lies outside the zone of influence and hence is not impacted by settlement. Therefore this building does not need an assessment.

Submission No.			213	
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 1 Georges Quay and others.				
23	Ground Movement- Corn Exchange	41	Corn Exchange: Stage 1: Defines extent of ground movement using Moderately Conservative parameters. The parameters considered by MetroLink are: ■ Volume Loss, Vs = 1.5 ■ 1 rough Width parameter, k = 0.3 The Volume Loss is considered moderately conservative. However, the trough parameter is very narrow and 0.4 would be considered more conservative. The extent of the zone of influence is defined by the 1mm contour line (Dark Red) and the Corn Exchange lies just outside the zone of influence. The ground movement impact on the Corn Exchange is not specified in the report and the OPW requests that this building has its own assessment.	8.3.1 Ground Movement Corn Exchange: The assessments undertaken to date are, as you say, moderately conservative. Any further detailed assessment would seek to strip out some of the conservatism. This property currently lies outside the zone of influence and hence is not deemed impacted by settlement. Therefore this building does not need an assessment. The K values have been determined considering the ground conditions specific to location and hence K values vary between 0.3 to 0.5 as shown in Table 5.1 of Appendix 5.17 of the EIAR. The rationale for the selection of K values is given further in section 4.2.3 of Appendix 5.17.
24	Ground Movement 83.1.3 13/15 HATCH STREET	42	83.1.3 13/15 HATCH STREET Stage 2: Three sections were considered in the assessment. The assessment did not address the structures directly.	8.3.1 Hatch Street: This property lies outside the zone of influence and hence is not impacted by settlement. Therefore this building does not need an assessment.
25	Ground Movement 83.1.3 13/15 HATCH STREET	42	Stage 3: The OPW expects that a Stage 3 assessment will be carried out for 13-15 Hatch St by the Contractor appointed to construct this section of the MetroLink. The OPW expects to be consulted on the detail, scope of this assessment and programme for these assessments. It would be helpful if TII were to develop a Design Standard to ensure that all Stage 3 analyses of the OPW properties are carried out equally. No mention of Stage 4 or 5 has been found in the Draft Railway Order or EIAR. Industry best practice as applied to London's Elizabeth Line (Crossrail) required that two further Stages in the Assessment of ground movement were undertaken during the project.	See response number (24). TII's position is that a Stage 3 assessment is not required for 13-15 Hatch Street.
26	Ground Movement 83.1.3 13/15 HATCH STREET	43	Stage 4 (Construction Stage): This stage is where any mitigation is implemented, and the monitoring of the stakeholder's infrastructure is carried out. Also, the pre-construction defect surveys are carried out prior to any excavation. The OPW requires to review the detailed proposals for mitigation and monitoring. Monitoring proposals submitted to the OPW for review should include deep level monitoring and ground water level monitoring in addition to the building and surface monitoring typically implemented. The deep level monitoring will provide valuable data relating to the rock behaviour and has been usefully employed on HS2. The OPW will facilitate and observe the pre-construction defect surveys. It is noted that these shall be carried out by Professionally Qualified Engineers or Surveyors. The contractor(s) will coordinate pre-construction defect surveys for identified properties, liaising (in conjunction with the employer) with the building surveyor employed to carry out the surveys and maintaining a dialogue with the relevant property owners throughout the duration of the works.	Please note this building is outside the zone of influence and hence this is not relevant.
27	Ground Movement 83.1.3 13/15 HATCH STREET	43	Stage 5 (Close out): Once the excavation (tunnelling and station excavation) has been completed then the Contractor will want to decommission his monitoring. The OPW expects to be provided with close out reports for the monitoring of their property. As a minimum the close out report should include details of any mitigation carried out, a list of any repairs, time history graphs showing the movements monitored.	TII will share the closeout monitoring report that will demonstrate that construction ground movements have ceased, which will also require historical movement information to be presented. In the event of repairs, these will be scheduled. Please note this building is outside the zone of influence and hence this is not relevant.
28	Ground movement- Trinity Point- 8.3. 1.4	44	Stage 3: The EIAR states that a Stage 3 assessment will be carried out for Trinity Point by the Contractor appointed to construct this section of the MetroLink. The OPW expects to be consulted on the detail, scope of this assessment and programme for these assessments. It would be helpful if TII were to develop a Design Standard to ensure that all Stage 3 analyses of the OPW properties are carried out equally. No mention of Stage 4 or 5 has been found in the Draft Railway Order or EIAR. Industry best practice as applied to London's Elizabeth Line (Crossrail) required that two further Stages in the Assessment of ground movement were undertaken during the project.	8.3.1.4 Stage 3 Assessment: The Trinity Point Stage 3 assessment will be undertaken by the contractor and the results will be shared with OPW. TII will consult OPW on the detail, scope and programme for this assessment. To educate the Phase 3 assessment TII will consult with OPW to ensure that any record drawings for this (and any other OPW buildings) are collated and included in the contract documents issued to tenderers. -TII are in the process of procuring resources to develop the design for tender. This design will include developing design standards, procedures etc for all aspects of the works as is standard practice for major infrastructure projects. With regard to stage 4 and 5 - i.e. the development of monitoring and mitigation plans and the subsequent close out of the impacts of settlement will form part of the scope of the project for the design and construct phases. The details as noted above will be developed during the procurement phase as is standard practice.

Submission No.			213		
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW		
Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 1 Georges Quay and others.					
29	Ground movement- Trinity Point- 8.3. 1.4	45	Stage 4 (Construction Stage): This stage is where any mitigation is implemented, and the monitoring of the stakeholders’ infrastructure is carried out. Also, the pre-construction defect surveys are carried out prior to any excavation. The OPW requires to review the detailed proposals for mitigation and monitoring. Monitoring proposals submitted to the OPW for review should include deep level monitoring and ground water level monitoring in addition to the building and surface monitoring typically implemented. The deep level monitoring will provide valuable data relating to the rock behaviour and has been usefully employed on HS2. The OPW will facilitate and observe the pre-construction defect surveys. It is noted that these shall be carried out by Professionally Qualified Engineers or Surveyors. The contractor(s) will coordinate pre- construction defect surveys for identified properties, liaising (in conjunction with the employer) with the building surveyor employed to carry out the surveys and maintaining a dialogue with the relevant property owners throughout the duration of the works.	See response number (26) above.	
30	Ground movement- Trinity Point- 8.3. 1.4	45	Stage 5 (Close out): Once the excavation (tunnelling and station excavation) has been completed then the Contractor will want to decommission his monitoring. The OPW expects to be provided with close out reports for the monitoring of their property. As a minimum the close out report should include details of any mitigation carried out, a list of any repairs, time history graphs showing the movements monitored.	TII will share the closeout monitoring report that will demonstrate that construction ground movements have ceased, which will also require historical movement information to be presented. In the event of repairs, these will be scheduled.	
31	Ground Movement 8.3.1.5 EARLSFORT DEVELOPMENT CENTRE	46	Stage 2: The assessment did not explicitly comment on the building in Table 5.2 Result of Phase 2a Building Damage Assessment- Representative Buildings. A map corresponding the Building IDs in this list to delineated buildings might aid with understanding specific buildings included or excluded from the Reports assessment. The building should be considered a Special Building and progressed to a Phase 3 assessment if it hasn't been identified already.	The Earlsfort Development Centre is included as building B53 in Appendix 5.17 of the EIAR. The building is identified as a special building and will be subject to a Phase 3 assessment.	
32	Ground Movement 8.3.1.5 EARLSFORT DEVELOPMENT CENTRE	46	Stage 3: The EIAR states that a Stage 3 assessment will be carried out for The Earlsfort Centre by the Contractor appointed to construct this section of the MetroLink. The OPW expects to be consulted on the detail, scope of this assessment and programme for these assessments. It would be helpful if Til were to develop a Design Standard to ensure that all Stage 3 analyses of the OPW properties are carried out equally. No mention of Stage 4 or 5 has been found in the Draft Railway Order or EIAR. Industry best practice as applied to London's Elizabeth Line (Crossrail) required that two further Stages in the Assessment of ground movement were undertaken during the project.	The Earlsfort Stage 3 assessment will be undertaken by the contractor and the results will be shared with OPW. To educate the Phase 3 assessment TII will consult with OPW to ensure that any record drawings for this (and any other OPW buildings) are collated and included in the contract documents issued to tenderers. TII are in the process of procuring resources to help develop the design for tender. This design will include developing design standards, procedures etc for all aspects of the works as is standard practice for major infrastructure projects. With regard to stage 4 and 5 - i.e. the development of monitoring and mitigation plans and the subsequent close out of the impacts of settlement will form part of the scope of the project for the design and construct phases. The details as noted above will be developed during the procurement phase as is standard practice.	
33	Ground Movement 8.3.1.5 EARLSFORT DEVELOPMENT CENTRE	47	Stage 4 (Construction Stage): This stage is where any mitigation is implemented, and the monitoring of the stakeholder's infrastructure is carried out. Also, the pre-construction defect surveys are carried out prior to any excavation. The OPW requires to review the detailed proposals for mitigation and monitoring. Monitoring proposals submitted to the OPW for review should include deep level monitoring and ground water level monitoring in addition to the building and surface monitoring typically implemented. The deep level monitoring will provide valuable data relating to the rock behaviour and has been usefully employed on HS2. The OPW will facilitate and observe the pre-construction defect surveys. It is noted that these shall be carried out by Professionally Qualified Engineers or Surveyors. The contractor(s) will coordinate pre- construction defect surveys for identified properties, liaising (in conjunction with the employer) with the building surveyor employed to carry out the surveys and maintaining a dialogue with the relevant property owners throughout the duration of the works.	Please see response number (26) above.	
34	Ground Movement 8.3.1.5 EARLSFORT DEVELOPMENT CENTRE	47	Stage 5 (Close out): Once the excavation (tunnelling and station excavation) has been completed then the Contractor will want to decommission his monitoring. The OPW expects to be provided with close out reports for the monitoring of their property. As a minimum the close out report should include details of any mitigation carried out, a list of any repairs, time history graphs showing the movements monitored.	Please see response number (27) above.	

Submission No.			213		
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW		
Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 1 Georges Quay and others.					
35	8.3.3 Noise and Vibration(a) Tunnelling	50	INTREO OFFICE & PARKRITE PARKING: ■ Ground borne noise was not calculated for this property. However, no significant impact is anticipated. ■ Ground borne vibration was not calculated for this property. However, no significant impact is anticipated. EIAR Table 6.2- GNV1 states that there is no effective mitigation available and therefore the impact will be managed by detailed consultation with the building owners. With respect to the above-mentioned, the OPW requests that a specific study is carried for the foregoing properties to determine whether ground borne noise and vibration will have any impact. Where any impact is identified then threshold limits will need be applied and monitored. Where the building is considered vulnerable to vibration induced damage EIAR Table 6.2 - ANV16. sets out requirement for pre- and post-construction surveys of these structures.	The INTREO OFFICE is in excess of 300m from the tunnel centreline and Parkrite Parking is in excess of 230m from the tunnel centreline. EIAR Table 14.14 states that impacts from groundborne noise and vibration from TBM passage may extend to a plan distance of 100m from the tunnel, and Section 14.2.5.4.2 states that the operation of the rail line is unlikely to have an impact beyond 50m from the rail line. As these buildings are outside of these distances groundborne noise and vibration have not been calculated for them. However, groundborne noise contours are given for TBM passage in Figure 14.2 and operation in Figure 14.6 where it can be seen that these buildings are outside of the 30 dB LASmax contour, and below the thresholds for significant impacts of 45 dB and 40 dB respectively. As the buildings are below any thresholds no further surveys are required.	
36	8.3.3 Noise and Vibration	51	1GQ, 1 George's Quay is located approximately 85m from Tara Station, while Corn Exchange is located c. 125m from this Station excavation and the peak particle velocity for these properties is predicted to be 1.1mm/s and 0.8mm/s respectively. The OPW requests a specific assessment of the impact of blasting on 1GQ, 1 George's Quay and Corn Exchange. 13/15 Hatch Street, Trinity Point, and Earlsfort Development Centre are located far enough away from either station excavation for the predicted peak particle velocity to be less than 1mm/s. The INTREO Office & Parkrite Parking is located 400m from O'Connell Street Station excavation and therefore the peak particle velocity is predicted to be less than 1mm/s. The OPW requests a specific assessment of the impact on this property to be carried out.	Table 14.5 of the EIAR presents threshold vibration levels for blasting of 8mm/s for standard buildings, and 3 mm/s for potentially vulnerable buildings. The predicted vibration levels during blasting of 1.1 mm/s PPV at 1 George's Quay 1.1 mm/s, and 0.8 mm/s PPV at Corn Exchange are well below these thresholds. Therefore no significant impact is predicted and further mitigation measures are not considered necessary. The other buildings that have been listed, namely 13/15 Hatch Street, Trinity Point, Earlsfort Development Centre and INTREO Office & Parkrite Parking are located at sufficient distances from any blasting that vibration levels would be well below 1 mm/s PPV as indicated in Figure 14.4 Blasting contours of PPV, no significant impacts would be felt. Therefore no significant impact is predicted and further mitigation measures are not considered necessary.	
37	8.3.4 Work Sites	51	(b) Ground Water Control There is the potential for ground water lowering for the construction of Tara Station to impact 1GQ, 1 George's Quay and Corn Exchange. Thus, the OPW requests that TII provides an assessment and limits that will be applied to dewatering for the construction of Tara Station. Regarding the 13/15 Hatch Street, Trinity Point, and Earlsfort Development Centre, there is an assumption that the tunnelling will not affect the ground water above the tunnel. However, there should be a ground water monitoring scheme implemented to confirm this and a contingency plan to manage any residual risk. In relation to INTREO Office & Parkrite Parking, the is the potential for ground water lowering for the construction of O'Connell Street Station to impact the property. Thus, the OPW requests that TII provides an assessment and limits that will be applied to dewatering for the Construction of O'Connell Street Station.	TII understand your concern, however following reviews, surveys and monitoring of groundwater, it can be concluded that the referenced buildings will not be impacted by works. As outlined in EIAR Chapter 19 (Hydrogeology), groundwater assessment and monitoring were and will continue to be undertaken for the proposed Project: • AWN undertook an extensive desktop review in order to establish baseline conditions along the proposed alignment corridor. The baseline study included reference to historical ground investigation data including the 2007 IGSL investigation borehole dataset (IGSL 2008) and data from Norwest Holst (2008) as well as information from contemporary (2019-2021) ground investigations specific to the proposed Project (Table 19.2); • A number of field surveys and walkover assessments were carried out to add to existing assessment of long-term trend analysis for water quality undertaken by the EPA (Section 19.3.3.4); • A number of intrusive ground investigations were commissioned for the proposed Project including ground water level monitoring (Section 19.3.3.5). A programme of continuous groundwater level monitoring, aquifer testing and groundwater quality monitoring was devised with focus on key well locations along the alignment including at deep station excavations; and • A hydrogeological review of Tara Street was undertaken and can be found in EIAR Appendix A19.11. Dewatering and unmitigated releases to ground during the Construction Phase could have permanent water quality and quantity impacts on the hydrogeological (and hydrological/ecological) environment if not effectively mitigated (Section 19.5.1). However, for the proposed Project, Construction Phase management includes mitigation measures presented in the EIAR and outlined in the outline Construction and Environmental Management Plan (CEMP) (Appendix A5.1) for the proposed Project to protect receiving waters (groundwater and surface water) and ensure continued conveyance of natural groundwater flow patterns, as well as of surface water courses.	
38	8.3.4 Work Sites	18	(e) Traffic There will be significant traffic diversions required to construct Tara Station site that may impact personnel and clients attending 1GQ, 1 George's Quay and Corn Exchange. Thus, the OPW requests to ensure that full access is maintained to these properties, including car parks, etc. This item does not apply to 13/15 Hatch Street, Trinity Point, and Earlsfort. In relation the INTREO Office & Parkrite Parking and its proximity to the O'Connell Street Station, there will be significant traffic management required to construct this Station site, and that may impact personnel and clients attending the property and/or using car parking at the INTERO Office & Parkrite Parking. It is noted that the Traffic Management Plan envisages that all construction traffic from O'Connell Street Station construction will be routed west along Parnell Street. Accordingly, the OPW requests that Til carry out a study to consider the impact on the Parkrite car parking at Loftus Lane.	As set out in Section 7.9 of Appendix A9.5 Scheme Traffic Management Plan - Luke St will be closed between Poolbeg St and Townshend St which will still enable access to the George's Quay Car Park from Townsend St, while the site boundary does not block access to the car park from Luke St (Fig 7-49 of same Section and Section 5.10.11 of Chapter 5). In relation to buildings at Corn Exchange, none of the envisaged TTM restrictions will hinder access to this location. In Section 7.8 of Appendix A9.5 Scheme Traffic Management Plan - No adverse impacts have been set out or identified in relation to Parkrite or INTREO sites.

Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW		
Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 1 Georges Quay and others.					
39	8.4 During Operation of the MetroLink 8.4.1 Noise and Vibration	52	8.4.1 Noise and Vibration In relation to 1GQ, 1 George's Quay and Corn Exchange, TH proposes to mitigate the noise and vibration resulting from the railway operations by installing resilient track slab to meet threshold of 40 dBtamaxs and VDV = 0.8 m/s 1 respectively. The vibration during railway operations will not impact the building fabric or structure. In relation to 13/15 Hatch Street, Trinity Point and Earlsfort Development Centre, TII proposes to mitigate the noise and vibration resulting from the railway operations by installing floating track slab to meet thresholds of 25 dBLamax,sand VC-D respectively. EIAR Chapter 14 Table 14.47 provides some guidance on where this will be constructed but it is not clear exactly where. The OPW requests that floating track slab is installed between Chainage 17+980 and 19+000, between Chainage 17+980 and 18+400 (St. Stephen's Green Station), and between Chainage 17+980 and 18+900. This would mitigate the noise and vibration to acceptable levels under all the Government buildings, museums, and the National Concert Hall. The vibration during railway operations will not impact the building fabric or structure. In relation to INTREO Office & Parkrite Parking, Til proposes to mitigate the noise and vibration resulting from the railway operations by installing resilient track slab to meet threshold of 35 dBiamaxzs and VDV = 0.4 m/s 1 respectively. The vibration during railway operations will not impact the building fabric or structure.	Predictions of groundborne noise and vibration are given in EIAR Appendix 14.5. For Earlsfort Development Centre the predicted level of groundborne noise is 21 dB LASmax, below the 40 dB LASmax threshold. For vibration the predicted level is 0.002 mm/s VDV which is below the threshold level of 0.8 mm/s PPV. Groundborne noise and vibration would be expected to be lower at 13/15 Hatch Street due the increased distance from the tunnel. In relation to Trinity Point (10-11 Leinster Street) the predicted operational noise level is of 18 dB LASmax, which is below the threshold of 40 dB LASmax. For vibration the predicted level is 0.002 mm/s VDV which is below the threshold level of 0.8 mm/s PPV. Given that the predicted levels of groundborne noise and vibration are below the threshold levels for operation at the stated buildings and no significant impact is predicted there is no need for floating track slab in this area.	
40	8.4.2 Future Development	53	The railway is 85m from 1GQ, 1 George's Quay, and 40m from the Corn Exchange. Therefore, the railway will not hinder future (re)development of these properties. It is likely that there will be restrictions on future sub-grade development for the Trinity Point as parts sit atop the current planned alignment. It is also likely that there will be restrictions on future sub-grade development for the Earlsfort Development Centre as one corner of the building footprint is extremely close to the current planned alignment. Provided the proposed railway alignment does not change then there will be no restriction on future development at INTREO Office & Parkrite Parking. Should the position change, the OPW reserves the right to develop the subject property in the future. This includes property above and below ground, subject to normal planning criteria.	Please refer to response number (6) above.	
41	8.5 Future Development	53	The OPW reserves the right to develop any of its portfolio of properties in the future, which includes property above and below ground, subject to normal planning criteria. It is important that the development of the MetroUnk does not interfere with extant planning permissions pertaining to the subject property and the right of the applicant to develop these, in advance, in tandem or post operation of the MetroLink Project.	Please refer to response number (6) above.	
42	CONCLUSION	54	With regards to the Gall Zeidler assessment, the risk of damage from ground movement on the properties subject to this submission is suggested to be negligible. However, given the significance of the building in terms of function and use, pre- and post-construction surveys, trials, and monitoring is requested. The OPW also seeks assurance from TII that Stage 2 ground movement assessment will be carried in relation to INTREO Office & Parkrite Parking during detailed design if there are material changes to the alignment. Once the railway is in operation, it is possible that there will be noise and vibration impact and TII should seek assurance that a detailed evaluation will be performed.	Given that no significant impacts have been predicted at these buildings then pre and post construction surveys, trials and monitoring are not considered to be necessary. If there are changes to alignment, then the impacts of the changes would be assessed for all affected buildings.	
43	CONCLUSION	54	With respect to these properties, the OPW is seeking: 1) To ensure no disruption to the public access of these buildings and their day-to-day uses and functions, as well as no damage to the buildings, their historical profile in terms of being listed as Protected Structure and/or their Conservation Area setting (if there is any), resulting from the implementation of the Project.	Scheme impacts in the area surrounding these properties has been undertaken in Section 7.9 of Appendix A9.5 Scheme Traffic Management Plan with no adverse impacts identified. The buildings have been assessed for all impacts due to construction and operation as detailed throughout the EIAR and in these responses. The assessments take into account the nature of the Protected buildings and their setting.	
44	CONCLUSION	54	2) To ensure pre- and post-construction surveys are carried out and that these should relate to but not limited to ground movement, noise and vibration, blasting and water lowering, as well as construction traffic impacts, also including traffic diversions.	Agreed.	
45	CONCLUSION	54	3) To ensure that the following specific assessments of the impacts on 1GQ, 1 George's Quay and Corn Exchange are provided, with precedents applied to ensure best industry practice: a. Ground movement impact (Stage 2 and 3 Assessment). b. Ground borne noise and vibration, including the application and monitoring of threshold limits, pre- and post-construction surveys. c. The impact of blasting given the proximity of these properties to the Station.	a. As noted previously further ground movement assessment of 1GQ and the Corn Exchange are not required as both buildings are outside the zone of influence. b. Please see response number (39) above.. c. According to Appendix 14.5 Groundborne Noise and Vibration and Blasting Modelling Results, the values of vibration due to blasting for 1 George's Quay and Corn Exchange are 1.1mm/s and 0mm/s compared to the threshold value of 8 mm/s. As a result no significant impact is expected on these buildings as a result of blasting activities.	

Submission No.			213	
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 1 Georges Quay and others.				
46	CONCLUSION	54	4) To ensure acceptable levels of dewatering for construction of Tara Station are provided as there is a potential for ground water lowering which can adversely impact the 1GQ, George's Quay and Corn Exchange.	Please refer to response number (37).
47	CONCLUSION	54	5) To ensure an assessment of traffic impact on the accessibility of 1GQ, George's Quay and Corn Exchange for both personnel and clients during construction of Tara Station due to traffic diversions.	Scheme impacts in the area surrounding these properties has been undertaken in Section 7.9 of Appendix A9.5 Scheme Traffic Management Plan with no adverse impacts identified.
48	CONCLUSION	54	6) Once the railway is in operation it is possible that there will be residual impacts arising from the above assessments and Tii should seek assurance that a detailed evaluation will be performed.	The Operational Phase has been fully assessed and TII will ensure that operational surveys are undertaken to verify actual impacts.
49	CONCLUSION	54	8) Precedents to be applied to the risk assessments to ensure utilising best industry practice within implementation of the Project.	TII intend to apply industry best practice to build and operate the MetroLink whilst minimising impacts to 3rd parties. The Project will be delivered in accordance with relevant risk management processes.
50	APPENDIX 1: LIST OF PLANNING LEGISLATION & POLICY	56	This appendix provides a non-exhaustive list of planning policy, legislation, and guidelines. We would respectfully request that An Bord Pleanála ensure that TH have fully assessed the Project with regard to existing planning policy, as well as adherence to the relevant local policies and guidelines pertaining to each individual property. DOWNEY note that this proposed Draft Railway Order is a strategic long-term development and An Bord Pleanála may consider Development Plans in assessing the Project. It is also crucial to note that on foot of a granted Order and during the detailed design stage, a revision to planning policy is expected, whereby adopted plans and legislation may have to be adhered within this stage. This may require an amendment to the Railway Order and further assessment, including public consultation.	Please refer to response number (5) above.
51	Appendix 2: Ground movement Assessment	page 61	Duplicate of Appendix to D to OPW Cover Letter - Re: Railway (Metrolink–Estuary to Charlemont via Dublin Airport) Order 2022 – Submissions by the Commissioners of Public Works in Ireland	Refer to OPW Cover Letter response

Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 13-14 Burgh Quay.					
1	Downey Report- Executive Summary		With respect to this property, the OPW is seeking: 1) To ensure no disruption to the public access of the building and its day-to-day uses and functions. Access to associated car parking on Corn Exchange Place must be maintained at all times. 2) To ensure no damage to the building, pre-construction and post-construction surveys, trials and monitoring is required. This is mainly concerned with the fact that the ground movement impact, as well as ground borne noise and vibration impact on the building, has not been incorporated within the Draft Railway Order. 3) To ensure an assessment on the impact of blasting to facilitate construction of Tara Station on the building, is included, since this is to take place in close proximity to the building (approximately 125m). 4) To ensure no adverse impact on the access and function(s) of the building due to traffic diversions to construct Tara Station. 5) To ensure specific vibrations limits will be applied to 13/14 Burgh Quay and a monitoring regime is implemented. 6) To include adverse impacts of Tara Station within the risk assessment studies for 13/14 Burgh Quay and provide for mitigation measure, as construction of this Station will generate additional lorry movements for both deliveries and spoil removal. 7) Precedents to be applied to the risk assessments to ensure best industry practice is adopted in the implementation of the Project.	TII thank you for your comments. Further to TII's response to the OPW Covering letter, the matters raised by OPW specific to these buildings are addressed in responses (2) through to (38) below.	
2	Downey Report- 3.0 Overview of the Draft Railway Order	Page 8, 9	While extensive pre-planning consultations also took place between Til and the OPW, a detailed assessment of the individual properties affected has not yet taken place. The Draft Railway Order application 2022 is a Draft Order, and should the route be approved by An Bord Pleanála, further detailed design will be submitted which will require further consideration and approval. Factors such as the internal uses of the properties, their construction methods, age and historical importance and the effect of construction on these sensitivities has not been assessed as part of the Project thus far. Additional consideration needs to be given to the potential effects on the built environment before a route and construction method can be confirmed. The OPW reserves the right to make further commentary, pending more detailed design proposals.	TII have undertaken a Phased Ground Movement Impact Assessment and the results of the assessments are included in the RO documentation within Appendix 5.17 of the EIAR. Appendix B2 of that document indicates the list of special buildings that would be subject to a subsequent Phase 3 assessment irrespective of the engineering need to do so. Many OPW buildings are in this category. It should be noted that the further assessments that will be done by the contractor if the RO is granted will likely reduce the impacts on the buildings as the Phase 2 assessment is a conservative assessment whose results are generally more significant than the results of a Phase 3 assessment. This point was discussed with OPW and their consultants in January 2023. TII will consult with OPW in relation to the results of any Phase 3 assessments and any requirements for monitoring and / or other mitigations that eventuate will be discussed with OPW. . TII are satisfied that the approach adopted to date follows an industry standard approach undertaken on tunnelling and underground projects around the world including on the Channel Tunnel Rail Link and Crossrail in London, the Dublin Port Tunnel and currently on High Speed 2 in England, and therefore that further assessment is not required and should not be delivered prior to the route being consented. This property is outside the zone of influence (1mm contour) and hence no impacts from ground movement are predicted. Further, please refer to response number (20) below.	
3	Downey Report -4.1 property location and description	page 10	This property is a four-storey over basement corner building, located at Nos. 13-14 Burgh Quay, Dublin 2. The building is situated between the Rosie Hackett Bridge and the R802 Bridge. The building extends down Corn Exchange Place with its rear elevation on Poolbeg Street. The building consists of a divide between a modern office complex (14 Burgh Quay) and an old Georgian Protected Structure (13 Burgh Quay). Originally built as a house, 13/14 Burgh Quay, is currently in use as a key public office for the Immigration Services. It offers administration serves for a range of Government Departments and Agencies.	It should be noted that the ownership/management role of this building was not identified by OPW to TII in previous significant consultation undertaken with OPW. Nevertheless, TII is satisfied that the assessment of impacts on this building is suitable for the purposes of the EIAR.	
4	4.2 Historical Context/Conservation Status	12	No. 13 Burgh Quay was originally built as part of a row of Georgian houses that fronted onto Burgh Quay and were designed to the standard of the Wide Street Commission. The buildings were built c. early 19 the century, in which Aston Quay and George's Quay were joined together to create Burgh Quay. The buildings had mixed use functions, but No. 13 Burgh Quay was primarily used as a residential unit. The building had various uses at the ground floor, including a corn merchant office, with a residence on the upper floors. It was also part of the Tivoli Theatre and used by the origins of the Irish Press, at one stage. The building has retained some of its historical features, with the retention of the stone entablature and arcaded shopfront, showcasing the neighbouring buildings perhaps where the original shopfront for the terrace was. It creates a sense of unity in the streetscape with its original red-brick features, a shared height and cornice and fenestration arrangement. Partially located within a Conservation Area in the Dublin City Development Plan 2022-2028 and registered under RPS Ref. No. 1023 of the Council's Record of Protected Structures, 13/14 Burgh Quay is designated as a Protected Structure.	Your observation is noted. TII understand that number 14 is not a protected structure and number 13 has been rebuilt and only the facade and surviving elements of the nineteenth-century building are protected. The presence of number 13 was noted in the Architectural Heritage chapter of the EIAR.	

Submission No.			214	
Organisation Name or Name of Submission			OPW Cover Letter & Downey Planning on behalf of OPW	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 13-14 Burgh Quay.				
5	4.3 Current Use/Uses	11	This building is a critical public office for the Immigration Services and provides c. 4,500sqm of public office and administration services for a number of Government Departments and State Agencies. It is a State-owned building with accommodation over 6 floors and basement car parking.	TII have noted this observation.
6	4.4 Planning context	12	In relation to the Draft Railway Order's consistency with planning policy and planning guidelines, a non-exhaustive list of planning policy and legislation at National, Regional, and Local levels, is included in Appendix 1 of this submission and the Board is invited to refer to this for further details. We would respectfully request that An Bord Pleanála ensure that TII have fully assessed the Project regarding existing planning policy, as well as adherence to the relevant local policies and guidelines pertaining to each individual property.	TII have undertaken a full assessment of the planning policy and planning guidelines in the Planning Report that was submitted as part of the Railway Order Application.
7	4.4 Planning context	12	DOWNEY note that this proposed Draft Railway Order is a strategic long-term development and An Bord Pleanála may consider Draft Development Plans in assessing the Project. It is also crucial to note that on foot of a granted Order and during the detailed design stage, a revision to planning policy is expected, whereby adopted plans and legislation may have to be adhered within this stage. This may require an amendment to the Draft Railway Order and further assessment, including public consultation.	The only policy relevant to the decision on whether to grant the Railway Order and the necessary conditionality is the policy in force at the date of the grant of the Railway Order, as has been made clear in numerous High Court decisions including Element Power v An Bord Pleanála [2017] IEHC 550 and the Railway Order cannot be made conditional on compliance with future, yet to be developed policy. As planning and policy and strategy are being updated constantly, TII will undertake a further review of planning policy in advance of any oral hearing to allow for an updated presentation on the projects consistency with active policy requirements to be presented to An Bord Pleanála.
8	4.6 Potential Development of the Property	12	No. 14 Burgh Quay is a recent development with no significant historical context. No. 13 Burgh Quay is a Protected Structure and therefore, no development is expected. However, there is always the possibility that sub-terranean development could take place.	TII will be required to make submissions in relation to planning applications for proposed future developments on or adjacent to MetroLink and there will necessarily be some engineering constraints (such as permissible loadings) required. However MetroLink is committed to engaging with known development proposals and new development proposals as they emerge with the intent of facilitating such developments as they emerge to the maximum extent consistent with the safe operation of the proposed Project. Again in common with other existing rail and tunnel projects, following grant of the Railway Order and development of detailed design, TII will produce "Guidance Note for Developers" that will be the subject of bye-laws following the grant of Railway Order and which is designed to facilitate future adjacent or over-site development while protecting the integrity and safety of the MetroLink works and operations. It is inappropriate and unworkable to produce this policy at this stage because it would have to be in broad terms that deal not only with the current RO proposal and any contingencies that might arise from the Board seeking revised designs or new conditionality as part of the RO application process. Therefore at this stage TII is dealing with known development proposals on a case by case basis, TII will work with parties in the future to assist with the wider development of sites over and above stations and tunnels. In this context TII has successfully engaged with a number of developers over the last two years to accommodate development over and in proximity to the alignment and there have been no material restrictions on development subject to the implementation of agreed design and mitigation measures and it is not anticipated that MetroLink will have a material impact on the development potential of sites above and in proximity to the alignment in future.
9	5.0 MATERIAL CONSIDERATIONS	12	The alignment drawing ML1-JAI-EIA-ROUT_XX-DR-Y-04025 and the Contour drawing ML1-JAI-E1A-ROUT_XX-DR-Y-21148 show different alignments. This error has resulted in deficient information within the SID application submitted under Section 2 of the Planning and Development Act 2000 (as amended), to assess the vulnerability of damage due to vibration cause by both tunnelling and operation of underground train on this section of the alignment. This affects several buildings under the management of the OPW particularly within the Kildare Street, Merrion Square and St. Stephen's Green areas.	On two drawings (Figures 20.16 Settlement Contours, sheets 27 and 28 of 30) in EIAR Appendix 5.17 Building Damage Report, the tunnel centreline is plainly incorrect as it is deviates from the centre of the settlement contours between Tara and St. Stephen's Green stations. The settlement contours are correct and reflect the proposed Railway Order alignment and as such the drawing serves its core purpose, which is to identify, describe and assess the settlement impact of the railway works. In any event, revised drawings will be submitted to the Board to rectify the error. The correct alignment has been used for all environmental impact assessments including tunnel induced settlement, and construction and operational noise and vibration impact assessments.

Submission No.			214		
Organisation Name or Name of Subm			OPW Cover Letter & Downey Planning on behalf of OPW		
Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 13-14 Burgh Quay.					
10	6.0 LEGAL CONSIDERATIONS	12	The Commissioners of Public Works would seek to enter into appropriate, property-specific legal agreements with TII, to ensure the protection of key State property and of the State's activities undertaken within those and other properties. Given the importance of such properties and activities, the Commissioners of Public Works consider it appropriate that An Bord Pleanála would make the Railway Order conditional on such legal agreements being in place between TII and the OPW. Creating such legal agreements between TII and the OPW would be possible only after TII make available the more detailed design and risk-mitigation measures for the construction and operational phases of the MetroLink project, and before any development begins. Therefore, the Commissioners of Public Works would request that this aspect be reflected in the conditions set out by An Bord Pleanála to TII, as this would provide assurances to the Commissioners of Public Works relating to future legal agreements that protect and secure State property and activities from risks associated with the construction or operations of the MetroLink.	TII's preference is carry out all of the permitted railway works with the agreement of affected landowners and prescribed bodies. However, it should not be condition of the railway order that TII reach such agreement with OPW. In the event that agreement cannot be reached with OPW, TII should be entitled to carry out the railway works over their objections provided that it complies with the terms and conditions of the Railway Order. The Board's function is to satisfy itself that those terms and conditions are adequate to ensure that the construction and operation of the railway works will be consistent with proper planning and sustainable development and have acceptable impacts on the environment. TII believes that the RO application and the EIAR in particular sets out mitigation and monitoring measures that are sufficient for that purpose	
11	7.1.1 Route Alignment	13	The MetroLink 8.5m ID running tunnel passes approximately 20m from the front of this building. Tara Station is approximately 125m southwest of this property. The alignment drawing ML1-JAI-EIA-ROUT_XX-DR-Y-05024 and the Contour drawing ML1-JAI-EIA-ROUT_XX-DR-Y-21147 show the alignment and the predicted ground movement. Many of the reports refer to chainages along the alignment. However, there are no plans that indicate these chainages, and this makes reviewing the Draft Railway Order and EIAR difficult.	Reference to chainages along the alignment are provided within the Railway Order Plans\Drawings under Alignment Drawings.	
12	7.1.3 Station Excavation	14	13/14 Burgh Quay is situated approximately 125m from Tara Station Box. The excavation for the stations will be through fluvio-glacial deposits, Weathered Rock, and Argillaceous Limestone. The excavation through the Limestone will most likely include blasting, which is unlikely to affect 13/14 Burgh Quay.	Please refer to response number (22) below.	
13	7.3 Contractual Arrangement	15	The contractor(s) appointed will be responsible for the organisation, direction, and execution of environmental related activities during the detailed design and construction of the proposed Project. The contractor(s) is required to undertake all activities in accordance with the relevant environmental requirements including the consent documentation and other regulatory and contractual requirements.	TII's contractors will be bound by the Railway Order, further agreements entered into by TII and other relevant statutory or MetroLink specific regulation. An Bord Pleanála's statutory responsibility includes satisfying itself that the terms and conditions of any railway order will ensure that the railway works are consistent with the proper planning and sustainable development of the area and will not have unacceptable impacts on the environment regardless of the contractual structure.	
14	8.0 POTENTIAL IMPACTS ON THE PROPERTY	15	DOWNEY and Gall Zeidler have carried out a detailed examination of the property subject to this submission. Having regard to the status and current use of the property and identified constraints, the following raises concerns regarding potential impacts of the MetroLink on the property. This has been elaborated to include potential impacts during the construction and operation phases of developing MetroLink, as well as any impediments and/or implications for future development of the property.	Please refer to response numbers (15) through to (26).	
15	8.1 Monitoring	15	Given the sensitivity of the uses within this property, coupled with its importance, we request that An Bord Pleanála attach a condition to the Draft Railway Order that ensures continuous monitoring of the property to prevent any negative impacts. Access to all properties must be agreed in advance with the OPW and its clients. It is recommended that this monitoring takes place at least 3 months in advance of the construction of the Project and throughout the operational stage of the MetroLink.	TII will procure its contractors to develop Instrumentation and Monitoring Plans in tandem with Monitoring Action Plans. These plans will help assure that the risks associated with tunnelling and station excavations impacting OPW property are appropriately managed and controlled. TII will provide details of any monitoring proposed by the contractor at detailed design stage and agree the methodology of installation to the OPW property. TII will provide advance notice of any attendance that the monitoring contractor may require. With regard to the timing of monitoring specific to ground movement TII will ensure that it is commenced 3 months prior to the construction activities that would give rise to the settlement. However, as these construction activities may complete years prior to the MetroLink operational phase the termination of monitoring will be linked to a determination that settlement has effectively ceased, allowing a removal of the instrumentation.	
16	8.2 Security Issues	15	Given the nature of the State properties affected by the Project, we would respectfully refer An Bord Pleanála to Part XI of the Planning & Development Act 2000 (as amended), which states that: "Development by State authorities. 181.— (1) (a) The Minister may, by regulations, provide that, except for this section F902[and sections 181 A to 181C], the provisions of this Act shall not apply to any specified class or classes of development by or on behalf of a State authority where the development is, in the opinion of the Minister, in connection with or for the purposes of public safety or order, the administration of justice or national security or defence and, for so long as the regulations are in force, the provisions of this Act shall not apply to the specified class or classes of development. b(iii) the making available for inspection by members of the public of any specified documents, particulars, plans or other information with respect to the proposed development;"	This provision allows the Minister for Housing to provide that certain State developments do not require planning permission. It is not relevant to the MetroLink project. The MetroLink project is authorised by railway order and does not require planning permission. In that regard, we refer to section 38 of the Transport (Railway Infrastructure) Act 2001, which provides that "Each of the following shall be exempted development for the purposes of the Act of 2000: (a) development consisting of the carrying out of railway works, including the use of the railway works or any part thereof for the purposes of the operation of a railway, authorised by the Board and specified in a railway order or of any incidental or temporary works connected with such development; (b) development consisting of the carrying out of railway works for the maintenance, improvement or repair of a railway that has been built pursuant to a railway order."	
17	8.2 Security Issues	16	All employees contracted to work on behalf of the Til on this Project, and any associated works, must adhere to the properties protocol around access, security, and safety. This applies to all persons entering or working in proximity of the property.	TII will ensure that contractors working on its behalf on OPW property comply with property protocols around access, security and safety.	

Submission No.			214	
Organisation Name or Name of Subm			OPW Cover Letter & Downey Planning on behalf of OPW	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 13-14 Burgh Quay.				
18	8.2 Security Issues	16	The day-to-day operations of the property cannot be interrupted by disruptions to any utilities.	There is no intent to disrupt the day to day activities. If subsequently, it is found that a disruption to utility provision is inevitable this will be discussed with OPW and the timing and duration of any disruption optimised to minimise said disruption.
19	8.2 Security Issues	16	The design and operation of the MetroLink should be in line with best international practice, in relation to anti-terrorism and security measures.	Safety and security are two priorities for the MetroLink in operation and hence the design will be developed cognisant of the risk in relation to terrorism and best practice applied. Further dialogue with OPW will be undertaken throughout the design and construction to ensure suitable provisions are in place.
20	8.3.1 Ground Movement	17	Stage 1: Defines extent of ground movement using Moderately Conservative parameters. The parameters considered by MetroLink are: ■ Volume Loss, V s = 1.5 ■ Trough Width parameter, k = 0.3 The Volume Loss is considered moderately conservative. However, the trough parameter is very narrow and 0.4 could be considered more conservative. The extent of the zone of influence is defined by the 1mm contour line (Dark Red) and 13/14 Burgh Quay lies just within the zone of influence and will be subject to up to 40mm settlement. The ground movement impact on the 13/14 Burgh Quay is not specified in the report and the OPW requests that this building has its own assessment.	TII disagree with the OPW assessment here. Burgh Quay lies just outside the 1mm contour and cannot therefore have settlement of 40mm as stated. No further assessment is required. The assessments undertaken to date are, as you say, moderately conservative. Any further detailed assessment would seek to strip out some of the conservatism. The K values have been determined considering the ground conditions specific to location and hence K values vary between 0.3 to 0.5 as shown in Table 5.1 of Appendix 5.17 of the EIAR. The rationale for the selection of K values is given further in section 4.2.3 of Appendix 5.17.
21	8.3.3 Noise and Vibration	17	(a) Tunnelling During the passage of the Tunnel Boring Machine (TBM) the noise is predicted to be 50 dBLAmax,s exceeding the acceptable threshold (45 dBLAmax,s)and this may last for 2 weeks. The vibration from the passage of the TBM is predicted to be 0.275 VDVB.ms'1 - 75 less than the threshold (1.6 VDVB.ms'1,75). EIAR Table 6.2- GNV1 states that there is no effective mitigation available and therefore the impact will be managed by detailed consultation with the building owners. The OPW requests that a specific study is carried for this 13/14 Burgh Quay to determine whether ground borne noise and vibration will have any impact. Where any impact is identified then threshold limits will need be applied and monitored. Where the building is considered vulnerable to vibration induced damage EIAR Table 6.2- ANV16. sets out requirement for pre- and post-construction surveys of these structures.	It should be noted that a full assessment of groundborne noise & vibration effects have been provided in Chapter 14 of the EIAR. The modelling undertaken in this chapter presents the potential impacts arising from all stages of the construction phase of the project. The assessment has identified that there will be no potential for structural damage due to vibration as levels of vibration are predicted to be below the construction threshold of 1.6 mm-1.75 VDV (Please refer to Appendix 14.5 - Groundborne Noise and Vibration and Blasting Modelling Results) and accordingly the specific study requested is not required. Regarding groundborne noise, unfortunately, there are no effective methods available to reduce groundborne noise from TBMs at source, but noting that the duration of this impact will be of the order of two weeks. TII will consult and liaise with 13-14 Burgh Quay , to ensure the timing of these impacts are known. The principal mitigation measures aimed at minimising impacts are as follows: - Advance public consultation and stakeholder engagement can greatly reduce the significance of groundborne noise effects, as building occupants would be prepared for the passage of the TBM and resultant elevated noise and vibration levels. - TII will accept and consider applications for additional measures on a case-by case basis, in accordance with its Noise and Vibration Mitigation Policy (see Appendix A14.6 Airborne Noise and Groundborne Noise Mitigation Policy).
22	8.3.3 Noise and Vibration	17	(b) Station Excavation GNV2 states that Monitoring of blasting and re-optimising the blast design (minimising the explosive charge considering the results) will be carried out as standard. A5.20 Blasting Strategy provides information on the classification of buildings and potential damage due to blasting for the station excavations. There are also calculations for estimated magnitude of the peak particle velocity (ppv) for various explosive charges. The assumption is that the lowest charge would be implemented to avoid damage. 13/14 Burgh Quay is located approximately 125m from Tara Station excavation and the peak particle velocity is predicted to be 0.6mm/s. The OPW requests a specific assessment of the impact of blasting on 13/14 Burgh Quay.	The EIAR Chapter 14 presents an assessment of vibration and air overpressure from blasting. According to Appendix 14.5 - Groundborne Noise and Vibration and Blasting Modelling Results vibration from blasting at 13/14 Burgh Quay will be 0.6 mm/s PPV which is below the threshold of 8 mm/s PPV. As a result no significant impact is expected on these buildings as a result of blasting activities. No further assessment is required.

Submission No.			214

Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 13-14 Burgh Quay.					
23	8.3.4 Work Sites	17	(a) Dust Appendix A16.4 of the EIAR requires a Dust Management Plan to be produced and implemented. The tunnelling will not generate dust in the vicinity of 13/14 Burgh Quay. The Station construction site is 60m from 13/14 Burgh Quay and therefore dust from these constructions sites is likely to affect this building.	TII acknowledge your concern and will put measures into place to ensure your property / equipment is not damaged by dust. An Air Quality Management Plan, detailing dust mitigation methods will be prepared prior to construction works (Section 16.6.1.1 Chapter 16 Air Quality). A summary of dust mitigation measures to be implemented are as follows (Section 16.6.1.1, Chapter 16): •Material handling systems and site stockpiling of materials will be designed and laid out to minimise exposure to wind. Water misting or sprays will be used as required if particularly dusty activities are necessary during dry or windy periods; •Any blasting will be completed by specialised contractors with a specific blasting dust management plan; •Liaison with local authorities and community groups; •Hoarding will be provided around the construction compounds; and •It is anticipated that methods of collecting rainwater and recycling for general site use, will be adopted where practical. When the dust minimisation measures detailed in the mitigation section (Section 16.6) of EIAR Chapter 16 are implemented, fugitive emissions of dust from the site are not predicted to cause damage to property or human health.	
24	8.3.4 Work Sites	18	(b) Ground Water Control There is the potential for ground water lowering for the construction of Tara Station to impact 13/14 Burgh Quay. The OPW requests Til to provide an assessment and limits, which will be applied to dewatering for the Construction of Tara Station.	TII understand your concern, however following reviews, surveys and monitoring of groundwater, it can be concluded that 13/14 Burgh Quay will not be impacted by dewatering at Tara Street Station. As outlined in EIAR Chapter 19 (Hydrogeology), groundwater assessment and monitoring were and will continue to be undertaken for the proposed Project: • AWN undertook an extensive desktop review in order to establish baseline conditions along the proposed alignment corridor. The baseline study included reference to historical ground investigation data including the 2007 IGSL investigation borehole dataset (IGSL 2008) and data from Norwest Holst (2008) as well as information from contemporary (2019-2021) ground investigations specific to the proposed Project (Table 19.2); • A number of field surveys and walkover assessments were carried out to add to existing assessment of long-term trend analysis for water quality undertaken by the EPA (Section 19.3.3.4); • A number of intrusive ground investigations were commissioned for the proposed Project including ground water level monitoring (Section 19.3.3.5). A programme of continuous groundwater level monitoring, aquifer testing and groundwater quality monitoring was devised with focus on key well locations along the alignment including at deep station excavations; and • A hydrogeological review of Tara Street was undertaken and can be found in EIAR Appendix A19.11. The design permeability used for bedrock beneath the proposed Tara Street Station is 5.64E-06m/s (CLU). The predicted effect of Construction Phase dewatering (from either drawdown or water quality effects) at Tara Street is considered Temporary, Not Significant to Slight in the absence of mitigation. Therefore, it is considered that there is no perceptible effect on groundwater body/surface waterbody status.	
25	8.3.4 Work Sites	18	(e) Traffic There will be significant traffic diversions required to construct Tara Station site that will impact personnel and clients attending 13/14 Burgh Quay. Access to associated car parking on this property must be maintained at all times.	As set out in Section 7.9 of Appendix A9.5 Scheme Traffic Management Plan and Figure 7-44 with trucks routed eastwards and along the quays - there will be no Construction movements impact to buildings at Corn Exchange as none of the envisaged TTM restrictions will hinder access to this location.	
26	8.5Future Development	18 and 19	The railway is 20m from 13/14 Burgh Quay. Therefore, the railway may hinder future re-development. The OPW reserves the right to develop the subject property in the future, including property above and below ground, subject to normal planning criteria .It is important that the development of the MetroLink does not interfere with extant planning permissions pertaining to the subject property and the right of the applicant to develop in advance, in tandem or post operation of the MetroLink Project.	See response (8)	
27	CONCLUSION	19	The most significant impact of the MetroLink project on 13/14 Burgh Quay will be from the construction of the running tunnel between O'Connell Street and Tara stations generating ground movement, noise and vibration. The OPW seeks assurances from Til that Stage 2 and 3 ground movement assessments will be carried specifically for this building.	Further to response number (20) and (21) above, as no ground movement and vibration impact is anticipated from the tunnelling past Burgh Quay, no Stage 2 or 3 building assessments are required. Proposed Mitigation measure in response to anticipated groundborne noise from the tunnelling operation past Burgh Quay s also set out in response number (21) above.	

Submission No.			214	
Organisation Name or Name of Submission			OPW Cover Letter & Downey Planning on behalf of OPW	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 13-14 Burgh Quay.				
28	CONCLUSION	19	Once the railway is in operation, it is possible that there will be noise and vibration impact and the OPW seeks assurance that a detailed evaluation will be performed. Future development of the site may require consultation with TII due to its proximity to the tunnel alignment.	Groundborne noise and vibration from operation of the railway has been calculated for 13/14 Burgh Quay with the results presented in Appendix 14.5 Groundborne Noise and Vibration and Blasting Modelling Results of the EIAR. The predicted level of groundborne noise is 30 dB LASmax, which is below the 40 dB LASmax threshold, resulting in a not significant impact on the building. The predicted level of groundborne vibration is 0.006 m/s-1.75, much lower than the VDV Threshold Level for the building of 0.8 m/s-1.75, resulting in a not significant impact on the building. Accordingly, the requested further evaluation is not required.
29	CONCLUSION	19	With respect to this property, the OPW is seeking: 1) To ensure no disruption to the public access of the building and its day-to-day uses and functions. Access to associated car parking on Corn Exchange Place must be maintained at all times.	Access will not be impacted. Please refer to response number (25).
30	CONCLUSION	19	With respect to this property, the OPW is seeking: 2) To ensure no damage to the building, pre-construction and post-construction surveys, trials and monitoring is required. This is mainly concerned with the fact that the ground movement impact, as well as ground borne noise and vibration impact on the building, has not been incorporated within the Draft Railway Order	As refer to in response numbers (21) and (22) above, it is incorrect to state that ground movement impacts have not been considered for this building in the Draft Railway Order.
31	CONCLUSION	19	With respects to this property, the OPW is seeking: 3) To ensure an assessment on the impact of blasting to facilitate construction of Tara Station on the building, is included, since this is to take place in close proximity to the building (approximately 125m).	Blasting impact is referred to in response number (22) above.
32	CONCLUSION	19	With respect to this property, the OPW is seeking: 4) To ensure no adverse impact on the access and function(s) of the building due to traffic diversions to construct Tara Station.	Access will not be impacted. Please refer to response number (25).
33	CONCLUSION	19	With respect to this property , OPW is seeking: 5) To ensure specific vibrations limits will be applied to 13/14 Burgh Quay and a monitoring regime is implemented.	As referred to in response numbers (21), (22) and (28) above, vibration levels are predicted to be below threshold levels, so it is anticipated that monitoring will not be required..
34	CONCLUSION	19	6) To include adverse impacts of Tara Station within the risk assessment studies for 13/14 Burgh Quay and provide for mitigation measure, as construction of this Station will generate additional lorry movements for both deliveries and spoil removal.	No impact on this building is anticipated. Please refer to response number (25) above.
35	CONCLUSION	20	7) Precedents to be applied to the risk assessments to ensure best industry practice is adopted in the implementation of the Project.	TII intend to apply industry best practice to build and operate the MetroLink whilst minimising impacts to 3rd parties.
36	APPENDIX 1: LIST OF PLANNING LEGISLATION & POLICY	21	This appendix provides a non-exhaustive list of planning policy, legislation, and guidelines. We would respectfully request that An Bord Pleanála ensure that TH have fully assessed the Project with regard to existing planning policy, as well as adherence to the relevant local policies and guidelines pertaining to each individual property. DOWNEY note that this proposed Draft Railway Order is a strategic long-term development and An Bord Pleanála may consider Development Plans in assessing the Project. It is also crucial to note that on foot of a granted Order and during the detailed design stage, a revision to planning policy is expected, whereby adopted plans and legislation may have to be adhered within this stage. This may require an amendment to the Railway Order and further assessment, including public consultation.	Please refer to response number (7) above.
37	Appendix 2: Ground movement Assessment	26-Jan	Duplicate of Appendix to D to OPW Cover Letter - Re: Railway (Metrolink–Estuary to Charlemont via Dublin Airport) Order 2022 – Submissions by the Commissioners of Public Works in Ireland	Refer to OPW Cover Letter response

OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 14-17 Moore Street - 8-9 Moore Lane.				
1	Downey Report- Executive Summary		With respect to this property, the OPW is seeking: 1) TII to conduct a Stage 3 assessment to ensure that 14-17 Moore Street, which are Protected Structures and National Monuments, are undamaged by the construction of MetroLink and the construction of O'Connell Street Station. 2) To ensure no damage to the façades of the buildings and their architectural detailing, pre- construction and post construction surveys, trials and monitoring is required. This is mainly concerned with demolition, noise, vibration, and dust which can damage the buildings, which is of historical significance. 3) To ensure that any future development at nos. 14-17 Moore Street follows the Moore Street and Environs Local Area Plan and Moore Street Battlefield Site Plan." 4) To ensure the appropriate conservation and structural appraisals are conducted as part of the Detailed Design Assessment. 5) Precedents to be applied to the risk assessments to ensure utilising best industry practice within implementation of the Project. 6) The Project Boundary submitted as part of the Draft Railway Order abuts Nos. 8-9 Moore Lane, the preservation order made under the National Monuments Acts 1930 to 2014 (PO no. 1/2007) encompass Nos 8-9 Moore Lane. In this regard, the site boundary for O'Connell Street Station should be reviewed and agreed in advance of construction with the OPW and DCC due to its proximity to the boundary of the National Monument. The OPW requires access to the National Monument via Moore Lane to be maintained.	TII thank you for your comments. Further to TII's response to the OPW Covering letter, the matters raised by OPW specific to these buildings are addressed in responses (2) through to (44) below.
2	Downey Report- 3.0 Overview of the Draft Railway Order	Page 8, 9	While extensive pre-planning consultations also took place between Til and the OPW, a detailed assessment of the individual properties affected has not yet taken place. The Draft Railway Order application 2022 is a Draft Order, and should the route be approved by An Bord Pleanála, further detailed design will be submitted which will require further consideration and approval. Factors such as the internal uses of the properties, their construction methods, age and historical importance and the effect of construction on these sensitivities has not been assessed as part of the Project thus far. Additional consideration needs to be given to the potential effects on the built environment before a route and construction method can be confirmed. The OPW reserves the right to make further commentary, pending more detailed design proposals.	TII have undertaken a Phased Ground Movement Impact Assessment and the results of the assessments are included in the RO documentation within Appendix 5.17 of the EIAR. Appendix B2 of that document indicates the list of special buildings that would be subject to a subsequent Phase 3 assessment irrespective of the engineering need to do so. Many OPW buildings are in this category. It should be noted that the further assessments that will be done by the contractor if the RO is granted will likely reduce the impacts on the buildings as the Phase 2 assessment is a moderately conservative assessment whose results are generally more significant than the results of a Phase 3 assessment. This point was discussed with OPW and their consultants in January 2023. TII will consult with OPW in relation to the results of any Phase 3 assessments and any requirements for monitoring and / or other mitigations that eventuate will be discussed with OPW. . TII are satisfied that the approach adopted to date follows an industry standard approach undertaken on tunnelling and underground projects around the world including on the Channel Tunnel Rail Link and Crossrail in London, the Dublin Port Tunnel and currently on High Speed 2 in England, and therefore that further assessment is not required and should not be delivered prior to the route being consented. For these particular properties, the assessment outlined in the EIAR predicts slight damage impact or less, based on assessment on adjacent buildings reference B-199 and AB-50 within Table 5-2 of Appendix 5.17. While slight impact or less is anticipated, these building will be included in a Phase 3 assessment by the appointed contractor for their Special Building Status as Sections 4 of Appendix A5.17. Please also refer to response number (26) below.
3	Downey Report -4.1 property location and description	page 10	14, 15, 16 and 17 Moore Street are terraced two-bay, three-storey houses that form on the eastern side of Moore Street. They are on the Dublin City Council Record of Protected Structures list (RPS No. 5282, 5283, 5284, 5285) and are of historical merit particularly given they have survived despite the fact that much of the area was largely lost during the Easter Rising and subsequent historical events that flattened much of the north inner-city. The buildings were the location where the leaders of 1916 decided to surrender. Numbers 14 -17 Moore Street are subject to a preservation order made under the National Monuments Acts 1930 to 2014 (PO no. 1/2007). The designation comprises Nos 14, 15, 16 and 17 Moore Street and includes the rear yards of Nos 15 and 16 Moore Street and Nos 8-9 Moore Lane. The modest terrace buildings, all re-faced in the late nineteenth century, likely disguises eighteenth-century houses, circa 1760, that have served Moore Street open-air fruit and vegetable market, which is one of the oldest street markets in Dublin that is still in operation.	Noted. These buildings were included in the Architectural Heritage chapter of the EIAR and the potential direct and indirect effects of the proposed project on these buildings was assessed and mitigation measures included.
4	4.2 Historical Context/Conservation Status	12	14-17 Moore Street is of particular importance both architecturally and historically, with plans to create a museum, eventually becoming the focal point of this street.Nos. 14 -17 Moore Street are subject to a preservation order made under the National Monuments cts 1930 to 2014 (PO no. 1/2007). Structure RPS No. NIAH Ref Rating NIAH Categories 14, Moore Street 5282 50010489 Regional Architectural, Historical 15, Moore Street 5283 50010490 Regional Architectural, Historical 16, Moore Street 5284 50010491 Regional Architectural, Historical 17, Moore Street 5285 50010492 Regional Architectural	TII have noted this observation.

Submission No.			215		
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW		
Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 14-17 Moore Street - 8-9 Moore Lane.					
5	4.3 Current Use/Uses	11	Essential Works to safeguard the National Monument were completed in June 2017. These works were defined by High Court Order. Prior to these works a contract was underway to conserve and adapt the National Monument as a museum/cultural use. The Essential Works provided limited permanent repairs to the National Monument such that its safeguarding depends on temporary works, designed for a 2-year life span and requiring ongoing monitoring and maintenance. The National Monument includes the surviving cellars and fabric at 8-9 Moore Lane. The cellars have a fragile jack arched concrete vaulted ceiling with the crown of the arches of c. 150mm in thickness. As the upper part of this former warehouse building has been exposed to weather for some time (possibly since mid-1980's), and subject to loading above (used for vehicular access prior to its protection), the cellar structure also requires remedial works. They are currently protected from weather and any overhead loads. Approximately 50% of underpinning to Nos 14-17 was completed in 2017. In addition to completion of underpinning, other structural repair works are required to stabilise the structure and fabric of the buildings at 14-17 Moore Street, the surviving cellars and structure to 8-9 Moore Lane and the enclosing boundary walls to the National Monument. These works form part of a future works project to complete stabilisation of the National Monument and facilitate its public use	According to Chapter 26 Architectural Heritage, the rear of number 14-17 Moore Street buildings backs on to Moore Lane introducing the potential for impact by vehicles. As a result, the following mitigations measures will be implemented: 14 Moore Street - The exclusion zone established by the Ministers office is to be maintained at all times and settlement and vibration monitoring is to be carried out as a precautionary measure. The threshold limits are to be agreed with the Ministers office. In the event of threshold limits being exceeded all work in the vicinity is to stop until the cause of the issue is identified and resolved are to be protected from potential damage by means of strong hoardings during construction. 14-17 Moore Street – An exclusion zone is to be provided around numbers 14 to 17 Moore Street, extending to Moore Lane, and the structures adjacent to the haul route are to be protected from potential damage by means of strong hoardings during construction.	
6	4.3 Current Use/Uses		Within the Dublin City Development Plan, there is a proposed future use to conserve and adapt the National Monument to a museum/cultural use. Uninterrupted access to the building is necessary at all times and for access by emergency services (e.g., fire services and ambulance). Access required to both the front (Moore Street) and the rear (Moore Lane).	As set out by Figure 38 of Appendix A.9.5, construction traffic will only extend southwards down Moore Lane and Moore Street as far as O’Rahilly Parade and will not impact upon the properties in question. The potential for future development in this location has also been taken into account throughout Section 7.8 with two scenarios considered for the analysis of this site - one with future development around Moore St/Lane and one without.	
7	4.3 Current Use/Uses	13	The OPW and/the State, and their authorised agents, require access to the building at all times for the purpose of facilities management, maintenance, repairs and any major conservation, repair or development programme, planned, or as may arise during the construction period of MetroLink.	Please refer to response number (6).	
8	4.4 Planning context	13,14,15	The National Development Plan outlines that the completion of the conservation of the Moore Street National Monument (14-17 Moore Street), along with the provision of visitor and exhibition facilities on site is a National Heritage Strategic Investment priority. There is currently a proposal by the DHLGH to development the site as a cultural centre; Ministerial Consent ref number C492. The Dublin City Development Plan 2022-2028 also promotes the restoration of 14-17 Moore Street and the establishment of a commemorative visitor centre to mark the importance of the event and the role the buildings and Moore St played in the Easter Rising. The Development Plan contains two specific objectives for 14-17 Moore Street, which read as follows: "BHA30: Moore Street National Monument. To co-operate with and facilitate the state in its presentation of the National Monument at 14-17 Moore Street on a joint venture basis and to support the retention and refurbishment of the cultural quarter associated with 1916 on Moore Street. CUO9: 14-17 Moore Street To support the preservation and restoration of the historic terrace 10-25 Moore Street and adjacent yards and lanes, and the remaining historic built heritage of the street, including numbers 1-8 Moore Street, and the establishment of a commemorative visitor centre, as a fitting tribute to the men and women of Easter 1916 and as an educational and cultural resource centre." Moore Street also falls within the boundaries of SDRA 10- Northeast Inner City. The area is designated to undergoing transformation with a number of initiatives being implemented on foot of the Mulvey report titled "Creating a Brighter Future". The area has received funding for a number of projects under the Urban and Regional Development Fund (URDF) including public realm works at Parnell Square, Moore Street, the Five Lamps and also restoration works at Moore Street and Mountjoy Square. As outlined in the Planner's Report of the Draft Railway Order 2022, "O'Connell Street Station is located on the site of the proposed Dublin Central CP Ltd development known as Dublin Central Site 2. The site is bordered by O'Connell Street Upper to the east, Moore Lane to the west, Henry Place to the south and Central Site 1 to the north". It must be noted that the Project Boundary abuts Nos. 8-9 Moore Lane, the preservation order made under the National Monuments Acts 1930 to 2014 (PO no. 1/2007) encompass Nos 8-9 Moore Lane. In this regard, the site boundary for the O'Connell Street Station should be reviewed and agreed in advance of construction with the OPW and DCC due to its proximity to the boundary of the National Monument.	The Proposed Project will not prevent the proposed objectives of the Dublin City Development Plan 2022-2028 from being achieved. The relevant Dublin City Development Plan 2022 – 2028 objectives along with the SDRA 10 North East Inner City will be facilitated by the proposed development. Care will be taken at the boundary of the site, where it is in proximity to the National Monument and on the lands at rear of 25 Moore Street where an existing car park / undeveloped site will be within the construction area of the project. The two identified objectives for Moore Street stated in the submission are facilitated by the proposed project. It is noted that the principles of SDRA 10 note a need to consider the following:- Proposals for this area must also have regard to: •The policies and provisions of the O’Connell Street Architectural Conservation Area (ACA), 2001, and the Scheme of Special Planning Control for O’Connell Street & Environs 2016, including any amendments thereto, along with those of the proposed Draft Moore Street Architectural Conservation Area or similar where adopted. Considered within the scheme design. No Draft Moore Street ACA has been prepared to date. •Protected Structures (as provided on the City Council’s Record of Protected Structures (RPS)) and the policies and objectives of this development plan for such structures, together with the provisions of the Architectural Heritage Protection Guidelines for Planning Authorities (2011). Policies in respect of Protected Structures have been taken into account in the scheme design. •Ministerial Recommendations for the proposed addition of buildings and other structures to the City Council’s RPS, provided under Section 53 of the Planning and Development Act, 2000 (as amended), together with the relevant policies and objectives for same in this development plan. Potential future protected structures have not been included in the project design. •The content of the Moore Street Advisory Group’s 2021 report to the Minister. The Advisory Groups report concentrates on the lands west of Moore Lane, and the Proposed Project has limited impact. The project boundary is appropriate and should not be changed in the RO. Heritage impacts on the national monument have been assessed in the relevant chapters of the EIAR as noted above in response (5).	

Submission No.			215	
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 14-17 Moore Street - 8-9 Moore Lane.				
9	4.4 Planning History	17	It must be noted that Upper O'Connell is the proposed location for the O'Connell Street MetroLink Station and is within the proposed development boundary of Dublin Central regeneration project.	This is understood and there has been full engagement with the Dublin Central project during the project development to ensure that both projects are consistent and can be developed at the site. It should also be noted that the EIAR has been developed to present an assessment of the potential for effect at this site both with the Dublin Central development in place and without.
10	4.4 Planning History	18	In relation to the Draft Railway Order's consistency with planning policy and planning guidelines, a non-exhaustive list of planning policy and legislation at National, Regional, and Local levels, is included in Appendix 1 of this submission, the Board are invited to refer to this for further details. We would respectfully request that An Bord Pleanála ensure that TII have fully assessed the Project regarding existing planning policy, as well as adherence to the relevant local policies and guidelines pertaining to each individual property. DOWNEY note that this proposed Draft Railway Order is a strategic long-term development and An Bord Pleanála may consider Draft Development Plans in assessing the Project. It is also crucial to note that on foot of a granted Order and during the detailed design stage, a revision to planning policy is expected, whereby adopted plans and legislation may have to be adhered within this stage. This may require an amendment to the Draft Railway Order and further assessment, including public consultation.	TII have undertaken a full assessment of the planning policy and planning guidelines in the Planning Report that was submitted as part of the Railway Order Application. The only policy relevant to the decision on whether to grant the Railway Order and the necessary conditionality is the policy in force at the date of the grant of the Railway Order, as has been made clear in numerous High Court decisions including Element Power v An Bord Pleanála [2017] IEHC 550 and the Railway Order cannot be made conditional on compliance with future, yet to be developed policy. As planning and policy and strategy are being updated constantly, TII will undertake a further review of planning policy in advance of any oral hearing to allow for an updated presentation on the projects consistency with active policy requirements to be presented to An Bord Pleanála.
11	4.6 Potential Development of the Property	18, 19	The OPW reserves the right to development the subject property in the future, this includes property above and below ground, subject to normal planning criteria. No. 14-17 Moore Street are subject to a preservation order made under the National Monuments Acts 1930 to 2014 (PO no. 1/2007) and the proposed O'Connell Street Station, under the draft Railway Order encompasses part of Moore Lane. It is the objective of the OPW to ensure that any future development at nos. 14-17 Moore Street follows the Moore Street and Environs Local Area Plan and Moore Street Battlefield Site Plan. It is important that the development of the MetroLink does not interfere with extant planning permissions pertaining to the subject property and the right of the applicant to develop these, in advance, in tandem or post operation of the MetroLink Project.	MetroLink does not impact on current proposals. MetroLink will be a catalyst for and provide opportunity for future development and regeneration. While the MetroLink Railway Order does not include for future neighbouring or overhead development, the tunnels and stations are designed to support appropriate future imposed loads. TII will be required to make submissions in relation to planning applications for proposed future developments on or adjacent to MetroLink and there will necessarily be some engineering constraints (such as permissible loadings) required. However MetroLink is committed to engaging with known development proposals and new development proposals as they emerge with the intent of facilitating such developments as they emerge to the maximum extent consistent with the safe operation of the proposed Project. Again in common with other existing rail and tunnel projects, following grant of the Railway Order and development of detailed design, TII will produce "Guidance Note for Developers" that will be the subject of bye-laws following the grant of Railway Order and which is designed to facilitate future adjacent or over-site development while protecting the integrity and safety of the MetroLink works and operations. It is inappropriate and unworkable to produce this policy at this stage because it would have to be in broad terms that deal not only with the current RO proposal and any contingencies that might arise from the Board seeking revised designs or new conditionality as part of the RO application process. Therefore at this stage TII is dealing with known development proposals on a case by case basis, TII will work with parties in the future to assist with the wider development of sites over and above stations and tunnels. In this context TII has successfully engaged with a number of developers over the last two years to accommodate development over and in proximity to the alignment and there have been no material restrictions on development subject to the implementation of agreed design and mitigation measures and it is not anticipated that MetroLink will have a material impact on the development potential of sites above and in proximity to the alignment in future.
12	5.0 MATERIAL CONSIDERATIONS	19	The alignment drawing ML1-JAI-EIA-ROUT_XX-DR-Y-04025 and the Contour drawing ML1-JAI-E1A-ROUT_XX-DR-Y-21148 show different alignments. This error has resulted in deficient information within the SID application submitted under Section 2 of the Planning and Development Act 2000 (as amended), to assess the vulnerability of damage due to vibration cause by both tunnelling and operation of underground train on this section of the alignment. This affects several buildings under the management of the OPW particularly within the Kildare Street, Merrion Square and St. Stephen's Green areas.	On two drawings (Figures 20.16 Settlement Contours, sheets 27 and 28 of 30) in EIAR Appendix 5.17 Building Damage Report, the tunnel centreline is plainly incorrect as it is deviates from the centre of the settlement contours between Tara and St. Stephen's Green stations. The settlement contours are correct and reflect the proposed Railway Order alignment and as such the drawing serves its core purpose, which is to identify, describe and assess the settlement impact of the railway works. In any event, revised drawings will be submitted to the Board to rectify the error. The correct alignment has been used for all environmental impact assessments including tunnel induced settlement, and construction and operational noise and vibration impact assessments.

Submission No.			215	
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 14-17 Moore Street - 8-9 Moore Lane.				
13	6.0 LEGAL CONSIDERATIONS	19	The Commissioners of Public Works would seek to enter into appropriate, property-specific legal agreements with TII, to ensure the protection of key State property and of the State's activities undertaken within those and other properties. Given the importance of such properties and activities, the Commissioners of Public Works consider it appropriate that An Bord Pleanála would make the Railway Order conditional on such legal agreements being in place between TII and the OPW. Creating such legal agreements between TII and the OPW would be possible only after TII make available the more detailed design and risk-mitigation measures for the construction and operational phases of the MetroLink project, and before any development begins. Therefore, the Commissioners of Public Works would request that this aspect be reflected in the conditions set out by An Bord Pleanála to TII, as this would provide assurances to the Commissioners of Public Works relating to future legal agreements that protect and secure State property and activities from risks associated with the construction or operations of the MetroLink.	TII's preference is carry out all of the permitted railway works with the agreement of affected landowners and prescribed bodies. However, it should not be condition of the railway order that TII reach such agreement with OPW. In the event that agreement cannot be reached with OPW, TII should be entitled to carry out the railway works over their objections provided that it complies with the terms and conditions of the Railway Order. The Board's function is to satisfy itself that those terms and conditions are adequate to ensure that the construction and operation of the railway works will be consistent with proper planning and sustainable development and have acceptable impacts on the environment. TII believes that the RO application and the EIAR in particular sets out mitigation and monitoring measures that are sufficient for that purpose
14	7.1.1 Route Alignment	21	In the vicinity of 14-17 Moore Street, the geology comprises Argillaceous Limestone rock (CLU) underlying weathered rock (Q.TR) underlying Brown Boulder Clay (Q.BR) containing extensive fluvio- glacial sands and gravels. Cover to the tunnel crown is approximately 18m comprising Brown Boulder Clay. The invert will be excavated through both weathered and un weathered limestone. This will present a significant challenge to ground movement mitigation using tunnel management.	The comment is noted and part of the reason for proposing a pressurised full face TBM designed to cater for this ground. Further the Contractors will be required to prepare a Tunnel Management Plan which will dictate the controls to be implemented to suit the varying ground conditions to minimise any impacts so far as reasonably practical.
15	7.3 Contractual Arrangement	22	The contractor(s) appointed will be responsible for the organisation, direction, and execution of environmental related activities during the detailed design and construction of the proposed Project. The contractor(s) is required to undertake all activities in accordance with the relevant environmental requirements including the consent documentation and other regulatory and contractual requirements.	TII's contractors will be bound by the Railway Order, further agreements entered into by TII and other relevant statutory or MetroLink specific regulation. An Bord Pleanála's statutory responsibility includes satisfying itself that the terms and conditions of any railway order will ensure that the railway works are consistent with the proper planning and sustainable development of the area and will not have unacceptable impacts on the environment regardless of the contractual structure.
16	8.0 POTENTIAL IMPACTS ON THE PROPERTY	22	DOWNEY and Gall Zeidler have carried out a detailed examination of the property subject to this submission. Having regard to the status and current use of the property and identified constraints, the following raises concerns regarding potential impacts of the MetroLink on the property. This has been elaborated to include potential impacts during the construction and operation phases of developing MetroLink, as well as any impediments and/or implications for future development of the property.	Please see answers to responses (17) to (33) below.
17	8.1 Monitoring	22	Given the sensitivity of the uses within this property, coupled with its historic importance, we request that An Bord Pleanála attach a condition to the draft Railway Order that ensures continuous monitoring of the property to prevent any negative impacts. Access to all properties must be agreed in advance with the OPW and its clients. It is recommended that this monitoring takes place at least 3 months in advance of the construction of the Project and at least 6 weeks post the operational stage of the MetroLink.	TII will procure its contractors to develop Instrumentation and Monitoring Plans in tandem with Monitoring Action Plans. These plans will help assure that the risks associated with tunnelling and station excavations impacting OPW property are appropriately managed and controlled. TII will provide details of any monitoring proposed by the contractor at detailed design stage and agree the methodology of installation to the OPW property. TII will provide advance notice of any attendance that the monitoring contractor may require. With regard to the timing of monitoring specific to ground movement TII will ensure that it is commenced 3 months prior to the construction activities that would give rise to the settlement. However, as these construction activities may complete years prior to the MetroLink operational phase the termination of monitoring will be linked to a determination that settlement has effectively ceased, allowing a removal of the instrumentation.
18	8.2 Security Issues	22	Given the nature of the State properties affected by the Project, we would respectfully refer An Bord Pleanála to Part XI of the Planning & Development Act 2000 (as amended), which states that: "Development by State authorities. 181.— (1) (a) The Minister may, by regulations, provide that, except for this section F902[and sections 181 A to 181C], the provisions of this Act shall not apply to any specified class or classes of development by or on behalf of a State authority where the development is, in the opinion of the Minister, in connection with or for the purposes of public safety or order, the administration of justice or national security or defence and, for so long as the regulations are in force, the provisions of this Act shall not apply to the specified class or classes of development. b(iii) the making available for inspection by members of the public of any specified documents, particulars, plans or other information with respect to the proposed development;"	This provision allows the Minister for Housing to provide that certain State developments do not require planning permission. It is not relevant to the MetroLink project. The MetroLink project is authorised by railway order and does not require planning permission. In that regard, we refer to section 38 of the Transport (Railway Infrastructure) Act 2001, which provides that "Each of the following shall be exempted development for the purposes of the Act of 2000: (a) development consisting of the carrying out of railway works, including the use of the railway works or any part thereof for the purposes of the operation of a railway, authorised by the Board and specified in a railway order or of any incidental or temporary works connected with such development; (b) development consisting of the carrying out of railway works for the maintenance, improvement or repair of a railway that has been built pursuant to a railway order."
19	8.2 Security Issues	23	It is essential that security issues do not arise in the event of sensitive information being shared on the structure and operation of these properties. However, the OPW understands the importance of the detailed design stage of the Project and the wish to ensure that the detailed assessment of these properties takes place in the early stages of the design process, in conjunction with the OPW, to ensure that these sensitive State buildings are not negatively impacted upon by the proposed Project. The OPW will liaise with TII and An Bord Pleanála on this matter.	While the management of secure state information is outside the scope of the Board's functions, TII understands the OPW's concerns propose a meeting is held with the requisite OPW / security experts to discuss potential risks and the management of these risks during the construction and operational phases of the Project. TII and their consultants store all data on secure systems in line with best practice and treat all information as confidential. TII are available to engage with the OPW to discuss any specific requirements the OPW have in regard to data security.

Submission No.			215		
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW		
Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 14-17 Moore Street - 8-9 Moore Lane.					
20	8.2 Security Issues	23	All employees contracted to work on behalf of the TII on this Project, and any associated works, must adhere to the properties protocol around access, security, and safety. This applies to all persons entering or working in proximity of the property.	TII will ensure that contractors working on its behalf on OPW property comply with property protocols around access, security and safety. Once the TII worksites are established, works within those sites will be secured to MetroLink standards.	
21	8.2 Security Issues	23	The day-to-day operations of the property cannot be interrupted by disruptions to any utilities.	There is no intent to disrupt the day to day activities. If subsequently, it is found that a disruption to utility provision is inevitable this will be discussed with OPW and the timing and duration of any disruption optimised to minise said disruption	
22	8.2 Security Issues	23	The design and operation of the MetroLink should be in line with best international practice, in relation to anti-terrorism and security measures.	Safety and security are two priorities for the MetroLink in operation and hence the design will be developed cognisant of the risk in relation to terrorism and best practice applied. Further dialogue with OPW will be undertaken throughout the design and construction stages to ensure suitable provisions are in place.	
23	8.3 During Construction of the MetroLink	23	Numbers 14 -17 Moore Street are subject to a preservation order made under the National Monuments Acts 1930 to 2014 (PO no. 1/2007). The designation comprises Nos 14, 15, 16 and 17 Moore Street and includes the rear yards of Nos 15 and 16 Moore Street and Nos 8-9 Moore Lane. These buildings must be "maintained and supported", to protect their façades and interiors from damage. The impact of any proposed works in terms of noise and vibration, which effects conservation works would need to be carefully considered to ensure no damage of any significance is enacted on this National Monument site.	TII recognises the value of numbers 14 -17 Moore Street in terms of archaeological heritage. A Noise and Vibration Management Plan (CNVMP) will be drafted by the contractor(s) as part of the outline Construction Environmental Management Plan (CEMP) (EIAR Appendix A5.1) which will be submitted to Dublin City Council for review and approval prior to construction. This document will contain a detailed investigation of potential noise and vibration impacts associated with each construction compound. Impacts identified at this stage will then be mitigated against (Section 13.6.1 Chapter 13, Section 14.5.1 Chapter 14), where possible, ensuring numbers 14 - 17 will not be damaged. Please also refer to response (29) below.	
24	8.3 During Construction of the MetroLink	23	The construction of the MetroLink O'Connell Street Station Box will be carried out by the developer of Dublin Central and referred to as MetroLink Enabling Works (MEW). Therefore, the OPW requires that the developer is a party to any agreements with Til related to the construction of MetroLink O'Connell Street Station providing detail on the impact of the construction of the station box including any potential negative impact on Nos. 14-17 Moore Street & Nos. 8-9 Moore Lane. The detail shall include the detailed drawings, ground movement impact assessment, noise, vibration impact assessment, and foundation arrangements for the retained façade (O'Connell Street).	The developer will only be entitled to carry out works authorised by the Railway Order pursuant to an agreement with TII. See in that regard, the definition of "TII " in draft RO and " <i>railway undertaking</i> " in the Transport (Railway Infrastructure) Act 2001. Only TII and parties it has made an arrangement with pursuant to Section 43(5) of the 2001 Act would be authorised to carry out works under the Railway Order.	
25	8.3.1 Ground Movement	24	Stage 1: Defines extent of ground movement using Moderately Conservative parameters. The parameters considered by MetroLink for the tunnelling are: • Volume Loss, Vs = 1.5 • Trough Width parameter, k = 0.3 The Volume Loss is considered moderately conservative however the trough parameter is very narrow and 0.4 could be considered more conservative.	The assessments undertaken to date are, as you say, moderately conservative. Any further detailed assessment would seek to strip out some of the conservatism. The K values have been determined considering the ground conditions specific to location and hence K values vary between 0.3 to 0.5 as shown in Table 5.1 of Appendix 5.17 of the EIAR. The rationale for the selection of K values is given further in section 4.2.3 of Appendix 5.17.	
26	8.3.1 Ground Movement	24	Stage 2 - Initial Assessment: The ground movement impact on the 14-17 Moore Street has not been identified in EIAR A5. 17. A Stage 2 assessment should be carried out for this building. The OPW requests that only Engineers or Surveyors with proven competence in regard to (historic) buildings of this fabric type, period and nature are selected.	As this is a Protected Structure it is designated as a Special case and will have a full Phase 3 assessment. TII will ensure that those undertaking the assessment are competent to do so.	
27	8.3.1 Ground Movement	25	Stage 4 - Construction Stage: Mitigation may be required for this building and therefore the OPW expected to be consulted. The OPW expects that pre-construction defect surveys and monitoring are carried out for this building. The OPW requests that only Engineers or Surveyors with proven competence in regard to (historic) buildings of this fabric type, period and nature are selected.	All surveys, monitoring and mitigation proposed for OPW property will be discussed with OPW. TII will employ Professionally Qualified Engineers / Surveyors with the appropriate expertise to undertake the pre and post condition surveys and OPW are welcome to observe the surveys being undertaken of their property.	
28	8.3.1 Ground Movement	25	Stage 5 - Close Out: Once the excavation (tunnelling and station excavation) has been completed then the Contractor will want to decommission his monitoring. The OPW will expect to be provided with close out reports for the monitoring of their property. As a minimum the close out report should include details of any mitigation carried out, a list of any repairs, time history graphs showing the movements monitored.	TII will share the closeout monitoring report that will demonstrate that construction ground movements have ceased, which will also require historical movement information to be presented. In the event of repairs, these will be scheduled.	

Submission No.			215		
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW		
Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 14-17 Moore Street - 8-9 Moore Lane.					
29	8.3.3 Noise and Vibration	25	(a) Tunnelling During the passage of the tunnel boring machine (TBM) the noise is predicted to be 43 dBLA_{max,s} lower than the acceptable threshold (45 dBLA_{max,s})and this may last for 2 weeks. The vibration from the passage of the TBM is predicted to be 0.181 VDVdb, ms-1.75 less than the threshold (1.6 VDVdb,ms-1.75). EIAR Table 6.2- GNV1 states that there is no effective mitigation available and therefore the impact will be managed by detailed consultation with the building owners. The OPW will request that a specific study is carried for this 14-17 Moore Street/8-9 Moore Lane to determine whether ground borne noise and vibration will have any impact. Where any impact is identified then threshold limits will need be applied and monitored. Where the building is considered vulnerable to vibration induced damage EIAR Table 6.2- ANV16. Sets out requirement for Pre and post construction surveys of these structures.	It should be noted that a full assessment of groundborne noise & vibration effects have been provided in Chapter 14 of the EIAR. The modelling undertaken in this chapter presents the potential impacts arising from all stages of the construction phase of the project. The assessment has identified that there will be no potential for structural damage due to vibration as levels of vibration are predicted to be below the construction threshold of 0.8 ms-1.75 VDV (Please refer to Appendix 14.5 - Groundborne Noise and Vibration and Blasting Modelling Results) and accordingly the specific study requested is not required. Regarding groundborne noise, unfortunately, there are no effective methods available to reduce groundborne noise from TBMs at source, but noting that the duration of this impact will be of the order of two weeks. TII will consult and liaise with 14-17 Moore Street, 8-9 Moore, to ensure the timing of these impacts are known. The principal mitigation measures aimed at minimising impacts are as follows: - Advance public consultation and stakeholder engagement can greatly reduce the significance of groundborne noise effects, as building occupants would be prepared for the passage of the TBM and resultant elevated noise and vibration levels. - TII will accept and consider applications for additional measures on a case-by case basis, in accordance with its Noise and Vibration Mitigation Policy (see Appendix A14.6 Airborne Noise and Groundborne Noise Mitigation Policy).	
30	8.3.3 Noise and Vibration	25	(b) Station Excavation GNV2 states that Monitoring of blasting and re-optimising the blast design (minimising the explosive charge considering the results) will be carried out as standard. A5.20 Blasting Strategy provides information on the classification of buildings and potential damage due to blasting for the station excavations. There are also calculations for estimated magnitude of the peak particle velocity (ppv) for various explosive charges. The assumption is that the lowest charge would be implemented to avoid damage. The 14-17 Moore Street is located approximately 35m from O’Connell St Station excavation and a peak particle velocity Ppv = 1.9mm/s is predicted exceeding the threshold, lmm/s. The OPW will request a specific assessment of the impact of blasting on 14-17 Moore Street and the basements of 8-10 Moore Lane.	As presented in Chapter 14, the thresholds for vibration values due to blasting activities are 8mm/s for standard buildings and 3mm/s for listed or potentially vulnerable buildings. In this case the vibration value is below both threshold limits. As a result, no significant impact is expected on these buildings and accordingly the specific study requested is not required.	
31	8.3.4 Work Sites	26	(b) Ground Water Control There is the potential for ground water lowering for the construction of O’Connell Street station to impact 14-17 Moore Street. The OPW will request that TH provides an assessment and limits that will be applied to dewatering for the Construction of O’Connell Street Station.	As outlined in EIAR Chapter 19 (Hydrogeology), groundwater assessment and monitoring was and will continue to be undertaken for the proposed Project. Section 19.4.11.4 describes how continuous data logging of water levels was carried out at approximately 38 locations from Northwood to Charlemont (AZ4), which includes O’Connell Street Station and therefore water levels in the area around this proposed station footprint. A Groundwater Hydrograph (Diagram 19.11) at O’Connell Street -NBH23A (overburden) & NBH23W (bedrock) indicates minimal change in recorded groundwater levels for overburden well NBH23A screened within gravel strata (0.20m) for the period presented and possibly reflects the lack of localised recharge due to hardstanding ground cover in the Dublin City Centre setting. A series of dewatering pumping tests were undertaken at O’Connell Street (Section 19.4.13.2.4). Overall, the maximum drawdown (mBGL) achieved at O’Connell Street for the [significant water-bearing] Gravels borehole was ~10.5m (using a 50m3/hr pump size capacity, and 24-hour test only) and ~32.9m for the well screened in the underlying bedrock. The target drawdown depths were generally achieved at both wells, with a reducing outflow rate observed at the bedrock borehole only, over the full duration of each test. Based on the results of the pumping tests, water-bearing granular lenses, spatial/environmental setting and interpreted regional flow direction, a qualitative Risk Level ‘H’ is applied here. The test area is located within an area where the possibility of a ‘barrier effect’ exists (refer Section 19.5.3.6). As outlined in Section 19.5.1, dewatering and unmitigated releases to ground during the Construction Phase could have permanent water quality and quantity impacts on the hydrogeological (and hydrological/ecological) environment if not effectively mitigated. However, for the proposed Project,	

Submission No.			215	
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 14-17 Moore Street - 8-9 Moore Lane.				
				Construction Phase management includes mitigation measures presented in the EIAR and outlined in the outline Construction and Environmental Management Plan (CEMP) (Appendix A5.1) for the proposed Project to protect receiving waters (groundwater and surface water) and ensure continued conveyance of natural groundwater flow patterns, as well as of surface water courses. Section 19.5.3.5 assesses the potential for groundwater lowering associated with underground construction in the context of the station boxes including at the proposed O'Connell Street station. For the current proposed Project, the ZOI has been modelled (refer Appendix A19.8) and details on the interpreted results are presented for each of the stations discussed under Section 19.5.3.4 in the EIAR Chapter 19. It is stated under Section 19.5.3.5 that 'lowering of the phreatic level, prior to excavating (or because of tunnelling works), may also cause immediate settlement to occur in layers or lenses of compressible soils, as well as in weathered rocky materials. The impact of such lowering of the groundwater table varies in proportion to its magnitude and radius of influence (i.e. ZOI)'. For the proposed O'Connell Street station, dewatering during works will be temporary only with the anticipated radius effect of dewatering reducing as the station construction progresses towards full perimeter and base seal (i.e. full watertight conditions) including toe grouting assumed to 1.50m below base of D-wall. Note: The modelling for O'Connell Street station box footprint and drawdown/ZOI results presented for this location are appropriate to the site as a whole i.e. irrespective of whether or not the proposed Hammersons [Hotel] Development (i.e. Phase 1 of the Developer's phased construction strategy) is constructed before the station box (i.e. Phase 2A, Phase 2B and Phase 2B) which is the current proposal for the O'Connell Street over site development. Finally, in the short-term term following completion of the Construction Phase, groundwater levels will re-stabilise to pre-construction patterns and any ZOI associated with Construction Phase dewatering activities will fully dissipate. There is no active dewatering associated with the operational phase.
32	8.3.4 Work Sites	27	(e) Traffic There will be significant traffic diversions required to construct O'Connell Street station site that will impact personnel and clients attending the 14-17 Moore Street. Moore Lane may become a construction access.	Please refer to response number (6).
33	8.5Future Development	27	The National Monuments Service of the Department of Housing, Local Government and Heritage (DHLGH) and the OPW looks after National Monuments in State care. There is currently a proposal by the DHLGH to development the site as a cultural centre; Ministerial Consent ref number C492. The OPW reserves the right to development the subject property in the future, this includes property above and below ground, subject to normal planning criteria. It is important that the development of the MetroLink does not interfere with extant planning permissions pertaining to the subject property and the right of the applicant to develop these, in advance, in tandem or post operation of the MetroLink Project.	Please refer to response number (11).
34	9.0 CONCLUSION	28	The most significant impact of the MetroLink project on 14-17 Moore Street & 8-9 Moore Lane will be from the construction of the O'Connell St. Station. The OPW expects that pre-construction defect surveys and monitoring are carried out for this building. The OPW requests that only Engineers or Surveyors with proven competence in regard to (historic) buildings of this fabric type, period and nature are selected.	Given the importance of the buildings full condition surveys will be undertaken as part of the Phase 3 assessment. TII will procure its contractors to develop Instrumentation and Monitoring Plans in tandem with Monitoring Action Plans. These plans will help assure that the risks associated with tunnelling and station excavations impacting OPW property are appropriately mitigated. These monitoring programmes will be developed based on a preconstruction building survey used to identify any potential vulnerabilities of the building in question.
35	9.0 CONCLUSION	28	The OPW will seek assurances from TII that Stage 2 and 3 ground movement assessments will be carried specifically for this building due to its proximity to the boundary of the National Monument. These ground movement assessments should carefully consider the parameters that are used.	TII confirm that a full stage 3 assessment for settlement will be undertaken for these buildings.
36	9.0 CONCLUSION	28	During construction it is possible that there will be major noise and vibration impact and the OPW requires assurance that a detailed evaluation will be performed.	It should be noted that a full assessment of noise & vibration effects have been provided in Chapter 13 Airborne Noise and Vibration; and Chapter 14 Groundborne Noise and Vibration of the EIAR. The modelling undertaken in this chapters present the potential impacts arising from all stages of the construction phase of the project. This assessment will be supplemented by a pre-construction survey and monitoring programme during construction to ensure that defined criteria for groundborne noise and vibration are adhered to during the construction phase.

Submission No.			215	
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 14-17 Moore Street - 8-9 Moore Lane.				
37	CONCLUSION	28	With respect to this property, the OPW is seeking: 1) Til to conduct a Stage 3 assessment to ensure that 14-17 Moore Street, which are Protected Structures and National Monuments, are undamaged by the construction of MetroLink and the construction of O'Connell Street Station.	TII confirm that a full stage 3 assessment for settlement will be undertaken for these buildings and mitigation measures will be employed as required to ensure that they are undamaged by the construction of MetroLink and O'Connell Street Station..
38	CONCLUSION	28	With respect to this property, the OPW is seeking: 2) To ensure no damage to the façades of the buildings and their architectural detailing, pre- construction and post construction surveys, trials and monitoring is required. This is mainly concerned with demolition, noise, vibration, and dust which can damage the buildings, which is of historical significance.	A full pre-construction survey will be undertaken at these buildings to identify any specific features that require additional protection. As outlined in Chapter 14 of the EIAR, specific criteria have been identified for the protection of vulnerable buildings. Based on this analysis Limits/Criteria will as specified in the Railway Order for the proposed Project. A monitoring programme will be initiated in advance and during the construction phase to ensure that defined criteria for groundborne noise and vibration are adhered to during the construction phase.
39	CONCLUSION	28	With respects to this property, the OPW is seeking: 3) To ensure that any future development at nos. 14-17 Moore Street follows the Moore Street and Environs Local Area Plan and Moore Street Battlefield Site Plan.	Refer to response 11.
40	CONCLUSION	28	With respect to this property, the OPW is seeking: 4) To ensure the appropriate conservation and structural appraisals are conducted as part of the Detailed Design Assessment.	A full pre-construction survey will be undertaken at these buildings to identify any specific features that require additional protection.
41	CONCLUSION	28	With respect to this property , OPW is seeking: 5) Precedents to be applied to the risk assessments to ensure utilising best industry practice within implementation of the Project.	TII intend to apply industry best practice to build and operate the MetroLink whilst minimising impacts to 3rd parties.
42	CONCLUSION	28	6) The Project Boundary submitted as part of the Draft Railway Order abuts Nos. 8-9 Moore Lane, the preservation order made under the National Monuments Acts 1930 to 2014 (PO no. 1/2007) encompass Nos 8-9 Moore Lane. In this regard, the site boundary for O'Connell Street Station should be reviewed and agreed in advance of construction with the OPW and DCC due to its proximity to the boundary of the National Monument. The OPW requires access to the National Monument via Moore Lane to be maintained.	The project boundary is appropriate and should not be changed in the RO. All heritage impacts on the national monument have been assessed in the EIAR. Refer to Chapter 24.
43	APPENDIX 1: LIST OF PLANNING LEGISLATION & POLICY	30	This appendix provides a non-exhaustive list of planning policy, legislation, and guidelines. We would respectfully request that An Bord Pleanála ensure that TH have fully assessed the Project with regard to existing planning policy, as well as adherence to the relevant local policies and guidelines pertaining to each individual property. DOWNEY note that this proposed Draft Railway Order is a strategic long-term development and An Bord Pleanála may consider Development Plans in assessing the Project. It is also crucial to note that on foot of a granted Order and during the detailed design stage, a revision to planning policy is expected, whereby adopted plans and legislation may have to be adhered within this stage. This may require an amendment to the Railway Order and further assessment, including public consultation.	Please see response number (10).
44	Appendix 2: Ground movement Assessment	page 35	Duplicate of Appendix to D to OPW Cover Letter - Re: Railway (Metrolink–Estuary to Charlemont via Dublin Airport) Order 2022 – Submissions by the Commissioners of Public Works in Ireland	Refer to OPW Cover Letter response

Submission No.			216	
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 16 Parnell Square East.				
1	Downey Report- Executive Summary		With respect to this property, the OPW is seeking: 1) To ensure no disruption to the public access of the building and its day-to-day uses and functions. 2) To ensure no damage to the building and its day-to-day functions, pre-construction and post-construction surveys, trials and monitoring is required. This is mainly concerned with noise and vibration which can damage this building of historical significance, as well as its functions." 3) To ensure specific vibration limits will be applied to No. 16 Parnell Square and a monitoring regime is to be implemented 4) To include adverse impacts of the Mater and O'Connell Street stations within the risk assessment studies for No. 16 Parnell Square and provide for mitigation measures, as construction of these stations will generate additional lorry movements for both deliveries and spoil removal. 5)Precedents to be applied to the risk assessments to ensure utilising best industry practice within implementation of the proposed Project.	TII thank you for your comments. Further to TII's response to the OPW Covering letter, the matters raised by OPW specific to these buildings are addressed in responses (2) through to (37) below.
2	Downey Report- 3.0 Overview of the Draft Railway Order	8, 9	While extensive pre-planning consultations also took place between TII and the OPW, a detailed assessment of the individual properties affected has not yet taken place. The Draft Railway Order application 2022 is a Draft Order, and should the route be approved by An Bord Pleanála, further detailed design will be submitted which will require further consideration and approval. Factors such as the internal uses of the properties, their construction methods, age and historical importance and the effect of construction on these sensitivities has not been assessed as part of the Project thus far. Additional consideration needs to be given to the potential effects on the built environment before a route and construction method can be confirmed. The OPW reserves the right to make further commentary, pending more detailed design proposals.	TII have undertaken a Phased Ground Movement Impact Assessment and the results of the assessments are included in the RO documentation within Appendix 5.17 of the EIAR. Appendix B2 of that document indicates the list of special buildings that would be subject to a subsequent Phase 3 assessment irrespective of the engineering need to do so. Many OPW buildings are in this category. It should be noted that the further assessments that will be done by the contractor if the RO is granted will likely reduce the impacts on the buildings as the Phase 2 assessment is a conservative assessment whose results are generally more significant than the results of a Phase 3 assessment. This point was discussed with OPW and their consultants in January 2023. TII will consult with OPW in relation to the results of any Phase 3 assessments and any requirements for monitoring and / or other mitigations that eventuate will be discussed with OPW. TII are satisfied that the approach adopted to date follows an industry standard approach undertaken on tunnelling and underground projects around the world including on the Channel Tunnel Rail Link and Crossrail in London, the Dublin Port Tunnel and currently on High Speed 2 in England, and therefore that further assessment is not required and should not be delivered prior to the route being consented. For this particular property, the assessment outlined in the EIAR predicts negligible to slight damage impact, based on assessment on adjacent buildings reference B-88 and B-89 within Table 5-2 of Appendix 5.17. While negligible or slight impact is anticipated, this building may be subject to inclusion in a Phase 3 assessment by the appointed contractor if Special Building Status can be determined for it as Sections 4 of Appendix A5.17.
3	Downey Report -4.1 property location and description	10	No. 16 Parnell Square is a five-storey over basement office development situated on Parnell Square East, Rotunda, Dublin 1. It currently accommodates a number of different State bodies and agencies. To note, this building is held by way of a commercial lease. No. 16 is located on the most northern plot along the eastern side of Parnell Square East. Parnell Square was developed by Dr. Bartholomew Mosse in the 1760's, who conceived the idea of the Lying- In Hospital (Rotunda Hospital) to be funded by entrance fees and subscriptions to the gardens, and large townhouses that surround it.	TII welcome this information in relation to this building and confirm that the EIAR assessments undertaken are appropriate.

Submission No.			216		
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW		
Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 16 Parnell Square East.					
4	4.2 Historical Context/Conservation Status	11	Rutland Square, renamed Parnell Square on the 3 rd of April 1933, was laid out as a fashionable residential square between 1753 and 1785. No. 16 Parnell Square East was a terraced two-bay four- storey over exposed basement townhouse that sat at the north-eastern edge of the square. After the Act of Union 1800, the fashionable square fell out of use and gradually fell into decline. By 1996, the building was deemed unfit for use with only the ground floor in use as a bistro. Although the building was condemned to demolition by Dublin Corporation, engineers were able to delay the demolition. In 1998, planning permission was granted by Dublin City Council for a five-storey over basement office development at No. 16 Parnell Square, involving the demolition of the remaining portion of the List 2 building. The modern building retains many of the features that existed on the previous building, with a flat brick façade, the same proportions with tall sash windows along the bottom two floors, as well as being a similar height. Located within a Conservation Area under the Dublin City Development Plan 2022-2028 and registered under RPS Ref. No. 6378 of the Dublin City Council Record of Protected Structures list, No. 16 Parnell Square East is a Protected Structure. For that reason, the façade facing Parnell Square must preserve the existing architectural characteristics of townhouses that line each side of Parnell Square. However, along Gardiner Row, the use of a glass façade, which acts to bridge the Georgian facade with a modern facade to the rear of the building, reveals the contemporary nature of the building.	The history, description and setting of the present building are noted.	
5	4.4 Planning context	12	In relation to the Draft Railway Order's consistency with planning policy and planning guidelines, a non-exhaustive list of planning policy and legislation at National, Regional, and Local levels, is included in Appendix 1 of this submission and the Board is invited to refer to this for further details. We would respectfully request that An Bord Pleanála ensure that TII have fully assessed the Project regarding existing planning policy, as well as adherence to the relevant local policies and guidelines pertaining to each individual property.	TII have undertaken a full assessment of the planning policy and planning guidelines in the Planning Report that was submitted as part of the Railway Order Application.	
6	4.4 Planning context	12	DOWNEY note that this proposed Draft Railway Order is a strategic long-term development and An Bord Pleanála may consider Draft Development Plans in assessing the Project. It is also crucial to note that on foot of a granted Order and during the detailed design stage, a revision to planning policy is expected, whereby adopted plans and legislation may have to be adhered within this stage. This may require an amendment to the Draft Railway Order and further assessment, including public consultation.	The only policy relevant to the decision on whether to grant the Railway Order and the necessary conditionality is the policy in force at the date of the grant of the Railway Order, as has been made clear in numerous High Court decisions including Element Power v An Bord Pleanála [2017] IEHC 550 and the Railway Order cannot be made conditional on compliance with future, yet to be developed policy. As planning and policy and strategy are being updated constantly, TII will undertake a further review of planning policy in advance of any oral hearing to allow for an updated presentation on the projects consistency with active policy requirements to be presented to An Bord Pleanála.	
7	5.0 Material Considerations	12	The alignment drawing ML1-JAI-EIA-ROUT_XX-DR-Y-04025 and the Contour drawing ML1-JAI-E1A-ROUT_XX-DR-Y-21148 show different alignments. This error has resulted in deficient information within the SID application submitted under Section 2 of the Planning and Development Act 2000 (as amended), to assess the vulnerability of damage due to vibration cause by both tunnelling and operation of underground train on this section of the alignment. This affects several buildings under the management of the OPW particularly within the Kildare Street, Merrion Square and St. Stephen's Green areas.	On two drawings (Figures 20.16 Settlement Contours, sheets 27 and 28 of 30) in EIAR Appendix 5.17 Building Damage Report, the tunnel centreline is plainly incorrect as it is deviates from the centre of the settlement contours between Tara and St. Stephen's Green stations. The settlement contours are correct and reflect the proposed Railway Order alignment and as such the drawing serves its core purpose, which is to identify, describe and assess the settlement impact of the railway works. In any event, revised drawings will be submitted to the Board to rectify the error. The correct alignment has been used for all environmental impact assessments including tunnel induced settlement, and construction and operational noise and vibration impact assessments.	
8	6.0 Legal Considerations	12 and 13	The Commissioners of Public Works would seek to enter into appropriate, property-specific legal agreements with TII, to ensure the protection of key State property and of the State's activities undertaken within those and other properties. Given the importance of such properties and activities, the Commissioners of Public Works consider it appropriate that An Bord Pleanála would make the Railway Order conditional on such legal agreements being in place between TII and the OPW. Creating such legal agreements between TII and the OPW would be possible only after TII make available the more detailed design and risk-mitigation measures for the construction and operational phases of the MetroLink project, and before any development begins. Therefore, the Commissioners of Public Works would request that this aspect be reflected in the conditions set out by An Bord Pleanála to TII, as this would provide assurances to the Commissioners of Public Works relating to future legal agreements that protect and secure State property and activities from risks associated with the construction or operations of the MetroLink.	TII's preference is carry out all of the permitted railway works with the agreement of affected landowners and prescribed bodies. However, it should not be condition of the railway order that TII reach such agreement with OPW. In the event that agreement cannot be reached with OPW, TII should be entitled to carry out the railway works over their objections provided that it complies with the terms and conditions of the Railway Order. The Board's function is to satisfy itself that those terms and conditions are adequate to ensure that the construction and operation of the railway works will be consistent with proper planning and sustainable development and have acceptable impacts on the environment. TII believes that the RO application and the EIAR in particular sets out mitigation and monitoring measures that are sufficient for that purpose	

Submission No.			216		
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW		
Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 16 Parnell Square East.					
9	7.1.1 Route Alignment	13	The MetroLink 8.5m ID running tunnel passes approximately 2m from the front of this building. 'Connell Street Station is approximately 340m south of this property. The alignment drawing ML1-JAI-EIA-ROUTXX-DR-Y-05023 and the Contour drawing ML1-JAI-EIA-ROUT_XX-DR-Y-21145 show the alignment and the predicted ground movement. Many of the reports refer to chainages along the alignment. However, there are no plans that indicate these chainages, and this makes reviewing the Draft Railway Order and EIAR difficult. Adjacent to No. 16 Parnell Square, the proposed MetroLink will be excavated through Argillaceous Limestone rock (CLU), underlying Weathered Rock (QTR), underlying Brown Boulder Clay (QBR), containing extensive fluvio-glacial sands and gravels. Cover to the tunnel crown is approximately 23m comprising Brown Boulder Clay. The invert level will be excavated through both weathered and unweathered limestone. This will present a significant challenge to ground movement mitigation using tunnel management.	OPW's observation with regard to the alignment and geology is noted and is the reason for the selection of the proposed TBM and the mixed face conditions identified have been used to conservatively predict the impacts on overlying buildings and infrastructure. TII will develop both TBM operational Specifications and Ground Movement and Monitoring Specifications to ensure that residual risks are appropriately managed. These will be bound into the subsequent contracts. Chainage drawings can be found in the Alignment Drawings pack.	
10	7.1.3 Station Excavation	14	No. 16 Parnell Square is situated approximately 420m from the Mater Station Box and approximately 530m from O'Connell Station box. The excavation for the stations will be through Brown Boulder Clay, Weathered Rock, and Argillaceous Limestone. The excavation through the Limestone will most likely include blasting, which is unlikely to affect No. 16 Parnell Square.	TII can confirm that the proposed excavation of the station at O'Connell St and at Mater Hospital will not impact on this building due to significant distance from these construction works to the building. However the TBM passage has potential to impact on the building (in terms of effects on occupants of the building) as discussed in Chapter 14 of the EIAR. However it is important to know that the modelling undertaken to inform this chapter has identified that there will be no damage to the building resulting from vibration arising from the TBM progression.	
11	7.3 Contractual Arrangement	15	The contractor(s) appointed will be responsible for the organisation, direction, and execution of environmental related activities during the detailed design and construction of the proposed Project. The contractor(s) is required to undertake all activities in accordance with the relevant environmental requirements including the consent documentation and other regulatory and contractual requirements.	TII's contractors will be bound by the Railway Order, further agreements entered into by TII and other relevant statutory or MetroLink specific regulation. An Bord Pleanála's statutory responsibility includes satisfying itself that the terms and conditions of any railway order will ensure that the railway works are consistent with the proper planning and sustainable development of the area and will not have unacceptable impacts on the environment regardless of the contractual structure.	
12	8.0 Potential Impacts on the Property	15	DOWNEY and Gall Zeidler have carried out a detailed examination of the property subject to this submission. Having regard to the status and current use of the property and identified constraints, the following raises concerns regarding potential impacts of the MetroLink on the property. This has been elaborated to include potential impacts during the construction and operation phases of developing MetroLink, as well as any impediments and/or implications for future development of the property.	Please refer to response numbers (13) through to (28) below.	
13	8.1 Monitoring	15	Given the sensitivity of the uses within this property, coupled with its historic importance, we request that An Bord Pleanála attach a condition to the Draft Railway Order that ensures continuous monitoring of the property to prevent any negative impacts. Access to all properties must be agreed in advance with the OPW and its clients. It is recommended that this monitoring takes place at least 3 months in advance of the construction of the Project and at least 6 weeks post the operational stage of the MetroLink.	TII will procure its contractors to develop Instrumentation and Monitoring Plans in tandem with Monitoring Action Plans. These plans will help assure that the risks associated with tunnelling and station excavations impacting OPW property are appropriately managed and controlled. TII will provide details of any monitoring proposed by the contractor at detailed design stage and agree the methodology of installation to the OPW property. TII will provide advance notice of any attendance that the monitoring contractor may require. With regard to the timing of monitoring specific to ground movement TII will ensure that it is commenced 3 months prior to the construction activities that would give rise to the settlement. However, as these construction activities may complete years prior to the MetroLink operational phase the termination of monitoring will be linked to a determination that settlement has effectively ceased, allowing a removal of the instrumentation.	
14	8.2 Security Issues	15	Given the nature of the State properties affected by the Project, we would respectfully refer An Bord Pleanála to Part XI of the Planning & Development Act 2000 (as amended), which states that: "Development by State authorities. 181.— (1) (a) The Minister may, by regulations, provide that, except for this section F902[and sections 181 A to 181C], the provisions of this Act shall not apply to any specified class or classes of development by or on behalf of a State authority where the development is, in the opinion of the Minister, in connection with or for the purposes of public safety or order, the administration of justice or national security or defence and, for so long as the regulations are in force, the provisions of this Act shall not apply to the specified class or classes of development. b(iii) the making available for inspection by members of the public of any specified documents, particulars, plans or other information with respect to the proposed development;"	This provision allows the Minister for Housing to provide that certain State developments do not require planning permission. It is not relevant to the MetroLink project. The MetroLink project is authorised by railway order and does not require planning permission. In that regard, we refer to section 38 of the Transport (Railway Infrastructure) Act 2001, which provides that "Each of the following shall be exempted development for the purposes of the Act of 2000: (a) development consisting of the carrying out of railway works, including the use of the railway works or any part thereof for the purposes of the operation of a railway, authorised by the Board and specified in a railway order or of any incidental or temporary works connected with such development; (b) development consisting of the carrying out of railway works for the maintenance, improvement or repair of a railway that has been built pursuant to a railway order."	
15	8.2 Security Issues	16	All employees contracted to work on behalf of the TII on this Project, and any associated works, must adhere to the properties protocol around access, security, and safety. This applies to all persons entering or working in proximity of the property.	TII will ensure that contractors working on its behalf on OPW property comply with property protocols around access, security and safety.	

Submission No.			216		
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW		
Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 16 Parnell Square East.					
16	8.2 Security Issues	16	The day-to-day operations of the property cannot be interrupted by disruptions to any utilities.	There is no intent to disrupt the day to day activities. If subsequently, it is found that a disruption to utility provision is inevitable this will be discussed with OPW and the timing and duration of any disruption optimised to minimise said disruption	
17	8.2 Security Issues	16	The design and operation of the MetroLink should be in line with best international practice, in relation to anti-terrorism and security measures.	Safety and security are two priorities for the MetroLink in operation and hence the design will be developed cognisant of the risk in relation to terrorism and best practice applied. Further dialogue with OPW will be undertaken throughout the design and construction stages to ensure suitable provisions are in place.	
18	8.3.1 Ground Movement	16 and 17	Stage 1: Defines extent of ground movement using Moderately Conservative parameters. The parameters considered by MetroLink are: ■ Volume Loss, Vs = 1.5 ■ Trough Width parameter, k = 0.3 The Volume Loss is considered moderately conservative. However, the trough parameter is very narrow and 0.4 could be considered more conservative. The extent of the zone of influence is defined by the 1mm contour line (Dark Red) and No. 16 Parnell Square lies just within the zone of influence and will be subject to up to 40mm settlement.	The assessments undertaken to date are, as you say, moderately conservative. Any further detailed assessment would seek to strip out some of the conservatism. The K values have been determined considering the ground conditions specific to location and hence K values vary between 0.3 to 0.5 as shown in Table 5.1 of Appendix 5.17 of the EIAR. The rationale for the selection of K values is given further in section 4.2.3 of Appendix 5.17.	
19	8.3.1 Ground Movement	17	Stage 2: Initial Assessment: The ground movement impact on No. 16 Parnell Square is not specified in the report and the OPW requests to ensure that this building has its own assessment	Please refer to response number (2) above.	
20	8.3.1 Ground Movement	17	Stage 3: Detailed Assessment: Because this building is approximately 2m from the tunnel centreline a Stage 3 assessment is required for this building.	Please refer to response number (2) above.	
21	8.3.1 Ground Movement	17	Stage 4 (Construction Stage): Mitigation may be required for this building and therefore, the OPW expects to be consulted. The OPW expects that pre-construction defect surveys and monitoring are carried out for this building.	All surveys, monitoring and mitigation proposed for OPW property will be discussed with OPW. TII will employ Professionally Qualified Engineers / Surveyors with the appropriate expertise to undertake the pre and post condition surveys and OPW are welcome to observe the surveys being undertaken of their property.	
22	8.3.1 Ground Movement	17	Stage 5 (Close Out): Once the excavation (tunnelling and station excavation) has been completed then the Contractor will want to decommission his monitoring. The OPW will expect to be provided with close out reports for the monitoring of its property. As a minimum the close out report should include details of any mitigation carried out, a list of any repairs, time history graphs showing the movements monitored.	TII will share the closeout monitoring report that will demonstrate that construction ground movements have ceased, which will also require historical movement information to be presented. In the event of repairs, these will be scheduled.	

Submission No.			216	
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 16 Parnell Square East.				
23	8.3.3 Noise and Vibration	17	(a) Tunnelling During the passage of the tunnel boring machine (TBM) the noise is predicted to be 48 dBLAmax, s which exceeds the acceptable threshold (45 dBLAmax,s)and this may last for 2 weeks. The vibration from the passage of the TBM is predicted to be 0.245 VDVdb.ms'175 less than the threshold (1.6 VDVdb.ms 175). EIAR Table 6.2- GNV1 states that there is no effective mitigation available and therefore the impact will be managed by detailed consultation with the building owners. The OPW requests that a specific study is carried out for No. 16 Parnell Square, to determine whether ground borne noise and vibration will have any impact. Where any impact is identified then threshold limits will need to be applied and monitored. Where the building is considered vulnerable to vibration induced damage, EIAR Table 6.2 ANV16, sets out the requirement for pre- and post-construction surveys of these structures.	TII have already undertaken a full assessment of groundborne noise & vibration effects (EIAR Chapter 14), including 16 Parnell Square East. A summary of the assessment results are provided on table 14.29 Noise and table 14.32 Vibration from TBM operations in AZ4. The details of the modelling results for both groundborne noise and vibration from the TBM operation and related to specific properties are provided in Appendix 14.5 - Groundborne Noise and Vibration and Blasting Modelling Results - Page 77 (page 85/113 of the electronic document) for 16 Parnell Square East. Accordingly, the specific study requested is not required. While vibration will not exceed the threshold levels as the TBM passes this property, unfortunately groundborne noise will. As stated there are no effective methods available to reduce groundborne noise from TBMs at source, but noting that the duration of this impact will be of the order of two weeks. TII will consult and liaise with 16 Parnell Sq, to ensure the timing of these impacts are known. The principal mitigation measures aimed at minimising impacts are as follows: - Advance public consultation and stakeholder engagement can greatly reduce the significance of groundborne noise effects, as building occupants would be prepared for the passage of the TBM and resultant elevated noise and vibration levels. - TII will accept and consider applications for additional measures on a case-by case basis, in accordance with its Noise and Vibration Mitigation Policy (see Appendix A14.6 Airborne Noise and Groundborne Noise Mitigation Policy).
24	8.3.3 Noise and Vibration	17	(b) Station Excavation GNV2 states that Monitoring of blasting and re-optimising the blast design (minimising the explosive charge considering the results) will be carried out as standard. A5.20 Blasting Strategy provides information on the classification of buildings and potential damage due to blasting for the station excavations. There are also calculations for estimated magnitude of the peak particle velocity (ppv) for various explosive charges. The assumption is that the lowest charge would be implemented to avoid damage. No. 16 Parnell Square is located approximately 320m from O'Connell Street excavation and the peak particle velocity is predicted to be 1mm/s. The OPW requests a specific assessment of the impact of blasting on No. 16 Parnell Square.	TII have already undertaken a full assessment of groundborne noise & vibration effects have been provided in Chapter 14 of the EIAR. The modelling undertaken in this chapter presents the potential impacts arising from blasting at each of the station excavation sites. The assessment has identified that there will be no potential for structural damage due to vibration at this building, due to the distance from the excavation as the vibration level will be well below the assessment criteria for building damage which is 8mm/s for this building. (Please refer to Appendix 14.5 - Groundborne Noise and Vibration and Blasting Modelling Results). This assessment will be supplemented by a full pre-construction survey and monitoring programme during the construction to ensure that defined criteria for groundborne noise and vibration are adhered to during the construction phase.
25	8.3.4 Work Sites	18	(a) Dust Appendix A16.4 of the EIAR requires a Dust Management Plan to be produced and implemented. The tunnelling will not generate dust in the vicinity of No. 16 Parnell Square. The station construction site is 60m from No. 16 Parnell Square and therefore dust from these constructions sites is likely to affect this building.	TII acknowledge your concern and will put measures into place to ensure your property / equipment is not damaged by dust. An Air Quality Management Plan, detailing dust mitigation methods will be prepared prior to construction works (Section 16.6.1.1 Chapter 16 Air Quality). A summary of dust mitigation measures to be implemented are as follows (Section 16.6.1.1, Chapter 16): •Material handling systems and site stockpiling of materials will be designed and laid out to minimise exposure to wind. Water misting or sprays will be used as required if particularly dusty activities are necessary during dry or windy periods; •Any blasting will be completed by specialised contractors with a specific blasting dust management plan; •Liaison with local authorities and community groups; •Hoarding will be provided around the construction compounds; and •It is anticipated that methods of collecting rainwater and recycling for general site use, will be adopted where practical. When the dust minimisation measures detailed in the mitigation section (Section 16.6) of EIAR Chapter 16 are implemented, fugitive emissions of dust from the site are not predicted to cause damage to property or human health.

Submission No.			216		
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW		
Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 16 Parnell Square East.					
26	8.3.4 Work Sites	18	(b) Ground Water Control There is the potential for ground water lowering for the construction of the Mater Station to impact No. 16 Parnell Square. The OPW requests that TII provides an assessment and level of limits that will be applied to dewatering for the construction of O'Connell Street Station.	TII understand your concern, however 16 Parnell Square East lies outside Zone of Influence (201.5m) of the proposed Mater station and therefore will not be negatively effected. As outlined in EIAR Chapter 19 (Hydrogeology), groundwater assessment and monitoring were and will continue to be undertaken for the proposed Project: • Awn undertook an extensive desktop review in order to establish baseline conditions along the proposed alignment corridor. The baseline study included reference to historical ground investigation data including the 2007 IGSL investigation borehole dataset (IGSL 2008) and data from Norwest Holst (2008) as well as information from contemporary (2019-2021) ground investigations specific to the proposed Project (Table 19.2); • A number of field surveys and walkover assessments were carried out to add to existing assessment of long-term trend analysis for water quality undertaken by the EPA (Section 19.3.3.4); and • A number of intrusive ground investigations were commissioned for the proposed Project including ground water level monitoring (Section 19.3.3.5). A programme of continuous groundwater level monitoring, aquifer testing and groundwater quality monitoring was devised with focus on key well locations along the alignment including at deep station excavations. The key hydrogeological data available and interpreted for the Mater Station and O'Connell Street is presented in Table 19.35. The dewatering process during the construction of the stations will be in the order of 15.74l/sec as a maximum value. Further information on construction phase dewatering can be found in Section 19.5.3. No impacts are predicted on this building due to dewatering.	
27	8.3.4 Work Sites	18	(e) Traffic There will be significant traffic diversions required to construct the Mater and O'Connell Street Station sites, that will impact personnel and clients attending No. 16 Parnell Square. Lorry movements will have a tunnelling advance rate of 80-120m/week.	As set out by Figure 38 of Appendix A.9.5, construction traffic will not pass this property with construction vehicles entering and existing the area via Parnell Street, at its closest c.250m from this property.	
28	8.5Future Development	18 and 19	The OPW reserves the right to develop the subject property in the future, this includes property above and below ground, subject to normal planning criteria. It is important that the development of the MetroLink does not interfere with extant planning permissions pertaining to the subject property and the right of the applicant to develop these, in advance, in tandem or post operation of the MetroLink Project.	TII will be required to make submissions in relation to planning applications for proposed future developments on or adjacent to MetroLink and there will necessarily be some engineering constraints (such as permissible loadings) required. However MetroLink is committed to engaging with known development proposals and new development proposals as they emerge with the intent of facilitating such developments as they emerge to the maximum extent consistent with the safe operation of the proposed Project. Again in common with other existing rail and tunnel projects, following grant of the Railway Order and development of detailed design, TII will produce "Guidance Note for Developers" that will be the subject of bye-laws following the grant of Railway Order and which is designed to facilitate future adjacent or over-site development while protecting the integrity and safety of the MetroLink works and operations. It is inappropriate and unworkable to produce this policy at this stage because it would have to be in broad terms that deal not only with the current RO proposal and any contingencies that might arise from the Board seeking revised designs or new conditionality as part of the RO application process. Therefore at this stage TII is dealing with known development proposals on a case by case basis, TII will work with parties in the future to assist with the wider development of sites over and above stations and tunnels. In this context TII has successfully engaged with a number of developers over the last two years to accommodate development over and in proximity to the alignment and there have been no material restrictions on development subject to the implementation of agreed design and mitigation measures and it is not anticipated that MetroLink will have a material impact on the development potential of sites above and in proximity to the alignment in future.	
29	CONCLUSION	19	The most significant impact of the MetroLink project on No. 16 Parnell Square will be from the construction of the running tunnel between the Mater and O'Connell Street Stations, generating ground movement, noise, and vibration. The OPW seeks assurances from Til that Stage 2 and 3 ground movement assessments will be carried out specifically for this building. These ground movement assessments should carefully consider the parameters that are used.	Refer to Item (2). For this particular property, the assessment outlined in the EIAR predicts negligible to slight damage impact, based on assessment on adjacent buildings reference B-88 and B-89 within Table 5-2 of Appendix 5.17. While negligible or slight impact is anticipated, this building may be subject to inclusion in a Phase 3 assessment by the appointed contractor if Special Building Status can be determined for it as Sections 4 of Appendix A5.17.	

Submission No.			216		
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW		
Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 16 Parnell Square East.					
30	CONCLUSION	19	Once the railway is in operation it is possible that there will be major noise and vibration impact and the OPW seeks assurance that a detailed evaluation will be performed.	It should be noted that a full assessment of noise & vibration effects have been provided in Chapter 13 Airborne Noise and Vibration; and Chapter 14 Groundborne Noise and Vibration of the EIAR. Noise and vibration modelling of the operation of the MetroLink project has been undertaken, with the results for addresses within approximately 50m of the tunnel presented in EIAR Appendix A14.5 Groundborne Noise and Vibration Blasting Modelling Results. At 16 Parnell Square East the predicted groundborne noise during operation is 32 dB LAsmax, which is below the threshold level of 40 dB LAsmax, indicating no significant impact at this location. The predicted level of vibration during railway operation is 0.007 ms-1.75 VDV in the daytime and 0.004 ms-1.75 VDV at night. These predicted levels are below the thresholds for human response of 0.8 ms-1.75 VDV and 0.4 ms-1.75 VDV for the day and night respectively, indicating no significant impact.	
31	CONCLUSION	19	With respect to this property, the OPW is seeking: 1) To ensure no disruption to the public access of the building and its day-to-day uses and functions	Noted, TII will ensure that there is no disruption to access or operation / function.	
32	CONCLUSION	19	With respect to this property, the OPW is seeking: 2) To ensure no damage to the building and its day-to-day functions, pre-construction and post-construction surveys, trials and monitoring is required. This is mainly concerned with noise and vibration which can damage this building of historical significance, as well as its functions.	TII are happy to engage with OPW on an appropriate monitoring programme for this building. Detailed monitoring proposals will be developed at detailed design.	
33	CONCLUSION	20	With respects to this property, the OPW is seeking: 3) To ensure specific vibration limits will be applied to No. 16 Parnell Square and a monitoring regime is to be implemented.	Please refer to response number (30) above.	
34	CONCLUSION	20	With respect to this property, the OPW is seeking: 4) To include adverse impacts of the Mater and O’Connell Street stations within the risk assessment studies for No. 16 Parnell Square and provide for mitigation measures, as construction of these stations will generate additional lorry movements for both deliveries and spoil removal.	Please refer to response number (27) above.	
35	CONCLUSION	20	With respect to this property, OPW is seeking: 5)Precedents to be applied to the risk assessments to ensure utilising best industry practice within implementation of the proposed Project.	TII intend to apply industry best practice to build and operate the MetroLink whilst minimising impacts to 3rd parties.	
36	APPENDIX 1: LIST OF PLANNING LEGISLATION & POLICY	21	This appendix provides a non-exhaustive list of planning policy, legislation, and guidelines. We would respectfully request that An Bord Pleanála ensure that TH have fully assessed the Project with regard to existing planning policy, as well as adherence to the relevant local policies and guidelines pertaining to each individual property. DOWNEY note that this proposed Draft Railway Order is a strategic long-term development and An Bord Pleanála may consider Development Plans in assessing the Project. It is also crucial to note that on foot of a granted Order and during the detailed design stage, a revision to planning policy is expected, whereby adopted plans and legislation may have to be adhered within this stage. This may require an amendment to the Railway Order and further assessment, including public consultation.	Please refer to response number (5) above.	
37	Appendix 2: Ground movement Assessment	26	Duplicate of Appendix to D to OPW Cover Letter - Re: Railway (Metrolink–Estuary to Charlemont via Dublin Airport) Order 2022 – Submissions by the Commissioners of Public Works in Ireland	Refer to OPW Cover Letter response	

Submission No.			217	
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 22-25 Clare Street.				
1	Downey Report- Executive Summary		With respect to this property, the OPW is seeking: 1) To ensure minimum disruption to the working access of the building and its day-to-day uses and functions. 2) To ensure that there is no impact to the future development plans for this property, including above, around and below the property. A planning application is due to be lodged by the OPW in 2023 to extend the property. Access for construction and operation of any future development is of paramount importance. 3) Precedents to be applied to the risk assessments to ensure utilising best industry practice. 4) To mitigate the noise and vibration to the acceptable levels for this cultural and government block by installing floating track slab between Chainage 17+980 and 18+400, which is the St. Stephen's Green Station.	TII thank you for your comments. Further to TII's response to the OPW Covering letter, the matters raised by OPW specific to these buildings are addressed in responses (2) through to (31) below.
2	Downey Report- 3.0 Overview of the Draft Railway Order	Page 8, 9	While extensive pre-planning consultations also took place between TII and the OPW, a detailed assessment of the individual properties affected has not yet taken place. The Draft Railway Order application 2022 is a Draft Order, and should the route be approved by An Bord Pleanála, further detailed design will be submitted which will require further consideration and approval. Factors such as the internal uses of the properties, their construction methods, age and historical importance and the effect of construction on these sensitivities has not been assessed as part of the Project thus far. Additional consideration needs to be given to the potential effects on the built environment before a route and construction method can be confirmed. The OPW reserves the right to make further commentary, pending more detailed design proposals.	This building is distant from the tunnel alignment, outside any zone of influence and therefore not impacted by settlement, groundborne noise or vibration.
3	4.4 Planning context	12	In relation to the Draft Railway Order's consistency with planning policy and planning guidelines, a non-exhaustive list of planning policy and legislation at National, Regional, and Local levels, is included in Appendix 1 of this submission and the Board is invited to refer to this for further details. We would respectfully request that An Bord Pleanála ensure that TII have fully assessed the Project regarding existing planning policy, as well as adherence to the relevant local policies and guidelines pertaining to each individual property.	TII have undertaken a full assessment of the planning policy and planning guidelines in the Planning Report that was submitted as part of the Railway Order Application.
4	4.4 Planning context	12	DOWNEY note that this proposed Draft Railway Order is a strategic long-term development and An Bord Pleanála may consider Draft Development Plans in assessing the Project. It is also crucial to note that on foot of a granted Order and during the detailed design stage, a revision to planning policy is expected, whereby adopted plans and legislation may have to be adhered within this stage. This may require an amendment to the Draft Railway Order and further assessment, including public consultation.	The only policy relevant to the decision on whether to grant the Railway Order and the necessary conditionality is the policy in force at the date of the grant of the Railway Order, as has been made clear in numerous High Court decisions including Element Power v An Bord Pleanála [2017] IEHC 550 and the Railway Order cannot be made conditional on compliance with future, yet to be developed policy. As planning and policy and strategy are being updated constantly, TII will undertake a further review of planning policy in advance of any oral hearing to allow for an updated presentation on the projects consistency with active policy requirements to be presented to An Bord Pleanála.
5	4.6 Potential Development of the Property	18	The OPW reserves the right to develop the subject property in the future, this includes property above and below ground, subject to normal planning criteria. Considering the historically significant and strategic location of the property within the Government quarter, there are development plans being considered for the property with a planning application due to be lodged by the OPW in 2023.	Irrelevant for this building, please refer to response (2) above.
6	5.0 MATERIAL CONSIDERATIONS	12	The alignment drawing ML1-JAI-EIA-ROUT_XX-DR-Y-04025 and the Contour drawing ML1-JAI-E1A-ROUT_XX-DR-Y-21148 show different alignments. This error has resulted in deficient information within the SID application submitted under Section 2 of the Planning and Development Act 2000 (as amended), to assess the vulnerability of damage due to vibration cause by both tunnelling and operation of underground train on this section of the alignment. This affects several buildings under the management of the OPW particularly within the Kildare Street, Merrion Square and St. Stephen's Green areas.	Irrelevant for this building, please refer to response (2) above.
7	6.0 LEGAL CONSIDERATIONS	12, 13	The Commissioners of Public Works would seek to enter into appropriate, property-specific legal agreements with TII, to ensure the protection of key State property and of the State's activities undertaken within those and other properties. Given the importance of such properties and activities, the Commissioners of Public Works consider it appropriate that An Bord Pleanála would make the Railway Order conditional on such legal agreements being in place between TII and the OPW. Creating such legal agreements between TII and the OPW would be possible only after TII make available the more detailed design and risk-mitigation measures for the construction and operational phases of the MetroLink project, and before any development begins. Therefore, the Commissioners of Public Works would request that this aspect be reflected in the conditions set out by An Bord Pleanála to TII, as this would provide assurances to the Commissioners of Public Works relating to future legal agreements that protect and secure State property and activities from risks associated with the construction or operations of the MetroLink..	TII's preference is carry out all of the permitted railway works with the agreement of affected landowners and prescribed bodies. However, it should not be condition of the railway order that TII reach such agreement with OPW. In the event that agreement cannot be reached with OPW, TII should be entitled to carry out the railway works over their objections provided that it complies with the terms and conditions of the Railway Order. The Board's function is to satisfy itself that those terms and conditions are adequate to ensure that the construction and operation of the railway works will be consistent with proper planning and sustainable development and have acceptable impacts on the environment. TII believes that the RO application and the EIAR in particular sets out mitigation and monitoring measures that are sufficient for that purpose

Submission No.			217	
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 22-25 Clare Street.				
8	7.1.1 Route Alignment	13, 14	The tunnel alignment does not pass directly beneath the building at 22/25 Clare Street. However, there is inconsistency in the alignment between Tara Station and St. Stephen's Green. The alignment drawing ML1-JAI-EIA-ROUT_XX-DR-Y-05025 and the Contour drawing ML1-JAI-EIA-ROUT_XX-DR-Y-21148 show different alignments. Many of the reports refer to chainages along the alignment. However, there are no plans that indicate these chainages, and this makes reviewing the Draft Railway Order and EIAR difficult.	Irrelevant for this building, please refer to response (2) above.
9	7.1.2 Tunnelling	14	The MetroLink 8.5m ID tunnel will be excavated by Tunnel Boring Machine (TBM). The ground conditions along the route are variable and therefore the machine could be either Earth Pressure Balance (EPB) or Slurry (STB). A modern Variable Density TBM would also be suitable and is currently being used in the UK for similar ground conditions. All these machines can control the ground movement with appropriate tunnel management. The 980m drive between Tara Station and St. Stephen's Green (C8) will be entirely within the Argillaceous Limestone.	Irrelevant for this building, please refer to response (2) above.
10	7.3 Contractual Arrangement	14	The contractor(s) appointed will be responsible for the organisation, direction, and execution of environmental related activities during the detailed design and construction of the proposed Project. The contractor(s) is required to undertake all activities in accordance with the relevant environmental requirements including the consent documentation and other regulatory and contractual requirements.	Irrelevant for this building, please refer to response (2) above.
11	8.0 POTENTIAL IMPACTS ON THE PROPERTY	15	DOWNEY and Gall Zeidler have carried out a detailed examination of the property subject to this submission. Having regard to the status and current use of the property and identified constraints, the following raises concerns regarding potential impacts of the MetroLink on the property. This has been elaborated to include potential impacts during the construction and operation phases of developing MetroLink, as well as any impediments and/or implications for future development of the property.	Irrelevant for this building, please refer to response (2) above.
12	8.1 Monitoring	15	Given the sensitivity of the uses within this property, coupled with its historic importance as part of the overall Leinster House/National Gallery complex, we request that An Bord Pleanála attach a condition to the Draft Railway Order that ensures continuous monitoring of the property to prevent any negative impacts. Access to all properties must be agreed in advance with the OPW and its clients. It is recommended that this monitoring takes place at least 3 months in advance of the construction of the Project and at least 6 weeks post the operational stage of the MetroLink.	Irrelevant for this building, please refer to response (2) above.
13	8.2 Security Issues	15	Given the nature of the State properties affected by the Project, we would respectfully refer An Bord Pleanála to Part XI of the Planning & Development Act 2000 (as amended), which states that: "Development by State authorities. 181.— (1) (a) The Minister may, by regulations, provide that, except for this section F902[and sections 181 A to 181C], the provisions of this Act shall not apply to any specified class or classes of development by or on behalf of a State authority where the development is, in the opinion of the Minister, in connection with or for the purposes of public safety or order, the administration of justice or national security or defence and, for so long as the regulations are in force, the provisions of this Act shall not apply to the specified class or classes of development. b(iii) the making available for inspection by members of the public of any specified documents, particulars, plans or other information with respect to the proposed development;"	Irrelevant for this building, please refer to response (2) above.
14	8.2 Security Issues	15	It is essential that security issues do not arise in the event of sensitive information being shared on the structure and operation of these properties. However, the OPW understands the importance of the detailed design stage of the Project and the wishes to ensure that the detailed assessment of these properties takes place in the early stages of the design process, in conjunction with the OPW, to ensure that these sensitive State buildings are not negatively impacted upon by the proposed Project. The OPW will liaise with TII and An Bord Pleanála on this matter..	Irrelevant for this building, please refer to response (2) above.
15	8.2 Security Issues	15	All employees contracted to work on behalf of the TII on this Project, and any associated works, must adhere to the properties protocol around access, security, and safety. This applies to all persons entering or working in proximity of the property.	While not relevant for this building, please refer to response number (1) above, TII will ensure that contractors working on its behalf on any OPW property comply with property protocols around access, security and safety.
16	8.2 Security Issues	15	The day-to-day operations of the property cannot be interrupted by disruptions to any utilities.	There is no intent to disrupt the day to day activities of this building, particular as MetroLink Works have no direct impact. If subsequently, it is found that a disruption to utility provision is inevitable this will be discussed with OPW and the timing and duration of any disruption optimised to minimise said disruption.

Submission No.			217	
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 22-25 Clare Street.				
17	8.2 Security Issues	15	The design and operation of the MetroLink should be in line with best international practice, in relation to anti-terrorism and security measures.	Safety and security are two priorities for the MetroLink in operation and hence the design will be developed cognisant of the risk in relation to terrorism and best practice applied. Further dialogue with OPW will be undertaken throughout the design and construction stages to ensure suitable provisions are in place.
18	8.3.1 Ground Movement	17	Stage 3: The OPW requests that a Stage 3 assessment will be carried out for the property by the Contractor appointed to construct this section of the MetroLink. The OPW expects to be consulted on the detail, scope of this assessment and programme for these assessments. It would be helpful if TII were to develop a Design Standard to ensure that all Stage 3 analyses of the OPW properties are carried out equally.	Irrelevant for this building, please refer to response (2) above.
19	8.3.1 Ground Movement	17	No mention of Stage 4 or 5 has been found in the Draft Railway Order or EIAR. Industry best practice as applied to London's Elizabeth Line (Crossrail) required that two further Stages in the Assessment of ground movement were undertaken during the project. Stage 4 (Construction Stage): This stage is where any mitigation is implemented, and the monitoring of the stakeholder's infrastructure is carried out. Also, the pre-construction defect surveys are carried out prior to any excavation. The OPW requires to review the detailed proposals for mitigation and monitoring. Monitoring proposals submitted to the OPW for review should include deep level monitoring and ground water level monitoring in addition to the building and surface monitoring typically implemented. The deep level monitoring will provide valuable data relating to the rock behaviour and has been usefully employed on HS2. The OPW will facilitate and observe the pre-construction defect surveys. It is noted that these shall be carried out by Professionally Qualified Engineers or Surveyors. The contractor(s) will coordinate pre-construction defect surveys for identified properties, liaising (in conjunction with the employer) with the building surveyor employed to carry out the surveys and maintaining a dialogue with the relevant property owners throughout the duration of the works.	Irrelevant for this building, please refer to response (2) above.
20	8.3.1 Ground Movement	17	Stage 5 (Close out): Once the excavation (tunnelling and station excavation) has been completed then the Contractor will want to decommission his monitoring. The OPW expects to be provided with close out reports for the monitoring of its property. As a minimum, the close out report should include details of any mitigation carried out, a list of any repairs, time history graphs showing the movements monitored.	Irrelevant for this building, please refer to response (2) above.
21	8.3.3 Noise and Vibration	17	(a) Tunnelling EIAR Chapter 14 Ground Borne Noise and Vibration Measures does not identify any impact of noise and vibration on the building at 22/25 Clare Street during TBM excavation, likely attributable to the building's distance from the anticipated tunnel alignment.	Irrelevant for this building, please refer to response (2) above.
22	8.3.4 Work Sites	19	(b) Ground Water Control There is an assumption that the tunnelling will not affect the ground water above the tunnel. However, there should be a ground water monitoring scheme implemented to confirm this and a contingency plan to manage any residual risk.	Irrelevant for this building, please refer to response (2) above.
23	8.4.1 Noise and Vibration	19	TII proposes to mitigate the noise and vibration resulting from the railway operations by installing floating track slab to meet thresholds of 25 dBL _{max} , s and VC-D respectively. EIAR Chapter 14 Table 14.47 provides some guidance on where this will be constructed but it is not clear exactly where. The OPW requests that floating track slab is installed between Chainage 17+980 and 18+400 (St. Stephen's Green Station). This would mitigate the noise and vibration to acceptable levels under all the Government buildings, museums, and the 22/25 Clare Street. The vibration during railway operations will not impact the building fabric or structure.	Irrelevant for this building, please refer to response (2) above.

Submission No.			217		
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW		
Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 22-25 Clare Street.					
24	8.4.3 Evacuation Strategy	19	The are no planned intervention/evacuation shafts between Tara Station and St. Stephen's Green. However, it is understood that the Fire Brigade have not accepted the strategy proposed by TII. This may have an impact on the building at 22/25 Clare Street should any intermediate shafts be required.	There is no requirement for additional shafts.	
25	Future Development	19	The OPW reserves the right to develop the subject property in the future, including property above and below ground, subject to normal planning criteria. A significant development is planned for the property by the OPW. A planning application is due to be lodged in 2023. Access for construction and the operation of any future development is of paramount importance. It is important that the development of the MetroLink does not interfere with extant planning permissions pertaining to the subject property and the right of the applicant to develop these, in advance, in tandem or post operation of the MetroLink Project.	Irrelevant for this building, please refer to response (2) above.	
26	CONCLUSION	20	With respect to this property, the OPW is seeking: 1) To ensure minimum disruption to the working access of the building and its day-to-day uses and functions.	Construction Traffic is not expected to pass within 400m of this property as set out in sections 7.9 and 7.10 of Appendix A.9.5. While no adverse impacts to users of this street have been identified in Appendices A.9.5 or A.9.2	
27	CONCLUSION	20	With respect to this property, the OPW is seeking: 2) To ensure that there is no impact to the future development plans for this property, including above, around and below the property. A planning application is due to be lodged by the OPW in 2023 to extend the property. Access for construction and operation of any future development is of paramount importance.	Irrelevant for this building, please refer to response (2) above.	
28	CONCLUSION	20	With respect to this property, the OPW is seeking: 3) Precedents to be applied to the risk assessments to ensure utilising best industry practice within the implementation of the Project.	TII intend to apply industry best practice to build and operate the MetroLink whilst minimising impacts to 3rd parties.	
29	CONCLUSION	20	4) To mitigate the noise and vibration to the acceptable levels for this cultural and government block by installing floating track slab between Chainage 17+980 and 18+400, which is the St. Stephen's Green Station.	Irrelevant for this building, please refer to response (2) above. Information on the locations assessed as requiring floating track slab is listed in Table 14.47.	
30	APPENDIX 1: LIST OF PLANNING LEGISLATION & POLICY	21	This appendix provides a non-exhaustive list of planning policy, legislation, and guidelines. We would respectfully request that An Bord Pleanála ensure that TII have fully assessed the Project with regard to existing planning policy, as well as adherence to the relevant local policies and guidelines pertaining to each individual property. DOWNEY note that this proposed Draft Railway Order is a strategic long-term development and An Bord Pleanála may consider Development Plans in assessing the Project. It is also crucial to note that on foot of a granted Order and during the detailed design stage, a revision to planning policy is expected, whereby adopted plans and legislation may have to be adhered within this stage. This may require an amendment to the Railway Order and further assessment, including public consultation.	Please refer to response number (4) above.	
31	Appendix 2: Ground movement Assessment	26	Duplicate of Appendix to D to OPW Cover Letter - Re: Railway (Metrolink–Estuary to Charlemont via Dublin Airport) Order 2022 – Submissions by the Commissioners of Public Works in Ireland	Refer to OPW Cover Letter response	

Submission No.			218	
Organisation Name or Name of Submitter			Office of Public Works (OPW)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW 44/45 O'Connell Street - Re: Railway (Metrolink–Estuary to Charlemont via Dublin Airport) Order 2022 – Submissions by the Commissioners of Public Works in Ireland				
1	Report Executive Summary	23	With respect to the proportion of the State's property portfolio managed by the OPW, we will endeavour to share knowledge and information with Transport Infrastructure Ireland (TII) to facilitate the successful delivery of the project through a collaborative approach. This submission has been prepared by DOWNEY in conjunction with Gall Zeidler Consultants, on behalf of The Commissioners of Public Works in Ireland (hereinafter the Office of Public Works (OPW)) and on foot of extensive consultation(s) with the OPW and its clients, which relates to the MetroLink route, and its relationship with Nos. 44-45 O'Connell Street Upper, Dublin 1. With respect to this property, the OPW is seeking: 1) To note the subject property is owned by the OPW. Agreement with the OPW will be required prior to any works being carried out to 44/45 O'Connell Street. The façade to 44/45 O'Connell Street is a Protected Structure to be retained and incorporated into the O'Connell Street Station Entrance. 2) To ensure no interference with or damage to the façade of the building and its architectural detailing, pre-construction and post-construction surveys, trials, and monitoring is required. This is mainly concerned with demolition, noise, vibration, and dust which can damage the buildings, which is of historical significance. 3) To ensure the appropriate conservation and structural appraisals are conducted as part of the Detailed Design Assessment. 4) Precedents to be applied to the risk assessments to ensure utilising best industry practice within implementation of the Project.	TII thank you for your comments. Further to TII's response to the OPW Covering letter, the matters raised by OPW specific to these buildings are addressed in responses (2) through to (33) below.
2	Report 3.0 Overview of the Draft Railway Order	8	While extensive pre-planning consultations also took place between TII and the OPW, a detailed assessment of the individual properties affected has not yet taken place. The draft Railway Order application 2022 is a Draft Order, and should the route be approved by An Bord Pleanála, further detailed design will be submitted which will require further consideration and approval. Factors such as the internal uses of the properties, their construction methods, age and historical importance and the effect of construction on these sensitivities has not been assessed as part of the Project thus far. Additional consideration needs to be given to the potential effects on the built environment before a route and construction method can be confirmed. The OPW reserves the right to make further commentary, pending more detailed design proposals.	TII have undertaken a Phased Ground Movement Impact Assessment and the results of the assessments are included in the RO documentation within Appendix 5.17 of the EIAR. Appendix B2 of that document indicates the list of special buildings that would be subject to a subsequent Phase 3 assessment irrespective of the engineering need to do so. Many OPW buildings are in this category. It should be noted that the further assessments that will be done by the contractor if the RO is granted will likely reduce the impacts on the buildings as the Phase 2 assessment is a conservative assessment whose results are generally more significant than the results of a Phase 3 assessment. This point was discussed with OPW and their consultants in January 2023. TII will consult with OPW in relation to the results of any Phase 3 assessments and any requirements for monitoring and / or other mitigations that eventuate will be discussed with OPW. TII are satisfied that the approach adopted to date follows an industry standard approach undertaken on tunnelling and underground projects around the world including on the Channel Tunnel Rail Link and Crossrail in London, the Dublin Port Tunnel and currently on High Speed 2 in England, and therefore that further assessment is not required and should not be delivered prior to the route being consented. Please note that these buildings are due to be demolished with the facades retained. As such the phased ground movement assessment is not applicable.
3	Cover Letter Appendix D - Ground Movement Assessment	12	The following sets out the requirements for assessing the impact of ground movement resulting from underground construction, such as tunnelling, embedded wall installation, and excavation for station boxes, together with requirements for monitoring and the close out.	Further to the OPW covering letter, TII observations in relation to the specific requirements of Appendix D and the report provided by OPW for 44 and 45 O'Connell Street are set out in responses (4) to (xx) below
4	Report: Section 4.6 Potential Development of the Property	18	As per the drawing ML1_JAJ_EIA_ROUT_XX_DR_Y_05056 enclosed with the EIAR, 44/45 O'Connell Street are denoted with green star, which demonstrates properties to be "partially demolished, maintained and supported" (See Figure 4). This is submitted to conflict the text within the EIAR, which needs further clarification.	TII confirm that number 44 and 45 O'Connell Street are to be demolished for the construction of the MetroLink Station at O'Connell Street with only the façades retained.

Submission No.			218	
Organisation Name or Name of Submitter			Office of Public Works (OPW)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW 44/45 O'Connell Street - Re: Railway (Metrolink–Estuary to Charlemont via Dublin Airport) Order 2022 – Submissions by the Commissioners of Public Works in Ireland				
5	Cover Letter Appendix D - Ground Movement Assessment	16	The detailed assessments should include a number of iterations to determine how the risk of damage to a building may be reduced. Asset-specific empirical models shall be prepared successively using moderately conservative and best estimate parameters. If after these iterations the use of empirical methods do not reduce the risk of building damage to acceptable levels (i.e. Damage Category 2 'slight' damage category and below or below the agreed tolerable limits), the damage assessment shall be refined by increasing the sophistication of the analysis with the aim of reducing the risk of asset damage to acceptable levels and to eliminate the asset from further assessment. If the risk of damage cannot be shown to be reduced by detailed assessment to acceptable levels, then mitigation measures shall be designed. The primary means of settlement mitigation shall be practical measures to control ground movement by good design and construction practice. This could include staged excavation sequences within sprayed concrete lining (SCL) works, ground treatment, face stabilisation, spiling /face dowels, increasing face pressure when using a tunnel boring machine (TBM), adopting stiffer walls/propping for rectangular shafts etc. In the event that physical mitigation measures are still required (i.e. to control building damage to Damage Category 2 'slight' and below or below the agreed tolerable limits), the Designer shall seek to obtain the Asset Owners approval. The Designer shall also undertake a comparative risk assessment to demonstrate that the risks associated with installation/implementation of any intrusive mitigation measures (such as compensation grouting) are no worse than the risks associated with the base case.	Further to response number (4) above, the buildings referenced are to be demolished, with only the façades retained. The retained façades will be supported to minimise damage. The current landowner is seeking permission for the development of this site and the MetroLink works will facilitate that being done if that permission is granted.
6	Cover Letter Appendix D - Ground Movement Assessment	17	The relevant Local Authority and the OPW shall be consulted on the results of the Protected Building assessment reports and the proposals for protective measures, if any are required. The OPW shall also be consulted in relation to Listed or Protected Buildings where they would normally be notified or consulted on planning applications or listed building consent applications	TII will consult with OPW and Dublin City Council with regard to the façade retention proposals.
7	Cover Letter Appendix D - Ground Movement Assessment	17	The form of monitoring of Listed Buildings should be determined based on the results of the assessment process.	TII advise that the proposed process for undertaking the assessments on any buildings impacted by MetroLink is set out within EIAR Appendix A5.17.
8	Cover Letter Appendix D - Ground Movement Assessment	17	Where repair works are necessary they will require the consent of those with relevant interest(s) in the building.	This is understood and while the façade of these building are retained to allow MetroLink to be progressed, the subsequent developer under their own application will be responsible for the repair of any damage as these façades are incorporated into the final development. This is outside of the scope of the RO.
9	Cover Letter Appendix D - Ground Movement Assessment	17	For railway track and track support structures the designer shall: a) review the track surveys (including specifying additional surveys if required) and establish that ground movement can be accommodated without exceeding track standard operational tolerance in conjunction with the relevant Infrastructure Manager; b) identify locations where fettling of the track is required pre construction and /or during construction to ensure the track geometry and clearances are acceptable. The designer shall prepare plans and sections showing the zone of influence of the works that is defined by ground movements exceeding 1 mm.	This comment appears to be erroneous, and not relevant to the Railway Order.
10	Cover Letter Appendix D - Ground Movement Assessment	17	The designer shall develop an instrumentation and monitoring plan to validate that ground movements within the zone of influence are in accordance with design assumptions and that the infrastructure remains within acceptable limits. The designer shall ensure that there is a clear distinction between parameters measured to confirm the change in any parameter is in accordance with the design and parameters measured to limit damage to the assets. This plan shall identify the minimum period of time required to obtain base line data for each monitoring point.	TII will procure its contractors to develop Instrumentation and Monitoring Plans in tandem with Monitoring Action Plans. These plans will help assure that the risks associated with tunnelling and station excavations impacting any OPW property are appropriately managed and controlled. TII will provide details of any monitoring proposed by the contractor at detailed design stage and discuss the methodology of installation to the OPW property. TII will provide advance notice of any attendance that the monitoring contractor may require. With regard to the timing of monitoring specific to ground movement TII will ensure that it is commenced 3 months prior to the construction activities that would give rise to the settlement. However, as these construction activities may complete years prior to the MetroLink operational phase the termination of monitoring will be linked to a determination that settlement has effectively ceased, allowing a removal of the instrumentation.
11	Cover Letter Appendix D - Ground Movement Assessment	18	The designer shall demonstrate that the monitoring system complies with the British Tunnelling Society Monitoring Underground Construction best practice guide.	The intent is clear and TII will develop the Instrumentation and Monitoring Specifications with due regard to industry best practice.

OPW 44/45 O'Connell Street - Re: Railway (Metrolink–Estuary to Charlemont via Dublin Airport) Order 2022 – Submissions by the Commissioners of Public Works in Ireland				
12	Cover Letter Appendix D - Ground Movement Assessment	18	A review of the monitoring system against the checklists provided in Appendix B of the BTS Monitoring Underground Construction best practice guide may be used as a tool to demonstrate compliance.	Please refer to response number (11) above.
13	Cover Letter Appendix D - Ground Movement Assessment	18	The detailed assessments shall define the control limits that need to be imposed on the TBM/SCL excavation in the zone of influence. The designer shall state these control measures on drawings and specifications.	While no SCL excavation is proposed at this location, all tunnelling management processes and controls will be detailed within the Contractors "Tunnelling Management Plan" for approval prior to works commencing. More information on the tunnelling processes and supporting systems is provided in Chapter 5, Appendix A5.13 Tunnelling.
14	Cover Letter Appendix D - Ground Movement Assessment	18	The designer shall identify the critical parameters to be monitored and define the Asset Control Limits based on: a) the ability of the asset or structure to withstand ground movement investigated a) during the assessments carried out in Stage 2 and 3. b) the risk to third party operations	Agreed, this is part of the process outlined within the Railway Order. Please refer to Chapter 5, Appendix A5.17.
15	Cover Letter Appendix D - Ground Movement Assessment	18	The designer shall link the Asset Control Limits to actions within an Emergency Preparedness Plan.	This comment is erroneous but the intent is clear. Please refer to response number (11), (13), and (14) above and (15) to (19) below.
16	Cover Letter Appendix D - Ground Movement Assessment	18	The Instrumentation and Monitoring Plan and Emergency preparedness Plan shall be agreed with the relevant Asset Owner.	The Instrumentation and Monitoring proposals developed by the contractor will be discussed with relevant parties.
16	Cover Letter Appendix D - Ground Movement Assessment	18	Contingency plans shall be developed and agreed with the OPW to cover the risks posed to the OPW before commencement of the construction activity. Contingency plans shall be implemented where the results of monitoring or inspection so indicate.	TII will consult with OPW and Dublin City Council with regard to the façade retention proposals.
18	Cover Letter Appendix D - Ground Movement Assessment	18	Ground movement and construction progress records shall be maintained and reported in regular reviews when construction processes are taking place within the zone of influence.	Agreed as this is standard practice.
19	Cover Letter Appendix D - Ground Movement Assessment	18	Predictions and assumptions made during design in respect of both ground movement and the effects which such ground movement will have on adjacent assets shall be verified by measurement during construction.	Agreed.
20	Cover Letter Appendix D - Ground Movement Assessment	18	Completion and Close-out After ground movement has stopped, as confirmed by instrumentation and monitoring, the designer shall prepare a "Completion Report". This shall include the following: a) details of any modifications/mitigation measures to the existing structure; b) graphs that show the ground movement and construction progress over time a) with at least 3 months duration of readings which show no change; b) a schedule showing actual movement compared to predicted movement; c) a schedule of defects recording only the exceptions (changes) identified during the post construction defects survey; d) details of any remedial works undertaken; e) as-built records (including any temporary works remaining in situ on completion of the works)	TII will share the closeout monitoring report that will demonstrate that construction ground movements have ceased, which will also require historical movement information to be presented. In the event of repairs, these will be scheduled.

Submission No.			218	
Organisation Name or Name of Submitter			Office of Public Works (OPW)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW 44/45 O'Connell Street - Re: Railway (Metrolink–Estuary to Charlemont via Dublin Airport) Order 2022 – Submissions by the Commissioners of Public Works in Ireland				
21	Cover Letter Appendix D - Ground Movement Assessment	18	A schedule of defects shall be recorded prior to the start of construction for all buildings, structures, utilities and facilities and Outside Party assets predicted to experience ground movement exceeding 1mm.	These comments cover a broad remit of assets potentially beyond the remit of the OPW at this location. However, the process described is contained within the Railway Order.
22	Report 5.0 Material Considerations	18	The alignment drawing ML1-JA1-EIA-ROUT_XX-DR-Y-04025 and the Contour drawing ML1-JAI-EIA- ROUT_XX-DR-Y-21148 show different alignments. This error has resulted in deficient information within the SID application submitted under Section 2 of the Planning and Development Act 2000 (as amended), to assess the vulnerability of damage due to vibration cause by both tunnelling and operation of underground train on this section of the alignment. This affects several buildings under the management of the OPW particularly with Kildare Street, Merriion Square and St Stephens Green areas	On two drawings (Figures 20.16 Settlement Contours, sheets 27 and 28 of 30) in EIAR Appendix 5.17 Building Damage Report, the tunnel centreline is plainly incorrect as it is deviates from the centre of the settlement contours between Tara and St. Stephen's Green stations. The settlement contours are correct and reflect the proposed Railway Order alignment and as such the drawing serves its core purpose, which is to identify, describe and assess the settlement impact of the railway works. In any event, revised drawings will be submitted to the Board to rectify the error. The correct alignment has been used for all environmental impact assessments including tunnel induced settlement, and construction and operational noise and vibration impact assessments.
23	Report 6.0 Legal Considerations	18	The Commissioners of Public Works would seek to enter into appropriate, property-specific legal agreements with TII, to ensure the protection of key State property and of the State's activities undertaken within those and other properties. Given the importance of such properties and activities, the Commissioners of Public Works consider it appropriate that An Bord Pleanála would make the Railway Order conditional on such legal agreements being in place between Til and the OPW. Creating such legal agreements between TH and the OPW would be possible only after Til make available the more detailed design and risk-mitigation measures for the construction and operational phases of the MetroLink project, and before any development begins.	TII's preference is carry out all of the permitted railway works with the agreement of affected landowners and prescribed bodies. However, it should not be condition of the railway order that TII reach such agreement with OPW. In the event that agreement cannot be reached with OPW, TII should be entitled to carry out the railway works over their objections provided that it complies with the terms and conditions of the Railway Order. The Board's function is to satisfy itself that those terms and conditions are adequate to ensure that the construction and operation of the railway works will be consistent with proper planning and sustainable development and have acceptable impacts on the environment. TII believes that the RO application and the EIAR in particular sets out mitigation and monitoring measures that are sufficient for that purpose
23	Potential impacts on the property	21	DOWNEY and Gall Zeidler have carried out a detailed examination of the property subject to this submission. Having regard to the status and current use of the property and identified constraints, the following raises issues regarding potential impacts of the MetroLink on the property. This has been elaborated to include potential impacts during the construction and operation phases of developing MetroLink, as well as any impediments and/or implications for future development of the property	Please note that the buildings are to be demolished, with the façades retained. The future development is by others under a separate planning application to the Railway Order, who are cognisant of the restrictions due to the station. Under the current plan, there is no development opportunity for OPW.
25	Monitoring	21	Given the sensitivity if the façade of this property, we request that An Bord Pleanála attach a condition to the Draft Railway Order that ensures continuous monitoring of the property to prevent any negative impacts. Access to all properties must be agreed in advance with the OPW. It is recommended that this monitoring takes place at least 3 months in advance of the construction of the Project and at least 6 weeks post the operational stage of the MetroLink.	Please refer to response number (10) above.
26	Security Issues	21	All employees contracted to work on behalf of the Til on this Project, and any associated works, must adhere to the properties protocol around access, security, and safety. This applies to all persons entering or working in proximity of the property. The design and operation of the MetroLink should be in line with best international practice, in relation to anti-terrorism and security measures.	Not applicable as the property referred to will be demolished with the façades retained.
27	During Construction of the MetroLink	22	As stated with the Draft Railway Order, these buildings are "Commercial properties to be partially demolished, maintained and supported", in order to protect the façades, the impact of any proposed works in terms of demolition, noise, vibration, etc. which effects conservation works would need to be carefully considered.	Noted and agreed.
28	Ground movement	22	The most significant impact of the MetroLink project on 44/45 O'Connell Street will be from the construction of the O'Connell Street Station which may require part demolition of this and several surrounding buildings. The façade may be retained and incorporated in a new over station development. In order to create a watertight perimeter to the station box diaphragm walls or secant piles will be required. It would be extremely difficult to install these with demolishing the buildings behind the façades. This is recognised in the submission from Dublin Central.	Noted and agreed. The oversite development will depend on the developer obtaining planning permission for same, as it is not provided for in the draft Railway Order. The plan is to demolish these buildings and retain the facades.

Submission No.			218		
Organisation Name or Name of Submitter			Office of Public Works (OPW)		
Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
OPW 44/45 O'Connell Street - Re: Railway (Metrolink–Estuary to Charlemont via Dublin Airport) Order 2022 – Submissions by the Commissioners of Public Works in Ireland					
27	Ground movement	22	The construction of the MetroLink O'Connell Station Box will be carried out by the developer of Dublin Central and referred to as MetroLink Enabling Works (MEW). Therefore, the OPW requires that the developer is a party to any agreements with TII related to the construction of MetroLink O'Connell Street Station providing detail on the impact of the construction of the station box including the impact of any demolition on the fabric of 44/45 O'Connell Street. The detail shall include the detailed drawings, ground movement impact assessment, noise, vibration impact assessment, and foundation arrangements for the retained façade.	The draft Railway Order provides for the construction of the MetroLink Enabling Works and its conditions (and the conditions of the developer's permission) will both apply to its construction. The contractual structure is outside the scope of the Railway Order process and it is part of An Bord Pleanála's statutory function to ensure that the terms and conditions of the Railway Order are such that the construction of these works is consistent with proper planning and sustainable development and has acceptable impacts on the environment regardless of the contractual arrangements.	
30	Future development	23	The OPW reserves the right to develop the subject property in the future, including property above and below ground, subject to normal planning criteria. It is important that the development of the MetroLink does not interfere with extant planning permissions pertaining to the subject property and the right of the applicant to develop these, in advance, in tandem or post operation of the MetroLink Project.	The draft Railway Order allows for oversite development at this location. It is understood that Dublin Central GP intends to carry out oversite development following the grant of a Railway Order and relevant planning permission. It is understood that the OPW does not have any further intentions for this site after the grant of Railway Order.	
31	Conclusion	23	The most significant impact of the MetroLink Project on 44/45 O'Connell Street will be from the construction of the O'Connell Street Station that will require these buildings and several surrounding buildings to be demolished. The façades may be retained and incorporated in a new over station development.	Agreed and the impact is detailed in the EIAR supporting this Railway Order.	
32	Conclusion	23	With respect to this property, the OPW is seeking: 1) To note the subject property is owned by the OPW. Agreement with the OPW will be required prior to any works being carried out to 44/45 O'Connell Street. The façade to 44/45 O'Connell Street is a Protected Structure to be retained and incorporated into the O'Connell Street Station Entrance. 2) To ensure no interference with or damage to the façade of the building and its architectural detailing, pre-construction and post-construction surveys, trials, and monitoring is required. This is mainly concerned with demolition, noise, vibration, and dust which can damage the buildings, which is of historical significance. 3) To ensure the appropriate conservation and structural appraisals are conducted as part of the Detailed Design Assessment. 4) Precedents to be applied to the risk assessments to ensure utilising best industry practice within implementation of the Project. In light of the above, DOWNEY respectfully request that An Bord Pleanála take into consideration the issues raised by the OPW when assessing the Draft Railway Order 2022 (MetroLink - Estuary to Charlemont via Dublin Airport).	TII response to comments: 1) The façades will be retained and incorporated into subsequent development. 2) Pre and Post construction surveys will be undertaken and proposals developed so as to minimise any impacts. 3) Agreed. 4) TII will implement industry best practice risk management techniques.	
33	APPENDIX 1: LIST OF PLANNING LEGISLATION & POLICY DOCUMENTS	25	An Bord Pleanála ensure that Til have fully assessed the Project with regard to existing planning policy, as well as adherence to the relevant local policies and guidelines pertaining to each individual property.	TII have undertaken a full assessment of the planning policy and planning guidelines in the Planning Report that was submitted as part of the Railway Order Application.

Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 52 St Stephens Green.				
1	Downey Report- Executive Summary		With respect to this property, the OPW is seeking: 1) To ensure no disruption to the access of the building by staff and visitors in order to carry out the functions of a key Government Department. 2) To ensure no damage to the buildings and its architectural detailing- pre-construction and post-construction surveys, trials and monitoring is required. This is mainly concerned with noise, vibration and dust which can damage this historically significant building and disturb day-to-day functioning of the buildings for its occupants. 3) To ensure that all parts of, aspects of, collections and business of No. 52 St. Stephen's Green are subject to Stage 3 assessment, and consequent, subsequent stages of assessment. 4) To set up an access control regime in agreement with the OPW and relevant stakeholders when applying a continuous monitoring mechanism pre- and post-construction. 5) To reserve the right of the OPW in relation to future development and that the development of the MetroLink does not interfere extant permissions pertaining to No. 52 St. Stephen's Green and its future development, including above and below its ground levels; nor interfere with major maintenance, conservation, refurbishment, or construction works which are currently anticipated as or may arise in the future. 6) Precedents to be applied to the risk assessments to ensure utilising best industry practice within the implementation of the Project. 7) To mitigate the noise and vibration to the acceptable levels for occupants by installing floating track slab at this section of the alignment. 8) To ensure that traffic diversions as a result of station excavation will be kept to a minimum and for the shortest time possible. 9) Regarding the tunnel boring and station excavation machine noise over a 2-weeks period when the noise is predicted to exceed the acceptable threshold, it is respectfully requested for the timeline of the work to be pushed during recess of the Dail/Government in order to avoid any disruption to the functions of the Department of Further and Higher Education, Research, Innovation and Science.	TII thank you for your comments. Further to TII's response to the OPW Covering letter, the matters raised by OPW specific to these buildings are addressed in responses (2) through to (38) below.
2	Downey Report- 3.0 Overview of the Draft Railway Order	8, 9	While extensive pre-planning consultations also took place between TII and the OPW, a detailed assessment of the individual properties affected has not yet taken place. The Draft Railway Order application 2022 is a Draft Order, and should the route be approved by An Bord Pleanála, further detailed design will be submitted which will require further consideration and approval. Factors such as the internal uses of the properties, their construction methods, age and historical importance and the effect of construction on these sensitivities has not been assessed as part of the Project thus far. Additional consideration needs to be given to the potential effects on the built environment before a route and construction method can be confirmed. The OPW reserves the right to make further commentary, pending more detailed design proposals.	TII have undertaken a Phased Ground Movement Impact Assessment and the results of the assessments are included in the RO documentation within Appendix 5.17 of the EIAR. Appendix B2 of that document indicates the list of special buildings that would be subject to a subsequent Phase 3 assessment irrespective of the engineering need to do so. Many OPW buildings are in this category. It should be noted that the further assessments that will be done by the contractor if the RO is granted will likely reduce the impacts on the buildings as the Phase 2 assessment is a moderately conservative assessment whose results are generally more significant than the results of a Phase 3 assessment. This point was discussed with OPW and their consultants in January 2023. TII will consult with OPW in relation to the results of any Phase 3 assessments and any requirements for monitoring and / or other mitigations that eventuate will be discussed with OPW. TII are satisfied that the approach adopted to date follows an industry standard approach undertaken on tunnelling and underground projects around the world including on the Channel Tunnel Rail Link and Crossrail in London, the Dublin Port Tunnel and currently on High Speed 2 in England, and therefore that further assessment is not required and should not be delivered prior to the route being consented. For this particular property, the assessment outlined in the EIAR predicts negligible impact (Table 5-2 of Appendix 5.17 - building reference B 3). While negligible impact is anticipated, as this building is designated as a Special Building, it will be subject to further Phase 3 assessment by the appointed contractor.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 52 St Stephens Green.					
3	4.2 Historical Context/Conservation Status	13	Registered under RPS Ref. No. 7785 of the Dublin City Council Record of Protected Structures and NIAH reg. ref 50920302, No. 52 St. Stephen's Green is designated as a protected structure. It is a c1771 five-bay four-storey over basement, former townhouse built over basement in 1771. It is an imposing presence on St. Stephen's Green, having retained much of its historic features and materials that enhance the grandeur of its Georgian properties. The interior remains significant and retains many of its original features, such as chimney pieces, rare wall brackets, grisailles of musical themes and fine decorative plasterwork. The grisailles and other murals are fragile and, being intrinsic to the building fabric, would be particularly susceptible to damage from vibration or movement. An inscribed slab is recorded as being insitu on the property (Sites and Monuments Record TS075-023046). No. 52 St. Stephen's Green is an important historic building in its own right. It stands within a very significant terrace which defines the east side of St. Stephen's Green. Each of the Georgian buildings within this terrace and its elements contribute, both individually and collectively, to the special character of this urban quarter of the city. These buildings are also an intrinsic part of the historic development of St. Stephen's Green and its environs. The history and development of the central park is dealt as part of the St. Stephen's Green submission. As such, it is important that interventions and impacts in this quarter are considered at both the urban scale and individual building scale, and down to individual elements of fragile fabric and detail.	As part of the EIAR, 52 St. Stephens Green has been assessed over a number of environmental topics with the consideration of its Protected Structure status. In particular, this is examined in Chapter 26 of the EIAR (BH-513). This building was designated a high baseline rating and it was noted that Settings of protected structures will be reinstated on completion of works and no further mitigation is necessary. As part of the noise & vibration assessment, it was deemed that the only construction works that would have an impact at this location was groundborne noise from TBM passage. This was deemed to be noticeable to all and disturbing to some over a number of days. Mitigation here would involve advanced notice and engagement prior to these works. EIAR Appendix A 5.17, Building Damage Report, covers the assessed impacts of construction generated ground movements and settlement on properties. Table 5-2 of this report outlines the results of Phase 2a Building Damage Assessment conducted on this building and shows that this building has been assessed as falling within the "Negligible damage" category. The damage categories are described in Section 4.3.2 of the EIAR Appendix A5.17, Building Damage Report. Given the importance of this building it is designated as a special building which will move forward to further assessment at the detailed design phase - Phase 3 Assessment. The Phase 3 assessment will take account of final design and construction methodology details. For the Phase 3 assessment, each building will be subject to detailed assessment on an individual basis. A detailed survey will be carried out as part of the Phase 3 assessment to provide the necessary additional information to inform this detailed analysis of how the individual elements of the building would be affected by the predicted ground movements. The method and extent of the detailed analysis will be determined on a case-by case basis and may include a more sophisticated semi-empirical or a detailed soil-structure interaction using finite element modelling methods. It is likely that the Phase 3 assessment will yield further improvement to the damage category determined by the Phase 2b assessment. The results of this refined assessment typically show that earlier assessments are conservative and over estimate the likely impact of construction generated ground movements.	
4	4.3 Current Use/Uses	13	No. 52 St. Stephen's Green is in current use as the Government office for the Department of Further and Higher Education, Research, Innovation and Science body of the Government. Uninterrupted access to the building is required at all times for the conduct of the business of the Department and for access by emergency services (e.g., fire services and ambulance). The OPW/the State, and their authorised agents, require access to the building at all times for the purpose of facilities management, maintenance, repairs and any major conservation, repair or development programme, planned, or as may arise during the construction period of MetroLink.	Outlined in Section 7.10 of Appendix A9.5, while SSG East will see lane, parking and footpath reductions, access to this property will be maintained with no full closures of SGG East planned.	
5	4.4 Planning context	13	In relation to the Draft Railway Order's consistency with planning policy and planning guidelines, a non-exhaustive list of planning policy and legislation at National, Regional, and Local levels, is included in Appendix 1 of this submission and the Board is invited to refer to this for further details. We would respectfully request that An Bord Pleanála ensure that TII have fully assessed the Project regarding existing planning policy, as well as adherence to the relevant local policies and guidelines pertaining to each individual property.	TII have undertaken a full assessment of the planning policy and planning guidelines in the Planning Report that was submitted as part of the Railway Order Application.	
6	4.4 Planning context	13	DOWNEY note that this proposed Draft Railway Order is a strategic long-term development and An Bord Pleanála may consider Draft Development Plans in assessing the Project. It is also crucial to note that on foot of a granted Order and during the detailed design stage, a revision to planning policy is expected, whereby adopted plans and legislation may have to be adhered within this stage. This may require an amendment to the Draft Railway Order and further assessment, including public consultation.	The only policy relevant to the decision on whether to grant the Railway Order and the necessary conditionality is the policy in force at the date of the grant of the Railway Order, as has been made clear in numerous High Court decisions including Element Power v An Bord Pleanála [2017] IEHC 550 and the Railway Order cannot be made conditional on compliance with future, yet to be developed policy. As planning and policy and strategy are being updated constantly, TII will undertake a further review of planning policy in advance of any oral hearing to allow for an updated presentation on the projects consistency with active policy requirements to be presented to An Bord Pleanála.	

Submission No.			219	
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 52 St Stephens Green.				
7	4.6 Potential Development of the Property	14	This building itself is a protected structure in a sensitive location. The OPW reserves the right to develop the subject property in the future, including property above and below ground, subject to normal planning criteria. It is important that the development of the MetroLink does not interfere with extant planning permissions pertaining to the subject property and the right of the applicant to develop these, in advance, in tandem or post operation of the MetroLink Project.	TII will be required to make submissions in relation to planning applications for proposed future developments on or adjacent to MetroLink and there will necessarily be some engineering constraints (such as permissible loadings) required. However MetroLink is committed to engaging with known development proposals and new development proposals as they emerge with the intent of facilitating such developments as they emerge to the maximum extent consistent with the safe operation of the proposed Project. Again in common with other existing rail and tunnel projects, following grant of the Railway Order and development of detailed design, TII will produce "Guidance Note for Developers" that will be the subject of bye-laws following the grant of Railway Order and which is designed to facilitate future adjacent or over-site development while protecting the integrity and safety of the MetroLink works and operations. It is inappropriate and unworkable to produce this policy at this stage because it would have to be in broad terms that deal not only with the current RO proposal and any contingencies that might arise from the Board seeking revised designs or new conditionality as part of the RO application process. Therefore at this stage TII is dealing with known development proposals on a case by case basis, TII will work with parties in the future to assist with the wider development of sites over and above stations and tunnels. In this context TII has successfully engaged with a number of developers over the last two years to accommodate development over and in proximity to the alignment and there have been no material restrictions on development subject to the implementation of agreed design and mitigation measures and it is not anticipated that MetroLink will have a material impact on the development potential of sites above and in proximity to the alignment in future.
8	5.0 MATERIAL CONSIDERATIONS	14	The alignment drawing ML1-JAI-EIA-ROUT_XX-DR-Y-04025 and the Contour drawing ML1-JAI-E1A-ROUT_XX-DR-Y-21148 show different alignments. This error has resulted in deficient information within the SID application submitted under Section 2 of the Planning and Development Act 2000 (as amended), to assess the vulnerability of damage due to vibration cause by both tunnelling and operation of underground train on this section of the alignment. This affects several buildings under the management of the OPW particularly within the Kildare Street, Merriion Square and St. Stephen's Green areas.	On two drawings (Figures 20.16 Settlement Contours, sheets 27 and 28 of 30) in EIAR Appendix 5.17 Building Damage Report, the tunnel centreline is plainly incorrect as it is deviates from the centre of the settlement contours between Tara and St. Stephen's Green stations. The settlement contours are correct and reflect the proposed Railway Order alignment and as such the drawing serves its core purpose, which is to identify, describe and assess the settlement impact of the railway works. In any event, revised drawings will be submitted to the Board to rectify the error. The correct alignment has been used for all environmental impact assessments including tunnel induced settlement, and construction and operational noise and vibration impact assessments.
9	6.0 LEGAL CONSIDERATIONS	14	The Commissioners of Public Works would seek to enter into appropriate, property-specific legal agreements with TII, to ensure the protection of key State property and of the State's activities undertaken within those and other properties. Given the importance of such properties and activities, the Commissioners of Public Works consider it appropriate that An Bord Pleanála would make the Railway Order conditional on such legal agreements being in place between TII and the OPW. Creating such legal agreements between TII and the OPW would be possible only after TII make available the more detailed design and risk-mitigation measures for the construction and operational phases of the MetroLink project, and before any development begins. Therefore, the Commissioners of Public Works would request that this aspect be reflected in the conditions set out by An Bord Pleanála to TII, as this would provide assurances to the Commissioners of Public Works relating to future legal agreements that protect and secure State property and activities from risks associated with the construction or operations of the MetroLink.	TII's preference is carry out all of the permitted railway works with the agreement of affected landowners and prescribed bodies. However, it should not be condition of the railway order that TII reach such agreement with OPW. In the event that agreement cannot be reached with OPW, TII should be entitled to carry out the railway works over their objections provided that it complies with the terms and conditions of the Railway Order. The Board's function is to satisfy itself that those terms and conditions are adequate to ensure that the construction and operation of the railway works will be consistent with proper planning and sustainable development and have acceptable impacts on the environment. TII believes that the RO application and the EIAR in particular sets out mitigation and monitoring measures that are sufficient for that purpose
10	7.1.1 Route Alignment	15	The edge of the St. Stephen's Green station box is approximately 22.5m west of this property. Many of the reports refer to chainages along the alignment. However, there are no plans that indicate these chainages, and this makes reviewing the Railway Order and EIAR difficult.	Reference to chainages along the alignment are provided within the Railway Order Plans\Drawings under Alignment Drawings.
11	7.3 Contractual Arrangement	16	The contractor(s) appointed will be responsible for the organisation, direction, and execution of environmental related activities during the detailed design and construction of the proposed Project. The contractor(s) is required to undertake all activities in accordance with the relevant environmental requirements including the consent documentation and other regulatory and contractual requirements.	TII's contractors will be bound by the Railway Order, further agreements entered into by TII and other relevant statutory or MetroLink specific regulation. An Bord Pleanála's statutory responsibility includes satisfying itself that the terms and conditions of any railway order will ensure that the railway works are consistent with the proper planning and sustainable development of the area and will not have unacceptable impacts on the environment regardless of the contractual structure.
12	8.0 POTENTIAL IMPACTS ON THE PROPERTY	16	DOWNEY and Gall Zeidler have carried out a detailed examination of the property subject to this submission. Having regard to the status and current use of the property and identified constraints, the following raises concerns regarding potential impacts of the MetroLink on the property. This has been elaborated to include potential impacts during the construction and operation phases of developing MetroLink, as well as any impediments and/or implications for future development of the property.	Please refer to response numbers (13) through to (26) below.

Submission No.			219		
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW		
Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 52 St Stephens Green.					
13	8.1 Monitoring	16	Given the sensitivity of the uses within this property, coupled with its historic importance, we request that An Bord Pleanála attach a condition to the Railway Order that ensures continuous monitoring of the property to prevent any negative impacts. Access to all properties must be agreed in advance with the OPW and its clients. It is recommended that this monitoring takes place at least 3 months in advance of the construction of the Project and at least 6 weeks post the operational stage of the MetroLink.	TII will procure its contractors to develop Instrumentation and Monitoring Plans in tandem with Monitoring Action Plans. These plans will help assure that the risks associated with tunnelling and station excavations impacting any OPW property are appropriately managed and controlled. TII will provide details of any monitoring proposed by the contractor at detailed design stage and agree the methodology of installation to the OPW property. TII will provide advance notice of any attendance that the monitoring contractor may require. With regard to the timing of monitoring specific to ground movement TII will ensure that it is commenced 3 months prior to the construction activities that would give rise to the settlement. However, as these construction activities may complete years prior to the MetroLink operational phase the termination of monitoring will be linked to a determination that settlement has effectively ceased, allowing a removal of the instrumentation.	
14	8.2 Security Issues	17	Given the nature of the State properties affected by the Project, we would respectfully refer An Bord Pleanála to Part XI of the Planning & Development Act 2000 (as amended), which states that: "Development by State authorities. 181.— (1) (a) The Minister may, by regulations, provide that, except for this section F902[and sections 181 A to 181C], the provisions of this Act shall not apply to any specified class or classes of development by or on behalf of a State authority where the development is, in the opinion of the Minister, in connection with or for the purposes of public safety or order, the administration of justice or national security or defence and, for so long as the regulations are in force, the provisions of this Act shall not apply to the specified class or classes of development. b(iii) the making available for inspection by members of the public of any specified documents, particulars, plans or other information with respect to the proposed development;"	This provision allows the Minister for Housing to provide that certain State developments do not require planning permission. It is not relevant to the MetroLink project. The MetroLink project is authorised by railway order and does not require planning permission. In that regard, we refer to section 38 of the Transport (Railway Infrastructure) Act 2001, which provides that "Each of the following shall be exempted development for the purposes of the Act of 2000: (a) development consisting of the carrying out of railway works, including the use of the railway works or any part thereof for the purposes of the operation of a railway, authorised by the Board and specified in a railway order or of any incidental or temporary works connected with such development; (b) development consisting of the carrying out of railway works for the maintenance, improvement or repair of a railway that has been built pursuant to a railway order."	
15	8.2 Security Issues	17	All employees contracted to work on behalf of the TII on this Project, and any associated works, must adhere to the properties protocol around access, security, and safety. This applies to all persons entering or working in proximity of the property.	TII will ensure that contractors working on its behalf on OPW property comply with property protocols around access, security and safety.	
16	8.2 Security Issues	17	The day-to-day operations of the property cannot be interrupted by disruptions to any utilities.	There is no intent to disrupt the day to day activities. If subsequently, it is found that a disruption to utility provision is inevitable this will be discussed with OPW and the timing and duration of any disruption optimised to minimise said disruption	
17	8.2 Security Issues	17	The design and operation of the MetroLink should be in line with best international practice, in relation to anti-terrorism and security measures.	Safety and security are two priorities for the MetroLink in operation and hence the design will be developed cognisant of the risk in relation to terrorism and best practice applied. Further dialogue with OPW will be undertaken throughout the design and construction stages to ensure suitable provisions are in place.	
18	8.3 During Construction of the MetroLink	17	This building is a fully functioning multi-lease property with commercial, restaurants and offices. It provides functional spaces and office accommodation and as such the impact of any proposed works in terms of noise, vibration, etc. which effects the quality of the working environment would need to be carefully considered.	Further to response number (2) above, the impact assessment in the EIAR in terms of noise and vibration considers different types of building uses in the assessment, with threshold criteria for different uses given in Table 14.18 Assessment Locations and Thresholds for AZ4 Northwood to Charlemont.	
19	8.3.1 Ground Movement	19	Stage 3: The EIAR states that a Stage 3 assessment will be carried out for the No. 52 St. Stephen's Green by the Contractor appointed to construct this section of the MetroLink. The OPW is expecting to be consulted on the detail, scope of this assessment and programme for these assessments. It would be helpful if TII were to develop a Design Standard to ensure that all Stage 3 analyses of the OPW properties are carried out equally. No mention of Stage 4 or 5 has been found in the Railway Order or EIAR. Industry best practice as applied to London's Elizabeth Line (Crossrail) required that two further Stages in the Assessment of ground movement were undertaken during the project.	A design standard will be prepared that reflects the methodology described in EIAR Appendix 5.17. The development of monitoring, mitigation and contingency plans and the subsequent close out of the impacts of settlement will form part of the scope of the Project for the detail design and construct phases. TII will develop the process to be adhered to by the contractor and this will be included in the contract documentation prepared for that contract. TII notes the description of stages 4 and 5 as included as Appendix D and confirm that the MetroLink Specification will reflect similar requirements to achieve the desired outcomes.	

Submission No.			219	
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 52 St Stephens Green.				
20	8.3.1 Ground Movement	19	Stage 4 (Construction Stage): This stage is where any mitigation is implemented, and the monitoring of the stakeholder's infrastructure is carried out. Also, the preconstruction defect surveys are carried out prior to any excavation. The OPW will require to review the detailed proposals for mitigation and monitoring. Monitoring proposals submitted to the OPW for review should include deep level monitoring and ground water level monitoring in addition to the building and surface monitoring typically implemented. The deep level monitoring will provide valuable data relating to the rock behaviour and has been usefully employed on HS2. The OPW will facilitate and observe the preconstruction defect surveys. It is noted that these shall be carried out by Professionally Qualified Engineers or Surveyors. The OPW requests that only Engineers or Surveyors with proven competence in relation to (historic) buildings of this fabric type, period and nature are selected. The contractor(s) will coordinate preconstruction defect surveys for identified properties, liaising (in conjunction with the employer) with the building surveyor employed to carry out the surveys and maintaining a dialogue with the relevant property owners throughout the duration of the works.	All surveys, monitoring and mitigation proposed for OPW property will be discussed with OPW. TII will employ Professionally Qualified Engineers / Surveyors with the appropriate expertise to undertake the pre and post condition surveys and OPW are welcome to observe the surveys being undertaken of their property.
21	8.3.1 Ground Movement	19	Stage 5 (Close out): Once the excavation (tunnelling and station excavation) has been completed then the Contractor will want to decommission his monitoring. The OPW will expect to be provided with close out reports for the monitoring of their property. As a minimum the close out report should include details of any mitigation carried out, a list of any repairs, time history graphs showing the movements monitored.	TII will share the closeout monitoring report that will demonstrate that construction ground movements have ceased, which will also require historical movement information to be presented. In the event of repairs, these will be scheduled.
22	8.3.3 Noise and Vibration	19,20	(a) Tunnelling EIAR Chapter 14 Ground Borne Noise and Vibration Measures identifies identify impacts on No. 52 St. Stephen's Green during TBM excavation: • Ground borne noise 50 dBA L_{Amax} - Significant impact • Ground borne vibration 0.275 VD_{Vdb}, ms⁻¹.75- no significant impact EIAR Table 6.2- GNV1 states that there is no effective mitigation available and therefore the impact will be managed by detailed consultation with the building owners. The OPW will require specific vibration limits that will be applied to No. 52 St. Stephen's Green and that TII ensures that a monitoring regime is implemented. EIAR Table 6.2- ANV16. Sets out requirement for Pre and post construction surveys of structures vulnerable to vibration induced damage. The OPW will require pre and post construction surveys of structures vulnerable to vibration induced damage are carried out and this should include No. 52 St. Stephen's Green.	It should be noted that a full assessment of groundborne noise & vibration effects has been provided in Chapter 14 of the EIAR. The modelling undertaken in this chapter presents the potential impacts arising from all stages of the construction phase of the project. The assessment has identified that there will be no potential for structural damage due to vibration as levels of vibration are predicted to be below the construction threshold of 1.6 ms⁻¹.75 VDV (Please refer to Appendix 14.5 - Groundborne Noise and Vibration and Blasting Modelling Results). Therefore, monitoring for vibration impacts is not required. Regarding groundborne noise, unfortunately, there are no effective methods available to reduce groundborne noise from TBMs at source, but noting that the duration of this impact will be of the order of two weeks. TII will consult and liaise with OPW to ensure the timing of these impacts are known. The principal mitigation measures aimed at minimising impacts are as follows: - Advance public consultation and stakeholder engagement can greatly reduce the significance of groundborne noise effects, as building occupants would be prepared for the passage of the TBM and resultant elevated noise and vibration levels. - TII will accept and consider applications for additional measures on a case-by case basis, in accordance with its Noise and Vibration Mitigation Policy (see Appendix A14.6 Airborne Noise and Groundborne Noise Mitigation Policy).
23	8.3.4 Work Sites	20	(b) Ground Water Control There is an assumption that the tunnelling will not affect the ground water above the tunnel. However, there should be a ground water monitoring scheme implemented to confirm this and a contingency plan to manage any residual risk.	Groundwater levels will be monitored (baseline, during construction and for close out) and contingency plans will be in place linked to predetermined trigger levels.
24	8.3.4 Work Sites	20	(d) Intervention Strategy No. 52 St. Stephen's Green is located at the construction site of St. Stephen's Green MetroLink Station. The construction of this station will generate additional lorry movements, for both deliveries and spoil removal and other associated construction activities. There is significant risk that this will impact on the historic fabric, structure, and elements of this important Protected Structure. It will be necessary that TII and their contractors to demonstrate that this risk will be addressed and that all measures are taken to ensure there is no impact arising.	Lorry movements will not impact the historic fabric, structure and elements of St Stephen's Green as there will be no risk of collision between HGVs and this building. There is estimated to be between 20 and 60 vehicle movements per day on average, with a maximum of 136 vehicle movements predicted for a four day period. This level of vehicle activity is very low when compared to existing traffic movements on St Stephen's Green East and will not result in any potential impact to the historic fabric or to this Protected Structure..

Submission No.			219	
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 52 St Stephens Green.				
25	8.4 During Operation of the MetroLink 8.4.1 Noise and Vibration	21	TII proposes to mitigate the noise and vibration resulting from the railway operations by installing floating track slab to meet thresholds of 25 dBL _{max,s} and VC-D respectively. EIAR Chapter 14 Table 14.47 provides some guidance on where this will be constructed but it is not clear exactly where. The OPW requests that floating track slab is installed between Chainage 17+980 and 18+400 (St. Stephen's Green Station). This would mitigate the noise and vibration to acceptable levels under all the Government buildings, museums and the National Concert Hall and other significant Protected Structures along this route such as No. 52 St. Stephen's Green. The vibration during railway operations will not impact the building fabric or structure.	Information on the locations assessed as requiring floating track slab is listed in Table 14.47. Floating slab track has been proposed between Ch 17+980 - 18+100 and Ch. 18+760 - 18+940. Floating slab track is proposed as a mitigation measure in locations where buildings that are sensitive to groundborne noise have the potential for significant effects during the operation of the proposed Project. 52 St Stephens Green was assessed for predicted groundborne noise during operation (table 14.44 of the EIAR) and it was deemed that groundborne noise at this location fell below the sensitive receptor threshold level (threshold = 40, predicted = 35) so the impacts at this location are not significant. Therefore floating slab track is not proposed at this location.
26	8.5 Future Development	21	The OPW reserves the right to develop the subject property in the future, including property above and below ground, subject to normal planning criteria. It is important that the development of the MetroLink does not interfere with extant planning permissions pertaining to the subject property and the right of the applicant to develop these, in advance, in tandem or post operation of the MetroLink Project.	Please refer to response number (6) above.
27	CONCLUSION	22	With regard to the Gall Zeidler assessment, the most significant impact of the MetroLink project on No. 52 St. Stephen's Green will be from the construction of St. Stephen's Green station including associated utility and traffic diversions, dust and noise. The OPW will require assurances from TII that disruption from construction will be kept to a minimum and for the shortest time possible.	Following the impact assessment in the EIAR, mitigation measures are proposed to minimise the impact of Metrolink construction on receptors in the area, such as: dust, noise, & traffic management The appointed contractors will be required to develop their plans for detailed environmental mitigation through the development of the Construction Environmental Management Plan (CEMP) for approval by Dublin City Council. The outline CEMP is provided in EIAR Chapter 5, Appendix 5.1 and the summarises of route wide mitigation and monitoring proposed included in Chapter 31 of the EIAR. Attenuation and mitigation of disruption from construction is a priority for the proposed Project and TII are happy to engage further with OPW.
28	CONCLUSION	22	With respect to this property, the OPW is seeking: 1) To ensure no disruption to the access of the building by staff and visitors in order to carry out the functions of a key Government Department.	TII note this request and confirm that minimal impact on Pedestrians on the eastern footpath is expected during construction. Despite intermittent lane closures on SSG East, pedestrian access will be maintained at all times. See Appendix A.9.5 Section 7.10
29	CONCLUSION	22	With respect to this property, the OPW is seeking: 2) To ensure no damage to the buildings and its architectural detailing- pre-construction and post-construction surveys, trials and monitoring is required. This is mainly concerned with noise, vibration and dust which can damage this historically significant building and disturb day-to-day functioning of the buildings for its occupants.	TII are happy to engage with OPW in order to reach agreement on an appropriate monitoring programme for the above mentioned building. This will be developed at detailed design stage. There is no intent to disrupt the day to day activities. If subsequently, it is found that a disruption to utility provision is inevitable this will be discussed with OPW and the timing and duration of any disruption optimised to minimise said disruption.
30	CONCLUSION	22	With respects to this property, the OPW is seeking: 3) To ensure that all parts of, aspects of, collections and business of No. 52 St. Stephen's Green are subject to Stage 3 assessment, and consequent, subsequent stages of assessment.	Please refer to response number (2) above.
31	CONCLUSION	22	With respect to this property, the OPW is seeking:4) To set up an access control regime in agreement with the OPW and relevant stakeholders when applying a continuous monitoring mechanism pre- and post-construction.	Please refer to the first paragraph of response number (28) above.
32	CONCLUSION	22	5) To reserve the right of the OPW in relation to future development and that the development of the MetroLink does not interfere extant permissions pertaining to No. 52 St. Stephen's Green and its future development, including above and below its ground levels; nor interfere with major maintenance, conservation, refurbishment, or construction works which are currently anticipated as or may arise in the future.	Please refer to response number (7) above.

Submission No.			219	
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 52 St Stephens Green.				
33	CONCLUSION	22	With respect to this property, the OPW is seeking: 6) Precedents to be applied to the risk assessments to ensure utilising best industry practice within the implementation of the Project.	TII intend to apply industry best practice to build and operate the MetroLink whilst minimising impacts to 3rd parties.
34	CONCLUSION	22	With respect to this property, the OPW is seeking: 7) To mitigate the noise and vibration to the acceptable levels for occupants by installing floating track slab at this section of the alignment.	Please refer to response number (25) above.
35	CONCLUSION	22	With respect to this property, the OPW is seeking: 8) To ensure that traffic diversions as a result of station excavation will be kept to a minimum and for the shortest time possible.	TII will minimise traffic disruption. As set out in Section 7.10.6.3.1 of Appendix 9.5 - Traffic disruption due to diversions/reduced capacity along SSG East will be minimal with a 140 second delay predicted as a result of temporary traffic management during the main works.
36	CONCLUSION	22	With respect to this property, the OPW is seeking: 9) Regarding the tunnel boring and station excavation machine noise over a 2-weeks period when the noise is predicted to exceed the acceptable threshold, it is respectfully requested for the timeline of the work to be pushed during recess of the Dail/Government in order to avoid any disruption to the functions of the Department of Further and Higher Education, Research, Innovation and Science.	Further to our earlier comments in response numbers (3) and (22) above, the noise mitigation measures presented in Chapter 14 will be applied. TII are happy to engage with OPW in order to provide advance notice of any disruption and likely timings. The actual levels of disturbance will be identified earlier in the tunnel programme as this building is towards the southern end on the line and hence TII can establish in advance if disruption is likely to occur. It is not possible to commit at this stage to tunnelling beneath during recess of the Dail.
37	APPENDIX 1: LIST OF PLANNING LEGISLATION & POLICY	24	This appendix provides a non-exhaustive list of planning policy, legislation, and guidelines. We would respectfully request that An Bord Pleanála ensure that TII have fully assessed the Project with regard to existing planning policy, as well as adherence to the relevant local policies and guidelines pertaining to each individual property. DOWNEY note that this proposed Draft Railway Order is a strategic long-term development and An Bord Pleanála may consider Development Plans in assessing the Project. It is also crucial to note that on foot of a granted Order and during the detailed design stage, a revision to planning policy is expected, whereby adopted plans and legislation may have to be adhered within this stage. This may require an amendment to the Railway Order and further assessment, including public consultation.	Please refer to response number (6) above.
38	Appendix 2: Ground movement Assessment	29	Duplicate of Appendix to D to OPW Cover Letter - Re: Railway (Metrolink–Estuary to Charlemont via Dublin Airport) Order 2022 – Submissions by the Commissioners of Public Works in Ireland	Refer to OPW Cover Letter response

Submission No.			220		
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW		
Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 9-15 O'Connell Street.					
1	Downey Report- Executive Summary		With respect to this property, the OPW is seeking: 1} To ensure minimum disruption to the working access to the building and its day-to-day uses and functions. 2) To ensure no damage to the building and its architectural detailing, pre-construction and post-construction surveys, trials and monitoring is required. This is mainly concerned with noise, vibration, and dust which can damage buildings which is of historical significance and character. 3) Disruptions to traffic may happen during construction phases, wayleave to staff as well as postal vans and lorries will be required. 4) Precedents to be applied to the risk assessments to ensure utilising best industry practice within the implementation of the Project. 5) To ensure future development of 9/15 O'Connell Street is not impacted, including emergency works which may need to be carried out on the building, repairs, refurbishments, and development. 6) To mitigate the noise and vibration to the acceptable levels for this commercial and governmental office block by installing floating track slab at this section of the alignment.	TII thank you for your comments. Further to TII's response to the OPW Covering letter, the matters raised by OPW specific to these buildings are addressed in responses (2) through to (40) below.	
2	Downey Report- 3.0 Overview of the Draft Railway Order	Page 8, 9	While extensive pre-planning consultations also took place between TII and the OPW, a detailed assessment of the individual properties affected has not yet taken place. The Draft Railway Order application 2022 is a Draft Order, and should the route be approved by An Bord Pleanála, further detailed design will be submitted which will require further consideration and approval. Factors such as the internal uses of the properties, their construction methods, age and historical importance and the effect of construction on these sensitivities has not been assessed as part of the Project thus far. Additional consideration needs to be given to the potential effects on the built environment before a route and construction method can be confirmed. The OPW reserves the right to make further commentary, pending more detailed design proposals.	TII have undertaken a Phased Ground Movement Impact Assessment and the results of the assessments are included in the RO documentation within Appendix 5.17 of the EIAR. Appendix B2 of that document indicates the list of special buildings that would be subject to a subsequent Phase 3 assessment irrespective of the engineering need to do so. Many OPW buildings are in this category. It should be noted that the further assessments that will be done by the contractor if the RO is granted will likely reduce the impacts on the buildings as the Phase 2 assessment is a moderately conservative assessment whose results are generally more significant than the results of a Phase 3 assessment. As such, the Phase 2 assessment does take account of the details referred to in OPW's submission, because it proceeds on conservative assumptions. This point was discussed with OPW and their consultants in January 2023. TII will consult with OPW in relation to the results of any Phase 3 assessments and any requirements for monitoring and / or other mitigations that eventuate. TII are satisfied that the approach adopted to date follows an industry standard approach undertaken on tunnelling and underground projects around the world including on the Channel Tunnel Rail Link and Crossrail in London, the Dublin Port Tunnel and currently on High Speed 2 in England, and therefore that further assessment is not required and should not be delivered prior to the route being consented. For these particular properties, the assessment outlined in the EIAR predicts slight damage impact or less, based on assessment on adjacent buildings reference B-192 to B 195 within Table 5-2 of Appendix 5.17. While slight impact or less is anticipated, these building will be included in a Phase 3 assessment by the appointed contractor for their Special Building Status as Sections 4 of Appendix A5.17.	
3	4.2 Historical Context/Conservation Status	12	The buildings comprising O'Connell Street Upper 9-15 are situated within the O'Connell Street Architectural Conservation Area. These buildings are not included in Dublin City Council's Record of Protected Structures. However, No's 9-10 (Burger King) and Nos. 11-13 (Hammam Buildings) are included in the N1AH, as record numbers 50010544 and 50010545 respectively.	The presence of these buildings was noted in the EIAR Chapter 26 Architectural Heritage and specifically listed together with NIAH record numbers in Table 26.20. The potential effects are assessed.	
4	4.2 Building sensitivities	12	These early 20th century buildings may consist of iron/steel frames with stone facing to composite walls. Bronze fixtures and features enhance the buildings. Any early glass may be delicate. These building systems and materials may be brittle and may not respond well to movement.	TII have noted this observation and these features will be included in any Phase 3 assessments required.	
5	4.3 Current Use/Uses	12	No. 10 to No. 15 O'Connell Street Upper front O'Connell Street and there are several commercial uses at ground floor level. Caffè Nero, Discover Ireland Tourist Centre, Fishing Guide Ireland, Hop-On Hop-Off Dublin Bus Tour, Peter Mark Hairdressing are situated on this stretch of O'Connell Street, while the Civil Service has offices at the upper floors. There is significant infrastructure operated by Eir on the ground floor and basement levels. It would be important that Eir is consulted as part of this process in relation to the potential impact on its operations.	TII appreciate the information provided. It should be noted that all building owners and occupiers have been made aware of the proposed project through the consultation and CPO notification process. These buildings have been assessed in the EIAR.	
6	4.4 Planning context	13	In relation to the Draft Railway Order's consistency with planning policy and planning guidelines, a non-exhaustive list of planning policy and legislation at National, Regional, and Local levels, is included in Appendix 1 of this submission and the Board is invited to refer to this for further details. We would respectfully request that An Bord Pleanála ensure that TII have fully assessed the Project regarding existing planning policy, as well as adherence to the relevant local policies and guidelines pertaining to each individual property.	TII have undertaken a full assessment of the planning policy and planning guidelines in the Planning Report that was submitted as part of the Railway Order Application.	

Submission No.			220		
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW		
Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 9-15 O'Connell Street.					
7	4.4 Planning context	13	DOWNEY note that this proposed Draft Railway Order is a strategic long-term development and An Bord Pleanála may consider Draft Development Plans in assessing the Project. It is also crucial to note that on foot of a granted Order and during the detailed design stage, a revision to planning policy is expected, whereby adopted plans and legislation may have to be adhered within this stage. This may require an amendment to the Draft Railway Order and further assessment, including public consultation.	The only policy relevant to the decision on whether to grant the Railway Order and the necessary conditionality is the policy in force at the date of the grant of the Railway Order, as has been made clear in numerous High Court decisions including Element Power v An Bord Pleanála [2017] IEHC 550 and the Railway Order cannot be made conditional on compliance with future, yet to be developed policy. As planning and policy and strategy are being updated constantly, TII will undertake a further review of planning policy in advance of any oral hearing to allow for an updated presentation on the projects consistency with active policy requirements to be presented to An Bord Pleanála.	
8	4.6 Potential Development of the Property	18	The OPW reserves the right to development of the subject property in the future, to include property above and below ground, subject to normal planning criteria. It is important that the development of the MetroLink does not interfere with extant planning permissions pertaining to the subject property and the right of the applicant to develop these, in advance, in tandem or post operation of the MetroLink Project.	MetroLink will be a catalyst for and provide opportunity for future development and regeneration. While the MetroLink Railway Order does not include for future neighbouring or overhead development, the tunnels and stations are designed to support appropriate future imposed loads. TII will be required to make submissions in relation to planning applications for proposed future developments on or adjacent to MetroLink and there will necessarily be some engineering constraints (such as permissible loadings) required. However MetroLink is committed to engaging with known development proposals and new development proposals as they emerge with the intent of facilitating such developments as they emerge to the maximum extent consistent with the safe operation of the proposed Project. Again in common with other existing rail and tunnel projects, following grant of the Railway Order and development of detailed design, TII will produce “Guidance Note for Developers” that will be the subject of bye-laws following the grant of Railway Order and which is designed to facilitate future adjacent or over-site development while protecting the integrity and safety of the MetroLink works and operations. It is inappropriate and unworkable to produce this policy at this stage because it would have to be in broad terms that deal not only with the current RO proposal and any contingencies that might arise from the Board seeking revised designs or new conditionality as part of the RO application process. Therefore at this stage TII is dealing with known development proposals on a case by case basis, TII will work with parties in the future to assist with the wider development of sites over and above stations and tunnels. In this context TII has successfully engaged with a number of developers over the last two years to accommodate development over and in proximity to the alignment and there have been no material restrictions on development subject to the implementation of agreed design and mitigation measures and it is not anticipated that MetroLink will have a material impact on the development potential of sites above and in proximity to the alignment in future.	
9	5.0 MATERIAL CONSIDERATIONS	18	The alignment drawing ML1-JAI-EIA-ROUT_XX-DR-Y-04025 and the Contour drawing ML1-JAI-E1A-ROUT_XX-DR-Y-21148 show different alignments. This error has resulted in deficient information within the SID application submitted under Section 2 of the Planning and Development Act 2000 (as amended), to assess the vulnerability of damage due to vibration cause by both tunnelling and operation of underground train on this section of the alignment. This affects several buildings under the management of the OPW particularly within the Kildare Street, Merrion Square and St. Stephen's Green areas.	On two drawings (Figures 20.16 Settlement Contours, sheets 27 and 28 of 30) in EIAR Appendix 5.17 Building Damage Report, the tunnel centreline is plainly incorrect as it is deviates from the centre of the settlement contours between Tara and St. Stephen's Green stations. The settlement contours are correct and reflect the proposed Railway Order alignment and as such the drawing serves its core purpose, which is to identify, describe and assess the settlement impact of the railway works. In any event, revised drawings will be submitted to the Board to rectify the error. The correct alignment has been used for all environmental impact assessments including tunnel induced settlement, and construction and operational noise and vibration impact assessments.	
10	6.0 LEGAL CONSIDERATIONS	18	The Commissioners of Public Works would seek to enter into appropriate, property-specific legal agreements with TII, to ensure the protection of key State property and of the State's activities undertaken within those and other properties. Given the importance of such properties and activities, the Commissioners of Public Works consider it appropriate that An Bord Pleanála would make the Railway Order conditional on such legal agreements being in place between TII and the OPW. Creating such legal agreements between TII and the OPW would be possible only after TII make available the more detailed design and risk-mitigation measures for the construction and operational phases of the MetroLink project, and before any development begins. Therefore, the Commissioners of Public Works would request that this aspect be reflected in the conditions set out by An Bord Pleanála to TII, as this would provide assurances to the Commissioners of Public Works relating to future legal agreements that protect and secure State property and activities from risks associated with the construction or operations of the MetroLink.	TII's preference is carry out all of the permitted railway works with the agreement of affected landowners and prescribed bodies. However, it should not be condition of the railway order that TII reach such agreement with OPW. In the event that agreement cannot be reached with OPW, TII should be entitled to carry out the railway works over their objections provided that it complies with the terms and conditions of the Railway Order. The Board’s function is to satisfy itself that those terms and conditions are adequate to ensure that the construction and operation of the railway works will be consistent with proper planning and sustainable development and have acceptable impacts on the environment. TII believes that the RO application and the EIAR in particular sets out mitigation and monitoring measures that are sufficient for that purpose	

Submission No.			220	
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 9-15 O'Connell Street.				
11	7.1.1 Route Alignment	18	The MetroLink 8.5m ID running tunnel passes approximately 120m in front of these buildings. O'Connell Street Station is approximately 100m from this building. The alignment drawing ML1-JAI-E1A-ROUT_XX-DR-Y-04024 and the Contour drawing ML1-JAI-E1A-ROUT_XX-DR-Y-21146 show the alignment and the predicted ground movement. Beneath 9/15 O'Connell Street Upper, the proposed MetroLink will be excavated through Argillaceous Limestone rock (CLU) underlying Weathered Rock (QTR) underlying Brown Boulder Clay (QBR), containing extensive fluvio-glacial sands and gravels. Cover to the tunnel crown is approximately 23m comprising Brown Boulder Clay. The invert will be excavated through both weathered and un-weathered limestone. This will present a significant challenge to ground movement mitigation using tunnel management.	OPW's observation with regard to the alignment and geology below these buildings is noted and is the reason for the selection of the proposed TBM and the mixed face conditions identified have been used to conservatively predict the impacts on overlying buildings and infrastructure. TII will develop both TBM operational Specifications and Ground Movement and Monitoring Specifications to ensure that residual risks are appropriately managed.
12	7.1.3 Station Excavation	20	9/15 O'Connell Street is situated approximately 50m from O'Connell Street station box. The excavation for the stations will be through Brown Boulder Clay, Weathered Rock, and Argillaceous Limestone. The excavation through the Limestone will most likely include blasting which may affect the 9/15 O'Connell Street Upper properties.	The EIAR Chapter 14 presents an assessment of vibration and Air Overpressure from blasting. According to Figure 14.4 Blasting Contours (Drawing ML1-JAI-E1A-ROUT_XX-DR-Y-14024) the 9-15 O'Connell Street buildings are outside of the 2 mm/s contour line, which is below the blasting vibration threshold of 8 mm/s PPV. As a result no significant impact is expected on these buildings as a result of blasting activities.
13	7.3 Contractual Arrangement	20	The contractor(s) appointed will be responsible for the organisation, direction, and execution of environmental related activities during the detailed design and construction of the proposed Project. The contractor(s) is required to undertake all activities in accordance with the relevant environmental requirements including the consent documentation and other regulatory and contractual requirements.	TII's contractors will be bound by the Railway Order, further agreements entered into by TII and other relevant statutory or MetroLink specific regulation. An Bord Pleanála's statutory responsibility includes satisfying itself that the terms and conditions of any railway order will ensure that the railway works are consistent with the proper planning and sustainable development of the area and will not have unacceptable impacts on the environment regardless of the contractual structure.
14	8.0 POTENTIAL IMPACTS ON THE PROPERTY	20	DOWNEY and Gall Zeidler have carried out a detailed examination of the property subject to this submission. Having regard to the status and current use of the property and identified constraints, the following raises concerns regarding potential impacts of the MetroLink on the property. This has been elaborated to include potential impacts during the construction and operation phases of developing MetroLink, as well as any impediments and/or implications for future development of the property.	Please see answers to responses (15) through to (30) below.
15	8.1 Monitoring	21	Given the sensitivity of the uses within this property, we request that An Bord Pleanála attach a condition to the Draft Railway Order that ensures continuous monitoring of the property to prevent any negative impacts. Access to all properties must be agreed in advance with the OPW and its clients. It is recommended that this monitoring takes place at least 3 months in advance of the construction of the Project and at least 6 weeks post the operational stage of the MetroLink.	TII will procure its contractors to develop Instrumentation and Monitoring Plans in tandem with Monitoring Action Plans. These plans will help assure that the risks associated with tunnelling and station excavations impacting OPW property are appropriately managed and controlled. TII will provide details of any monitoring proposed by the contractor at detailed design stage and agree the methodology of installation to the OPW property. TII will provide advance notice of any attendance that the monitoring contractor may require. With regard to the timing of monitoring specific to ground movement TII will ensure that it is commenced 3 months prior to the construction activities that would give rise to the settlement. However, as these construction activities may complete years prior to the MetroLink operational phase the termination of monitoring will be linked to a determination that settlement has effectively ceased, allowing a removal of the instrumentation.
16	8.2 Security Issues	21	Given the nature of the State properties affected by the Project, we would respectfully refer An Bord Pleanála to Part XI of the Planning & Development Act 2000 (as amended), which states that: "Development by State authorities. 181.— (1) (a) The Minister may, by regulations, provide that, except for this section F902[and sections 181 A to 181C], the provisions of this Act shall not apply to any specified class or classes of development by or on behalf of a State authority where the development is, in the opinion of the Minister, in connection with or for the purposes of public safety or order, the administration of justice or national security or defence and, for so long as the regulations are in force, the provisions of this Act shall not apply to the specified class or classes of development. b(iii) the making available for inspection by members of the public of any specified documents, particulars, plans or other information with respect to the proposed development;"	This provision allows the Minister for Housing to provide that certain State developments do not require planning permission. It is not relevant to the MetroLink project. The MetroLink project is authorised by railway order and does not require planning permission. In that regard, we refer to section 38 of the Transport (Railway Infrastructure) Act 2001, which provides that "Each of the following shall be exempted development for the purposes of the Act of 2000: (a) development consisting of the carrying out of railway works, including the use of the railway works or any part thereof for the purposes of the operation of a railway, authorised by the Board and specified in a railway order or of any incidental or temporary works connected with such development; (b) development consisting of the carrying out of railway works for the maintenance, improvement or repair of a railway that has been built pursuant to a railway order."
17	8.2 Security Issues	21	All employees contracted to work on behalf of the TII on this Project, and any associated works, must adhere to the properties protocol around access, security, and safety. This applies to all persons entering or working in proximity of the property.	TII will ensure that contractors working on its behalf on OPW property comply with property protocols around access, security and safety.
18	8.2 Security Issues	21	The day-to-day operations of the property cannot be interrupted by disruptions to any utilities.	There is no intent to disrupt the day to day activities. If subsequently, it is found that a disruption to utility provision is inevitable this will be discussed with OPW and the timing and duration of any disruption optimised to minimise said disruption
19	8.2 Security Issues	21	The design and operation of the MetroLink should be in line with best international practice, in relation to anti-terrorism and security measures.	Safety and security are two priorities for the MetroLink in operation and hence the design will be developed cognisant of the risk in relation to terrorism and best practice applied. Further dialogue with OPW will be undertaken throughout the design and construction stages to ensure suitable provisions are in place.

Submission No.			220		
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW		
Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 9-15 O'Connell Street.					
20	8.3 During Construction of the MetroLink	21 and 22	This building is a fully functioning multi-lease property with commercial, restaurants and offices. It provides functional spaces and office accommodation and as such the impact of any proposed works in terms of noise, vibration, etc. which effects the quality of the working environment would need to be carefully considered.	The impact assessment in the EIAR in terms of noise and vibration considers different types of building uses in the assessment, with threshold criteria for different uses given in Table 14.18 Assessment Locations and Thresholds for AZ4 Northwood to Charlemont.	
21	8.3.1 Ground Movement	22	Stage 1: Defines extent of ground movement using Moderately Conservative parameters. The parameters considered by MetroLink are: B Volume Loss, $V_s = 1.5 \times \text{Trough Width parameter}$, $k = 0.3$ The Volume Loss is considered moderately conservative. However, the through parameter is very narrow and 0.4 could be considered more conservative. The extent of the zone of influence is defined by the 1mm contour line (Dark Red) and O'Connell Street lies just within the zone of influence and will be subject to up to 40mm settlement.	The assessments undertaken to date are, as you say, moderately conservative. Any further detailed assessment would seek to strip out some of the conservatism. The K values have been determined considering the ground conditions specific to location and hence K values vary between 0.3 to 0.5 as shown in Table 5.1 of Appendix 5.17 of the EIAR. The rationale for the selection of K values is given further in section 4.2.3 of Appendix 5.17.	
22	8.3.1 Ground Movement	22	Stage 2: The ground movement impact on the 9/15 O'Connell Street Upper has not been identified in the EIAR A5.17. A Stage 2 Assessment should be carried out for this building.	A stage 2 assessment will be carried out by the main works contractor for this building.	
23	8.3.1 Ground Movement	22	Stage 3 (Detailed Assessment): A Stage 3 assessment is required for this building.	A stage 3 assessment will be carried out by the main works contractor for this building.	
24	8.3.1 Ground Movement	22	Stage 4: Mitigation may be required for this building and therefore the OPW expects to be consulted. The OPW expects that pre-construction defect surveys and monitoring are carried out for this building. The OPW will facilitate and observe the preconstruction defect surveys. It is noted that these shall be carried out by Professionally Qualified Engineers or Surveyors. The contractor(s) will coordinate preconstruction defect surveys for identified properties, liaising (in conjunction with the employer) with the building surveyor employed to carry out the surveys and maintaining a dialogue with the relevant property owners throughout the duration of the works.	All surveys, monitoring and mitigation proposed for OPW property will be discussed with OPW. TII will employ Professionally Qualified Engineers / Surveyors with the appropriate expertise to undertake the pre and post condition surveys and OPW are welcome to observe the surveys being undertaken of their property.	
25	8.3.1 Ground Movement	23	Stage 5 (Close out): Once the excavation (tunnelling and station excavation) has been completed then the Contractor will want to decommission his monitoring. The OPW expects to be provided with close out reports for the monitoring of its property. As a minimum, the close out report should include details of any mitigation carried out, a list of any repairs, time history graphs showing the movements monitored.	TII will share the closeout monitoring report that will demonstrate that construction ground movements have ceased, which will also require historical movement information to be presented. In the event of repairs, these will be scheduled.	
26	8.3.3 Noise and Vibration	23	(a) Tunnelling During the passage of the tunnel boring machine (TBM) the noise is predicted to be 49 dBLA _{max,s} exceeding the acceptable threshold (45 dBiA _{max,s})and this may last for 2 weeks. The vibration from the passage of the TBM is predicted to be 0.257 VDV _{db} , m s ⁻¹ , 1.75 less than the threshold (1.6 VDV _{dUms} -1.75). EIAR Table 6.2- GNV1 states that there is no effective mitigation available and therefore the impact will be managed by detailed consultation with the building owners. The OPW requires a specific study carried for 9/15 O'Connell Street Upper to determine whether ground borne noise and vibration will have any impact. Where any impact is identified then threshold limits will need be applied and monitored. Where the building is considered vulnerable to vibration induced damage EIAR Table 6.2- ANV16. sets out requirement for pre and post construction surveys of these structures.	It should be noted that a full assessment of groundborne noise & vibration effects have been provided in Chapter 14 of the EIAR. The modelling undertaken in this chapter presents the potential impacts arising from all stages of the construction phase of the project. The assessment has identified that there will be no potential for structural damage due to vibration as levels of vibration are predicted to be below the construction threshold of 1.6 ms-1.75 VDV (Please refer to Appendix 14.5 - Groundborne Noise and Vibration and Blasting Modelling Results) and accordingly there is no requirement for further specific studies requested. Regarding groundborne noise, unfortunately, there are no effective methods available to reduce groundborne noise from TBMs at source, but noting that the duration of this impact will be of the order of two weeks. TII will consult and liaise with 9-15 O'Connell Street, to ensure the timing of these impacts are known. The principal mitigation measures aimed at minimising impacts are as follows: - Advance public consultation and stakeholder engagement can greatly reduce the significance of groundborne noise effects, as building occupants would be prepared for the passage of the TBM and resultant elevated noise and vibration levels. - TII will accept and consider applications for additional measures on a case-by case basis, in accordance with its Noise and Vibration Mitigation Policy (see Appendix A14.6 Airborne Noise and Groundborne Noise Mitigation Policy).	

Submission No.			220	
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 9-15 O'Connell Street.				
27	8.3.3 Noise and Vibration	23	(b) Station Excavation GNV2 states that monitoring of blasting and re-optimising the blast design (minimising the explosive charge considering the results) will be carried out as standard. A5.20 Blasting Strategy provides information on the classification of buildings and potential damage due to blasting for the station excavations. There are also calculations for estimated magnitude of the peak particle velocity (ppv) for various explosive charges. The assumption is that the lowest charge would be implemented to avoid damage. m9/15 O'Connell Street Upper is located approximately 50m from O'Connell Street Station excavation and the peak particle velocity is predicted to exceed 1mm/s. The OPW requires a specific assessment of the impact of blasting on 9/15 O'Connell Street Upper.	Please refer to response number (12) above.
28	8.3.4 Work Sites	23	(a) Dust Appendix A16.4 of the EIAR requires a Dust Management Plan to be produced and implemented. The tunnelling will not generate dust in the vicinity of 9-10 O'Connell Street Upper. The station construction site is 60m from 9/15 O'Connell Street Upper and therefore dust from these constructions sites is likely to affect the buildings.	TII are in agreement that a dust mitigation strategy is necessary. Dust mitigation will be detailed in an Air Quality Management Plan which will be prepared and submitted for approval to the relevant planning authority before construction (Section 16.6.1.1 Chapter 16 Air Quality). The plan must include all appropriate dust and emissions mitigation measures including for asbestos and aspergillus, applicable to the circumstances of the relevant site, based on the local authority requirements and industry best practices. The plan will be developed by the contractor and for each worksite shall include: -An inventory and timetable of activities which may give rise to emissions or dust; -Alert levels; -Alert system to be used (including notification process); -Details of control measures; -Details of dust monitoring arrangements, including the location of sensitive receptors, monitoring locations, and monitoring equipment to be used; and -Details of the air quality reporting requirements. A summary of dust mitigation measures outlined in Section 16.6.1.1 of Chapter 16 to be implemented are as follows: -Material handling systems and site stockpiling of materials will be designed and laid out to minimise exposure to wind. Water misting or sprays will be used as required if particularly dusty activities are necessary during dry or windy periods; -Any blasting will be completed by specialised contractors with a specific blasting dust management plan; -Liaison with local authorities and community groups; -Hoarding will be provided around the construction compounds; and -It is anticipated that methods of collecting rainwater and recycling for general site use, will be adopted where practical. Requirements for dewatering installations at deep station and tunnel portals can also provide a valuable source of water for general site use. When the dust minimisation measures detailed in the mitigation section (Section 16.6) of EIAR Chapter 16 are implemented, fugitive emissions of dust from the site are not predicted to be significant and pose no nuisance, human health or ecological risk to nearby receptors. Thus, there will be no likely residual Construction Phase dust effects (Section 16.7.1 Chapter 16).

Submission No.			220	
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 9-15 O'Connell Street.				
29	8.3.4 Work Sites	24	b) Ground Water Control There is the potential for ground water lowering for the construction of O'Connell Street Station to impact 9/15 O'Connell Street Upper. The OPW requests that TII provides an assessment and limits that will be applied to dewatering for the construction of O'Connell Street Station.	TII understand your concern, however following reviews, surveys and monitoring of groundwater, it can be concluded that 9 – 15 O'Connell Street will not be impacted by works at the proposed O'Connell Street Station. As outlined in EIAR Chapter 19 (Hydrogeology), groundwater assessment and monitoring were and will continue to be undertaken for the proposed Project: • AWN undertook an extensive desktop review in order to establish baseline conditions along the proposed alignment corridor. The baseline study included reference to historical ground investigation data including the 2007 IGSL investigation borehole dataset (IGSL 2008) and data from Norwest Holst (2008) as well as information from contemporary (2019-2021) ground investigations specific to the proposed Project (Table 19.2); • A number of field surveys and walkover assessments were carried out to add to existing assessment of long-term trend analysis for water quality undertaken by the EPA (Section 19.3.3.4); • A number of intrusive ground investigations were commissioned for the proposed Project including ground water level monitoring (Section 19.3.3.5). A programme of continuous groundwater level monitoring, aquifer testing and groundwater quality monitoring was devised with focus on key well locations along the alignment including at deep station excavations; and • A hydrogeological review of Tara Street was undertaken and can be found in EIAR Appendix A19.11. Dewatering and unmitigated releases to ground during the Construction Phase could have permanent water quality and quantity impacts on the hydrogeological (and hydrological/ecological) environment if not effectively mitigated (Section 19.5.1). However, for the proposed Project, Construction Phase management includes mitigation measures presented in the EIAR and outlined in the outline Construction and Environmental Management Plan (CEMP) (Appendix A5.1) for the proposed Project to protect receiving waters (groundwater and surface water) and ensure continued conveyance of natural groundwater flow patterns, as well as of surface water courses.
30	8.3.4 Work Sites	24	(g) Traffic There will be significant traffic diversions required to construct O'Connell Street Station site that will impact personnel and clients attending the 9/15 O'Connell Street Upper buildings.	As outlined in Section 7.8 of Appendix 9.5 Scheme Traffic Management Plan - Construction Traffic will not enter O'Connell St, which itself has been found through models to see a net decrease in traffic volumes. With no other adverse impacts identified for O'Connell St.
31	CONCLUSION	25	The most significant impacts of the MetroLink project on 9-10 O'Connell Street Upper will be from the construction of the O'Connell Street Station directly opposite this building and the launching of the tunnel boring machine to Tara Station. Both generating ground movement, noise, and vibration. The OPW requires assurances from TII that Stage 2 and 3 ground movement assessments to be carried out specifically for this building. These ground movement assessments should carefully consider the parameters that are used.	Please refer to response number (2) above.
32	CONCLUSION	25	Once the railway is in operation, it is possible that there will be major noise and vibration impact and TII should seek assurance that a detailed evaluation will be performed.	Groundborne noise and vibration from operation of the railway has been calculated for buildings representing 9-15 O'Connell Street with the results presented in Appendix 14.5 Groundborne Noise and Vibration and Blasting Modelling Results of the EIAR. The highest level of groundborne noise is predicted for 14 O'Connell Street and is 36 dB LASmax, which is below the 40 dB LASmax threshold, resulting in a not significant impact on the building. The highest level of groundborne vibration is predicted for 14 O'Connell Street and is 0.01 m/s-1.75, much lower than the VDV Threshold Level for these buildings of 0.8 m/s-1.75, resulting in a not significant impact on the building.
33	CONCLUSION	25	With respect to this property, the OPW is seeking: 1) To ensure minimum disruption to the working access of the building and its day-to-day uses and functions.	Please refer to response number (32) above.

Submission No.			220	
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - 9-15 O'Connell Street.				
34	CONCLUSION	25	With respect to this property, the OPW is seeking: 2) To ensure no damage to the building and its architectural detailing, pre-construction and post-construction surveys, trials and monitoring is required. This is mainly concerned with noise, vibration, and dust which can damage the building which is of historical significance and character.	The mitigation measures outlined in Chapter 13 (Airborne Noise and Vibration), Chapter 14 (Ground borne Noise and Vibration) and Chapter 16 (Air Quality) ensure that the architectural detailing of 9 – 15 O'Connell Street will be protected. Protective measures are also outlined in the outline Construction Environmental Management Plan (CEMP) (EIAR Appendix A5.1). The outline CEMP will encompass a Noise and Vibration Management Plan (CNVMP) which will be formulated for the construction phase and used by all contractors based on the mitigation measures. Mitigation measures that will be implemented to reduce noise during construction include noise control at source, management of construction working hours and screening. Without mitigation, the predicted magnitude of construction noise impacts on 9 – 15 O'Connell Street are significant to very significant. Following mitigation, residual noise levels are calculated to be controlled to below the Construction Noise Threshold (CNT) and/or below the upper construction limit of 75dB LAeq,T at all Noise Sensitive Locations (NSLs) (13.7.1.1.4 Chapter 13). The likely effects associated with the Construction Phase dust emissions pre-mitigation are overall Negative, Not Significant and Medium-Term (Section 16.5.2.12.2 Chapter 16). Before commencing relevant works, an Air Quality Management Plan will be prepared and submitted for approval to the relevant planning authority. The plan will include all appropriate dust and emissions mitigation measures including for asbestos and aspergillus, applicable to the circumstances of the relevant site, based on the local authority requirements and industry best practices. In order to ensure that no dust nuisance occurs, a series of measures will be implemented, these have been detailed in EIAR Appendix A16.4. In summary, the measures which will be implemented will include: •Material handling systems and site stockpiling of materials will be designed and laid out to minimise exposure to wind. Water misting or sprays will be used as required if particularly dusty activities are necessary during dry or windy periods; •Any blasting will be completed by specialised contractors with a specific blasting dust management plan; •Liaison with local authorities and community groups; •Hoarding will be provided around the construction compounds; and •It is anticipated that methods of collecting rainwater and recycling for general site use, will be adopted where practical. Requirements for dewatering installations at deep station and tunnel portals can also provide a valuable source of water for general site use. When the dust minimisation measures detailed in the mitigation section of this chapter are implemented, fugitive emissions of dust from the site are not predicted to be significant and pose no nuisance, human health or ecological risk to nearby receptors. Thus, there will be no likely residual Construction Phase dust effects (Section 16.7.1 Chapter 16).
35	CONCLUSION	25	With respects to this property, the OPW is seeking: 3) Disruptions to traffic may happen during construction phases, wayleave to staff as well as postal vans and lorries will be required.	Please refer to response number (32) above.
36	CONCLUSION	25	With respect to this property, the OPW is seeking: 4) Precedents to be applied to the risk assessments to ensure utilising best industry practice within the implementation of the Project.	TII intend to apply industry best practice to build and operate the MetroLink whilst minimising impacts to 3rd parties. The Project will be delivered in accordance with relevant risk management processes.
37	CONCLUSION	25	5) To ensure future development of 9/15 O'Connell Street is not impacted, including emergency works which may need to be carried out on the building, repairs, refurbishments, and development.	Metrolink will not impede these works.
38	CONCLUSION	25	6) To mitigate the noise and vibration to the acceptable levels for this commercial and governmental office block by installing floating track slab at this section of the alignment.	Groundborne noise and vibration from operation of the railway has been calculated for buildings representing 9-15 O'Connell Street with the results presented in Appendix 14.5 Groundborne Noise and Vibration and Blasting Modelling Results of the EIAR. The highest level of groundborne noise is predicted for 14 O'Connell Street and is 36 dB LASmax, which is below the 40 dB LASmax threshold, resulting in a not significant impact on the building. The highest level of groundborne vibration is predicted for 14 O'Connell Street and is 0.01 m/s-1.75, much lower than the VDV Threshold Level for these buildings of 0.8 m/s-1.75, resulting in a not significant impact on the building. There is therefore no need to install floating slab track at this location.
39	APPENDIX 1: LIST OF PLANNING LEGISLATION & POLICY	27	This appendix provides a non-exhaustive list of planning policy, legislation, and guidelines. We would respectfully request that An Bord Pleanála ensure that TH have fully assessed the Project with regard to existing planning policy, as well as adherence to the relevant local policies and guidelines pertaining to each individual property. DOWNEY note that this proposed Draft Railway Order is a strategic long-term development and An Bord Pleanála may consider Development Plans in assessing the Project. It is also crucial to note that on foot of a granted Order and during the detailed design stage, a revision to planning policy is expected, whereby adopted plans and legislation may have to be adhered within this stage. This may require an amendment to the Railway Order and further assessment, including public consultation.	Please refer to response number (7) above.

Submission No.			221	
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - Apartments 1-8 Clare Court.				
1	Downey Report- Executive Summary		With respect to this property, the OPW is seeking: 1) To ensure no noise and disruption to the residential development. 2) To ensure that future development potential of Clare Court building can include multiple basement levels as part of the National Gallery of Ireland masterplan. 3) To ensure essential access from Clare Street and Clare Lane is undisturbed. Maintaining this access will be of paramount importance during construction and operation of the National Gallery of Ireland Masterplan in the coming years. 4) To include adverse impacts of Tara Street and St. Stephen's Green stations within the risk assessment studies for the residential complex and provide for mitigation measures, as construction of these stations will generate additional lorry movements for both deliveries and spoil removal." 5) Precedents to be applied to the risk assessments to ensure utilising best industry practice within implementation of the Project. 6} To ensure no conflicts between the construction and operation of the Project and the future development of the building as part of the National Gallery masterplan, as it is subject to on-going construction and further development, as part of Project Ireland 2040.	TII thank you for your comments. Further to TII's response to the OPW Covering letter, the matters raised by OPW specific to these buildings are addressed in responses (2) through to (28) below.
2	Downey Report- 3.0 Overview of the Draft Railway Order	8, 9	While extensive pre-planning consultations also took place between TII and the OPW, a detailed assessment of the individual properties affected has not yet taken place. The Draft Railway Order application 2022 is a Draft Order, and should the route be approved by An Bord Pleanála, further detailed design will be submitted which will require further consideration and approval. Factors such as the internal uses of the properties, their construction methods, age and historical importance and the effect of construction on these sensitivities has not been assessed as part of the Project thus far. Additional consideration needs to be given to the potential effects on the built environment before a route and construction method can be confirmed. The OPW reserves the right to make further commentary, pending more detailed design proposals	This building is distant from the tunnel alignment, outside any zone of influence and therefore not impacted by settlement, groundborne noise or vibration. No building specific assessments are therefore required and the property will not be prevented from future development by MetroLink.
3	4.4 Planning context	12	In relation to the Draft Railway Order's consistency with planning policy and planning guidelines, a non-exhaustive list of planning policy and legislation at National, Regional, and Local levels, is included in Appendix 1 of this submission and the Board is invited to refer to this for further details. We would respectfully request that An Bord Pleanála ensure that TII have fully assessed the Project regarding existing planning policy, as well as adherence to the relevant local policies and guidelines pertaining to each individual property.	TII have undertaken a full assessment of the planning policy and planning guidelines in the Planning Report that was submitted as part of the Railway Order Application.
4	4.4 Planning context	13	DOWNEY note that this proposed Draft Railway Order is a strategic long-term development and An Bord Pleanála may consider Draft Development Plans in assessing the Project. It is also crucial to note that on foot of a granted Order and during the detailed design stage, a revision to planning policy is expected, whereby adopted plans and legislation may have to be adhered within this stage. This may require an amendment to the Draft Railway Order and further assessment, including public consultation.	The only policy relevant to the decision on whether to grant the Railway Order and the necessary conditionality is the policy in force at the date of the grant of the Railway Order, as has been made clear in numerous High Court decisions including <i>Element Power v An Bord Pleanála</i> [2017] IEHC 550 and the Railway Order cannot be made conditional on compliance with future, yet to be developed policy. As planning and policy and strategy are being updated constantly, TII will undertake a further review of planning policy in advance of any oral hearing to allow for an updated presentation on the projects consistency with active policy requirements to be presented to An Bord Pleanála.
5	4.5 Potential Development of the Property	12	The site (part) is to be included as part of Phase 4 of the National Gallery of Ireland Master Development Plan 2017-2023, which aims to "establish new state-of-the-art, purpose-built spaces for Conservation, Education, Library & Archives and Commercial, as well as new exhibition spaces and storage areas." This envisages the construction of a new wing of the Gallery that would be situated along Clare Court and the car park to the rear of the flats. This expansion will allow the Gallery to grow and increase its capacity for new exhibition spaces and library and archives storage. It is essential for the development of the National Gallery that the planned MetroLink development cannot impede or limit the development potential of the site, including above or below ground. Access to this site by the OPW/its agents for construction and operation of any future development is of paramount importance.	Irrelevant for this building, please refer to response number (2) above.
6	5.0 MATERIAL CONSIDERATIONS	12	The alignment drawing ML1-JAI-EIA-ROUT_XX-DR-Y-04025 and the Contour drawing ML1-JAI-EIA-ROUT_XX-DR-Y-21148 show different alignments. This error has resulted in deficient information within the SID application submitted under Section 2 of the Planning and Development Act 2000 (as amended), to assess the vulnerability of damage due to vibration cause by both tunnelling and operation of underground train on this section of the alignment. This affects several buildings under the management of the OPW particularly within the Kildare Street, Merriion Square and St. Stephen's Green areas.	Irrelevant for this building, please refer to response number (2) above. On two drawings (Figures 20.16 Settlement Contours, sheets 27 and 28 of 30) in EIAR Appendix 5.17 Building Damage Report, the tunnel centreline is plainly incorrect as it is deviates from the centre of the settlement contours between Tara and St. Stephen's Green stations. The settlement contours are correct and reflect the proposed Railway Order alignment and as such the drawing serves its core purpose, which is to identify, describe and assess the settlement impact of the railway works. In any event, revised drawings will be submitted to the Board to rectify the error. The correct alignment has been used for all environmental impact assessments including tunnel induced settlement, and construction and operational noise and vibration impact assessments.

Submission No.			221	
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - Apartments 1-8 Clare Court.				
7	6.0 LEGAL CONSIDERATIONS	13	The Commissioners of Public Works would seek to enter into appropriate, property-specific legal agreements with TII, to ensure the protection of key State property and of the State's activities undertaken within those and other properties. Given the importance of such properties and activities, the Commissioners of Public Works consider it appropriate that An Bord Pleanála would make the Railway Order conditional on such legal agreements being in place between TII and the OPW. Creating such legal agreements between TII and the OPW would be possible only after TII make available the more detailed design and risk-mitigation measures for the construction and operational phases of the MetroLink project, and before any development begins. Therefore, the Commissioners of Public Works would request that this aspect be reflected in the conditions set out by An Bord Pleanála to TII, as this would provide assurances to the Commissioners of Public Works relating to future legal agreements that protect and secure State property and activities from risks associated with the construction or operations of the MetroLink.	TII's preference is carry out all of the permitted railway works with the agreement of affected landowners and prescribed bodies. However, it should not be condition of the railway order that TII reach such agreement with OPW. In the event that agreement cannot be reached with OPW, TII should be entitled to carry out the railway works over their objections provided that it complies with the terms and conditions of the Railway Order. The Board’s function is to satisfy itself that those terms and conditions are adequate to ensure that the construction and operation of the railway works will be consistent with proper planning and sustainable development and have acceptable impacts on the environment. TII believes that the RO application and the EIAR in particular sets out mitigation and monitoring measures that are sufficient for that purpose
8	7.1.1 Route Alignment	13, 14	The tunnel alignment does not pass directly beneath the Apartments 1-8 Clare Court. However, there is inconsistency in the alignment between Tara Station and St. Stephen's Green. The alignment drawing ML1-JAI-EIA-ROUT_XX-DR-Y-04025 and the Contour drawing ML1-JAI-EIA-ROUT_XX-DR-Y-21148 show different alignments. Many of the reports refer to chainages along the alignment. However, there are no plans that indicate these chainages, and this makes reviewing the Draft Railway Order and E1AR difficult.	Irrelevant for this building, please refer to response number (2) above. On two drawings (Figures 20.16 Settlement Contours, sheets 27 and 28 of 30) in EIAR Appendix 5.17 Building Damage Report, the tunnel centreline is plainly incorrect as it is deviates from the centre of the settlement contours between Tara and St. Stephen's Green stations. The settlement contours are correct and reflect the proposed Railway Order alignment and as such the drawing serves its core purpose, which is to identify, describe and assess the settlement impact of the railway works. In any event, revised drawings will be submitted to the Board to rectify the error. The correct alignment has been used for all environmental impact assessments including tunnel induced settlement, and construction and operational noise and vibration impact assessments.
9	7.3 Contractual Arrangement	15	The contractor(s) appointed will be responsible for the organisation, direction, and execution of environmental related activities during the detailed design and construction of the proposed Project. The contractor(s) is required to undertake all activities in accordance with the relevant environmental requirements including the consent documentation and other regulatory and contractual requirements.	Irrelevant for this building, please refer to response number (2) above. TII accepts this as accurate, but many of the matters referred to, in particular the contractual arrangements with the contractors, are outside the scope of the railway order process.
10	8.0 POTENTIAL IMPACTS ON THE PROPERTY	15	DOWNEY and Gall Zeidler have carried out a detailed examination of the property subject to this submission. Having regard to the status and current use of the property and identified constraints, the following raises concerns regarding potential impacts of the MetroLink on the property. This has been elaborated to include potential impacts during the construction and operation phases of developing MetroLink, as well as any impediments and/or implications for future development of the property.	Please refer to responses (11) through to (19) below.
11	8.1 Monitoring	16	Given the strategic importance of the property, we request that An Bond Pleanála attach a condition to the Draft Railway Order that ensures continuous monitoring of the property to prevent any negative impacts. Access to all properties must be agreed in advance with the OPW and its clients. It is recommended that this monitoring takes place at least 3 months in advance of the construction of the Project and at [east 6 weeks post the operational stage of the MetroLink.	Irrelevant for this building, please refer to response number (2) above.
12	8.2 Security Issues	16	Given the nature of the State properties affected by the Project, we would respectfully refer An Bord Pleanála to Part XI of the Planning & Development Act 2000 (as amended), which states that: "Development by State authorities. 181.— (1) (a) The Minister may, by regulations, provide that, except for this section F902[and sections 181 A to 181C], the provisions of this Act shall not apply to any specified class or classes of development by or on behalf of a State authority where the development is, in the opinion of the Minister, in connection with or for the purposes of public safety or order, the administration of justice or national security or defence and, for so long as the regulations are in force, the provisions of this Act shall not apply to the specified class or classes of development. b(iii) the making available for inspection by members of the public of any specified documents, particulars, plans or other information with respect to the proposed development;"	This provision allows the Minister for Housing to provide that certain State developments do not require planning permission. It is not relevant to the MetroLink project. The MetroLink project is authorised by railway order and does not require planning permission. In that regard, we refer to section 38 of the Transport (Railway Infrastructure) Act 2001, which provides that "Each of the following shall be exempted development for the purposes of the Act of 2000: (a) development consisting of the carrying out of railway works, including the use of the railway works or any part thereof for the purposes of the operation of a railway, authorised by the Board and specified in a railway order or of any incidental or temporary works connected with such development; (b) development consisting of the carrying out of railway works for the maintenance, improvement or repair of a railway that has been built pursuant to a railway order."
13	8.2 Security Issues	16	All employees contracted to work on behalf of the TII on this Project, and any associated works, must adhere to the properties protocol around access, security, and safety. This applies to all persons entering or working in proximity of the property.	While not relevant for this building, please refer to response number (2) above, TII will ensure that contractors working on its behalf on any OPW property comply with property protocols around access, security and safety.
14	8.2 Security Issues	16	The day-to-day operations of the property cannot be interrupted by disruptions to any utilities.	Day to day operations are not impacted.

Submission No.			221	
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - Apartments 1-8 Clare Court.				
15	8.2 Security Issues	16	The design and operation of the MetroLink should be in line with best international practice, in relation to anti-terrorism and security measures.	Safety and security are two priorities for the MetroLink in operation and hence the design will be developed cognisant of the risk in relation to terrorism and best practice applied. Further dialogue with OPW will be undertaken throughout the design and construction stages to ensure suitable provisions are in place.
16	8.3.1 Ground Movement	17	Stage 3: The OPW requests that a Stage 3 assessment will be carried out for the Apartments 1-8 Clare Court by the Contractor appointed to construct this section of the MetroLink. The OPW is expecting to be consulted on the detail, scope of this assessment and programme for these assessments. It would be helpful if Til were to develop a Design Standard to ensure that all Stage 3 analyses of the OPW properties are carried out equally. No mention of Stage 4 or 5 has been found in the Draft Railway Order or EIAR. Industry best practice as applied to London's Elizabeth Line (Crossrail) required that two further Stages in the Assessment of ground movement were undertaken during the project.	Irrelevant for this building, please refer to response number (2) above.
17	8.3.1 Ground Movement	18	Stage 4 (Construction Stage): This stage is where any mitigation is implemented, and the monitoring of the stakeholder's infrastructure is carried out. Also, the pre-construction defect surveys are carried out prior to any excavation. The OPW requires to review the detailed proposals for mitigation and monitoring. Monitoring proposals submitted to the OPW for review should include deep level monitoring and ground water level monitoring in addition to the building and surface monitoring typically implemented. The deep level monitoring will provide valuable data relating to the rock behaviour and has been usefully employed on HS2. The OPW will facilitate and observe the pre-construction defect surveys. It is noted that these shall be carried out by Professionally Qualified Engineers or Surveyors. The contractor(s) will coordinate pre-construction defect surveys for identified properties, liaising (in conjunction with the employer) with the building surveyor employed to carry out the surveys and maintaining a dialogue with the relevant property owners throughout the duration of the works.	Irrelevant for this building, please refer to response number (2) above.
18	8.3.1 Ground Movement	18	Stage 5 (Close out): Once the excavation (tunnelling and station excavation) has been completed, then the Contractor will want to decommission his monitoring. The OPW expects to be provided with close out reports for the monitoring of its property. As a minimum, the close out report should include details of any mitigation carried out, a list of any repairs and time history graphs showing the movements monitored.	Irrelevant for this building, please refer to response number (2) above.
19	8.5 Future Development	20	It is essential for the development of the National Gallery that the planned MetroLink development works cannot impede or limit the development potential of the site. Access to this site by the OPW/its agents for construction and operation of any future development is of paramount importance. The OPW reserves the right to development of the subject property in the future, including property above and below ground, subject to normal planning criteria. It is important that the development of the MetroLink does not interfere with extant planning permissions pertaining to the subject property and the right of the applicant to develop these, in advance, in tandem or post operation of the MetroLink Project.	Irrelevant for this building, please refer to response number (2) above. The distance of the property from MetroLink precludes an interface.
20	CONCLUSION	20	With regard to the Gall Zeidler assessment, the risk of damage to the Apartments 1-8 Clare Court from ground movement is negligible. Pre-construction and post-construction surveys, monitoring are required by the OPW. During the passage of the Tunnel Boring Machine (TBM) the noise and vibration were not estimated and considered negligible at this location.	Irrelevant for this building, please refer to response number (2) above.
21	CONCLUSION	20	With respect to this property, the OPW is seeking: 1) To ensure no noise and disruption to the residential development	Irrelevant for this building, please refer to response number (2) above.
22	CONCLUSION	21	With respect to this property, the OPW is seeking: 2) To ensure that future development potential of Clare Court building can include multiple basement levels as part of the National Gallery of Ireland masterplan.	Irrelevant for this building, please refer to response number (2, 19) above.
23	CONCLUSION	25	3) To ensure essential access from Clare Street and Clare Lane is undisturbed. Maintaining this access will be of paramount importance during construction and operation of the National Gallery of Ireland Masterplan in the coming years.	Construction Traffic is not expected to pass within 400m of this property as set out in sections 7.9 and 7.10 of Appendix A.9.5 of the EIAR. No adverse impacts to users of this street have been identified in Appendices A.9.5 or A.9.2 of the EIAR and access is not impacted.
24	CONCLUSION	21	With respects to this property, the OPW is seeking: 4) To include adverse impacts of Tara Street and St. Stephen's Green stations within the risk assessment studies for the residential complex and provide for mitigation measures, as construction of these stations will generate additional lorry movements for both deliveries and spoil removal.	Please refer to response number (23) above.

Submission No.			221	
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - Apartments 1-8 Clare Court.				
25	CONCLUSION	21	With respect to this property, the OPW is seeking: 5) Precedents to be applied to the risk assessments to ensure utilising best industry practice within implementation of the Project.	Irrelevant for this building, please refer to response number (2) above.
26	CONCLUSION	21	6} To ensure no conflicts between the construction and operation of the Project and the future development of the building as part of the National Gallery masterplan, as it is subject to on-going construction and further development, as part of Project Ireland 2040.	MetroLink does not impact on future plans for the development of this site.
27	APPENDIX 1: LIST OF PLANNING LEGISLATION & POLICY	21	This appendix provides a non-exhaustive list of planning policy, legislation, and guidelines. We would respectfully request that An Bord Pleanála ensure that TII have fully assessed the Project with regard to existing planning policy, as well as adherence to the relevant local policies and guidelines pertaining to each individual property. DOWNEY note that this proposed Draft Railway Order is a strategic long-term development and An Bord Pleanála may consider Development Plans in assessing the Project. It is also crucial to note that on foot of a granted Order and during the detailed design stage, a revision to planning policy is expected, whereby adopted plans and legislation may have to be adhered within this stage. This may require an amendment to the Railway Order and further assessment, including public consultation.	Please refer to response number (4) above.
28	Appendix 2: Ground movement Assessment	27	Duplicate of Appendix to D to OPW Cover Letter - Re: Railway (Metrolink–Estuary to Charlemont via Dublin Airport) Order 2022 – Submissions by the Commissioners of Public Works in Ireland	Refer to OPW Cover Letter response

Submission No.			222	
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - Ballymun Garda District Headquarters and INTERO offices.				
1	Downey Report- Executive Summary	N/A	With respect to this property, the OPW is seeking: 1) To note that this is an important building providing a range of civic services and includes the Regional Garda Headquarters Building, to which access must be maintained on a twenty-four- hour basis. Service at this building cannot be interrupted before, during or after the construction of the MetroLink. 2) To ensure no damage to the building and its day-to-day functions, pre-construction and post-construction surveys, trials and monitoring is required. This is mainly concerned with noise and vibration which can damage this important civic building, as well as its functions. 3) To ensure specific vibrations limits that will be applied to the Ballymun Garda District Headquarters & INTREO Office, and a monitoring regime is to be implemented. 4) To include adverse impacts of Ballymun station within the risk assessment studies for the Ballymun Garda District Headquarters & INTREO Office and provide for mitigation measure, as construction of these stations will generate additional lorry movements for both deliveries and spoil removal. 5) Precedents to be applied to the risk assessments to ensure utilising best industry practice within the implementation of the Project.	TII thank you for your comments. Further to TII's response to the OPW Covering letter, the matters raised by OPW specific to these buildings are addressed in responses (2) through to (25) below.
2	Downey Report- 3.0 Overview of the Draft Railway Order	Page 8, 9	While extensive pre-planning consultations also took place between Pleanála and the OPW, a detailed assessment of the individual properties affected has not yet taken place. The Draft Railway Order application 2022 is a Draft Order, and should the route be approved by An Bord Pleanála, further detailed design will be submitted which will require further consideration and approval. Factors such as the internal uses of the properties, their construction methods, age and historical importance and the effect of construction on these sensitivities has not been assessed as part of the Project thus far. Additional consideration needs to be given to the potential effects on the built environment before a route and construction method can be confirmed. The OPW reserves the right to make further commentary, pending more detailed design proposals.	TII have undertaken a Phased Ground Movement Impact Assessment and the results of the assessments are included in the RO documentation within Appendix 5.17 of the EIAR. Appendix B2 of that document indicates the list of special buildings that would be subject to a subsequent Phase 3 assessment irrespective of the engineering need to do so. Many OPW buildings are in this category. It should be noted that the further assessments that will be done by the contractor if the RO is granted will likely reduce the impacts on the buildings as the Phase 2 assessment is a moderately conservative assessment whose results are generally more significant than the results of a Phase 3 assessment. This point was discussed with OPW and their consultants in January 2023. TII will consult with OPW in relation to the results of any Phase 3 assessments and any requirements for monitoring and / or other mitigations that eventuate. TII are satisfied that the approach adopted to date follows an industry standard approach undertaken on tunnelling and underground projects around the world including on the Channel Tunnel Rail Link and Crossrail in London, the Dublin Port Tunnel and currently on High Speed 2 in England, and therefore that further assessment is not required and should not be delivered prior to the route being consented.
3	4.3 Current Use/Uses	11	This property is currently in use as an operational Garda station and Divisional Headquarters. The complex also extends to accommodate the Department of Social Protection which provides a full INTREO public office and other Government services. The building itself, completed c. 2008, extends to part-three, part-four storey over a large basement car park, which also serves the adjoining civic centre. There is additional surface parking for staff to the rear of the property. Full access to the building, both pedestrian and vehicular access to staff parking to the rear, will need to be maintained during the course of any construction works. To note, the Garda Station is open on a twenty-four-hour uninterrupted basis.	As set out in Section 7.3 of Appendix A.9.5, no adverse impacts are expected to the access of this building throughout the project with road and footpath access maintained at all times.
4	4.4 Planning context	12	Metrolink conducted a public consultation on the Preferred Route over an eight-week period from 26th March 2019 to 21st May 2019. Over 1,000 people attended the five public events which were held at key locations along the route. While extensive pre-planning consultations have been carried out on the route, a detailed assessment of the properties affected has not yet taken place. The Draft Railway Order application 2022 is a Draft Order and, should the route be approved by An Bord Pleanála, further detailed design considerations will be submitted which require further consideration and approval. At this current juncture a detailed analysis of the properties affected has not taken place, factors such as internal uses of buildings and the effect of construction has not been considered as part of the assessment thus far. More consideration needs to be given to the potential effects on the built environment before a route can be confirmed. The OPW reserves the right to make further commentary, should the alignment be changed, and which would require further assessment.	Please refer to response number (2) above.
5	4.4 Planning context	13	DOWNEY note that this proposed Draft Railway Order is a strategic long-term development and An Bord Pleanála may consider Draft Development Plans in assessing the Project. It is also crucial to note that on foot of a granted Order and during the detailed design stage, a revision to planning policy is expected, whereby adopted plans and legislation may have to be adhered within this stage. This may require an amendment to the Draft Railway Order and further assessment, including public consultation.	The only policy relevant to the decision on whether to grant the Railway Order and the necessary conditionality is the policy in force at the date of the grant of the Railway Order, as has been made clear in numerous High Court decisions including Element Power v An Bord Pleanála [2017] IEHC 550 and the Railway Order cannot be made conditional on compliance with future, yet to be developed policy. As planning and policy and strategy are being updated constantly, TII will undertake a further review of planning policy in advance of any oral hearing to allow for an updated presentation on the projects consistency with active policy requirements to be presented to An Bord Pleanála.

Submission No.			222		
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW		
Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
OPW Cover Letter - Re: Railway (MetroLink-Estuary to Charlemont via Dublin Airport) - Ballymun Garda District Headquarters and INTERO offices.					
6	5.0 MATERIAL CONSIDERATIONS	13	The alignment drawing ML1-JAI-EIA-ROUT_XX-DR-Y-04025 and the Contour drawing ML1-JAI-E1A-ROUT_XX-DR-Y-21148 show different alignments. This error has resulted in deficient information within the SID application submitted under Section 2 of the Planning and Development Act 2000 (as amended), to assess the vulnerability of damage due to vibration cause by both tunnelling and operation of underground train on this section of the alignment. This affects several buildings under the management of the OPW particularly within the Kildare Street, Merrion Square and St. Stephen's Green areas.	This observation is not relevant for this building	
7	6.0 LEGAL CONSIDERATIONS	13	The Commissioners of Public Works would seek to enter into appropriate, property-specific legal agreements with TII, to ensure the protection of key State property and of the State's activities undertaken within those and other properties. Given the importance of such properties and activities, the Commissioners of Public Works consider it appropriate that An Bord Pleanála would make the Railway Order conditional on such legal agreements being in place between TII and the OPW. Creating such legal agreements between TII and the OPW would be possible only after TII make available the more detailed design and risk-mitigation measures for the construction and operational phases of the MetroLink project, and before any development begins. Therefore, the Commissioners of Public Works would request that this aspect be reflected in the conditions set out by An Bord Pleanála to TII, as this would provide assurances to the Commissioners of Public Works relating to future legal agreements that protect and secure State property and activities from risks associated with the construction or operations of the MetroLink.	TII's preference is carry out all of the permitted railway works with the agreement of affected landowners and prescribed bodies. However, it should not be condition of the railway order that TII reach such agreement with OPW. In the event that agreement cannot be reached with OPW, TII should be entitled to carry out the railway works over their objections provided that it complies with the terms and conditions of the Railway Order. The Board's function is to satisfy itself that those terms and conditions are adequate to ensure that the construction and operation of the railway works will be consistent with proper planning and sustainable development and have acceptable impacts on the environment. TII believes that the RO application and the EIAR in particular sets out mitigation and monitoring measures that are sufficient for that purpose	
8	7.3 Contractual Arrangement	15	The contractor(s) appointed will be responsible for the organisation, direction, and execution of environmental related activities during the detailed design and construction of the proposed Project. The contractor(s) is required to undertake all activities in accordance with the relevant environmental requirements including the consent documentation and other regulatory and contractual requirements.	TIIs contractors will be bound by the Railway Order, further agreements entered into by TII and other relevant statutory or MetroLink specific regulation. An Bord Pleanála's statutory responsibility includes satisfying itself that the terms and conditions of any railway order will ensure that the railway works are consistent with the proper planning and sustainable development of the area and will not have unacceptable impacts on the environment regardless of the contractual structure.	
9	8.0 POTENTIAL IMPACTS ON THE PROPERTY	15	DOWNEY and Gall Zeidler have carried out a detailed examination of the property subject to this submission. Having regard to the status and current use of the property and identified constraints, the following raises concerns regarding potential impacts of the MetroLink on the property. This has been elaborated to include potential impacts during the construction and operation phases of developing MetroLink, as well as any impediments and/or implications for future development of the property.	Please refer to response numbers (10) to (17) below.	
10	8.1 Monitoring	16	Given the sensitivity of the uses within this property, we request that An Bord Pleanála attach a condition to the Draft Railway Order that ensures continuous monitoring of the property to prevent any negative impacts. Access to all properties must be agreed in advance with the OPW and its clients. It is recommended that this monitoring takes place at least 3 months in advance of the construction of the Project and at least 6 weeks post the operational stage of the MetroLink.	This building is outside settlement contours and hence is not impacted by MetroLink and ground movement monitoring is not required. No access is required.	
11	8.2 Security Issues	16	Given the nature of the State properties affected by the Project, we would respectfully refer An Bord Pleanála to Part XI of the Planning & Development Act 2000 (as amended), which states that: "Development by State authorities. 181.— (1) (a) The Minister may, by regulations, provide that, except for this section F902[and sections 181 A to 181C], the provisions of this Act shall not apply to any specified class or classes of development by or on behalf of a State authority where the development is, in the opinion of the Minister, in connection with or for the purposes of public safety or order, the administration of justice or national security or defence and, for so long as the regulations are in force, the provisions of this Act shall not apply to the specified class or classes of development. b(iii) the making available for inspection by members of the public of any specified documents, particulars, plans or other information with respect to the proposed development;"	This provision allows the Minister for Housing to provide that certain State developments do not require planning permission. It is not relevant to the MetroLink project. The MetroLink project is authorised by railway order and does not require planning permission. In that regard, we refer to section 38 of the Transport (Railway Infrastructure) Act 2001, which provides that " <i>Each of the following shall be exempted development for the purposes of the Act of 2000: (a) development consisting of the carrying out of railway works, including the use of the railway works or any part thereof for the purposes of the operation of a railway, authorised by the Board and specified in a railway order or of any incidental or temporary works connected with such development; (b) development consisting of the carrying out of railway works for the maintenance, improvement or repair of a railway that has been built pursuant to a railway order. "</i>	
12	8.2 Security Issues	16	All employees contracted to work on behalf of the Til on this Project, and any associated works, must adhere to the properties protocol around access, security, and safety. This applies to all persons entering or working in proximity of the property.	Not relevant, as TII access to this building will not be required.	
13	8.2 Security Issues	16	The day-to-day operations of the property cannot be interrupted by disruptions to any utilities.	There is no intent to disrupt the day to day activities. If subsequently, it is found that a disruption to utility provision is inevitable this will be discussed with OPW and the timing and duration of any disruption optimised to minimise said disruption.	

Submission No.			222	
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - Ballymun Garda District Headquarters and INTERO offices.				
14	8.2 Security Issues	16	The design and operation of the MetroLink should be in line with best international practice, in relation to anti-terrorism and security measures.	This is not relevant for this building, as it is not directly above the alignment. But for TII, safety and security are two priorities for the MetroLink in operation and hence the design will be developed cognisant of the risk in relation to terrorism and best practice applied. Further dialogue with OPW will be undertaken throughout the design and construction stages to ensure suitable provisions are in place.
15	Think section should be 8.3.3 Noise and Vibration, but not labelled in doc	18	(a) Tunnelling During the passage of the Tunnel Boring Machine (TBM) the noise is predicted to be 42 dBLAm ax,s does not exceed the acceptable threshold (45 dBLAm ax,s) and this may last for 2 weeks. The vibration from the passage of the TBM is predicted to be 0.174 VDvdb.ms'1-75 less than the threshold (1.6 VDvdb.ms'1.75) EIAR Table 6.2- GNV1 states that there is no effective mitigation available and therefore the impact will be managed by detailed consultation with the building owners. The OPW requests that a specific study is carried out for the Ballymun Garda District Headquarters & INTREO Office to determine whether ground borne noise and vibration will have any impact. Where any impact is identified then threshold limits will need to be applied and monitored. Where the building is considered vulnerable to vibration induced damage, EIAR Table 6.2- ANV16, sets out requirement for pre- and post-construction surveys of these structures.	It should be noted that a full assessment of groundborne noise & vibration effects have been provided in Chapter 14 of the EIAR. As stated in your comment and set out within Appendix 14.5 Groundborne Noise and Vibration and Blasting Modelling Results, the values of noise and vibration during construction and operation of Metrolink are below the threshold values for this building. As a result no significant impact is expected on these buildings. This assessment will be supplemented by a full pre-construction survey and monitoring programme during the construction phase to ensure that defined criteria for groundborne noise and vibration are adhered to during the construction phase. While groundborne noise during the TBM operation will not be exceeded, there are no effective methods available to further reduce groundborne noise from TBMs at source, but noting that the duration of this impact would be of the order of two weeks if this building were to be affected. TII will consult and liaise with Ballymun Garda, to ensure the timing of these impacts are known. The principal mitigation measures aimed at minimising impacts are as follows: - Advance public consultation and stakeholder engagement can greatly reduce the significance of groundborne noise effects, as building occupants would be prepared for the passage of the TBM and resultant elevated noise and vibration levels. - TII will accept and consider applications for additional measures on a case-by case basis, in accordance with its Noise and Vibration Mitigation Policy (see Appendix A14.6 Airborne Noise and Groundborne Noise Mitigation Policy).
16	8.3.4 Work Sites	18	(b) Ground Water Control There is the potential for ground water lowering for the construction of Ballymun station to impact Ballymun Garda District Headquarters & INTREO Office. The OPW requires an assessment and limits from Til that will be applied to dewatering for the construction of Ballymun Station.	As outlined in EIAR Chapter 19 (Hydrogeology), groundwater assessment and monitoring were and will continue to be undertaken for the proposed Project: • AWN undertook an extensive desktop review in order to establish baseline conditions along the proposed alignment corridor. The baseline study included reference to historical ground investigation data including the 2007 IGSL investigation borehole dataset (IGSL 2008) and data from Norwest Holst (2008) as well as information from contemporary (2019-2021) ground investigations specific to the proposed Project (Table 19.2); • A number of field surveys and walkover assessments were carried out to add to existing assessment of long-term trend analysis for water quality undertaken by the EPA (Section 19.3.3.4); and • A number of intrusive ground investigations were commissioned for the proposed Project including ground water level monitoring (Section 19.3.3.5). A programme of continuous groundwater level monitoring, aquifer testing and groundwater quality monitoring was devised with focus on key well locations along the alignment including at deep station excavations. The key hydrogeological data available and interpreted for the Ballymun Station is presented in Table 19.31. The dewatering process during the construction of the Ballymun Station will be in the order of 12.2l/sec as a maximum value. Ballymun Station perimeter will be sealed (D-walls) within the QBR subsoils with water-bearing Fluvio-glacial sands (also recorded in the wider area) and CLU (Lucan Formation) (Section 19.5.3.5.6). Dewatering at the Ballymun Station during works will be temporary only with the anticipated radius effect of dewatering reducing as the Station construction progresses towards full perimeter and base seal (i.e. full watertight conditions) including toe grouting assumed to 1.5m below base of D-wall. Mitigation measures employed will limit the impact of dewatering to within the site boundary.
17	8.5 Future Development	19	The OPW reserves the right to develop the subject property in the future, this includes property above and below ground, subject to normal planning criteria. It is important that the development of the MetroLink does not interfere with extant planning permissions pertaining to the subject property and the right of the applicant to develop the property, in advance, in tandem or post operation of the MetroLink Project.	Given the position of the MetroLink tunnel in relation to this building, this is not relevant.

Submission No.			222		
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW		
Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - Ballymun Garda District Headquarters and INTERO offices.					
18	CONCLUSION	20	The most significant impact of the MetroLink project on Ballymun Garda District Headquarters & INTREO Office will be from the construction of the Ballymun station including associated utility and traffic diversions, dust, and noise. The OPW will require assurances from TII that disruption from construction will be kept to a minimum and for the shortest time possible and pre-construction, post-construction surveys, monitoring should be requested.	There is no intent to disrupt the day to day activities. If subsequently, it is found that a disruption to utility provision is inevitable this will be discussed with OPW and the timing and duration of any disruption optimised to minimise said disruption.	
19	CONCLUSION	20	With respect to this property, the OPW is seeking: 1) To note that this is an important building providing a range of civic services and includes the Regional Garda Headquarters Building, to which access must be maintained on a twenty-four- hour basis. Service at this building cannot be interrupted before, during or after the construction of the MetroLink.	Please refer to response numbers (2) above.	
20	CONCLUSION	20	With respect to this property, the OPW is seeking: 2) To ensure no damage to the building and its day-to-day functions, pre-construction and post-construction surveys, trials and monitoring is required. This is mainly concerned with noise and vibration which can damage this important civic building, as well as its functions.	Please refer to response numbers (10) and (15) above.	
21	CONCLUSION	20	With respect to this property, the OPW is seeking: 3) To ensure specific vibrations limits that will be applied to the Ballymun Garda District Headquarters & INTREO Office, and a monitoring regime is to be implemented.	Please refer to response numbers (15) above.	
22	CONCLUSION	20	With respect to this property, the OPW is seeking: 4) To include adverse impacts of Ballymun station within the risk assessment studies for the Ballymun Garda District Headquarters & INTREO Office and provide for mitigation measure, as construction of these stations will generate additional lorry movements for both deliveries and spoil removal.	As set out in Section 7.3.3 of Appendix A.9.5, construction vehicles will exit the site via the junction of Silogue Road and Ballymun Road before travelling north and away from the building with a distance of ~60m between the closest building entrance and junction. As such, any adverse impacts on the property due to construction vehicles are expected to be minimal. TII will liaise with the Gardai throughout construction.	
23	CONCLUSION	20	With respect to this property, the OPW is seeking: 5) Precedents to be applied to the risk assessments to ensure utilising best industry practice within the implementation of the Project.	TII intend to apply industry best practice to build and operate the MetroLink whilst minimising impacts to 3rd parties.	
24	APPENDIX 1: LIST OF PLANNING LEGISLATION & POLICY	21	This appendix provides a non-exhaustive list of planning policy, legislation, and guidelines. We would respectfully request that An Bord ensure that TII have fully assessed the Project with regard to existing planning policy, as well as adherence to the relevant local policies and guidelines pertaining to each individual property. DOWNEY note that this proposed Draft Railway Order is a strategic long-term development and An Bord Pleanála may consider Development Plans in assessing the Project. It is also crucial to note that on foot of a granted Order and during the detailed design stage, a revision to planning policy is expected, whereby adopted plans and legislation may have to be adhered within this stage. This may require an amendment to the Railway Order and further assessment, including public consultation.	Please refer to response numbers (5) above.	
25	Appendix 2: Ground movement Assessment	26	Duplicate of Appendix to D to OPW Cover Letter - Re: Railway (Metrolink–Estuary to Charlemont via Dublin Airport) Order 2022 – Submissions by the Commissioners of Public Works in Ireland	Refer to OPW Cover Letter response	

Submission No.			223	
Organisation Name or Name of Submitter			Office of Public Works (OPW)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - Department of Enterprise, Trade and others				
1	Executive Summary	N/A	With respect to this property, the OPW is seeking: 1) To ensure no disruption to the accessibility of the buildings within Nos. 23-28 Kildare Street and their day-to-day uses and functions. 2) To ensure no damage to the buildings and their architectural detailing, pre-construction and post-construction surveys, trials and monitoring is required. This should include deep level monitoring and ground water level monitoring in addition to the building and surface monitoring typically implemented. 3) To set up an access control regime in agreement with the OPW and relevant stakeholders when applying a continuous monitoring mechanism pre- and post-construction. 4) To ensure no ventilation and/or evacuation shaft in the vicinity of the area is permitted due to vitality and sensitivity of the Complex's uses and functions. 5) To reserve the right for the OPW that the development of the MetroLink does not interfere with extant permissions pertaining to the property and its future development, including above property and below its ground levels. 6) Precedents to be applied to the risk assessments to ensure utilising best industry practice within implementation of the Project. 7) To mitigate the noise and vibration to the acceptable levels by installing floating track slab between Chainage 17+980 and 18+400, which is the St. Stephen's Green Station. 8) Regarding the tunnel boring machine noise over a 2-week period when the noise is predicted to exceed the acceptable threshold, it is respectfully requested for the timeline of the work to be agreed in advance with the OPW, to avoid any disruption to the functions of the building.	TII thank you for your comments. Further to TII's response to the OPW Covering letter, the matters raised by OPW specific to these buildings are addressed in responses (2) through to (39) below.
2	3.0 Overview of the Draft Railway Order	9	While extensive pre-planning consultations also took place between TII and the OPW, a detailed assessment of the individual properties affected has not yet taken place. The draft Railway Order application 2022 is a Draft Order, and should the route be approved by An Bord Pleanála, further detailed design will be submitted which will require further consideration and approval. Factors such as the internal uses of the properties, their construction methods, age and historical importance and the effect of construction on these sensitivities has not been assessed as part of the Project thus far. Additional consideration needs to be given to the potential effects on the built environment before a route and construction method can be confirmed. The OPW reserves the right to make further commentary, pending more detailed design proposals.	TII have undertaken a Phased Ground Movement Impact Assessment and the results of the assessments are included in the RO documentation within Appendix 5.17 of the EIAR. Appendix B2 of that document indicates the list of special buildings that would be subject to a subsequent Phase 3 assessment irrespective of the engineering need to do so. Many OPW buildings are in this category. It should be noted that the further assessments that will be done by the contractor if the RO is granted will likely reduce the impacts on the buildings as the Phase 2 assessment is a conservative assessment whose results are generally more significant than the results of a Phase 3 assessment. This point was discussed with OPW and their consultants in January 2023. results of any Phase 3 assessments and any requirements for monitoring and / or other mitigations that eventuate will be discussed with OPW. TII are satisfied that the approach adopted to date follows an industry standard approach undertaken on tunnelling and underground projects around the world including on the Channel Tunnel Rail Link and Crossrail in London, the Dublin Port Tunnel and currently on High Speed 2 in England, and therefore that further assessment is not required and should not be delivered prior to the route being consented. 23-28 Kildare Street is a distance from the zone of influence of the tunnel and hence no impacts due to ground movement will occur and hence this building is not subject to a building damage assessment.
3	4.3 Current Use/Use	13	The building is in use as Ministerial and government offices. Uninterrupted access to the building is necessary at all times for the conduct of government business and for access by emergency services (e.g., fire services and ambulance). The OPW and/the State, and their authorised agents, require access to the building at all times for the purpose of facilities management, maintenance, repairs and any major conservation, repair or development programme planned, or as may arise during the construction period of MetroLink.	No adverse impacts due to construction or operation of MetroLink have been identified for 23-28 Kildare Street. Please refer to the EIAR Appendices A9.5, A9.2, or A9.2-M. Access to the building will not be affected.
4	4.4 Planning Context	13	In relation to the Draft Railway Order's consistency with planning policy and planning guidelines, a non-exhaustive list of planning policy and legislation at National, Regional, and Local levels, is included in Appendix 1 of this submission and the Board are invited to refer to this for further details. We would respectfully request that An Bord Pleanála ensure that TII have fully assessed the Project regarding existing planning policy, as well as adherence to the relevant local policies and guidelines pertaining to each individual property. DOWNEY note that this proposed Draft Railway Order is a strategic long-term development and An Bord Pleanála may consider Draft Development Plans in assessing the Project. It is also crucial to note that on foot of a granted Order and during the detailed design stage, a revision to planning policy is expected, whereby adopted plans and legislation may have to be adhered within this stage. This may require an amendment to the Railway Order and further assessment, including public consultation.	TII have undertaken a full assessment of the planning policy and planning guidelines in the Planning Report that was submitted as part of the Railway Order Application. The only policy relevant to the decision on whether to grant the Railway Order and the necessary conditionality is the policy in force at the date of the grant of the Railway Order, as has been made clear in numerous High Court decisions including <i>Element Power v An Bord Pleanála</i> [2017] IEHC 550 and the Railway Order cannot be made conditional on compliance with future, yet to be developed policy. As planning and policy and strategy are being updated constantly, TII will undertake a further review of planning policy in advance of any oral hearing to allow for an updated presentation on the projects consistency with active policy requirements to be presented to An Bord Pleanála.
5	4.5 Potential Development of the Property	13	This building is a protected structure, and the property is located in a sensitive heritage location. The OPW reserves its right to develop the subject property in the future, this includes property above and below ground, subject to normal planning criteria. It is important that the development of the MetroLink does not interfere with extant planning permissions pertaining to the subject property and the right of the applicant to develop the property, in advance, in tandem or post operation of the MetroLink Project.	While acknowledging this comment, given the distance from the MetroLink alignment it will not apply to this particular building.

Submission No.			223	
Organisation Name or Name of Submitter			Office of Public Works (OPW)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - Department of Enterprise, Trade and others				
6	5.0 MATERIAL CONSIDERATIONS	14	The alignment drawing ML1-JAI-EIA-ROUT_XX-DR-Y-04025 and the contour drawing ML1-JAI-EIA-ROUT_XX-DR-Y-21148 show different alignments. This error has resulted in deficient and conflicting information within the SID application submitted under Section 2 of the Planning and Development Act 2000 (as amended). The conflicting information has resulted in a difficulty in assessing the impacts on the property due to vibration and noise caused by both the construction and operational phases of the MetroLink on this section of the alignment. This affects several buildings under the management of the OPW particularly at the Kildare Street, Merrion Square and St Stephen's Green areas.	On two drawings (Figures 20.16 Settlement Contours, sheets 27 and 28 of 30) in EIAR Appendix 5.17 Building Damage Report, the tunnel centreline is plainly incorrect as it is deviates from the centre of the settlement contours between Tara and St. Stephen's Green stations. The settlement contours are correct and reflect the proposed Railway Order alignment and as such the drawing serves its core purpose, which is to identify, describe and assess the settlement impact of the railway works. In any event, revised drawings will be submitted to the Board to rectify the error. The correct alignment has been used for all environmental impact assessments including tunnel induced settlement, and construction and operational noise and vibration impact assessments.
7	6.0 LEGAL CONSIDERATIONS	14	The Commissioners of Public Works would seek to enter into appropriate, property-specific legal agreements with TII, to ensure the protection of key State property and of the State's activities undertaken within those and other properties. Given the importance of such properties and activities, the Commissioners of Public Works consider it appropriate that An Bord Pleanála would make the draft Railway Order conditional on such legal agreements being in place between TH and the OPW. Creating such legal agreements between TII and the OPW would be possible only after TII make available the more detailed design and risk-mitigation measures for the construction and operational phases of the MetroLink project, and before any development begins. Therefore, the Commissioners of Public Works would request that this aspect be reflected in the conditions set out by An Bord Pleanála to TII, as this would provide assurances to the Commissioners of Public Works relating to future legal agreements that protect and secure State property and activities from risks associated with the construction or operations of the MetroLink.	TII's preference is carry out all of the permitted railway works with the agreement of affected landowners and prescribed bodies. However, it should not be condition of the railway order that TII reach such agreement with OPW. In the event that agreement cannot be reached with OPW, TII should be entitled to carry out the railway works over their objections provided that it complies with the terms and conditions of the Railway Order. The Board's function is to satisfy itself that those terms and conditions are adequate to ensure that the construction and operation of the railway works will be consistent with proper planning and sustainable development and have acceptable impacts on the environment. TII believes that the RO application and the EIAR in particular sets out mitigation and monitoring measures that are sufficient for that purpose
8	7.1.1 Route Alignment	14	The tunnel alignment does not pass directly beneath Nos. 23-28 Kildare Street. However, there is inconsistency in the alignment between Tara Station and St. Stephen's Green. The alignment drawing ML1-JAI-EIA-ROUT_XX-DR-Y-05025 and the Contour drawing ML1-JAI-EIA-ROUT_XX-DR-Y-21148 show different alignments.	Please refer to response number (6) above.
9	7.1.1 Route Alignment	15	Many of the reports refer to chainages along the alignment, however there are no plans that indicate these chainages, and this makes reviewing the Railway Order and EIAR difficult.	Reference to chainages along the alignment are provided within the Railway Order Plans\Drawings under Alignment Drawings.
10	7.1.2 Tunnelling	16	The MetroLink 8.5m ID tunnel will be excavated by Tunnel Boring Machine (TBM). The ground conditions along the route are variable and therefore the machine could be either earth pressure balance (EPB) or Slurry (STB). A modern Variable Density TBM would also be suitable and is currently being used in the UK for similar ground conditions. All these machines can control the ground movement with appropriate tunnel management. The 980m drive between Tara Station and St. Stephen's Green (C8) will be entirely within the Argillaceous Limestone.	While acknowledging this comment, given the distance from the MetroLink alignment it will not apply to this particular building.
11	7.3 Contractual Arrangement	16	The contractor(s) appointed will be responsible for the organisation, direction, and execution of environmental related activities during the detailed design and construction of the proposed Project. The contractor(s) is required to undertake all activities in accordance with the relevant environmental requirements including the consent documentation and other regulatory and contractual requirements.	TII accepts this as accurate, but many of the matters referred to, in particular the contractual arrangements with the contractors, are outside the scope of the railway order process.
12	8.0 POTENTIAL IMPACTS ON THE PROPERTY	16	DOWNEY and Gall Zeidler have carried out a detailed examination of the property subject to this submission; having regard to the status and current use of the property and identified constraints, the following raises concerns regarding potential impacts of the MetroLink on the property. This has been elaborated to include potential impacts during the construction and operation phases of developing MetroLink, as well as any impediments and/or implications for future development of the property.	Please refer to response numbers (13) to (28) below.
13	8.1 Monitoring	17	Given the sensitivity of the uses within this property, coupled with its historic importance, we request that An Bord Pleanála attach a condition to the Draft Railway Order that ensures continuous monitoring of the property to prevent any negative impacts. Access to all properties must be agreed in advance with the OPW and its clients. It is recommended that this monitoring takes place at least 3 months in advance of the construction of the Project and at least 6 weeks post the operational stage of the MetroLink.	While acknowledging this comment, given the distance from the MetroLink alignment it will not apply to this particular building - no monitoring is required.

Submission No.			223	
Organisation Name or Name of Submitter			Office of Public Works (OPW)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - Department of Enterprise, Trade and others				
14	8.2 Security Issues	17	Given the nature of the State properties affected by the Project, we would respectfully refer An Bord Pleanála to Part XI of the Planning & Development Act 2000 (as amended), which states that: "Development by State authorities. 181.— (1) (a) The Minister may, by regulations, provide that, except for this section F902[and sections 181A to 181C], the provisions of this Act shall not apply to any specified class or classes of development by or on behalf of a State authority where the development is, in the opinion of the Minister, in connection with or for the purposes of public safety or order, the administration of justice or national security or defence and, for so long as the regulations are in force, the provisions of this Act shall not apply to the specified class or classes of development. b(iii) the making available for inspection by members of the public of any specified documents, particulars, plans or other information with respect to the proposed development;"	This provision allows the Minister for Housing to provide that certain State developments do not require planning permission. It is not relevant to the MetroLink project. The MetroLink project is authorised by railway order and does not require planning permission. In that regard, we refer to section 38 of the Transport (Railway Infrastructure) Act 2001, which provides that <i>"Each of the following shall be exempted development for the purposes of the Act of 2000: (a) development consisting of the carrying out of railway works, including the use of the railway works or any part thereof for the purposes of the operation of a railway, authorised by the Board and specified in a railway order or of any incidental or temporary works connected with such development; (b) development consisting of the carrying out of railway works for the maintenance, improvement or repair of a railway that has been built pursuant to a railway order."</i>
15	8.2 Security Issues	17	It is essential that security issues do not arise in the event of sensitive information being shared on the structure and operation of these properties. However, the OPW understands the importance of the detailed design stage of the Project and the wish to ensure that the detailed assessment of these properties takes place in the early stages of the design process, in conjunction with the OPW, to ensure that these sensitive State buildings are not negatively impacted upon by the proposed Project. The OPW will liaise with TII and An Bord Pleanála on this matter.	This is understood and agreed. TII propose a meeting is held with the requisite OPW / security experts to discuss potential risks and the management of these risks during the construction and operational phases of the Project. TII and their consultants store all data on secure systems in line with best practice and treat all information as confidential. TII are available to engage with the OPW to discuss any specific requirements the OPW have in regard to data security.
16	8.2 Security Issues	17	All employees contracted to work on behalf of the TII on this Project, and any associated works, must adhere to the properties protocol around access, security, and safety. This applies to ail persons entering or working in proximity of the property.	TII will ensure that contractors working on its behalf on OPW property comply with property protocols around access, security and safety. Once the TII worksites are established, works within those sites will be secured to MetroLink standards.
17	8.2 Security Issues	17	The day-to-day operations of the property cannot be interrupted by disruptions to any utilities.	There is no intent to disrupt the day to day activities. If subsequently, it is found that a disruption to utility provision is inevitable this will be discussed with OPW and the timing and duration of any disruption optimised to minimise said disruption.
18	8.2 Security Issues	17	The design and operation of the MetroLink should be in line with best international practice, in relation to anti-terrorism and security measures.	Safety and security are two priorities for the MetroLink in operation and hence the design will be developed cognisant of the risk in relation to terrorism and best practice applied. Further dialogue with OPW will be undertaken throughout the design and construction stages to ensure suitable provisions are in place.
19	8.3.1 Ground Movement	18	Stage 2: Three sections were considered in the assessment. The assessment concludes that the risk of damage to 23/28 Kildare Street is Category 0, Negligible. However, as a "Special building" it shall progress to stage/Phase 3 assessment on the basis of the building's foundation being deeper than 4m.	While acknowledging this comment, given the distance from the MetroLink alignment it will not apply to this particular building. No assessment is required as no ground movement is assessed and hence no damage is predicted.
20	8.3.1 Ground Movement	18	Stage 3: The EIAR states that a Stage 3 assessment will be carried out for 23/28 Kildare Street by the Contractor appointed to construct this section of the MetroLink. The OPW expects to be consulted on the detail, scope of this assessment and programme for these assessments. It would be helpful if TII were to develop a Design Standard to ensure that all Stage 3 analyses of the OPW properties are carried out equally. No mention of Stage 4 or 5 has been found in the draft Railway Order or EIAR. Industry best practice as applied to London's Elizabeth Line (Crossrail) required that two further Stages in the Assessment of ground movement were undertaken during the project.	While acknowledging this comment, given the distance from the MetroLink alignment it will not apply to this particular building. No assessment is required as no ground movement is assessed and hence no damage is predicted.
21	8.3.1 Ground Movement	19	Stage 4 (Construction Stage): This stage is where any mitigation is implemented, and the monitoring of the stakeholders' infrastructure is carried out. Also, the preconstruction defect surveys are carried out prior to any excavation. The OPW requires to review the detailed proposals for mitigation and monitoring. Monitoring proposals submitted to the OPW for review should include deep level monitoring and ground water level monitoring in addition to the building and surface monitoring typically implemented. The deep level monitoring will provide valuable data relating to the rock behaviour and has been usefully employed on HS2. The OPW will facilitate and observe the preconstruction defect surveys. It is noted that these shall be carried out by Professionally Qualified Engineers or Surveyors. The OPW requests that only Engineers or Surveyors with proven competence regarding (historic) buildings of this fabric type, period and nature are selected. The contractor(s) will coordinate preconstruction defect surveys for identified properties, liaising (in conjunction with the employer) with the building surveyor employed to carry out the surveys and maintaining a dialogue with the relevant property owners throughout the duration of the works.	While acknowledging this comment, given the distance from the MetroLink alignment it will not apply to this particular building. No monitoring nor mitigation measures are required specific to this building.
22	8.3.1 Ground Movement	19	Stage 5 (Close out): Once the excavation (tunnelling and station excavation) has been completed then the Contractor will want to decommission his monitoring. The OPW expects to be provided with close out reports for the monitoring of its property. As a minimum the close out report should include details of any mitigation carried out, a list of any repairs, time history graphs showing the movements monitored.	While acknowledging this comment, given the distance from the MetroLink alignment it will not apply to this particular building.

Submission No.			223	
Organisation Name or Name of Submitter			Office of Public Works (OPW)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - Department of Enterprise, Trade and others				
23	8.4.3 Noise and Vibration	19	(a) Tunnelling EIAR Chapter 14 Ground Borne Noise and Vibration Measures identifies impacts on the 23/28 Kildare Street Complex during TBM excavation: ■ Ground borne noise 49 dBA LAm ax- Significant impact ■ Ground borne vibration 0.253 VDVB.ms*1 -75- no significant impact EIAR Table 6.2- GNV1 states that there is no effective mitigation available and therefore the impact will be managed by detailed consultation with the building owners. The OPW requests specific vibration limits to be applied to Nos. 23-28 Kildare Street and to ensure that a monitoring regime is implemented. EIAR Table 6.2 - ANV16. Sets out requirement for Pre and post construction surveys of structures vulnerable to vibration induced damage. The OPW requires pre- and post-construction surveys of structures vulnerable to vibration induced damage to be carried out and this should include 23/28 Kildare Street.	It should be noted that a full assessment of groundborne noise & vibration effects have been provided in Chapter 14 of the EIAR. The modelling undertaken in this chapter presents the potential impacts arising from all stages of the construction phase of the project. Given the distance from the MetroLink alignment, detailed calculation results for this building have not been included within the EIAR. Contours of groundborne noise during TBM passage are shown in Figure 14.2 (Groundborne Noise from Tunnel Boring Machine) with sheet 6 of 7 relevant to the 23/28 Kildare Street Complex. The location of this building is just outside of the 40 dB LAm _{ax,s} contour, which is below the 45dB LAm _{ax,s} threshold for potential significant impacts during TBM passage. Vibration during TBM passage has not been calculated for this building, but no significant impacts for vibration during TBM passage have been predicted for any building, including those directly above TBM passage. Appendix A5.1 of the EIAR provides the outline Construction Environmental Management Plan (CEMP), including Table 6.6 which outlines Noise and Vibration Measures for the mitigation of construction noise and vibration. Measure ANV16 sets out that property condition surveys will be undertaken at protected or identified vulnerable structures that are within 50m of the proposed surface working compounds, and at other locations depending on their vulnerability to vibration. Given the distance of this building from the MetroLink alignment condition surveys are unlikely to be required.
24	8.3.4 Work Sites	20	b) Ground Water Control There is an assumption that the tunnelling will not affect the ground water above the tunnel. However, there should be a ground water monitoring scheme implemented to confirm this and a contingency plan to manage any residual risk.	While acknowledging this comment, given the distance from the MetroLink alignment it will not apply to this particular building.
25	8.3.4 Work Sites	20	(c) Working Hours 23/28 Kildare Street is located between Tara Street and St. Stephen's Green Stations. The construction of these stations will generate additional lorry movements, for both deliveries and spoil removal, that TII and their contractors will need to manage to minimise impact in the vicinity.	Kildare Street is not on designated HGV routes for either Tara Street or St Stephens Green stations - See Sections 7.8 and 7.9 of Appendix A9.5 of the EIAR.
26	8.4.1 Noise and Vibration	21	TII proposes to mitigate the noise and vibration resulting from the railway operations by installing floating track slab to meet thresholds of 25 dBL _{am_s} and VCD respectively. EIAR Chapter 14 Table 14.47 provides some guidance on where this will be constructed but it is not clear exactly where. The OPW requests that floating track slab is installed between Chainage 17+980 and 18+400 (St. Stephen's Green Station). This would mitigate the noise and vibration to acceptable levels under all the Government buildings, museums, and the National Concert Hall.	While acknowledging this comment, given the distance from the MetroLink alignment it will not apply to this particular building. The locations of where floating track slab are to be installed are included in EIAR Chapter 14 and specifically in table 14.47. Floating slab track is planned between chainages 17+980 to 18+100 to mitigate impacts to the National Museums and National Gallery and between 18+780 and 19+940 for the National Concert Hall.
27	8.4.3 Evacuation Strategy	21	The are no planned intervention/evacuation shafts between Tara Station and St. Stephen's Green, however it is understood that the Fire Brigade have not accepted the strategy proposed by TII This may have an impact on 23/28 Kildare Street should any intermediate shafts be required.	There is no requirement for additional shafts.
28	8.5 Future Development	21	The OPW reserves the right to development of the subject property in the future, this includes property above and below ground, subject to normal planning criteria. It is important that the development of the MetroLink does not interfere with extant planning permissions pertaining to the subject property and the right of the applicant to develop these, in advance, in tandem or post operation of the MetroLink Project.	While acknowledging this comment, given the distance from the MetroLink alignment it will not apply to this particular building. MetroLink does not impact on future development of this building.
29	9.0 CONCLUSION	22	With regards to the Gall Zeidler assessment, the risk of damage to 23/28 Kildare Street from ground movement is negligible. Pre-construction, post-construction surveys, monitoring should be requested. During the passage of the Tunnel Boring Machine (TBM) the noise is estimated to exceed the acceptable threshold (45 dBL _{Am_s})and this may last for 2 weeks. The vibration from the passage of the TBM is predicted to be less than the threshold (1.6 VDVB.ms*1 75).	Please refer to response number (23) above.
30	9.0 CONCLUSION	22	With respect to this property, the OPW is seeking: 1) To ensure no disruption to the accessibility of the buildings within Nos. 23-28 Kildare Street and their day-to-day uses and functions.	There will be no impact on access to this building or day to day usage.

Submission No.			223	
Organisation Name or Name of Submitter			Office of Public Works (OPW)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - Department of Enterprise, Trade and others				
31	9.0 CONCLUSION	22	2) To ensure no damage to the buildings and their architectural detailing, pre-construction and post-construction surveys, trials and monitoring is required. This should include deep level monitoring and ground water level monitoring in addition to the building and surface monitoring typically implemented.	While acknowledging this comment, given the distance from the MetroLink alignment it will not apply to this particular building. Refer to Item 19.
32	9.0 CONCLUSION	22	3) To set up an access control regime in agreement with the OPW and relevant stakeholders when applying a continuous monitoring mechanism pre- and post-construction.	Any access to OPW property will be discussed with OPW. No access is required to this building and no monitoring is required.
33	9.0 CONCLUSION	22	4) To ensure no ventilation and/or evacuation shaft in the vicinity of the area is permitted due to vitality and sensitivity of the Complex's uses and functions.	No additional shafts are required.
34	9.0 CONCLUSION	22	5) To reserve the right for the OPW that the development of the MetroLink does not interfere with extant permissions pertaining to the property and its future development, including above property and below its ground levels.	While acknowledging this comment, given the distance from the MetroLink alignment it will not apply to this particular building as it is outside of any protection zones.
35	9.0 CONCLUSION	22	6) Precedents to be applied to the risk assessments to ensure utilising best industry practice within implementation of the Project.	TII intend to apply industry best practice to build and operate the MetroLink whilst minimising impacts to 3rd parties.
36	9.0 CONCLUSION	22	7) To mitigate the noise and vibration to the acceptable levels by installing floating track slab between Chainage 17+980 and 18+400, which is the St. Stephen's Green Station	While acknowledging this comment, given the distance from the MetroLink alignment it will not apply to this particular building. See response 26.
37	9.0 CONCLUSION	22	8) Regarding the tunnel boring machine noise over a 2-week period when the noise is predicted to exceed the acceptable threshold, it is respectfully requested for the timeline of the work to be agreed in advance with the OPW, to avoid any disruption to the functions of the building.	Further to response number (23) above, TII will provide advance notice of passage of the TBM.
38	APPENDIX 1: LIST OF PLANNING LEGISLATION & POLICY	23	This appendix provides a non-exhaustive list of planning policy, legislation, and guidelines. We would respectfully request that An Bord Pleanála ensure that TII have fully assessed the Project with regard to existing planning policy, as well as adherence to the relevant local policies and guidelines pertaining to each individual property. DOWNEY note that this proposed Draft Railway Order is a strategic long-term development and An Bord Pleanála may consider Development Plans in assessing the Project. It is also crucial to note that on foot of a granted Order and during the detailed design stage, a revision to planning policy is expected, whereby adopted plans and legislation may have to be adhered within this stage. This may require an amendment to the Railway Order and further assessment, including public consultation.	Please refer to response number (4) above
39	Appendix 2: Ground movement Assessment	28	Duplicate of Appendix to D to OPW Cover Letter - Re: Railway (Metrolink–Estuary to Charlemont via Dublin Airport) Order 2022 – Submissions by the Commissioners of Public Works in Ireland.	Refer to OPW Cover Letter response

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - Department of Finance.				
1	DOWNEY Report Executive Summary	N/A	With respect to this property, the OPW is seeking: 1) To ensure no disruption to occupants or the public accessing the building to carry out the duties of Government. 2) To ensure no damage to the buildings and their architectural detailing, pre-construction and post-construction surveys, trials and monitoring is required. This should include deep level monitoring and ground water level monitoring in addition to the building and surface monitoring typically implemented. 3) To set up an access control regime in agreement with the OPW and relevant stakeholders when applying a continuous monitoring mechanism pre- and post-construction." 4) To ensure no ventilation and/or evacuation shaft in the vicinity of the area is permitted due to vitality and sensitivity of the Government Buildings uses and functions. 5) To reserve the right for the OPW that the development of the MetroLink does not interfere with the future development of the building, including above property and below its ground levels. Nor interfere with major maintenance, conservation, refurbishment, or construction works which may arise in the future. 6) Precedents to be applied to the risk assessments to ensure utilising best industry practice within the implementation of the Project. 7) To mitigate the noise and vibration to the acceptable levels for this cultural and government block by installing floating track slab between Chainage 17+980 and 18+400, which is the St. Stephen's Green Station. 8) Regarding the tunnel boring machine noise over a 2-weeks period when the noise is predicted to exceed the acceptable threshold, it is respectfully requested for the timeline of the work to be pushed during recess of the Dail in order to avoid any disruption to the functions of the Department of Finance.	TII thank you for your comments. Further to TII's response to the OPW Covering letter, the matters raised by OPW specific to these buildings are addressed in responses (2) through to (33) below.
2	Downey Report- 3.0 Overview of the Draft Railway Order	Page 8, 9	While extensive pre-planning consultations also took place between Til and the OPW, a detailed assessment of the individual properties affected has not yet taken place. The Draft Railway Order application 2022 is a Draft Order, and should the route be approved by An Bord Pleanála, further detailed design will be submitted which will require further consideration and approval. Factors such as the internal uses of the properties, their construction methods, age and historical importance and the effect of construction on these sensitivities has not been assessed as part of the Project thus far. Additional consideration needs to be given to the potential effects on the built environment before a route and construction method can be confirmed. The OPW reserves the right to make further commentary, pending more detailed design proposals.	TII have undertaken a Phased Ground Movement Impact Assessment and the results of the assessments are included in the RO documentation within Appendix 5.17 of the EIAR. Appendix B2 of that document indicates the list of special buildings that would be subject to a subsequent Phase 3 assessment irrespective of the engineering need to do so. Many OPW buildings are in this category. It should be noted that the further assessments that will be done by the contractor if the RO is granted will likely reduce the impacts on the buildings as the Phase 2 assessment is a conservative assessment whose results are generally more significant than the results of a Phase 3 assessment. This point was discussed with OPW and their consultants in January 2023. TII will consult with OPW in relation to the results of any Phase 3 assessments and any requirements for monitoring and / or other mitigations that eventuate will be discussed with OPW. TII are satisfied that the approach adopted to date follows an industry standard approach undertaken on tunnelling and underground projects around the world including on the Channel Tunnel Rail Link and Crossrail in London, the Dublin Port Tunnel and currently on High Speed 2 in England, and therefore that further assessment is not required and should not be delivered prior to the route being consented. This property is outside the zone of influence and hence no impacts from ground movement are predicted.
3	4.2 Building sensitivities	13	The Billets is a proto-modern building: a composite of iron/steel structure and masonry with facing stone. Many of its materials and building systems may be brittle or inflexible.	TII welcome this information in relation to this building. The building is not predicted to be subject to movement.
4	4.5 Potential Development of the Property	13, 14	The Department of Finance includes the Billets, originally part of an important building complex (Royal College of Science/Government Buildings) is a Protected Structure, and all of the property is located in a sensitive heritage location. The OPW reserves its right to develop the subject property in the future, this includes property above and below ground, subject to normal planning criteria. It is important that the development of the MetroLink does not interfere with extant planning permissions pertaining to the subject property and the right of the applicant to develop the property, in advance, in tandem or post operation of the MetroLink Project.	While acknowledging this comment, given the distance from the MetroLink alignment, it will not apply to this particular building. There is no impact on future development of this site.
5	5.0 MATERIAL CONSIDERATIONS	14	The alignment drawing ML1-JAI-EIA-ROUT_XX-DR-Y-04025 and the Contour drawing ML1-JAI-E1A-ROUT_XX-DR-Y-21148 show different alignments. This error has resulted in deficient information within the SID application submitted under Section 2 of the Planning and Development Act 2000 (as amended), to assess the vulnerability of damage due to vibration cause by both tunnelling and operation of underground train on this section of the alignment. This affects several buildings under the management of the OPW particularly within the Kildare Street, Merrion Square and St. Stephen's Green areas.	This is not relevant for this building due to its distance from the tunnel alignment. On two drawings (Figures 20.16 Settlement Contours, sheets 27 and 28 of 30) in EIAR Appendix 5.17 Building Damage Report, the tunnel centreline is plainly incorrect as it is deviates from the centre of the settlement contours between Tara and St. Stephen's Green stations. The settlement contours are correct and reflect the proposed Railway Order alignment and as such the drawing serves its core purpose, which is to identify, describe and assess the settlement impact of the railway works. In any event, revised drawings will be submitted to the Board to rectify the error. The correct alignment has been used for all environmental impact assessments including tunnel induced settlement, and construction and operational noise and vibration impact assessments.

Submission No.			224	
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - Department of Finance.				
6	6.0 LEGAL CONSIDERATIONS	14	The Commissioners of Public Works would seek to enter into appropriate, property-specific legal agreements with TII, to ensure the protection of key State property and of the State's activities undertaken within those and other properties. Given the importance of such properties and activities, the Commissioners of Public Works consider it appropriate that An Bord Pleanála would make the Railway Order conditional on such legal agreements being in place between TII and the OPW. Creating such legal agreements between TII and the OPW would be possible only after TII make available the more detailed design and risk-mitigation measures for the construction and operational phases of the MetroLink project, and before any development begins. Therefore, the Commissioners of Public Works would request that this aspect be reflected in the conditions set out by An Bord Pleanála to TII, as this would provide assurances to the Commissioners of Public Works relating to future legal agreements that protect and secure State property and activities from risks associated with the construction or operations of the MetroLink.	TII's preference is carry out all of the permitted railway works with the agreement of affected landowners and prescribed bodies. However, it should not be condition of the railway order that TII reach such agreement with OPW. In the event that agreement cannot be reached with OPW, TII should be entitled to carry out the railway works over their objections provided that it complies with the terms and conditions of the Railway Order. The Board's function is to satisfy itself that those terms and conditions are adequate to ensure that the construction and operation of the railway works will be consistent with proper planning and sustainable development and have acceptable impacts on the environment. TII believes that the RO application and the EIAR in particular sets out mitigation and monitoring measures that are sufficient for that purpose
7	7.1.1 Route Alignment	14, 15	The tunnel alignment does not pass directly beneath the Department of Finance building. However, there is inconsistency in the alignment between Tara Station and St. Stephen's Green. The alignment drawing ML1-JA1-EIA-ROUT_XX-DR-Y-04026 and the Contour drawing ML1-JAI-EIA-ROUT_XX-DR-Y-21148 show different alignments. Many of the reports refer to chainages along the alignment. However, there are no plans that indicate these chainages, and this makes reviewing the Draft Railway Order and EIAR difficult.	Refer to Item 5 above.
8	7.1.2 Tunnelling	16	The MetroLink 8.5m ID tunnel will be excavated by Tunnel Boring Machine (TBM). The ground conditions along the route are variable and therefore the machine could be either earth pressure balance (EPB) or Slurry (STB). A modern Variable Density TBM would also be suitable and is currently being used in the UK for similar ground conditions. All these machines can control the ground movement with appropriate tunnel management. The 980m drive between Tara Station and St. Stephen's Green (C8) will be entirely within the Argillaceous Limestone.	While acknowledging this comment, given the distance from the MetroLink alignment it will not apply to this particular building. The TBM selection points are noted and reflect MetroLink proposals.
9	7.3 Contractual Arrangement	16	The contractor(s) appointed will be responsible for the organisation, direction, and execution of environmental related activities during the detailed design and construction of the proposed Project. The contractor(s) is required to undertake all activities in accordance with the relevant environmental requirements including the consent documentation and other regulatory and contractual requirements.	TII's contractors will be bound by the Railway Order, further agreements entered into by TII and other relevant statutory or MetroLink specific regulation. TII accepts this as accurate, but many of the matters referred to, in particular the contractual arrangements with the contractors, are outside the scope of the railway order process.
10	8.0 POTENTIAL IMPACTS ON THE PROPERTY	16	DOWNEY and Gall Zeidler have carried out a detailed examination of the property subject to this submission. Having regard to the status and current use of the property and identified constraints, the following raises concerns regarding potential impacts of the MetroLink on the property. This has been elaborated to include potential impacts during the construction and operation phases of developing MetroLink, as well as any impediments and/or implications for future development of the property.	Please refer to response numbers (11) through to (23) below.
11	8.1 Monitoring	17	Given the sensitivity of the uses within this property, coupled with its historic importance, we request that An Bord Pleanála attach a condition to the Draft Railway Order that ensures continuous monitoring of the property to prevent any negative impacts. Access to all properties must be agreed in advance with the OPW and its clients. It is expected that this monitoring takes place at least 3 months in advance of the construction of the Project and throughout the operational stage of the MetroLink.	While acknowledging this comment, given the distance from the MetroLink alignment it will not apply to this particular building. Monitoring of this property is not needed but other OPW properties in closer proximity to the tunnel will be monitored. These proposals will be discussed with the OPW.
12	8.2 Security Issues	17	Given the nature of the State properties affected by the Project, we would respectfully refer An Bord Pleanála to Part XI of the Planning & Development Act 2000 (as amended), which states that: "Development by State authorities. 181.— (1) (a) The Minister may, by regulations, provide that, except for this section F902[and sections 181 A to 181C], the provisions of this Act shall not apply to any specified class or classes of development by or on behalf of a State authority where the development is, in the opinion of the Minister, in connection with or for the purposes of public safety or order, the administration of justice or national security or defence and, for so long as the regulations are in force, the provisions of this Act shall not apply to the specified class or classes of development. b(iii) the making available for inspection by members of the public of any specified documents, particulars, plans or other information with respect to the proposed development;"	This provision allows the Minister for Housing to provide that certain State developments do not require planning permission. It is not relevant to the MetroLink project. The MetroLink project is authorised by railway order and does not require planning permission. In that regard, we refer to section 38 of the Transport (Railway Infrastructure) Act 2001, which provides that "Each of the following shall be exempted development for the purposes of the Act of 2000: (a) development consisting of the carrying out of railway works, including the use of the railway works or any part thereof for the purposes of the operation of a railway, authorised by the Board and specified in a railway order or of any incidental or temporary works connected with such development; (b) development consisting of the carrying out of railway works for the maintenance, improvement or repair of a railway that has been built pursuant to a railway order.

Submission No.			224	
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - Department of Finance.				
13	8.2 Security Issues	17	All employees contracted to work on behalf of the TII on this Project, and any associated works, must adhere to the properties protocol around access, security, and safety. This applies to all persons entering or working in proximity of the property.	TII will ensure that contractors working on its behalf on OPW property comply with property protocols around access, security and safety. Once the TII worksites are established, works within those sites will be secured to MetroLink standards.
14	8.2 Security Issues	17	The day-to-day operations of the property cannot be interrupted by disruptions to any utilities.	There is no intent to disrupt the day to day activities.
15	8.2 Security Issues	17	The design and operation of the MetroLink should be in line with best international practice, in relation to anti-terrorism and security measures.	Safety and security are two priorities for the MetroLink in operation and hence the design will be developed cognisant of the risk in relation to terrorism and best practice applied. Further dialogue with OPW will be undertaken throughout the design and construction to ensure suitable provisions are in place.
16	8.3.1 Ground Movement	18	Stage 2: Three sections were considered in the assessment. The assessment concludes that the risk of damage to the Department of Finance building is Category 0, Negligible. The Building Damage Assessment Report recommends that the building not progress to phase 3 of assessment. However, the building is also listed to have foundations at a depth beyond 4m which constitutes further examination or at the least clarification on this building specifically.	This building is outside the zone of influence and hence no ground movement is predicted. Therefore the building will not be subject to damage and hence no building damage assessments are required and hence why no assessment is required irrespective of foundation depth. It is therefore excluded from EIAR Appendix A5.17.
17	8.3.1 Ground Movement	18,19	Stage 3: The EIAR states that a Stage 3 assessment will be carried out for the Department of Finance building by the Contractor appointed to construct this section of the MetroLink. The OPW expects to be consulted on the detail, scope of this assessment and programme for these assessments. It would be helpful if TII were to develop a Design Standard to ensure that ail Stage 3 analyses of the OPW properties are carried out to an equal standard. No mention of Stage 4 or 5 has been found in the Draft Railway Order or EIAR. Industry best practice as applied to London's Elizabeth Line (Crossrail) required that two further Stages in the Assessment of ground movement were undertaken during the project.	Refer to Item 16 above. The further stages referred to are applicable to MetroLink and to a number of OPW properties but as this property is outside of the zone of influence of the tunnelling they do not apply in this case.
18	8.3.1 Ground Movement	19	Stage 4 (Construction Stage): This stage is where any mitigation is implemented, and the monitoring of the stakeholders' infrastructure is carried out. Also, the preconstruction defect surveys are carried out prior to any excavation. The OPW requires a review of the detailed proposals for mitigation and monitoring. Monitoring proposals submitted to the OPW for review should include deep level monitoring and ground water level monitoring in addition to the building and surface monitoring typically implemented. The deep level monitoring will provide valuable data relating to the rock behaviour and has been usefully employed on HS2. The OPW will facilitate and observe the pre-construction defect surveys. It is noted that these shall be carried out by Professionally Qualified Engineers or Surveyors. The contractor(s) will coordinate preconstruction defect surveys for identified properties, liaising (in conjunction with the employer) with the building surveyor employed to carry out the surveys and maintaining a dialogue with the relevant property owners throughout the duration of the works.	Refer to Item 17 above.
19	8.3.1 Ground Movement	19	Stage 5 (Close Out): Once the excavation (tunnelling and station excavation) has been completed then the Contractor will want to decommission his monitoring. The OPW expects to be provided with close out reports for the monitoring of its property. As a minimum the close out report should include details of any mitigation carried out, a list of any repairs, time history graphs showing the movements monitored.	Refer to Item 17 above.
20	8.3.4 Work Sites	20	(b) Ground Water Control There is an assumption that the tunnelling will not affect the ground water above the tunnel. However, there should be a ground water monitoring scheme implemented to confirm this and a contingency plan to manage any residual risk.	A groundwater monitoring scheme will be undertaken across MetroLink as referenced in the EIAR. This is not specific to this building.
21	8.4.1 Noise and Vibration	20	TII proposes to mitigate the noise and vibration resulting from the railway operations by installing floating track slab to meet thresholds of 25 dBLamax, s and VC-D respectively. EIAR Chapter 14 Table 14.47 provides some guidance on where this will be constructed but it is not clear exactly where. The OPW requests that floating track slab is installed between Chainage 17+980 and 18+400 (St Stephen's Green Station). This would mitigate the noise and vibration to acceptable levels under all the Government buildings, museums, and the National Concert Hall. The vibration during railway operations will not impact the building fabric or structure.	While acknowledging this comment, given the distance from the MetroLink alignment it will not apply to this particular building. The locations of where floating track slab are to be installed are included in EIAR Chapter 14 and specifically in table 14.47. Floating slab track is planned between chainages 17+980 to 18+100 to mitigate impacts to the National Museums and National Gallery and between 18+780 and 19+940 for the National Concert Hall. For all locations please refer to the table.

Submission No.			224	
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - Department of Finance.				
22	8.4.3 Evacuation Strategy	21	There are no planned intervention/evacuation shafts between Tara Station and St. Stephen's Green. However, it is understood that the Fire Brigade have not accepted the strategy proposed by TH. This may have an impact on the Department of Finance should any intermediate shafts be required, particularly in relation to security impacts. It is requested that a condition would be attached to any Draft Railway Order granted, requiring prior consultation and agreement by the OPW regarding any shafts or infrastructure in the vicinity of this, or any of the other named State properties.	No additional shafts are required. Discussions with the Fire Brigade are ongoing but would not lead to a need for a new shaft.
23	8.5 Future Development	21	The OPW reserves the right to develop the subject property in the future, including property above and below ground, subject to normal planning criteria. It is important that the development of the MetroLink does not interfere with extant planning permissions pertaining to the subject property and the right of the applicant to develop this, in advance, in tandem or post operation of the MetroLink Project.	Please refer to Item 4.
24	CONCLUSION	21	With respect to this property, the OPW is seeking: 1) To ensure no disruption to occupants or the public accessing the building to carry out the duties of Government.	Access to the buildings will not be restricted by MetroLink. No Temporary Traffic Management (TTM) measures for the construction phase are planned for Merrion Row or Merrion St Upper which will affect the Department of Finance, see Section 7.10 of Appendix A9.5 of the EIAR; and no operational phase impacts are expected to have adverse impact on these streets, see Appendix A9.2-M of the EIAR.
25	CONCLUSION	22	With respect to this property, the OPW is seeking: 2) To ensure no damage to the buildings and their architectural detailing, pre-construction and post-construction surveys, trials and monitoring is required. This should include deep level monitoring and ground water level monitoring in addition to the building and surface monitoring typically implemented.	While acknowledging this comment, given the distance from the MetroLink alignment it will not apply to this particular building. Please refer to Item 16.
26	CONCLUSION	22	With respects to this property, the OPW is seeking: 3) To set up an access control regime in agreement with the OPW and relevant stakeholders when applying a continuous monitoring mechanism pre- and post-construction.	Please refer to response number (11) above. No access is required.
27	CONCLUSION	22	4) To ensure no ventilation and/or evacuation shaft in the vicinity of the area is permitted due to vitality and sensitivity of the Government Buildings uses and functions.	Refer to Response 22.
28	CONCLUSION	22	5) To reserve the right for the OPW that the development of the MetroLink does not interfere with the future development of the building, including above property and below its ground levels. Nor interfere with major maintenance, conservation, refurbishment, or construction works which may arise in the future.	While acknowledging this comment, given the distance from the MetroLink alignment it will not apply to this particular building. Refer to response 4.
29	CONCLUSION	22	With respect to this property, the OPW is seeking: 6) Precedents to be applied to the risk assessments to ensure utilising best industry practice within the implementation of the Project.	TII intend to apply industry best practice to build and operate the MetroLink whilst minimising impacts to 3rd parties.
30	CONCLUSION	22	7) To mitigate the noise and vibration to the acceptable levels for this cultural and government block by installing floating track slab between Chainage 17+980 and 18+400, which is the St. Stephen's Green Station.	While acknowledging this comment, given the distance from the MetroLink alignment it will not apply to this particular building. Refer to Response Item 21.
31	CONCLUSION	22	8) Regarding the tunnel boring machine noise over a 2-weeks period when the noise is predicted to exceed the acceptable threshold, it is respectfully requested for the timeline of the work to be pushed during recess of the Dail in order to avoid any disruption to the functions of the Department of Finance.	TII will consult and liaise with OPW and the Department of the Taoiseach to ensure the timing of these impacts are known and can be agreed. It is not considered feasible nor necessary to limit TBM passage to recess periods.

Submission No.			224	
Organisation Name or Name of Submitter			OPW Cover Letter & Downey Planning on behalf of OPW	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - Department of Finance.				
32	APPENDIX 1: LIST OF PLANNING LEGISLATION & POLICY	23	This appendix provides a non-exhaustive list of planning policy, legislation, and guidelines. We would respectfully request that An Bord Pleanála ensure that TH have fully assessed the Project with regard to existing planning policy, as well as adherence to the relevant local policies and guidelines pertaining to each individual property. DOWNEY note that this proposed Draft Railway Order is a strategic long-term development and An Bord Pleanála may consider Development Plans in assessing the Project. It is also crucial to note that on foot of a granted Order and during the detailed design stage, a revision to planning policy is expected, whereby adopted plans and legislation may have to be adhered within this stage. This may require an amendment to the Railway Order and further assessment, including public consultation.	The only policy relevant to the decision on whether to grant the Railway Order and the necessary conditionality is the policy in force at the date of the grant of the Railway Order, as has been made clear in numerous High Court decisions including Element Power v An Bord Pleanála [2017] IEHC 550 and the Railway Order cannot be made conditional on compliance with future, yet to be developed policy. As planning and policy and strategy are being updated constantly, TII will undertake a further review of planning policy in advance of any oral hearing to allow for an updated presentation on the projects consistency with active policy requirements to be presented to An Bord Pleanála.
33	Appendix 2: Ground movement Assessment	27	Duplicate of Appendix to D to OPW Cover Letter - Re: Railway (Metrolink–Estuary to Charlemont via Dublin Airport) Order 2022 – Submissions by the Commissioners of Public Works in Ireland	Refer to OPW Cover Letter response

OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - Department of Justice 50-51 St Stephens Green					
1	Executive Summary	N/A	With respect to this property, the OPW is seeking: 1) To ensure no disruption to the access of the building by staff and visitors in order to carry out the duties of Government and Civil Service within the Department of Justice. 2) To ensure that the historic fabric of the buildings is considered in detail in Phase 3 design phase in order to provide maximum protections to the property from damage during construction and operation phases. 3) Pre-construction and post-construction surveys, trials, and monitoring to ensure no damage to the buildings and their architectural detailing. This mainly relates to noise, vibration, and dust which may damage this building of historical significance and disturb day-to-day functioning of the work of the Department. 4) To set up an access control regime in agreement with the OPW and relevant stakeholders when applying a continuous monitoring mechanism pre- and post-construction. 5) To ensure no ventilation and/or evacuation shaft in the vicinity of the area is permitted due to the sensitivity of the Department of Justice uses and functions. 6) To reserve the right for the OPW that the development of the Metro Link does not interfere with extant permissions pertaining to No. 50-51 St. Stephen's Green and its future development, including above property and below its ground levels. Nor interfere with major maintenance, conservation, refurbishment, or construction works which are currently anticipated or may arise in the future. 7) Precedents to be applied to the risk assessments to ensure utilising best industry practice within implementation of the Project. 8) To ensure that an appropriate traffic management plan is in place for the duration of the construction phases which ensures business continuity at the Dept.	TII thank you for your comments. Further to TII's response to the OPW Covering letter, the matters raised by OPW specific to these buildings are addressed in responses (2) through to (37) below.	
2	3.0 Overview of the Draft Railway Order	9	While extensive pre-planning consultations also took place between TII and the OPW, a detailed assessment of the individual properties affected has not yet taken place. The draft Railway Order application 2022 is a Draft Order, and should the route be approved by An Bord Pleanála, further detailed design will be submitted which will require further consideration and approval. Factors such as the internal uses of the properties, their construction methods, age and historical importance and the effect of construction on these sensitivities has not been assessed as part of the Project thus far. Additional consideration needs to be given to the potential effects on the built environment before a route and construction method can be confirmed. The OPW reserves the right to make further commentary, pending more detailed design proposals.	TII have undertaken a Phased Ground Movement Impact Assessment and the results of the assessments are included in the RO documentation within Appendix 5.17 of the EIAR. Appendix B2 of that document indicates the list of special buildings that would be subject to a subsequent Phase 3 assessment irrespective of the engineering need to do so. Many OPW buildings are in this category. It should be noted that the further assessments that will be done by the contractor if the RO is granted will likely reduce the impacts on the buildings as the Phase 2 assessment is a conservative assessment whose results are generally more significant than the results of a Phase 3 assessment. TII will consult with OPW in relation to the results of any Phase 3 assessments and any requirements for monitoring and / or other mitigations that eventuate will be discussed with OPW. TII are satisfied that the approach adopted to date follows an industry standard approach undertaken on tunnelling and underground projects around the world including on the Channel Tunnel Rail Link and Crossrail in London, the Dublin Port Tunnel and currently on High Speed 2 in England, and therefore that further assessment is not required and should not be delivered prior to the route being consented. Further details on assessments undertaken and next steps proposed for this building are detailed in response number (3) below.	
3	4.2 Historical Context /Conservation Status	13	Building Sensitivities These two building incorporate Georgian high status domestic construction, Victorian intervention and modern building elements. As Georgian buildings they have the usual sensitivities of brick facing, suspended timber floors with lathe and plaster ceiling with stucco, historic glass, internal downpipes, slate and lead roof coverings. Mid-nineteenth century interventions and new construction will likely have introduced cast iron and other (then) innovative materials. Cast-iron is brittle and railing enclosing the area may be very vulnerable to movement. The c.2000 atrium glazing and any other rooflights will also be vulnerable to movement.	TII welcome this information in relation to this building and would like to assure OPW that these details will be considered regarding potential sensitivity to settlement. The building has been assessed with impacts from ground movement to stage 2a as per the methodology described in EIAR Appendix 5.17 and the nature of the building has been taken into account. The initial assessment shows negligible impacts, but as TII have designated this a "Special" building, further detailed assessment will be undertaken to provide assurance.	
4	4.4 Planning Context	13	In relation to the Draft Railway Order's consistency with planning policy and planning guidelines, a non-exhaustive list of planning policy and legislation at National, Regional, and Local levels, is included in Appendix 1 of this submission and the Board are invited to refer to this for further details. We would respectfully request that An Bord Pleanála ensure that TII have fully assessed the Project regarding existing planning policy, as well as adherence to the relevant local policies and guidelines pertaining to each individual property. DOWNEY note that this proposed Draft Railway Order is a strategic long-term development and An Bord Pleanála may consider Draft Development Plans in assessing the Project. It is also crucial to note that on foot of a granted Order and during the detailed design stage, a revision to planning policy is expected, whereby adopted plans and legislation may have to be adhered within this stage. This may require an amendment to the Railway Order and further assessment, including public consultation.	The only policy relevant to the decision on whether to grant the Railway Order and the necessary conditionality is the policy in force at the date of the grant of the Railway Order, as has been made clear in numerous High Court decisions including Element Power v An Bord Pleanála [2017] IEHC 550 and the Railway Order cannot be made conditional on compliance with future, yet to be developed policy. As planning and policy and strategy are being updated constantly, TII will undertake a further review of planning policy in advance of any oral hearing to allow for an updated presentation on the projects consistency with active policy requirements to be presented to An Bord Pleanála.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - Department of Justice 50-51 St Stephens Green					
5	4.5 Potential Development of the Property	14	This building itself is a protected structure in a sensitive location. It is unlikely that permission will ever be sought in the future to extend upwards. The OPW reserves the right to develop the subject property in the future. This includes property above and below ground, subject to normal planning criteria. It is important that the development of the MetroLink does not interfere with extant planning permissions pertaining to the subject property and the right of the applicant to develop these, in advance, in tandem or post operation of the MetroLink Project.	MetroLink will be a catalyst for and provide opportunity for future development and regeneration. While the MetroLink Railway Order does not include for future neighbouring or overhead development, the tunnels and stations are designed to support appropriate future imposed loads. TII will be required to make submissions in relation to planning applications for proposed future developments on or adjacent to MetroLink and there will necessarily be some engineering constraints (such as permissible loadings) required. However MetroLink is committed to engaging with known development proposals and new development proposals as they emerge with the intent of facilitating such developments as they emerge to the maximum extent consistent with the safe operation of the proposed Project. Again in common with other existing rail and tunnel projects, following grant of the Railway Order and development of detailed design, TII will produce "Guidance Note for Developers" that will be the subject of bye-laws following the grant of Railway Order and which is designed to facilitate future adjacent or over-site development while protecting the integrity and safety of the MetroLink works and operations. It is inappropriate and unworkable to produce this policy at this stage because it would have to be in broad terms that deal not only with the current RO proposal and any contingencies that might arise from the Board seeking revised designs or new conditionality as part of the RO application process. Therefore at this stage TII is dealing with known development proposals on a case by case basis, TII will work with parties in the future to assist with the wider development of sites over and above stations and tunnels. In this context TII has successfully engaged with a number of developers over the last two years to accommodate development over and in proximity to the alignment and there have been no material restrictions on development subject to the implementation of agreed design and mitigation measures and it is not anticipated that MetroLink will have a material impact on the development potential of sites above and in proximity to the alignment in future.	
6	5.0 MATERIAL CONSIDERATIONS	14	The alignment drawing ML1-JAI-EIA-ROUT_XX-DR-Y-04025 and the contour drawing ML1-JAI-EIA-ROUT_XX-DR-Y-21148 show different alignments. This error has resulted in deficient and conflicting information within the SID application submitted under Section 2 of the Planning and Development Act 2000 (as amended). The conflicting information has resulted in a difficulty in assessing the impacts on the property due to vibration and noise caused by both the construction and operational phases of the MetroLink on this section of the alignment. This affects several buildings under the management of the OPW particularly at the Kildare Street, Merrion Square and St Stephen's Green areas.	This is not relevant for this building. On two drawings (Figures 20.16 Settlement Contours, sheets 27 and 28 of 30) in EIAR Appendix 5.17 Building Damage Report, the tunnel centreline is plainly incorrect as it deviates from the centre of the settlement contours between Tara and St. Stephen's Green stations. The settlement contours are correct and reflect the proposed Railway Order alignment and as such the drawing serves its core purpose, which is to identify, describe and assess the settlement impact of the railway works. In any event, revised drawings will be submitted to the Board to rectify the error. The correct alignment has been used for all environmental impact assessments including tunnel induced settlement, and construction and operational noise and vibration impact assessments.	
7	6.0 LEGAL CONSIDERATIONS	14	The Commissioners of Public Works would seek to enter into appropriate, property-specific legal agreements with TII, to ensure the protection of key State property and of the State's activities undertaken within those and other properties. Given the importance of such properties and activities, the Commissioners of Public Works consider it appropriate that An Bord Pleanála would make the Railway Order conditional on such legal agreements being in place between TII and the OPW. Creating such legal agreements between TII and the OPW would be possible only after TII make available the more detailed design and risk-mitigation measures for the construction and operational phases of the MetroLink project, and before any development begins. Therefore, the Commissioners of Public Works would request that this aspect be reflected in the conditions set out by An Bord Pleanála to TII, as this would provide assurances to the Commissioners of Public Works relating to future legal agreements that protect and secure State property and activities from risks associated with the construction or operations of the MetroLink	TII's preference is carry out all of the permitted railway works with the agreement of affected landowners and prescribed bodies. However, it should not be condition of the railway order that TII reach such agreement with OPW. In the event that agreement cannot be reached with OPW, TII should be entitled to carry out the railway works over their objections provided that it complies with the terms and conditions of the Railway Order. The Board's function is to satisfy itself that those terms and conditions are adequate to ensure that the construction and operation of the railway works will be consistent with proper planning and sustainable development and have acceptable impacts on the environment. TII believes that the RO application and the EIAR in particular sets out mitigation and monitoring measures that are sufficient for that purpose	
8	7.1.1 Route Alignment	15	Many of the reports refer to chainages along the alignment, however there are no plans that indicate these chainages, and this makes reviewing the Railway Order and EIAR difficult.	Reference to chainages along the alignment are provided within the Railway Order Plans\Drawings under Alignment Drawings.	
9	7.3 Contractual Arrangement	16	The contractor(s) appointed will be responsible for the organisation, direction, and execution of environmental related activities during the detailed design and construction of the proposed Project. The contractor(s) is required to undertake all activities in accordance with the relevant environmental requirements including the consent documentation and other regulatory and contractual requirements.	TII accepts this as accurate, but many of the matters referred to, in particular the contractual arrangements with the contractors, are outside the scope of the railway order process.	

Submission No.			225		
Organisation Name or Name of Submitter			Office of Public Works (OPW)		
Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - Department of Justice 50-51 St Stephens Green					
10	8.0 POTENTIAL IMPACTS ON THE PROPERTY	16	DOWNEY and Gall Zeidler have carried out a detailed examination of the property subject to this submission; having regard to the status and current use of the property and identified constraints, the following raises issues regarding potential impacts of the MetroLink on the property. This has been elaborated to include potential impacts during the construction and operation phases of developing MetroLink, as well as any impediments and/or implications for future development of the property.	Please refer to responses numbers (11) through to (26) below.	
11	8.1 Monitoring	16	Given the sensitivity of the uses within this property, coupled with its historic importance, we request that An Bord Pleanála attach a condition to the Railway Order that ensures continuous monitoring of the property to prevent any negative impacts. Access to all properties must be agreed in advance with the OPW and its clients. It is recommended that this monitoring takes place at least 3 months in advance of the construction of the Project and at least 6 weeks post the operational stage of the MetroLink.	It will procure its contractors to develop Instrumentation and Monitoring Plans in tandem with Monitoring Action Plans. These plans will help ensure that the risks associated with tunnelling and station excavations impacting any OPW property are appropriately managed and controlled. TII will provide details of any monitoring proposed by the contractor at detailed design stage and discuss the methodology of installation to the OPW property. TII will provide advance notice of any attendance that the monitoring contractor may require. With regard to the timing of monitoring specific to ground movement TII will ensure that it is commenced 3 months prior to the construction activities that would give rise to the settlement. However, as these construction activities may complete years prior to the MetroLink operational phase the termination of monitoring will be linked to a determination that settlement has effectively ceased, allowing a removal of the instrumentation.	
12	8.2 Security Issues	17	Given the nature of the State properties affected by the Project, we would respectfully refer An Bord Pleanála to Part XI of the Planning & Development Act 2000 (as amended), which states that: "Development by State authorities. 181.— (1) (a) The Minister may, by regulations, provide that, except for this section F902[and sections 181A to 181C], the provisions of this Act shall not apply to any specified class or classes of development by or on behalf of a State authority where the development is, in the opinion of the Minister, in connection with or for the purposes of public safety or order, the administration of justice or national security or defence and, for so long as the regulations are in force, the provisions of this Act shall not apply to the specified class or classes of development. (iii) the making available for inspection by members of the public of any specified documents, particulars, plans or other information with respect to the proposed development;"	This provision allows the Minister for Housing to provide that certain State developments do not require planning permission. It is not relevant to the MetroLink project. The MetroLink project is authorised by railway order and does not require planning permission. In that regard, we refer to section 38 of the Transport (Railway Infrastructure) Act 2001, which provides that "Each of the following shall be exempted development for the purposes of the Act of 2000: (a) development consisting of the carrying out of railway works, including the use of the railway works or any part thereof for the purposes of the operation of a railway, authorised by the Board and specified in a railway order or of any incidental or temporary works connected with such development; (b) development consisting of the carrying out of railway works for the maintenance, improvement or repair of a railway that has been built pursuant to a railway order.	
13	8.2 Security Issues	17	It is essential that security issues do not arise in the event of sensitive information being shared on the structure and operation of these properties. However, the OPW understands the importance of the detailed design stage of the Project and the wish to ensure that the detailed assessment of these properties takes place in the early stages of the design process, in conjunction with the OPW, to ensure that these sensitive State buildings are not negatively impacted upon by the proposed Project. The OPW will liaise with TII and An Bord Pleanála on this matter.	This is understood and agreed. TII propose a meeting is held with the requisite OPW / security experts to discuss potential risks and the management of these risks during the construction and operational phases of the Project. It and their consultants store all data on secure systems in line with best practice and treat all information as confidential. TII are available to engage with the OPW to discuss any specific requirements the OPW have in regard to data security.	
14	8.2 Security Issues	17	All employees contracted to work on behalf of the TII on this Project, and any associated works, must adhere to the properties protocol around access, security, and safety. This applies to all persons entering or working in proximity of the property.	It will ensure that contractors working on its behalf on OPW property comply with property protocols around access, security and safety. Once the TII worksites are established, works within those sites will be secured to MetroLink standards.	
15	8.2 Security Issues	17	The day-to-day operations of the property cannot be interrupted by disruptions to any utilities.	There is no intent to disrupt the day to day activities. If subsequently, it is found that a disruption to utility provision is inevitable this will be discussed with OPW and the timing and duration of any disruption optimised to minimise said disruption.	
16	8.2 Security Issues	17	The design and operation of the MetroLink should be in line with best international practice, in relation to anti-terrorism and security measures.	Safety and security are two priorities for the MetroLink in operation and hence the design will be developed cognisant of the risk in relation to terrorism and best practice applied. Further dialogue with OPW will be undertaken throughout the design and construction to ensure suitable provisions are in place.	

Submission No.			225		
Organisation Name or Name of Submitter			Office of Public Works (OPW)		
Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - Department of Justice 50-51 St Stephens Green					
17	8.3 During Construction of the MetroLink	17	These buildings provide offices for the Department of Justice. They provide functional spaces and office accommodation and as such the impact of any proposed works in terms of noise, vibration etc, which effects the quality of the working environment, would need to be carefully considered.	TII can confirm that the impact assessment in the EIAR in terms of noise and vibration was undertaken considering the type of building being assessed, and utilising different thresholds for each category (e.g. Commercial, residential, special buildings such as schools, hospitals, theatres or heritage buildings). As part of the noise & vibration assessment, it was deemed that the only construction works that would have an impact at this location was groundborne noise from TBM passage. This was deemed to be noticeable to all and disturbing to some over a number of days. Mitigation here would involve advanced notice and engagement prior to these works. See also response number (22) below.	
18	8.3.1 Ground Movement	18	Stage 2: Three sections were considered in the assessment. The assessment identifies a build between The Department of Justice and Equality and the Loreto College and identifies this building only as "OPW". We infer that this is the building at No. 50-51 St. Stephens Green. The assessment concludes that the risk of damage to No. 50-51 St. Stephens Green is Category 0, Negligible. However, as a "Special building" it shall progress to stage/Phase 3 assessment.	This observation is noted.	
19	8.3.1 Ground Movement	18	Stage 3: The EIAR states that a Stage 3 assessment will be carried out by the Contractor appointed to construct this section of the MetroLink. The OPW are expecting to be consulted on the detail, scope of this assessment and programme for these assessments. It would be helpful if TII were to develop a Design Standard to ensure that all Stage 3 analyses of The OPW properties are carried out equally. No mention of Stage 4 or 5 has been found in the Railway Order or EIAR. Industry best practice as applied to London's Elizabeth Line (Crossrail) required that two further Stages in the Assessment of ground movement were undertaken during the project.	A design standard will be prepared that reflects the methodology described in EIAR Appendix 5.17. The development of monitoring, mitigation and contingency plans and the subsequent close out of the impacts of settlement will form part of the scope of the Project for the detail design and construct phases. TII will develop the process to be adhered to by the contractor and this will be included in the contract documentation prepared for that contract. TII notes the description of stages 4 and 5 as included as Appendix D and confirm that the MetroLink Specification will reflect similar requirements to achieve the desired outcomes.	
20	8.3.1 Ground Movement	19	Stage 4 (Construction Stage): This stage is where any mitigation is implemented, and the monitoring of the stakeholders' infrastructure is carried out. Also, the preconstruction defect surveys are carried out prior to any excavation. The OPW will require to review the detailed proposals for mitigation and monitoring. Monitoring proposals submitted to the OPW for review should include deep level monitoring and ground water level monitoring in addition to the building and surface monitoring typically implemented. The deep level monitoring will provide valuable data relating to the rock behaviour and has been usefully employed on HS2. The OPW will facilitate and observe the preconstruction defect surveys. It is noted that these shall be carried out by Professionally Qualified Engineers or Surveyors. The contractor(s) will coordinate preconstruction defect surveys for identified properties, liaising (in conjunction with the employer) with the building surveyor employed to carry out the surveys and maintaining a dialogue with the relevant property owners throughout the duration of the works.	All surveys, monitoring and mitigation proposed for OPW property will be discussed with OPW. TII will employ Professionally Qualified Engineers / Surveyors with the appropriate expertise to undertake the pre and post condition surveys and OPW are welcome to observe the surveys being undertaken of their property.	
21	8.3.1 Ground Movement	19	Stage 5 (Close out) - Once the excavation (tunnelling and station excavation) has been completed then the Contractor will want to decommission his monitoring. The OPW will expect to be provided with close out reports for the monitoring of their property. As a minimum the close out report should include details of any mitigation carried out, a list of any repairs, time history graphs showing the movements monitored.	TII will share the closeout monitoring report that will demonstrate that construction ground movements have ceased, which will also require historical movement information to be presented. In the event of repairs, these will be scheduled.	
22	8.4.3 Noise and Vibration	19	(a) Tunnelling EIAR Chapter 14 Ground Borne Noise and Vibration Measures identifies identify impacts on No. 50-51 St. Stephen's Green during TBM excavation: • Ground borne noise 50 dBA L_{Amax} - Significant impact. • Ground borne vibration 0.275 VDV_{db,ms}-1.75- no significant impact. EIAR Table 6.2- GNV1 states that there is no effective mitigation available and therefore the impact will be managed by detailed consultation with the building owners. The OPW will request specific vibration limits to be applied to No. 50-51 St. Stephen's Green and ensure that a monitoring regime is implemented. EIAR Table 6.2- ANV16. Sets out requirement for Pre and post construction surveys of structures vulnerable to vibration induced damage. The OPW requires that pre and post construction surveys of structures vulnerable to vibration induced damage are carried out and this should include No. 50-51 St. Stephen's Green.	The assessment has identified that there will be no potential for structural damage due to vibration as levels of vibration are predicted to be below the construction threshold of 1.6 ms-1.75 VDV (Please refer to Appendix 14.5 - Groundborne Noise and Vibration and Blasting Modelling Results). Further to response number (17) above. Regarding groundborne noise, unfortunately, there are no effective methods available to reduce groundborne noise from TBMs at source, but noting that the duration of this impact will be of the order of two weeks. TII will consult and liaise with OPW to ensure the timing of these impacts are known. The principal mitigation measures aimed at minimising impacts are as follows: - Advance public consultation and stakeholder engagement can greatly reduce the significance of groundborne noise effects, as building occupants would be prepared for the passage of the TBM and resultant elevated noise and vibration levels. - TII will accept and consider applications for additional measures on a case-by case basis, in accordance with its Noise and Vibration Mitigation Policy (see Appendix A14.6 Airborne Noise and Groundborne Noise Mitigation Policy). All surveys, monitoring and mitigation proposed for OPW property will be discussed and agreed with OPW. TII will employ Professionally Qualified Engineers / Surveyors with the appropriate expertise to undertake the pre and post condition surveys and OPW are welcome to observe the surveys being undertaken of their property.	

Submission No.			225	
Organisation Name or Name of Submitter			Office of Public Works (OPW)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - Department of Justice 50-51 St Stephens Green				
23	8.3.4 Work Sites	20	b) Ground Water Control There is an assumption that the tunnelling will not affect the ground water above the tunnel, however there should be a ground water monitoring scheme implemented to confirm this and a contingency plan to manage any residual risk.	Ground water monitoring at stations will be undertaken by the contractor. The design of it and any contingencies will be developed at detailed design.
24	8.3.4 Work Sites	20	(c) Working Hours No. 50-51 St. Stephen's Green is located between Tara Street and St. Stephen's Green Stations. The construction of these stations will generate additional lorry movements, for both deliveries and spoil removal, that TII and their contractors will need to manage to minimise impact in the vicinity.	At this location, construction vehicles are proposed to enter the site south of the property and exit the site north of the property - minimising the impact of these vehicles as they will be behind the site hoarding line at this location, see Figure 7-53 of Appendix A9.5. Please also refer to the outline CEMP (EIAR appendix A5.1) for further mitigations proposed.
25	8.4.1 Noise and Vibration	21	TII proposes to mitigate the noise and vibration resulting from the railway operations by installing floating track slab to meet thresholds of 25 dBLamax,s and VC-D respectively. EIAR Chapter 14 Table 14.47 provides some guidance on where this will be constructed but it is not clear exactly where. The OPW requests that floating track slab is installed between Chainage 17+980 and 18+400 (St. Stephen's Green Station). This would mitigate the noise and vibration to acceptable levels under all the Government buildings, museums, and the National Concert Hall.	Information on the locations assessed as requiring floating track slab is listed in Table 14.47. Floating slab track has been proposed between Ch 17+980 - 18+100 and Ch. 18+760 - 18+940. Floating slab track is proposed as a mitigation measure in locations where buildings that are sensitive to groundborne noise have the potential for significant effects during the operation of the proposed Project. 51 St Stephens Green was assessed for predicted groundborne noise during operation (table 14.44 of the EIAR) and it was deemed that groundborne noise at this location fell below the sensitive receptor threshold level so the impacts at this location are not significant. Therefore floating slab track is not proposed at this location.
26	8.4.3 Evacuation Strategy	21	The are no planned intervention/evacuation shafts between Tara Station and St. Stephen's Green, however it is understood that the Fire Brigade have not accepted the strategy proposed by TII.	No additional shafts are required. Discussions with the Fire Brigade are ongoing but would not lead to a need for a new shaft.
27	9.0 CONCLUSION	21	With regards to the Gall Zeidler assessment, the most significant impact of the MetroLink project on No. 50-51 St. Stephen's Green will be from the construction of St. Stephens Green Station including associated utility and traffic diversions, dust, and noise. The OPW will seek assurances from TII that disruption from construction will be kept to a minimum and for the shortest time possible.	Following the impact assessment in the EIAR, mitigation measures were proposed in order to minimize the impact of Metrolink construction and operation on receptors in the area for impacts such as dust, noise & traffic management plans of which detailed mitigation measures can be found in the Outline Construction Environmental Management Plan (CEMP), appendix A5.1 and Chapter 31 of the EIAR. Attenuation and mitigation of disruption from construction is a priority for the proposed Project and TII are happy to engage further with OPW.
28	9.0 CONCLUSION	21	Reading this within the context of the building and its requirements, the main considerations for No. 50-51 St. Stephen's Green are as follow: 1) To ensure no disruption to the access of the building by staff and visitors in order to carry out the duties of Government and Civil Service within the Department of Justice.	Noted - Minimal impact on Pedestrians on eastern footpath is expected. While intermittent lane closures on SSG East are anticipated, pedestrian access will be maintained at all times. See Appendix A.9.5 Section 7.10
29	9.0 CONCLUSION	21	2) To ensure that the historic fabric of the buildings is considered in detail in Phase 3 design phase in order to provide maximum protections to the property from damage during construction and operation phases.	Please refer to response number (2) above.
30	9.0 CONCLUSION	21	3) Pre-construction and post-construction surveys, trials, and monitoring to ensure no damage to the buildings and their architectural detailing. This mainly relates to noise, vibration, and dust which may damage this building of historical significance and disturb day-to-day functioning of the work of the Department	TII are happy to engage with OPW in order to reach agreement on an appropriate monitoring programme for the above mentioned buildings. The monitoring is to be developed at detailed design stage.
31	9.0 CONCLUSION	21	4) To set up an access control regime in agreement with the OPW and relevant stakeholders when applying a continuous monitoring mechanism pre- and post-construction.	All access required to OPW property will be agreed with OPW.
32	9.0 CONCLUSION	21	5) To ensure no ventilation and/or evacuation shaft in the vicinity of the area is permitted due to the sensitivity of the Department of Justice uses and functions.	No additional shafts are required. Refer to Item26.
33	9.0 CONCLUSION	21	6) To reserve the right for the OPW that the development of the MetroLink does not interfere with extant permissions pertaining to No. 50-51 St. Stephen's Green and its future development, including above property and below its ground levels. Nor interfere with major maintenance, conservation, refurbishment, or construction works which are currently anticipated or may arise in the future.	Please refer to response number (5) above.
34	9.0 CONCLUSION	21	7) Precedents to be applied to the risk assessments to ensure utilising best industry practice within implementation of the Project.	TII intend to apply industry best practice to build and operate the MetroLink whilst minimising impacts to 3rd parties.
35	9.0 CONCLUSION	21	8) To ensure that an appropriate traffic management plan is in place for the duration of the construction phases which ensures business continuity at the Dept.	Agreed. A Traffic Management Plan is a key document of the Construction Environmental Management Plan (refer to Appendix A5.1 of the EIAR) for review and approval by Dublin City Council in advance of Construction Commencement.

OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - Department of Justice 50-51 St Stephens Green				
36	APPENDIX 1: LIST OF PLANNING LEGISLATION & POLICY	23	This appendix provides a non-exhaustive list of planning policy, legislation, and guidelines. We would respectfully request that An Bord Pleanála ensure that TII have fully assessed the Project with regard to existing planning policy, as well as adherence to the relevant local policies and guidelines pertaining to each individual property. DOWNEY note that this proposed Draft Railway Order is a strategic long-term development and An Bord Pleanála may consider Development Plans in assessing the Project. It is also crucial to note that on foot of a granted Order and during the detailed design stage, a revision to planning policy is expected, whereby adopted plans and legislation may have to be adhered within this stage. This may require an amendment to the Railway Order and further assessment, including public consultation.	Please refer to response number (4) above.
37	Appendix 2: Ground movement Assessment	28	Duplicate of Appendix to D to OPW Cover Letter - Re: Railway (Metrolink–Estuary to Charlemont via Dublin Airport) Order 2022 – Submissions by the Commissioners of Public Works in Ireland.	Refer to OPW Cover Letter response

Submission No.			226

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - Garden of Remembrance				
1	Executive Summary	N/A	With respect to this property, the OPW is seeking: j) That ABP note the historic significance of this property and its importance for use in conjunction with Government business, visiting world leaders and National Commemorations. Accordingly, full access to this property, unhindered, is required. k) To ensure no disruption to the public access of the Garden and its day-to-day uses and functions. l) To ensure inclusion of the Garden within Stage 3 detailed design process, in particular regarding ground movement and ground borne noise and vibration and their potential impacts on the Garden pre- and post-construction. m) To ensure no adverse impact of the traffic diversions on the accessibility of the Garden and visitors' attendance during construction of the Mater and O'Connell Street stations. n) To ensure no interference of the MetroLink development with the Garden and its potential future development.	II thank you for your comments. Further to TII's response to the OPW Covering letter, the matters raised by OPW specific to these uildings are addressed in responses (2) through to (35) below.
2	3.0 Overview of the Draft Railway Order	8	While extensive pre-planning consultations also took place between TII and the OPW, a detailed assessment of the individual properties ffected has not yet taken place. The draft Railway Order application 2022 is a Draft Order, and should the route be approved by An Bord Pleanála, further detailed design will be submitted which will require further consideration and approval. Factors such as the internal uses of the properties, their construction methods, age and historical importance and the effect of construction on these sensitivities has not been assessed as part of the Project thus far. Additional consideration needs to be given to the potential effects on the built environment before a route and construction method can be confirmed. The OPW reserves the right to make further commentary, pending more detailed design proposals.	II have undertaken a Phased Ground Movement Impact Assessment and the results of the assessments are included in the RO ocumentation within Appendix 5.17 of the EIAR. Appendix B2 of that document indicates the list of special buildings that would be object to a subsequent Phase 3 assessment irrespective of the engineering need to do so. Many OPW buildings are in this category. It should be noted that the further assessments that will be done by the contractor if the RO is granted will likely reduce the impacts on the uildings as the Phase 2 assessment is a moderately conservative assessment whose results are generally more significant than the esults of a Phase 3 assessment. This point was discussed with OPW and their consultants in January 2023. TII will consult with OPW in elation to the results of any Phase 3 assessments and any requirements for monitoring and / or other mitigations that eventuate will be iscussed with OPW. II are satisfied that the approach adopted to date follows an industry standard approach undertaken on tunnelling and underground rojects around the world including on the Channel Tunnel Rail Link and Crossrail in London, the Dublin Port Tunnel and currently on High peed 2 in England, and therefore that further assessment is not required and should not be delivered prior to the route being consented. or this particular property, the assessment outlined in the EIAR predicts that the 1mm settlement contour is outside the gates to the arden of Remembrance and hence this property is not impacted by settlement. See appendix A5.17 Building Damage report and page 22 of 158 of that report. As there is no impacts no further assessment is required.
3	4.3 Current Use/Uses	13	he Garden of Remembrance is a city garden and amenity space open to the public, occupying roughly a fifth of Parnell Square at its orthern end, with various points of entry. he Garden of Remembrance also plays a central role in State visits. All visiting Heads of State attend a ceremony at the gardens on their rrival to the country. This happens immediately after they are greeted by the Irish President at Áras an Uachtaráin. Queen Elizabeth II aid a wreath in the Garden of Remembrance during her State visit in May 2011, a gesture that was much praised in the Irish media, and which was also attended, upon invitation, by the widow and the daughter of the Garden's designer, Daithí Hanly. ensitivities: The tanking (waterproofing) and mosaic of the pond. The very high value bronze sculpture is at a remove from the roposed tunnel.	II welcome this information in relation to this site. TII will continue to liaise with the OPW to ensure there is no disruption to these vents. Please note the ponds and statues are outside the zone of influence of the tunnelling and are therefore unaffected.
4	4.4 Planning Context	14	n relation to the Draft Railway Order's consistency with planning policy and planning guidelines, a non-exhaustive list of planning policy nd legislation at National, Regional, and Local levels, is included in Appendix 1 of this submission. The Board are invited to refer to this or further details. We would respectfully request that An Bord Pleanála ensure that TII have fully assessed the Project with regard to xisting planning policy, as well as adherence to the relevant local policies and guidelines pertaining to each individual property. OWNEY note that this proposed Draft Railway Order is a strategic long-term development and An Bord Pleanála may consider Draft evelopment Plans in assessing the Project, it is also crucial to note that on foot of a granted Order and during the detailed design stage, evision to planning policy is expected, whereby adopted plans and legislation may have to be adhered within this stage. This may equire an amendment to the Draft Railway Order and further assessment, including public consultation.	he only policy relevant to the decision on whether to grant the Railway Order and the necessary conditionality is the policy in force at he date of the grant of the Railway Order, as has been made clear in numerous High Court decisions including Element Power v An Bord leanála [2017] IEHC 550 and the Railway Order cannot be made conditional on compliance with future, yet to be developed policy. As lanning and policy and strategy are being updated constantly, TII will undertake a further review of planning policy in advance of any ral hearing to allow for an updated presentation on the projects consistency with active policy requirements to be presented to An Bord leanála.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - Garden of Remembrance				
5	4.5 Potential Development of the Property	14	The Garden of Remembrance is a socio-cultural place with historical and artistic significance at national level. It is also a protected structure, and therefore, no side development is expected. However, there is always the possibility that sub-terranean development could take place.	MetroLink will be a catalyst for and provide opportunity for future development and regeneration. While the MetroLink Railway Order does not include for future neighbouring or overhead development, the tunnels and stations are designed to support appropriate future imposed loads. TII will be required to make submissions in relation to planning applications for proposed future developments on or adjacent to MetroLink and there will necessarily be some engineering constraints (such as permissible loadings) required. However MetroLink is committed to engaging with known development proposals and new development proposals as they emerge with the intent of facilitating such developments as they emerge to the maximum extent consistent with the safe operation of the proposed Project. Again in common with other existing rail and tunnel projects, following grant of the Railway Order and development of detailed design, TII will produce "Guidance Note for Developers" that will be the subject of bye-laws following the grant of Railway Order and which is designed to facilitate future adjacent or over-site development while protecting the integrity and safety of the MetroLink works and operations. It is inappropriate and unworkable to produce this policy at this stage because it would have to be in broad terms that deal not only with the current RO proposal and any contingencies that might arise from the Board seeking revised designs or new conditionality as part of the RO application process. Therefore at this stage TII is dealing with known development proposals on a case by case basis, TII will work with parties in the future to assist with the wider development of sites over and above stations and tunnels. In this context TII has successfully engaged with a number of developers over the last two years to accommodate development over and in proximity to the alignment and there have been no material restrictions on development subject to the implementation of agreed design and mitigation measures and it is not anticipated that MetroLink will have a material impact on the development potential of sites above and in proximity to the alignment in future
6	5.0 MATERIAL CONSIDERATIONS	14	The alignment drawing ML1-JAI-EIA-ROUT_XX-DR-Y-04025 and the contour drawing ML1-JAI-EIA-ROUT_XX-DR-Y-21148 show different alignments. This error has resulted in deficient and conflicting information within the SID application submitted under Section 2 of the Planning and Development Act 2000 (as amended). The conflicting information has resulted in a difficulty in assessing the impacts on the property due to vibration and noise caused by both the construction and operational phases of the MetroLink on this section of the alignment. This affects several buildings under the management of the OPW particularly at the Kildare Street, Merrion Square and St Stephen's Green areas.	On two drawings (Figures 20.16 Settlement Contours, sheets 27 and 28 of 30) in EIAR Appendix 5.17 Building Damage Report, the tunnel centreline is plainly incorrect as it deviates from the centre of the settlement contours between Tara and St. Stephen's Green stations. The settlement contours are correct and reflect the proposed Railway Order alignment and as such the drawing serves its core purpose, which is to identify, describe and assess the settlement impact of the railway works. In any event, revised drawings will be submitted to the Board to rectify the error. The correct alignment has been used for all environmental impact assessments including tunnel induced settlement, and construction and operational noise and vibration impact assessments.
7	6.0 LEGAL CONSIDERATIONS	14	The Commissioners of Public Works would seek to enter into appropriate, property-specific legal agreements with TII, to ensure the protection of key State property and of the State's activities undertaken within those and other properties. Given the importance of such properties and activities, the Commissioners of Public Works consider it appropriate that An Bord Pleanála would make the Railway Order conditional on such legal agreements being in place between TII and the OPW. Creating such legal agreements between TII and the OPW would be possible only after TII make available the more detailed design and risk-mitigation measures for the construction and operational phases of the MetroLink project, and before any development begins.	TII's preference is carry out all of the permitted railway works with the agreement of affected landowners and prescribed bodies. However, it should not be condition of the railway order that TII reach such agreement with OPW. In the event that agreement cannot be reached with OPW, TII should be entitled to carry out the railway works over their objections provided that it complies with the terms and conditions of the Railway Order. The Board's function is to satisfy itself that those terms and conditions are adequate to ensure that the construction and operation of the railway works will be consistent with proper planning and sustainable development and have acceptable impacts on the environment. TII believes that the RO application and the EIAR in particular sets out mitigation and monitoring measures that are sufficient for that purpose
8	7.1.1 Route Alignment	16	Adjacent to the Garden of Remembrance the proposed MetroLink will be excavated through argillaceous Limestone rock (CLU) underlying Weathered Rock (Q.TR) underlying Brown Boulder Clay (Q.BR), containing extensive fluvio-glacial sands and gravels. Cover to the tunnel crown is approximately 23m comprising Brown Boulder Clay. The invert will be excavated through both weathered and unweathered limestone. This will present a significant challenge to ground movement mitigation using tunnel management.	OPW's observation with regard to the alignment and geology is noted and is the reason for the selection of the proposed TBM and the mixed face conditions identified have been used to conservatively predict the impacts on overlying buildings and infrastructure. TII will develop both TBM operational Specifications and Ground Movement and Monitoring Specifications to ensure that residual risks are appropriately managed. These will be bound into the subsequent contracts. Chainage drawings can be found in the Alignment Drawings pack.
9	7.3 Contractual Arrangement	17	The contractor(s) appointed will be responsible for the organisation, direction, and execution of environmental related activities during the detailed design and construction of the proposed Project. The contractor(s) is required to undertake all activities in accordance with the relevant environmental requirements including the consent documentation and other regulatory and contractual requirements.	TII's contractors will be bound by the Railway Order, further agreements entered into by TII and other relevant statutory or MetroLink specific regulation. An Bord Pleanála's statutory responsibility includes satisfying itself that the terms and conditions of any railway order will ensure that the railway works are consistent with the proper planning and sustainable development of the area and will not have unacceptable impacts on the environment regardless of the contractual structure.

Submission No.			226		
Organisation Name or Name of Submitter			Office of Public Works (OPW)		
Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - Garden of Remembrance					
10	8.0 POTENTIAL IMPACTS ON THE PROPERTY	17	DOWNEY and Gall Zeidler have carried out a detailed examination of the property subject to this submission; having regard to the status and current use of the property and identified constraints, the following raises issues regarding potential impacts of the MetroLink on the property. This has been elaborated to include potential impacts during the construction and operation phases of developing MetroLink, as well as any impediments and/or implications for future development of the property.	Please refer to response numbers (11) through to (27) below.	
11	8.1 Monitoring	17	Given the sensitivity of the fabric and uses within this property, coupled with its historic importance, we request that An Bord Pleanála attach a condition to the Draft Railway Order that ensures continuous monitoring of the property to prevent any negative impacts. Access to all State properties must be agreed in advance with the OPW and its clients. It is recommended that this monitoring takes place at least 3 months in advance of the construction of the Project and throughout the operational stage of the MetroLink.	TII are happy to engage with OPW in order to reach agreement on an appropriate monitoring programme for any of the OPW buildings impacted by Metrolink works - this property is not a building. Area monitoring will be detailed at detailed design stage and any property specific detail needed will be discussed with the OPW.	
12	8.2 Security Issues	17	Given the nature of the State properties affected by the Project, we would respectfully refer An Bord Pleanála to Part XI of the Planning & Development Act 2000 (as amended), which states that: "Development by State authorities. 181.— (1) (a) The Minister may, by regulations, provide that, except for this section F902[and sections 181A to 181C], the provisions of this Act shall not apply to any specified class or classes of development by or on behalf of a State authority where the development is, in the opinion of the Minister, in connection with or for the purposes of public safety or order, the administration of justice or national security or defence and, for so long as the regulations are in force, the provisions of this Act shall not apply to the specified class or classes of development. b(iii) the making available for inspection by members of the public of any specified documents, particulars, plans or other information with respect to the proposed development;"	This provision allows the Minister for Housing to provide that certain State developments do not require planning permission. It is not relevant to the MetroLink project. The MetroLink project is authorised by railway order and does not require planning permission. In that regard, we refer to section 38 of the Transport (Railway Infrastructure) Act 2001, which provides that "Each of the following shall be exempted development for the purposes of the Act of 2000: (a) development consisting of the carrying out of railway works, including the use of the railway works or any part thereof for the purposes of the operation of a railway, authorised by the Board and specified in a railway order or of any incidental or temporary works connected with such development; (b) development consisting of the carrying out of railway works for the maintenance, improvement or repair of a railway that has been built pursuant to a railway order."	
13	8.2 Security Issues	18	It is essential that security issues do not arise in the event of sensitive information being shared on the structure and operation of these properties. However, the OPW understands the importance of the detailed design stage of the Project and the wish to ensure that the detailed assessment of these properties takes place in the early stages of the design process, in conjunction with the OPW, to ensure that these sensitive State buildings are not negatively impacted upon by the proposed Project. The OPW will liaise with TII and An Bord Pleanála on this matter.	This is understood and agreed. TII propose a meeting is held with the requisite OPW / security experts to discuss potential risks and the management of these risks during the construction and operational phases of the Project. TII and their consultants store all data on secure systems in line with best practice and treat all information as confidential. TII are available to engage with the OPW to discuss any specific requirements the OPW have in regard to data security.	
14	8.2 Security Issues	18	All employees contracted to work on behalf of the TII on this Project, and any associated works, must adhere to the properties protocol around access, security, and safety. This applies to ail persons entering or working in proximity of the property.	TII will ensure that contractors working on its behalf on OPW property comply with property protocols around access, security and safety. Once the TII worksites are established, works within those sites will be secured to MetroLink standards.	
15	8.2 Security Issues	18	The day-to-day operations of the property cannot be interrupted by disruptions to any utilities.	There is no intent to disrupt the day to day activities. If subsequently, it is found that a disruption to utility provision is inevitable this will be discussed with OPW and the timing and duration of any disruption optimised to minimise said disruption.	
16	8.2 Security Issues	18	The design and operation of the MetroLink should be in line with best international practice, in relation to anti-terrorism and security measures.	Safety and security are two priorities for the MetroLink in operation and hence the design will be developed cognisant of the risk in relation to terrorism and best practice applied. Further dialogue with OPW will be undertaken throughout the design and construction to ensure suitable provisions are in place.	
17	8.3.1 Ground Movement	18	Stage 1: Defines extent of ground movement using Moderately Conservative parameters. The parameters considered by MetroLink are: ■ Volume Loss, Vs = 1.5 ■ Trough Width parameter, k = 0.3 The Volume Loss is considered moderately conservative however the trough parameter is very narrow and 0.4 could be considered more conservative. The extent of the zone of influence is defined by the 1mm contour line (Dark Red) and the Garden of Remembrance lies just outside the zone of influence. A wider trough will move the 1mm contour into the Garden. The ground movement impact on the Garden of Remembrance is not specified in the report and the OPW requests that this has its own assessment.	The Garden of Remembrance is outside the 1mm contour and hence unaffected by settlement. Further assessments are not required.	

Submission No.			226	
Organisation Name or Name of Submitter			Office of Public Works (OPW)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - Garden of Remembrance				
18	8.3.1 Ground Movement	19	Stage 2 (Initial Assessment): The ground movement impact on the Garden of Remembrance is not specified in the report and the OPW should ensure that this building has its own assessment.	Please refer to response number (17) above.
19	8.3.1 Ground Movement	19	Stage 3 (Detailed Assessment): Because this garden is a site of National significance (NIAH), a Stage 3 Assessment is required for this Garden of Remembrance	Please refer to response number (17) above.
20	8.3.1 Ground Movement	19	Stage 4 (Construction Stage): Mitigation may be required for this structure and therefore, the OPW expects to be consulted. The OPW expects that pre-construction defect surveys and monitoring are carried out for this structure.	Please refer to response number (17) above.
21	8.3.1 Ground Movement	19	Stage 5 (Close Out): Once the excavation (tunnelling and station excavation) has been completed then the Contractor will want to decommission his monitoring. The OPW expects to be provided with close out reports for the monitoring of its property. As a minimum the close out report should include details of any mitigation carried out, a list of any repairs, time history graphs showing the movements monitored.	TII will share the closeout monitoring report that will demonstrate that construction ground movements have ceased, which will also require historical movement information to be presented. In the event of repairs, these will be scheduled.
22	8.4.3 Noise and Vibration	19	(a) Tunnelling During the passage of the Tunnel Boring Machine (TBM) the noise is predicted to be 48 dBLAmax,s exceeds the acceptable threshold (45 dBLAmax, s)and this may last for 2 weeks. The vibration from the passage of the TBM is predicted to be 0.247 VDvdb,ms'175 less than the threshold (1.6VDVdb.ms 1 7S). EIAR Table 6.2- GNV1 states that there is no effective mitigation available and therefore the impact will be managed by detailed consultation with the building owners. The OPW requests that a specific study is carried for this Garden of Remembrance to determine whether ground borne noise and vibration will have any impact. Where any impact is identified then threshold limits will need be applied and monitored. Where the building is considered vulnerable to vibration induced damage EIAR Table 6.2- ANV16. sets out requirement for pre- and post-construction surveys of these structures..	Information on the locations assessed as requiring floating track slab is listed in Table 14.47. Floating slab track has been proposed between Ch 17+980 - 18+100 and Ch. 18+760 - 18+940. Floating slab track is proposed as a mitigation measure in locations where buildings that are sensitive to groundborne noise have the potential for significant effects during the operation of the proposed Project. The Garden of Remembrance was not considered in this as it is not a building that falls within this category.
23	8.3.4 Work Sites	20	b) Ground Water Control There is the potential for ground water lowering for the construction of Mater Station to impact Garden of Remembrance. The OPW requests that TII provides an assessment and limits that will be applied to dewatering for the Construction of Mater Station.	As outlined in EIAR Chapter 19 (Hydrogeology), groundwater assessment and monitoring were and will continue to be undertaken for the proposed Project: • AWN undertook an extensive desktop review in order to establish baseline conditions along the proposed alignment corridor. The baseline study included reference to historical ground investigation data including the 2007 IGSL investigation borehole dataset (IGSL 2008) and data from Norwest Holst (2008) as well as information from contemporary (2019-2021) ground investigations specific to the proposed Project (Table 19.2); • A number of field surveys and walkover assessments were carried out to add to existing assessment of long-term trend analysis for water quality undertaken by the EPA (Section 19.3.3.4); and • A number of intrusive ground investigations were commissioned for the proposed Project including ground water level monitoring (Section 19.3.3.5). A programme of continuous groundwater level monitoring, aquifer testing and groundwater quality monitoring was devised with focus on key well locations along the alignment including at deep station excavations. The key hydrogeological data available and interpreted for the Mater Station is presented in Table 19.35. The dewatering process during the construction of the Mater Station will be in the order of 15.74 l/sec as a maximum value. Mater Station perimeter will be sealed (D-walls) within the QBR subsoils and CLU (Lucan Formation). Dewatering at the Mater Station during works will be temporary only with the anticipated radius effect of dewatering reducing as the station construction progresses towards full perimeter and base seal (i.e. full watertight conditions) including toe grouting assumed to 1.5m below base of D-wall. There is no impact predicted on the Garden of Remembrance due to the embedded mitigations noted above.
24	8.3.4 Work Sites	20	(c) Working Hours The Garden of Remembrance is located between Mater and O'Connell Street stations. The construction of these stations will generate additional lorry movements, for both deliveries and spoil removal, that TII and their contractors will need to manage to minimise impact in the vicinity.	TII will monitor road movements through out construction. Traffic Management planning within the EIAR proposes that construction vehicles from either of the closest sites Mater or O'Connell Street stations will not pass the Garden of Remembrance. Further information is provided in Appendix A9.5, see figures 7-37, 7-38, 7-28 and 7-29.

Submission No.			226	
Organisation Name or Name of Submitter			Office of Public Works (OPW)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - Garden of Remembrance				
25	8.3.4 Work Sites	20	(e) Traffic There will be significant traffic diversions required to construct Mater and O'Connell Street Station that will impact personnel and clients attending the Garden of Remembrance.	No adverse impacts have been identified for Parnell Square in the STMP for either O'Connell Street or Mater stations, see Sections 7.8 and 7.7 of Appendix A9.5
26	8.4.1 Noise and Vibration	21	TII proposes to mitigate the noise and vibration resulting from the railway operations by installing resilient track slab to meet threshold of 35 dBL _A x,s and VDV - 0.4 m/s ¹ - respectively. The vibration during railway operations will not impact the building fabric or structure.	Please refer to response number (22) above.
27	8.5 Future Development	21	The OPW reserves the right to develop the subject property in the future, this includes property above and below ground, subject to normal planning criteria. It is important that the development of the MetroLink does not interfere with extant planning permissions pertaining to the subject property and the right of the applicant to develop the property, in advance, in tandem or post operation of the MetroLink Project.	Please refer to response number (5) above.
28	9.0 CONCLUSION	21	With regards to the Gall Zeidler assessment, the risk of damage to Garden of Remembrance from ground movement is negligible. The OPW seeks assurances from TII that Stage 2 and Stage 3 ground movement assessments will be carried specifically for the structures during detailed design. Pre- construction, post-construction surveys, trials, and monitoring is also requested. Once the railway is in operation it is possible that there will be noise and vibration impact and TII should seek assurance that a detailed evaluation will be performed.	Please refer to response number (17) above.
29	9.0 CONCLUSION	21	With respect to this property, the OPW is seeking: 1) That ABP note the historic significance of this property and its importance for use in conjunction with Government business, visiting world leaders and National Commemorations. Accordingly, full access to this property, unhindered, is required.	No adverse impacts have been identified for Parnell Square in the STMP for either O'Connell Street or Mater stations, see Sections 7.8 and 7.7 of Appendix A9.5. TII will continue to liaise with the OPW to ensure access remains unhindered.
30	9.0 CONCLUSION	22	2) To ensure no disruption to the public access of the Garden and its day-to-day uses and functions.	Please refer to response number (29) above.
31	9.0 CONCLUSION	22	3) To ensure inclusion of the Garden with Stage 3 detailed design process, in particular regarding ground movement and ground borne noise and vibration and their potential impacts on the Garden pre- and post-construction.	Please refer to response number (17) above.
32	9.0 CONCLUSION	22	4) To ensure no adverse impact of the traffic diversions on the accessibility of the Garden and visitors' attendance during construction of the Mater and O'Connell Street stations.	Please refer to response number (29) above.
33	9.0 CONCLUSION	22	5) To ensure no interference of the MetroLink development with the extant permissions pertaining to the Garden and its potential future development.	Please refer to response number (5) above.
34	APPENDIX 1: LIST OF PLANNING LEGISLATION & POLICY	23	This appendix provides a non-exhaustive list of planning policy, legislation, and guidelines. We would respectfully request that An Bord Pleanála ensure that TII have fully assessed the Project with regard to existing planning policy, as well as adherence to the relevant local policies and guidelines pertaining to each individual property. DOWNEY note that this proposed Draft Railway Order is a strategic long-term development and An Bord Pleanála may consider Development Plans in assessing the Project. It is also crucial to note that on foot of a granted Order and during the detailed design stage, a revision to planning policy is expected, whereby adopted plans and legislation may have to be adhered within this stage. This may require an amendment to the Railway Order and further assessment, including public consultation.	Please refer to response number (4) above.

OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - Government Buildings Block (Merrion St Upper)				
1	Executive Summary	N/A	With respect to this property, the OPW asks that An Bord Pleanála notes the sensitivity of the historic buildings and the sensitive nature of Government business transacted here. The OPW also seeks: 1) The sensitivity of the historic buildings and the critical nature of Government business which is carried out at this location. 2) To ensure no disruption to the public access of the building by staff and visitors and to ensure continuity of Government functions. 3) To ensure no damage to the buildings and their architectural detailing, pre-construction and post- construction surveys, trials and monitoring are required. This should include deep level monitoring and ground water level monitoring in addition to the building and surface monitoring typically implemented. 4) To set up an access control regime in agreement with the OPW and relevant stakeholders when applying a continuous monitoring mechanism pre- and post-construction. 5) To ensure no disruption and/or adverse impacts on recording, televising, and broadcasting functions of the Government Buildings due to noise and vibration pre- and post-construction. 6) To ensure no ventilation and/or evacuation shaft in the vicinity of the area is permitted due to the sensitivity of the Government Buildings uses and functions and the security requirements for the complex refurbishment or construction works which are currently anticipated as or may arise in the future. 7) To reserve the right of the OPW that the development of the MetroLink does not interfere with extant permissions pertaining to the Government Building and its future development, including above property and below its ground levels, nor interfere with major maintenance, conservation, refurbishment, or construction works which are currently anticipated as or may arise in the future. 8) Precedents to be applied to the risk assessments to ensure utilising best industry practice within the implementation of the Project. 9) To mitigate the noise and vibration to the acceptable levels for this cultural and government block by installing floating track slab between Chainage 1 7+980 and 18+400, which is the St. Stephen's Green Station. 10) Regarding the tunnel boring machine noise over a 2-week period when the noise is predicted to exceed the acceptable threshold, it is respectfully requested for the timeline of the work to be agreed in advance with the Department of the Taoiseach and the OPW, to avoid any disruption to the functions of the Government Buildings.	TII thank you for your comments. Further to TII's response to the OPW Covering letter, the matters raised by OPW specific to these buildings are addressed in responses (2) through to (43) below.
2	3.0 Overview of the Draft Railway Order	9	While extensive pre-planning consultations also took place between TII and the OPW, a detailed assessment of the individual properties affected has not yet taken place. The draft Railway Order application 2022 is a Draft Order, and should the route be approved by An Bord Pleanála , further detailed design will be submitted which will require further consideration and approval. Factors such as the internal uses of the properties, their construction methods, age and historical importance and the effect of construction on these sensitivities has not been assessed as part of the Project thus far. Additional consideration needs to be given to the potential effects on the built environment before a route and construction method can be confirmed. The OPW reserves the right to make further commentary, pending more detailed design proposals.	TII have undertaken a Phased Ground Movement Impact Assessment and the results of the assessments are included in the RO documentation within Appendix 5.17 of the EIAR. Appendix B2 of that document indicates the list of special buildings that would be subject to a subsequent Phase 3 assessment irrespective of the engineering need to do so. Many OPW buildings are in this category. It should be noted that the further assessments that will be done by the contractor if the RO is granted will likely reduce the impacts on the buildings as the Phase 2 assessment is a conservative assessment whose results are generally more significant than the results of a Phase 3 assessment. -This point was discussed with OPW and their consultants in January 2023. TII will consult with OPW in relation to the results of any Phase 3 assessments and any requirements for monitoring and / or other mitigations that eventuate will be discussed with OPW. TII are satisfied that the approach adopted to date follows an industry standard approach undertaken on tunnelling and underground projects around the world including on the Channel Tunnel Rail Link and Crossrail in London, the Dublin Port Tunnel and currently on High Speed 2 in England, and therefore that further assessment is not required and should not be delivered prior to the route being consented. This property is outside the zone of influence and hence no impacts from ground movement are predicted.
3	4.1 Property Location & Description	12	A very important feature is the Evie Hone c. 1939 stained glass window, which may be vulnerable to vibration and movement. The glass in roof lights and the original historic glass in c. 1915 windows may be fragile and vulnerable to movement, especially if constrained by cast iron structure or iron frames.	TII welcome this information in relation to this building and would like to assure OPW that these details will be considered regarding potential noise and vibration impact. Please note no significant impacts have been predicted due to noise and vibration. Additionally, please note that this block is outside of the zone of influence with regard to ground movement.

Submission No.			227	
Organisation Name or Name of Submitter			Office of Public Works (OPW)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - Government Buildings Block (Merrion St Upper)				
4	4.3 Current Use/Uses	15	The Government Buildings Block currently houses a number of Government departments, including the Department of An Taoiseach which is located in the centre block of the courtyard; The Houses of the Oireachtas and the Office of the Attorney General which are on various floors to the North and East. The Department of Finance and The Department of Expenditure and Public Reform which are to the south. The Department of the Taoiseach is a link between the President, the Taoiseach, and other Departments of State. The Attorney General is the legal adviser to the Government and the chief law officer of the State. The Department of Finance is responsible for the administration of the public finances: the collection and expenditure of revenues, the implementation of the Programme for Government and the management and development of the public sector. Therefore, uninterrupted access to the building is necessary at all times for the conduct of Government business and for access by emergency services (e.g., fire services and ambulance).	TII recognise the importance of these buildings and the Government Departments housed therein. No Temporary Traffic Management measures or adverse impacts to access have been identified on Kildare Street or Merrion St Upper as part of works or operational phases of MetroLink from either Tara Street or St Stephens Green Stations. See Appendix A9.5 Sections 7.9 and 7.10, Appendix A9.2-M, and Appendix A9.2. TII will continue to liaise with OPW to ensure uninterrupted access.
5	4.3 Current Use/Uses	15	The Government Buildings Block also house a set of committee rooms and a press briefing room. It frequently (hosts - sic) International Heads of the State and Government and key press briefings of national importance. Televising, broadcasting, and recording are every-day functions of the Block, which are relatively sensitive activities regarding the noise and vibration, with the noise disrupting broadcasting and recording and affecting sound quality, and vibration adversely impacting on the cameras stability. Thus, a noise and vibration assessment prior to construction is required. This is expected to be followed by continuous on-site monitoring, which would also bring forward the security requirements regarding accessing the Block.	TII will procure its contractors to develop Instrumentation and Monitoring Plans in tandem with Monitoring Action Plans. These plans will help assure that the risks associated with tunnelling and station excavations impacting any OPW property are appropriately managed and controlled. TII will provide details of any monitoring proposed by the contractor at detailed design stage and agree the methodology of installation to the OPW property. TII will provide advance notice of any attendance that the monitoring contractor may require. With regard to the timing of monitoring specific to ground movement TII will ensure that it is commenced 3 months prior to the construction activities that would give rise to the settlement. However, as these construction activities may complete years prior to the MetroLink operational phase the termination of monitoring will be linked to a determination that settlement has effectively ceased, allowing a removal of the instrumentation.
6	4.3 Current Use/Uses	15	Furthermore, the OPW, the State, and their authorised agents, require access to the building at all times for the purpose of facilities management, maintenance, repairs and any major conservation, repair or development programme, planned, or as may arise during the construction period of MetroLink.	Please refer to response number (4) above.
7	4.3 Current Use/Uses	15	Considering the exceptionally high importance of the Complex, no ventilation and/or evacuation in the vicinity of the area can be permitted. Moreover, there are concerns regarding risk of acts of terrorism, which TII is required to assess separately in the Stage 3 application.	There is no ventilation nor evacuation shaft planned for this location. For details on concerns regarding security and risk of acts of terrorism, please refer to response number (18) to (21) below.
8	4.4 Planning Context	15	In relation to the Draft Railway Order's consistency with planning policy and planning guidelines, a non-exhaustive list of planning policy and legislation at National, Regional, and Local levels, is included in Appendix 1 of this submission. The Board are invited to refer to this for further details. We would respectfully request that An Bord Pleanála ensure that TII have fully assessed the Project with regard to existing planning policy, as well as adherence to the relevant local policies and guidelines pertaining to each individual property. DOWNEY note that this proposed Draft Railway Order is a strategic long-term development and An Bord Pleanála may consider Draft Development Plans in assessing the Project, it is also crucial to note that on foot of a granted Order and during the detailed design stage, a revision to planning policy is expected, whereby adopted plans and legislation may have to be adhered within this stage. This may require an amendment to the Draft Railway Order and further assessment, including public consultation.	The only policy relevant to the decision on whether to grant the Railway Order and the necessary conditionality is the policy in force at the date of the grant of the Railway Order, as has been made clear in numerous High Court decisions including Element Power v An Bord Pleanála [2017] IEHC 550 and the Railway Order cannot be made conditional on compliance with future, yet to be developed policy. As planning and policy and strategy are being updated constantly, TII will undertake a further review of planning policy in advance of any oral hearing to allow for an updated presentation on the projects consistency with active policy requirements to be presented to An Bord Pleanála.

Submission No.			227	
Organisation Name or Name of Submitter			Office of Public Works (OPW)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - Government Buildings Block (Merrion St Upper)				
9	4.5 Potential Development of the Property	16	The Government Buildings Block is a Protected Structure, in a sensitive location in terms of use and heritage, whereby critical central Government functions are in operation. The OPW reserves the right to develop the block in future, particularly at multiple basement levels, subject to future requirements of the Government. It is important that there should be no new constraints introduced which might limit the potential of this future development and the security and operations of the Government Buildings Block.	MetroLink will be a catalyst for and provide opportunity for future development and regeneration. While the MetroLink Railway Order does not include for future neighbouring or overhead development, the tunnels and stations are designed to support appropriate future imposed loads. TII will be required to make submissions in relation to planning applications for proposed future developments on or adjacent to MetroLink and there will necessarily be some engineering constraints (such as permissible loadings) required. However MetroLink is committed to engaging with known development proposals and new development proposals as they emerge with the intent of facilitating such developments as they emerge to the maximum extent consistent with the safe operation of the proposed Project. Again in common with other existing rail and tunnel projects, following grant of the Railway Order and development of detailed design, TII will produce "Guidance Note for Developers" that will be the subject of bye-laws following the grant of Railway Order and which is designed to facilitate future adjacent or over-site development while protecting the integrity and safety of the MetroLink works and operations. It is inappropriate and unworkable to produce this policy at this stage because it would have to be in broad terms that deal not only with the current RO proposal and any contingencies that might arise from the Board seeking revised designs or new conditionality as part of the RO application process. Therefore at this stage TII is dealing with known development proposals on a case by case basis, TII will work with parties in the future to assist with the wider development of sites over and above stations and tunnels. In this context TII has successfully engaged with a number of developers over the last two years to accommodate development over and in proximity to the alignment and there have been no material restrictions on development subject to the implementation of agreed design and mitigation measures and it is not anticipated that MetroLink will have a material impact on the development potential of sites above and in proximity to the alignment in future
10	5.0 MATERIAL CONSIDERATIONS	16	The alignment drawing ML1-JAI-EIA-ROUT_XX-DR-Y-04025 and the contour drawing M LI -J AI- EI A-ROUT_XX-DR-Y-21148 show different alignments. This error has resulted in deficient and conflicting information within the SID application submitted under Section 2 of the Planning and Development Act 2000 (as amended). The conflicting information has resulted in a difficulty in assessing the impacts on the property due to vibration and noise caused by both the construction and operational phases of the MetroLink on this section of the alignment. This affects several buildings under the management of the OPW particularly at the Kildare Street, Merrion Square and St Stephen's Green areas.	On two drawings (Figures 20.16 Settlement Contours, sheets 27 and 28 of 30) in EIAR Appendix 5.17 Building Damage Report, the tunnel centreline is plainly incorrect as it is deviates from the centre of the settlement contours between Tara and St. Stephen's Green stations. The settlement contours are correct and reflect the proposed Railway Order alignment and as such the drawing serves its core purpose, which is to identify, describe and assess the settlement impact of the railway works. In any event, revised drawings will be submitted to the Board to rectify the error. The correct alignment has been used for all environmental impact assessments including tunnel induced settlement, and construction and operational noise and vibration impact assessments.
11	6.0 LEGAL CONSIDERATIONS	16	The Commissioners of Public Works would seek to enter into appropriate, property-specific legal agreements with TII, to ensure the protection of key State property and of the State's activities undertaken within those and other properties. Given the importance of such properties and activities, the Commissioners of Public Works consider it appropriate that An Bord Pleanála would make the Railway Order conditional on such legal agreements being in place between TII and the OPW. Creating such legal agreements between TII and the OPW would be possible only after TII make available the more detailed design and risk-mitigation measures for the construction and operational phases of the MetroLink project, and before any development begins. Therefore, the Commissioners of Public Works would request that this aspect be reflected in the conditions set out by An Bord Pleanála to TII, as this would provide assurances to the Commissioners of Public Works relating to future legal agreements that protect and secure State property and activities from risks associated with the construction or operations of the MetroLink.	TII's preference is carry out all of the permitted railway works with the agreement of affected landowners and prescribed bodies. However, it should not be condition of the railway order that TII reach such agreement with OPW. In the event that agreement cannot be reached with OPW, TII should be entitled to carry out the railway works over their objections provided that it complies with the terms and conditions of the Railway Order. The Board's function is to satisfy itself that those terms and conditions are adequate to ensure that the construction and operation of the railway works will be consistent with proper planning and sustainable development and have acceptable impacts on the environment. TII believes that the RO application and the EIAR in particular sets out mitigation and monitoring measures that are sufficient for that purpose
12	7.1.1 Route Alignment	17	The tunnel alignment does not pass directly beneath the Government Buildings Block. However, there is inconsistency in the alignment between Tara Station and St. Stephen's Green. The alignment drawing ML1-JAI'EIA-ROUT_XX-DR-Y-05025 and the Contour drawing ML1-JAI-EIA-ROUT_XX-DR-Y- 21148 show different alignments.	Refer to Item16.
13	7.1.1 Route Alignment	17	Many of the reports refer to chainages along the alignment, however there are no plans that indicate these chainages, and this makes reviewing the Railway Order and EIAR difficult.	Reference to chainages along the alignment are provided within the Railway Order Plans\Drawings under Alignment Drawings.

Submission No.			227	
Organisation Name or Name of Submitter			Office of Public Works (OPW)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - Government Buildings Block (Merrion St Upper)				
14	7.3 Contractual Arrangement	19	The contractor(s) appointed will be responsible for the organisation, direction, and execution of environmental related activities during the detailed design and construction of the proposed Project. The contractor(s) is required to undertake all activities in accordance with the relevant environmental requirements including the consent documentation and other regulatory and contractual requirements.	TII's contractors will be bound by the Railway Order, further agreements entered into by TII and other relevant statutory or MetroLink specific regulation. An Bord Pleanála's statutory responsibility includes satisfying itself that the terms and conditions of any railway order will ensure that the railway works are consistent with the proper planning and sustainable development of the area and will not have unacceptable impacts on the environment regardless of the contractual structure.
15	8.0 POTENTIAL IMPACTS ON THE PROPERTY	19	DOWNEY and Gall Zeidler have carried out a detailed examination of the property subject to this submission. Having regard to the status and current use of the property and identified constraints, the following raises issues regarding potential impacts of the MetroLink on the property. This has been elaborated to include potential impacts during the construction and operation phases of developing MetroLink, as well as any impediments and/or implications for future development of the property.	Please refer to response numbers (16) through to (31) below.
16	8.1 Monitoring	19	Given the sensitivity of the uses within this property, coupled with Governmental uses, we request that An Bord Pleanála attach a condition to the Railway Order that ensures continuous monitoring of the property to prevent any negative impacts. Access to all properties must be agreed in advance with the OPW and its clients. It is recommended that this monitoring takes place at least 3 months in advance of the construction of the Project and at least 6 weeks post the operational stage of the MetroLink.	No building movement monitoring is required as the building is outside the zone of influence.
17	8.2 Security Issues	19	Given the nature of the State properties affected by the Project, we would respectfully refer An Bord Pleanála to Part XI of the Planning & Development Act 2000 (as amended), which states that: "Development by State authorities. 181.— (1) (a) The Minister may, by regulations, provide that, except for this section F902[and sections 181A to 181C], the provisions of this Act shall not apply to any specified class or classes of development by or on behalf of a State authority where the development is, in the opinion of the Minister, in connection with or for the purposes of public safety or order, the administration of justice or national security or defence and, for so long as the regulations are in force, the provisions of this Act shall not apply to the specified class or classes of development. b(iii) the making available for inspection by members of the public of any specified documents, particulars, plans or other information with respect to the proposed development;"	This provision allows the Minister for Housing to provide that certain State developments do not require planning permission. It is not relevant to the MetroLink project. The MetroLink project is authorised by railway order and does not require planning permission. In that regard, we refer to section 38 of the Transport (Railway Infrastructure) Act 2001, which provides that "Each of the following shall be exempted development for the purposes of the Act of 2000: (a) development consisting of the carrying out of railway works, including the use of the railway works or any part thereof for the purposes of the operation of a railway, authorised by the Board and specified in a railway order or of any incidental or temporary works connected with such development; (b) development consisting of the carrying out of railway works for the maintenance, improvement or repair of a railway that has been built pursuant to a railway order."
18	8.2 Security Issues	19	It is essential that security issues do not arise in the event of sensitive information being shared on the structure and operation of these properties. However, the OPW understands the importance of the detailed design stage of the Project and the wish to ensure that the detailed assessment of these properties takes place in the early stages of the design process, in conjunction with the OPW, to ensure that these sensitive State buildings are not negatively impacted upon by the proposed Project. The OPW will liaise with TII and An Bord Pleanála on this matter.	This is understood and agreed. TII propose a meeting is held with the requisite OPW / security experts to discuss potential risks and the management of these risks during the construction and operational phases of the Project. TII and their consultants store all data on secure systems in line with best practice and treat all information as confidential. TII are available to engage with the OPW to discuss any specific requirements the OPW have in regard to data security.
19	8.2 Security Issues	20	All employees contracted to work on behalf of the TII on this Project, and any associated works, must adhere to the properties protocol around access, security, and safety. This applies to ail persons entering or working in proximity of the property.	TII will ensure that contractors working on its behalf on OPW property comply with property protocols around access, security and safety. Once the TII worksites are established, works within those sites will be secured to MetroLink standards.
20	8.2 Security Issues	20	The day-to-day operations of the property cannot be interrupted by disruptions to any utilities.	There is no intent to disrupt the day to day activities. If subsequently, it is found that a disruption to utility provision is inevitable this will be discussed with OPW and the timing and duration of any disruption optimised to minimise said disruption.
21	8.2 Security Issues	20	The design and operation of the MetroLink should be in line with best international practice, in relation to anti-terrorism and security measures.	Safety and security are two priorities for the MetroLink in operation and hence the design will be developed cognisant of the risk in relation to terrorism and best practice applied. Further dialogue with OPW will be undertaken throughout the design and construction to ensure suitable provisions are in place.
22	8.3 During Construction of the MetroLink	20	This building has a critical Government use of national and international importance. It hosts the Department of the Taoiseach and is critical to the effective running of Government. It provides functional spaces and office accommodation and hosts Heads of State and dignitaries from around the world throughout the year. As such, the impact of any proposed works in terms of noise, vibration and disruptions which effects the quality of the working environment would need to be carefully considered. There are significant State security considerations to be taken into account, particularly by the State security agencies, well in advance of any construction or operational plans by TII	The impact assessment in the EIAR in terms of noise and vibration was done taking in consideration the type of building being assessed, with different thresholds for each category (ex. Commercial, residential, special buildings as schools, hospitals, theatres or heritage buildings). TII are happy to engage with OPW and discuss an appropriate work programme for the above mentioned buildings. In relation to security, please refer to response number (17) to (21) above.

Submission No.			227	
Organisation Name or Name of Submitter			Office of Public Works (OPW)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - Government Buildings Block (Merrion St Upper)				
23	8.3.1 Ground Movement	21	Stage 2: Three sections were considered in the assessment. The assessment concludes that the risk of damage to the Government Buildings Block is Category 0, Negligible. However, as a "Special building" it shall progress to Stage/Phase 3 assessment.	As these buildings are outside the zone of influence they need no further assessment or survey with regard to settlement.
24	8.3.1 Ground Movement	21	Stage 3: The EIAR states that a Stage 3 assessment will be carried out for Government Buildings by the Contractor appointed to construct this section of the MetroLink. The OPW expects to be consulted on the detail, scope of this assessment and programme for these assessments. It is vital that TII consults with the State security agencies well in advance of any proposed works. It would be helpful if TII were to develop a Design Standard to ensure that all Stage 3 analyses of the OPW properties are carried out equally. No mention of Stage 4 or 5 has been found in the Railway Order or EIAR. Industry best practice as applied to London's Elizabeth Line (Crossrail) required that two further Stages in the Assessment of ground movement were undertaken during the project.	Please refer to response number (23) above.
25	8.3.1 Ground Movement	21	Stage 4 (Construction Stage): This stage is where any mitigation is implemented, and monitoring of the stakeholders' infrastructure is carried out. Also, the preconstruction defect surveys are carried out prior to any excavation. The OPW requires a review of the detailed proposals for mitigation and monitoring. The OPW expects TII to consult with the relevant State security agencies separately. Monitoring proposals submitted to the OPW for review should include deep level monitoring and ground water level monitoring in addition to the building and surface monitoring typically implemented. The deep level monitoring will provide valuable data relating to the rock behaviour and has been usefully employed on HS2. The OPW will facilitate and observe the preconstruction defect surveys. It is noted that these shall be carried out by Professionally Qualified Engineers or Surveyors. The OPW requests that only Engineers or Surveyors with proven competence in relation to (historic) buildings of this fabric type, period and nature are selected. The contractor(s) will coordinate preconstruction defect surveys for identified properties, liaising (in conjunction with the employer) with the building surveyor employed to carry out the surveys and maintaining a dialogue with the relevant property owners throughout the duration of the works.	Please refer to response number (23) above.
26	8.3.1 Ground Movement	21	Stage 5 (Close Out): Once the excavation (tunnelling and station excavation) has been completed then the Contractor will want to decommission his monitoring. The OPW expects to be provided with close out reports for the monitoring of its property. As a minimum the close out report should include details of any mitigation carried out, a list of any repairs, time history graphs showing the movements monitored.	TII will share the closeout monitoring report that will demonstrate that construction ground movements have ceased, which will also require historical movement information to be presented. In the event of repairs, these will be scheduled.
27	8.3.4 Work Sites	22	b) Ground Water Control There is an assumption that the tunnelling will not affect the ground water above the tunnel. However, there should be a ground water monitoring scheme implemented to confirm this and a contingency plan to manage any residual risk.	While acknowledging this comment, given the distance from the MetroLink alignment it will not relevant to this particular building.
28	8.3.4 Work Sites	23	(c) Working Hours The Government Buildings Block is located between Tara Street and St Stephen's Green Stations. The construction of these stations will generate additional lorry movements, for both deliveries and spoil removal, that TII and their contractors will need to manage to minimise impact in the vicinity,	TII will monitor traffic movements throughout construction. Construction Vehicles from neither Tara St or St Stephens Green Stations are planned to traverse either Kildare Street or Merrion Street Upper - minimising any impact on this location. See Figure 7-44 and Figure 7-51 in Appendix A9.5
29	8.4.1 Noise and Vibration	23	TII proposes to mitigate the noise and vibration resulting from the railway operations by installing floating track slab to meet thresholds of 25 dBLamax and VC-D respectively. EIAR Chapter 14 Table14,47 provides some guidance on where this will be constructed but it is not clear exactly where. The OPW requests that floating track slab is installed between Chainage 17+980 and 18+400 (St Stephen's Green Station). This would mitigate the noise and vibration to acceptable levels under all the Government buildings, museums, and the Government Buildings Block.	Information on the locations assessed as requiring floating track slab is listed in Table 14.47. Floating slab track has been proposed between Ch 17+980 - 18+100 and Ch. 18+760 - 18+940. Floating slab track is proposed as a mitigation measure in locations where buildings that are sensitive to groundborne noise have the potential for significant effects during the operation of the proposed Project. Government Buildings were assessed for predicted groundborne noise during operation (table 14.44 of the EIAR) and it was deemed that groundborne noise at this location fell below the sensitive receptor threshold level so the impacts at this location are not significant. Therefore floating slab track is not proposed at this location.
30	8.4.3 Evacuation Strategy	23	The are no planned intervention/evacuation shafts between Tara Station and St. Stephen's Green, however it is understood that the Fire Brigade have not accepted the strategy proposed by TII. This may have an impact on Agriculture House should any intermediate shafts be required.	No additional shafts are required and are not provided for in the draft RO. TII has engaged with the Dublin Fire Brigade at all stages of the design and have not indicated that an intervention shaft is required at this location in that engagement or in their submission on the draft RO as part of their report to Dublin City Council. TII is continuing to engage with Dublin Fire Brigade in relation to the details of the strategy.

Submission No.			227	
Organisation Name or Name of Submitter			Office of Public Works (OPW)	
Item No.	Section Ref.	Page No.	Observation Statement	TII Response
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - Government Buildings Block (Merrion St Upper)				
31	8.5 Future Development	23	he OPW reserves the right to development the subject property in the future, this includes property above and below ground, subject to normal planning criteria. It is important that the development of the MetroLink does not interfere with extant planning permissions pertaining to the subject property and the right of the applicant to develop these, in advance, in tandem or post operation of the MetroLink Project.	While acknowledging this comment, given the distance from the MetroLink alignment it will not be relevant for this particular building.
32	9.0 CONCLUSION	24	With respect to this property, the OPW is seeking:) The sensitivity of the historic buildings and the critical nature of Government business which is carried out at this location.	his comments is noted.
33	9.0 CONCLUSION	24	) To ensure no disruption to the public access of the building by staff and visitors and to ensure continuity of Government functions.	lease refer to response number (4) above
34	9.0 CONCLUSION	24	) To ensure no damage to the buildings and their architectural detailing, pre-construction and post- construction surveys, trials and monitoring are required. This should include deep level monitoring and ground water level monitoring in addition to the building and urface monitoring typically implemented	While acknowledging this comment, given the distance from the MetroLink alignment it will not be relevant for this particular building.
35	9.0 CONCLUSION	24	) To set up an access control regime in agreement with the OPW and relevant stakeholders when applying a continuous monitoring mechanism pre- and post-construction.	While acknowledging this comment, given the distance between the building and the alignment, access will not be required.
36	9.0 CONCLUSION	24	i) To ensure no disruption and/or adverse impacts on recording, televising, and broadcasting functions of the Government Buildings due o noise and vibration pre- and post-construction.	lease refer to response number (22) above.
37	9.0 CONCLUSION	24	i) To ensure no ventilation and/or evacuation shaft in the vicinity of the area is permitted due to the sensitivity of the Government buildings uses and functions and the security requirements for the complex refurbishment or construction works which are currently nticipated as or may arise in the future.	No additional shafts are required.
38	9.0 CONCLUSION	24	) To reserve the right of the OPW that the development of the MetroLink does not interfere with extant permissions pertaining to the Government Building and its future development, including above property and below its ground levels, nor interfere with major maintenance, conservation, refurbishment, or construction works which are currently anticipated as or may arise in the future.	While acknowledging this comment, it is not relevant due to the distance from MetroLink.
39	9.0 CONCLUSION	25	) Precedents to be applied to the risk assessments to ensure utilising best industry practice within the implementation of the Project.	While acknowledging this comment, it is not relevant due to the distance from MetroLink.
40	9.0 CONCLUSION	25	) To mitigate the noise and vibration to the acceptable levels for this cultural and government block by installing floating track slab between Chainage 17+980 and 18+400, which is the St. Stephen's Green Station.	lease refer to response number (29) above.
41	9.0 CONCLUSION	25	.0) Regarding the tunnel boring machine noise over a 2-week period when the noise is predicted to exceed the acceptable threshold, it is espectfully requested for the timeline of the work to be agreed in advance with the Department of the Taoiseach and the OPW, to avoid ny disruption to the functions of the Government Buildings.	It will consult and liaise with OPW and the Department of the Taoiseach to ensure the timing of these impacts are known and can be greed.
42	APPENDIX 1: LIST OF PLANNING LEGISLATION & POLICY	26	his appendix provides a non-exhaustive list of planning policy, legislation, and guidelines. We would respectfully request that An Bord Pleanála ensure that TII have fully assessed the Project with regard to existing planning policy, as well as adherence to the relevant local policies and guidelines pertaining to each individual property. DOWNEY note that this proposed Draft Railway Order is a strategic long-term development and An Bord Pleanála may consider Development Plans in assessing the Project. It is also crucial to note that on foot of a granted Order and during the detailed design stage, revision to planning policy is expected, whereby adopted plans and legislation may have to be adhered within this stage. This may equire an amendment to the Railway Order and further assessment, including public consultation.	lease refer to response number (8) above.

OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - Headquarters of the Department of Agriculture, Food and the Marine				
1	Executive Summary	N/A	With respect to this property, the OPW is seeking: 1) To ensure no disruption to the accessibility of the Agriculture House and its day-to-day uses and functions. 2) To ensure no damage to the building, pre-construction and post-construction surveys, trials and monitoring is required. This should include deep level monitoring and ground water level monitoring in addition to the building and surface monitoring typically implemented. 3) To ensure inclusion of the Agriculture House in the risk assessment for Stage 3 with regard to the significance of the building and its cross departmental functions and with respect to the building's foundation exceeding 4m depth. 4) To ensure inclusion of the Agriculture House in pre- and post-construction surveys regarding vibration and its impacts on the building. 5) Precedents to be applied to the risk assessments to ensure utilising best industry practice within the implementation of the Project. 6) To mitigate the noise and vibration to the acceptable levels for this cultural and government block by installing floating track slab between Chainage 17+980 and 18+400, which is the St. Stephen's Green Station. 7) Regarding no planned intervention and/or evacuation shafts between Tara and Stephen's Green stations and Fire Brigade's concerns over a revised arrangement, the OPW requests to be consulted and informed on the proposed strategy and its impact on Agriculture House. 8) Regarding the tunnel boring machine noise over a 2 -week period when the noise is predicted to exceed the acceptable threshold, it is respectfully requested for the timeline of the work to be agreed in advance with the Department of Agriculture, Food & the Marine and the OPW, to avoid any disruption to the functions of the Agriculture House.	TII thank you for your comments. Further to TII's response to the OPW Covering letter, the matters raised by OPW specific to these buildings are addressed in responses (2) through to (36) below.
2	3.0 Overview of the Draft Railway Order	9	While extensive pre-planning consultations also took place between TII and the OPW, a detailed assessment of the individual properties affected has not yet taken place. The draft Railway Order application 2022 is a Draft Order, and should the route be approved by An Bord Pleanála, further detailed design will be submitted which will require further consideration and approval. Factors such as the internal uses of the properties, their construction methods, age and historical importance and the effect of construction on these sensitivities has not been assessed as part of the Project thus far. Additional consideration needs to be given to the potential effects on the built environment before a route and construction method can be confirmed. The OPW reserves the right to make further commentary, pending more detailed design proposals.	TII have undertaken a Phased Ground Movement Impact Assessment and the results of the assessments are included in the RO documentation within Appendix A5.17 of the EIAR. Appendix B2 of that document indicates the list of special buildings that would be subject to a subsequent Phase 3 assessment irrespective of the engineering need to do so. Many OPW buildings are in this category. It should be noted that the further assessments that will be done by the contractor if the RO is granted will likely reduce the impacts on the buildings as the Phase 2 assessment is a moderately conservative assessment whose results are generally more significant than the results of a Phase 3 assessment. This point was discussed with OPW and their consultants in January 2023. That said, if subsequent to the granting of the RO, OPW know of any specific reasons for other buildings to require a Phase 3 assessment TII will consider such requests. The results of any Phase 3 assessments and any requirements for monitoring and / or other mitigations that eventuate will be discussed with OPW. TII are satisfied that the approach adopted to date follows an industry standard approach undertaken on tunnelling and underground projects around the world including on the Channel Tunnel Rail Link and Crossrail in London, the Dublin Port Tunnel and currently on High Speed 2 in England, and therefore that further assessment is not required and should not be delivered prior to the route being consented. Please note that this building has been assessed for settlement impacts. This concluded that there would be Negligible damage. No further Phase 3 assessment is required. Please refer to Appendix A5.17 and Table 5-2: Results of Phase 2a Building Damage Assessment - building B-14.
3	4.4 Planning Context	13	In relation to the Draft Railway Order's consistency with planning policy and planning guidelines, a non-exhaustive list of planning policy and legislation at National, Regional, and Local levels, is included in Appendix 1 of this submission. The Board are invited to refer to this for further details. We would respectfully request that An Bord Pleanála ensure that TII have fully assessed the Project with regard to existing planning policy, as well as adherence to the relevant local policies and guidelines pertaining to each individual property. DOWNEY note that this proposed Draft Railway Order is a strategic long-term development and An Bord Pleanála may consider Draft Development Plans in assessing the Project, it is also crucial to note that on foot of a granted Order and during the detailed design stage, a revision to planning policy is expected, whereby adopted plans and legislation may have to be adhered within this stage. This may require an amendment to the Draft Railway Order and further assessment, including public consultation.	The only policy relevant to the decision on whether to grant the Railway Order and the necessary conditionality is the policy in force at the date of the grant of the Railway Order, as has been made clear in numerous High Court decisions including Element Power v An Bord Pleanála [2017] IEHC 550 and the Railway Order cannot be made conditional on compliance with future, yet to be developed policy. As planning and policy and strategy are being updated constantly, TII will undertake a further review of planning policy in advance of any oral hearing to allow for an updated presentation on the projects consistency with active policy requirements to be presented to An Bord Pleanála.

Item No.	Section Ref.	Page No.	Observation Statement	TII Response	
OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - Headquarters of the Department of Agriculture, Food and the Marine					
4	4.5 Potential Development of the Property	13	Although Agriculture House adjoins a listed Protected Structure, the property itself is not a Protected Structure and represents a significant development opportunity. Any future development would be expected to extend to multiple basement levels to maximise potential.	MetroLink will be a catalyst for and provide opportunity for future development and regeneration. While the MetroLink Railway Order does not include for future neighbouring or overhead development, the tunnels and stations are designed to support appropriate future imposed loads. TII will be required to make submissions in relation to planning applications for proposed future developments on or adjacent to MetroLink and there will necessarily be some engineering constraints (such as permissible loadings) required. However MetroLink is committed to engaging with known development proposals and new development proposals as they emerge with the intent of facilitating such developments as they emerge to the maximum extent consistent with the safe operation of the proposed Project. Again in common with other existing rail and tunnel projects, following grant of the Railway Order and development of detailed design, TII will produce “Guidance Note for Developers” that will be the subject of bye-laws following the grant of Railway Order and which is designed to facilitate future adjacent or over-site development while protecting the integrity and safety of the MetroLink works and operations. It is inappropriate and unworkable to produce this policy at this stage because it would have to be in broad terms that deal not only with the current RO proposal and any contingencies that might arise from the Board seeking revised designs or new conditionality as part of the RO application process. Therefore at this stage TII is dealing with known development proposals on a case by case basis, TII will work with parties in the future to assist with the wider development of sites over and above stations and tunnels. In this context TII has successfully engaged with a number of developers over the last two years to accommodate development over and in proximity to the alignment and there have been no material restrictions on development subject to the implementation of agreed design and mitigation measures and it is not anticipated that MetroLink will have a material impact on the development potential of sites above and in proximity to the alignment in future.	
5	5.0 MATERIAL CONSIDERATIONS	13	The alignment drawing ML1-JAI-EIA-ROUT_XX-DR-Y-04025 and the contour drawing M LI -J AI- EI A- ROUT_XX-DR-Y-21148 show different alignments. This error has resulted in deficient and conflicting information within the SID application submitted under Section 2 of the Planning and Development Act 2000 (as amended). The conflicting information has resulted in a difficulty in assessing the impacts on the property due to vibration and noise caused by both the construction and operational phases of the MetroLink on this section of the alignment. This affects several buildings under the management of the OPW particularly at the Kildare Street, Merrion Square and St Stephen's Green areas.	On two drawings (Figures 20.16 Settlement Contours, sheets 27 and 28 of 30) in EIAR Appendix 5.17 Building Damage Report, the tunnel centreline is plainly incorrect as it deviates from the centre of the settlement contours between Tara and St. Stephen's Green stations. The settlement contours are correct and reflect the proposed Railway Order alignment and as such the drawing serves its core purpose, which is to identify, describe and assess the settlement impact of the railway works. In any event, revised drawings will be submitted to the Board to rectify the error. The correct alignment has been used for all environmental impact assessments including tunnel induced settlement, and construction and operational noise and vibration impact assessments.	
6	6.0 LEGAL CONSIDERATIONS	13	The Commissioners of Public Works would seek to enter into appropriate, property-specific legal agreements with TII, to ensure the protection of key State property and of the State's activities undertaken within those and other properties. Given the importance of such properties and activities, the Commissioners of Public Works consider it appropriate that An Bord Pleanála would make the Railway Order conditional on such legal agreements being in place between TII and the OPW. Creating such legal agreements between TII and the OPW would be possible only after TII make available the more detailed design and risk-mitigation measures for the construction and operational phases of the MetroLink project, and before any development begins. Therefore, the Commissioners of Public Works would request that this aspect be reflected in the conditions set out by An Bord Pleanála to TII, as this would provide assurances to the Commissioners of Public Works relating to future legal agreements that protect and secure State property and activities from risks associated with the construction or operations of the MetroLink.	TII's preference is carry out all of the permitted railway works with the agreement of affected landowners and prescribed bodies. However, it should not be condition of the railway order that TII reach such agreement with OPW. In the event that agreement cannot be reached with OPW, TII should be entitled to carry out the railway works over their objections provided that it complies with the terms and conditions of the Railway Order. The Board's function is to satisfy itself that those terms and conditions are adequate to ensure that the construction and operation of the railway works will be consistent with proper planning and sustainable development and have acceptable impacts on the environment. TII believes that the RO application and the EIAR in particular sets out mitigation and monitoring measures that are sufficient for that purpose	
7	7.1.1 Route Alignment	14	The tunnel alignment passes directly beneath Agriculture House however there is inconsistency in the alignment between Tara Station and St Stephen's Green. The alignment drawing ML1-JAI-EIA- ROUT_XX-DR-Y-05025 and the Contour drawing ML1-JAI-EIA-ROUT_XX-DR-Y-21148 show different alignments.	Refer to Item 5.	
8	7.1.1 Route Alignment	15	Many of the reports refer to chainages along the alignment, however there are no plans that indicate these chainages, and this makes reviewing the Railway Order and EIAR difficult.	Reference to chainages along the alignment are provided within the Railway Order Plans\Drawings under Alignment Drawings.	
9	7.3 Contractual Arrangement	16	The contractor(s) appointed will be responsible for the organisation, direction, and execution of environmental related activities during the detailed design and construction of the proposed Project. The contractor(s) is required to undertake all activities in accordance with the relevant environmental requirements including the consent documentation and other regulatory and contractual requirements.	TIIs contractors will be bound by the Railway Order, further agreements entered into by TII and other relevant statutory or MetroLink specific regulation. An Bord Pleanála's statutory responsibility includes satisfying itself that the terms and conditions of any railway order will ensure that the railway works are consistent with the proper planning and sustainable development of the area and will not have unacceptable impacts on the environment regardless of the contractual structure.

OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - Headquarters of the Department of Agriculture, Food and the Marine				
10	8.0 POTENTIAL IMPACTS ON THE PROPERTY	16	DOWNEY and Gall Zeidler have carried out a detailed examination of the property subject to this submission. Having regard to the status and current use of the property and identified constraints, the following raises concerns regarding potential impacts of the MetroLink on the property. This has been elaborated upon to include potential impacts during the construction and operation phases of developing MetroLink, as well as any impediments and/or implications for future development of the property.	Please refer to response numbers (11) through to (26) below.
11	8.1 Monitoring	16	Given the sensitivity of the uses within this property, coupled with Governmental uses, we request that An Bord Pleanála attach a condition to the Railway Order that ensures continuous monitoring of the property to prevent any negative impacts. Access to all properties must be agreed in advance with the OPW and its clients. It is recommended that this monitoring takes place at least 3 months in advance of the construction of the Project and at least 6 weeks post the operational stage of the MetroLink.	TII will procure its contractors to develop Instrumentation and Monitoring Plans in tandem with Monitoring Action Plans. These plans will help assure that the risks associated with tunnelling and station excavations impacting any OPW property are appropriately managed and controlled. TII will provide details of any monitoring proposed by the contractor at detailed design stage and discuss the methodology of installation to the OPW property. TII will provide advance notice of any attendance that the monitoring contractor may require. With regard to the timing of monitoring specific to ground movement TII will ensure that it is commenced 3 months prior to the construction activities that would give rise to the settlement. However, as these construction activities may complete years prior to the MetroLink operational phase the termination of monitoring will be linked to a determination that settlement has effectively ceased, allowing a removal of the instrumentation.
12	8.2 Security Issues	16	Given the nature of the State properties affected by the Project, we would respectfully refer An Bord Pleanála to Part XI of the Planning & Development Act 2000 (as amended), which states that: "Development by State authorities. 181.— (1) (a) The Minister may, by regulations, provide that, except for this section F902[and sections 181A to 181C], the provisions of this Act shall not apply to any specified class or classes of development by or on behalf of a State authority where the development is, in the opinion of the Minister, in connection with or for the purposes of public safety or order, the administration of justice or national security or defence and, for so long as the regulations are in force, the provisions of this Act shall not apply to the specified class or classes of development. b(iii) the making available for inspection by members of the public of any specified documents, particulars, plans or other information with respect to the proposed development;"	This provision allows the Minister for Housing to provide that certain State developments do not require planning permission. It is not relevant to the MetroLink project. The MetroLink project is authorised by railway order and does not require planning permission. In that regard, we refer to section 38 of the Transport (Railway Infrastructure) Act 2001, which provides that "Each of the following shall be exempted development for the purposes of the Act of 2000: (a) development consisting of the carrying out of railway works, including the use of the railway works or any part thereof for the purposes of the operation of a railway, authorised by the Board and specified in a railway order or of any incidental or temporary works connected with such development; (b) development consisting of the carrying out of railway works for the maintenance, improvement or repair of a railway that has been built pursuant to a railway order."
13	8.2 Security Issues	17	It is essential that security issues do not arise in the event of sensitive information being shared on the structure and operation of these properties. However, the OPW understands the importance of the detailed design stage of the Project and the wish to ensure that the detailed assessment of these properties takes place in the early stages of the design process, in conjunction with the OPW, to ensure that these sensitive State buildings are not negatively impacted upon by the proposed Project. The OPW will liaise with TII and An Bord Pleanála on this matter .	This is understood and agreed. TII propose a meeting is held with the requisite OPW / security experts to discuss potential risks and the management of these risks during the construction and operational phases of the Project. TII and their consultants store all data on secure systems in line with best practice and treat all information as confidential. TII are available to engage with the OPW to discuss any specific requirements the OPW have in regard to data security.
14	8.2 Security Issues	17	All employees contracted to work on behalf of the TII on this Project, and any associated works, must adhere to the properties protocol around access, security, and safety. This applies to ail persons entering or working in proximity of the property.	TII will ensure that contractors working on its behalf on OPW property comply with property protocols around access, security and safety. Once the TII worksites are established, works within those sites will be secured to MetroLink standards.
15	8.2 Security Issues	17	The day-to-day operations of the property cannot be interrupted by disruptions to any utilities.	There is no intent to disrupt the day to day activities. If subsequently, it is found that a disruption to utility provision is inevitable this will be discussed with OPW and the timing and duration of any disruption optimised to minimise said disruption.
16	8.2 Security Issues	17	The design and operation of the MetroLink should be in line with best international practice, in relation to anti-terrorism and security measures.	Safety and security are two priorities for the MetroLink in operation and hence the design will be developed cognisant of the risk in relation to terrorism and best practice applied. Further dialogue with OPW will be undertaken throughout the design and construction to ensure suitable provisions are in place.
17	8.3.1 Ground Movement	18	Stage 2: Three sections were considered in the assessment. The assessment concludes that the risk of damage to Agriculture House is Category 0, Negligible. However, as a "Special building" it shall progress to stage/Phase 3 assessment on the basis of the building's foundation being deeper than 4m.	The building is not designated as a "Special" building and hence does not qualify for further assessment due to "negligible" damage category. Please also refer to response number (2) above.

OPW Cover Letter - Re: Railway (Metrolink-Estuary to Charlemont via Dublin Airport) - Headquarters of the Department of Agriculture, Food and the Marine				
18	8.3.1 Ground Movement	18	Stage 3: The EIAR states that a Stage 3 assessment will be carried out for Agriculture House by the Contractor appointed to construct this section of the MetroLink. The OPW expects to be consulted on the detail, scope of this assessment and programme for these assessments. It would be helpful if TII were to develop a Design Standard to ensure that all Stage 3 analyses of the OPW properties are carried out equally. No mention of Stage 4 or 5 has been found in the Railway Order or EIAR. Industry best practice as applied to London's Elizabeth Line (Crossrail) required that two further Stages in the Assessment of ground movement were undertaken during the project.	Please note that this building does not progress to Phase 3 assessment. Please refer to table 5-2 of EIAR Appendix 5.17. This building is referenced as B-14. Please also refer to response number (2) above.
