1 Introduction

The purpose of the report is to provide the technical input to the Preliminary Option Selection Report. This report provides the technical assessment of the user worked level crossing south of Donabate, from option selection through to the Draft Emerging Preferred Option, including the options considered and how a Draft Emerging Preferred Option was chosen.

The report includes:

- An introduction and description of the study;
- A summary of the option assessment approach undertaken;
- A description of the existing situation;
- The requirements;
- The relevant constraints;
- The option assessment containing:
 - Longlist of options;
 - Sifting of longlist of options;
 - Summary and details of the shortlisted options;
 - Multi-criteria analysis (MCA);
- The Draft Emerging Preferred Option.

1.1 Packages of work

The scope of work for DART+ Coastal North covers a wide range of interventions on the Northern Line needed in order to meet the Train Service Specification (TSS) requirements. To appropriately assess options against each other, the works have been split into separate work packages, as summarised within the separate Technical Annexes. Where appropriate, the Annexes have then been further split down into ‘sections’ which define the system which has been subject to the optioneering and design process.

This document is a Section of Annex 3.2 Technical Report for the Electrification of the Northern Line between Malahide and Drogheda. Please refer to Table 1-1 for a list of the different Sections which make up the electrification Annex.

This document contains an overview of the optioneering process for the user worked level crossing located close the Malahide Estuary south of Donabate. Intervention to the current crossing is considered due to an increase in the perceived risk from electrification of the railway line and greater frequency of trains.

1.3 Option Assessment Approach

The works proposed at Malahide have been assessed using the Department of Transport’s Common Appraisal Framework for Transport Projects and Programmes (CAF) as the options have the potential to be geographically different from each other and have a material difference on external parties or the environment. Further details can be found in the Option Selection Process section of the North Preliminary Option Selection Report.

2 Existing Situation

2.1 Overview

The level crossing is located south of Donabate, close to the Malahide Estuary. It is defined as a user worked crossing, connecting farmlands either side of the trainline. The level crossing's asset I.D is XB001.

Figure 2-1: Location of level crossing (XB001) in relation to Malahide and Donabate Station (Source: OSI aerial mapping)

Figure 2-2: Location of level crossing (XB001) (Source: OSI aerial mapping)

Figure 2-5: View looking southeast from level crossing, towards Malahide Estuary and agricultural land

Figure 2-6: East gate to crossing

Figure 2-7: West gate to crossing

Figure 2-8: Existing User Worked Crossing signage

2.2 Structures

There is one existing structure associated with the level crossing. This is a tidal outflow underbridge (reference UBB31) located north of the level crossing, as shown in Figure 2-9: UBB31 upstream, West elevation (source: Bridge Scour Inspection Survey Report, Murphy Surveys 2020).

Figure 2-9: UBB31 upstream, West elevation (source: Bridge Scour Inspection Survey Report, Murphy Surveys 2020)

Figure 2-10: UBB31 downstream, East elevation (source: Bridge Scour Inspection Survey Report, Murphy Surveys 2020)

2.3 Permanent Ways

The railway consists of two lines, the Up Main to Dublin and the Down Main to Drogheda. The line speed on both is 90Mph. It is currently un-electrified.

Signalling is controlled from North East CTC at Connolly

2.4 Ground Conditions

Historic mapping (1837) shows that the area was initially agricultural fields and indicates an embankment to cater for the Dublin-Drogheda railway line which was under construction.

Geological Survey Ireland (GSI) Quaternary sediment mapping indicates that the site is founded on an embankment over Irish sea till derived from Lower Palaeozoic sandstones and shales and estuarine silts and clays on both the eastern and western side of the site.

GSI mapping shows that the site is underlain by argillaceous bioclastic limestone, shale of the Malahide formation and the bedrock depth is in the range of 3 to 5m. There are no significant karst features identified near the site.

EPA (Environmental Protection Agency) river network mapping indicates that River Pill is located to the north of the site.

There is very limited historic ground investigations information available for this location which indicates the existing ground conditions at the site to comprise reclaimed land constituting of silts, glacial tills and gravels respectively.

Figure 2-11: Site Location (© OpenStreetMap)

2.5 Environmental

The existing level crossing links agricultural land on the eastern side of the railway line to approx. 5.5ha of grassland on the western side and is located at the northern end of Malahide Estuary.

The River Pill discharges to the estuary just north of the level crossing, running under the railway line. The Malahide Estuary is designated as both a Special Protection Area (SPA), Special Area of Conservation (SAC) and a proposed Natural Heritage Area (pNHA) in this area.

There is no significant development in the area, with the nearest development being approximately 500m away, including commercial and residential development.

A brief overview of the baseline environment, under key environmental criteria, is provided in the following sections.

2.5.1 Traffic and Transportation

Access to the site is provided through farmland towards the west of the rail line. The farmland is accessible via local roads. The nearest road link of regional importance is the R126 to the west, which links with Junction 4 on the M1.

A planned walkway and cycleway across Broadmeadow Estuary have been granted planning permission. The Broadmeadow Way forms part of the Fingal Coastal

Way, the NTA's Greater Dublin Area Cycle Network and East Coast Trail. It is funded by the NTA and Fingal County Council and construction is set to take place between 2022 and 2023. The route will run alongside the westside of the railway line, currently crossing the estuary and will include a 280 meters long bridge on the railway viaduct.

2.5.2 Landscape and visual impact

The rail line in this location runs on an embankment between farmland to the west and the estuary to the east. Sections of the rail line embankment are covered with areas of scrub planting. The level crossing provides access to a small area of farmland (circa 5 to 5.5ha.) that projects into the estuary east of the railway line. The level crossing is located in broadly flat, visually open lands adjacent to the estuary. The lands around the level crossing are zoned High Amenity and there is an objective to preserve views along Corballis Cottages Road east of the railway line (as noted on Sheet No. 7 of the Fingal County Council Development Plan).

2.5.3 Archaeological and cultural heritage

From an archaeological perspective, Malahide has been the focus for settlement activity for thousands of years, as evidenced by the Mesolithic and Neolithic flint scatters in the area. The village itself was based around a Viking landing point, which survived from the eighth century until the arrival of the Anglo-Normans. Malahide Castle (DU012:030) was built by Sir Richard Talbot, who was granted land here in 1176, and the castle remained in the family until the 1970s. The church (DU012:031) beside the castle is fifteenth or sixteenth century in date. The village continued as a fishing port and was also the site of several silk and poplin mills. The building of the Dublin to Drogheda railway viaduct in 1844 was largely responsible for the decline and eventual disappearance of the fishing fleet (Bennett 1991) at Malahide. The railway was also fundamental to the growth and development of Donabate and to the siting of St Ita's Hospital at Portrane. The railway infrastructure is an important aspect of the industrial past and contributes in a positive manner to the historic character of the coastal environment.

The railway runs through the Malahide and Rogerstown Estuaries on a viaduct (a protected structure (RPS No. 420 and 516) and resulted in the land being reclaimed from estuarial waters. The building of an embankment most likely led to a silting over of historic passes in the estuary. Rocque's map of Dublin (1756) shows the estuary's oyster beds, which were removed by the railway viaduct less than a hundred years later.

The earliest evidence of human activity in the form of two Bann flint flakes and a flint blade in Kilcrea townland (located to the west of the viaduct) dates to the late Mesolithic period (9000 BC-4000 BC) (NMI file no. (1967:182-184). Flint artefacts are evidence that the coast was exploited during prehistory. The process of change, alluvial deposition and coastal erosion can result in archaeological remains and the preservation of organic structures such as wood being buried under the silts and mud flats, masking features such as trackways, causeways, jetties and fishtraps as well as artefacts.

2.5.4 Architectural heritage

The lands to the south of Corballis Cottages were in open agricultural use, prior to the construction of the Dublin and Drogheda Railway which opened on 24 May 1844. The railway would eventually extend to link Dublin to Belfast with the completion of the Boyne crossing in 1855, merging to form the Great Northern Railway of Ireland (GNR(I)) in 1876, and operated by Iarnród Éireann since 1987. A level crossing had been established by 1907, to access the land on the east of the tracks as noted on the Ordnance Survey maps from this date. Following the construction of the railway, the area remained in agricultural use.

One protected structure was identified in the vicinity of the level crossing. This is the railway bridge over Corballis Cottages (FCC RPS 0502). The bridge is also included in the NIAH (NIAH 11336027) where it is rated of regional importance for reasons of architectural and technical interest.

No other features of built-heritage interest have been identified as part of the preliminary desk-based baseline review. The area is not included in an Architectural Conservation Area or a Conservation Area.

2.5.5 Noise and Vibration

The acoustic environment in the area of the level crossing will include noise from train passbys, as well as noise from agricultural activity from farmland to the west, and natural sounds (e.g. birds, wind, etc.) from the estuary to the east. Train passbys are expected to be the dominant noise source at the site, although intermittent. Freight trains are expected to have a higher level of noise than passenger trains.

Further information will become available once a site survey has been undertaken.

2.5.6 Air Quality and climate

Due to the rural location of the level crossing, the air quality in the area is considered to be very good.

2.5.7 Agricultural

The grassland to the east of the crossing is being used by folio DN6626 which is a beef farm located on the western side of the railway line. The land to the west of the railway line is medium quality and from examination of aerial photography on the Geohive¹ website from 2000, 2005, 2005-2012 and 2013 – 2018 this land has been used continuously for grassland.

2.5.8 Geology and Soils

As highlighted in Section 2.4, the expected ground conditions at the study area constitute reclaimed land of silts, glacial tills and gravels respectively.

¹ <http://map.geohive.ie/>

The Corine Land Cover 2018 categorises the land use in the area as coastal wetlands with intertidal flats.

2.5.9 Water resources

The site is within the Turvey_010 river sub basin which is in the Ballough Stream_SC_010 sub-catchment. The River Pill (Turvey_010) flows underneath the railway line 35m north of the crossing and discharges to Malahide Bay coastal waterbody (IE_EA_060_0000). No other surface water features have been identified at the site area.

Under the Water Framework Directive (WFD, 2000/60/EC) the “Ecological Status” of the Malahide Bay coastal water body is classified as Moderate for the 2013-2018 monitoring cycle and At Risk, indicating that the waterbody may not maintain or achieve that status on the next WFD cycle. The minimum objectives for a water body under the WFD are to achieve at least ‘Good’ status (or ‘Good potential’ for artificial/ highly modified water bodies), and no deterioration of existing status. The ecological status for the Turvey_010 river waterbody is unassigned.

The site is underlain by Dinantian Lower Impure Limestone which is part of the Malahide Formation. The aquifer is classified as a ‘Locally Important’ (LI) aquifer which is ‘Moderately Productive’ only in Local Zones. The groundwater vulnerability at the site is classified as low.

There are no high yielding water supply springs and wells i.e. public water supplies or group water scheme supplies within the site. No ‘Source Protection Zones’ associated with public or group groundwater supply schemes are located with the site.

The study area lies within the Swords groundwater body (IE_EA_G_011). The Swords groundwater body is currently at ‘Good’ WFD Status for the 2013-2018 monitoring cycle and currently ‘Not at Risk’ with regard to achieving its WFD objectives.

Historical flooding has been assessed by examining reports and maps from the Office of Public Work’s (OPW) National Flood Hazard mapping. There are no records of flood events within the site area. The risk of coastal flooding at Malahide Bay has been assessed and mapped by the OPW as part of the Fingal East Meath Flood Risk Assessment and Management (FRAM) study. According to the OPW predictive flood maps (floodinfo.ie), the site is located adjacent to areas at risk of tidal and fluvial flooding. The predicted level during the 0.5% Annual Exceedance Probability (AEP) event near the site is 3.18mOD, with the 1% AEP fluvial event flood level from River Pill at 1.25mOD.

2.5.10 Biodiversity

The works location is set adjacent to the estuarine environment of the Broadmeadow estuary, on the northern side of the estuary, south of Donabate.

The Broadmeadow estuary is designated as a Special Area of Conservation (SAC), a Special Protection Area (SPA) and a proposed Natural Heritage Area (pNHA), as

indicated in Figure 2-12: below. The land directly to the east of the railway line is also part of the Malahide Estuary SPA.

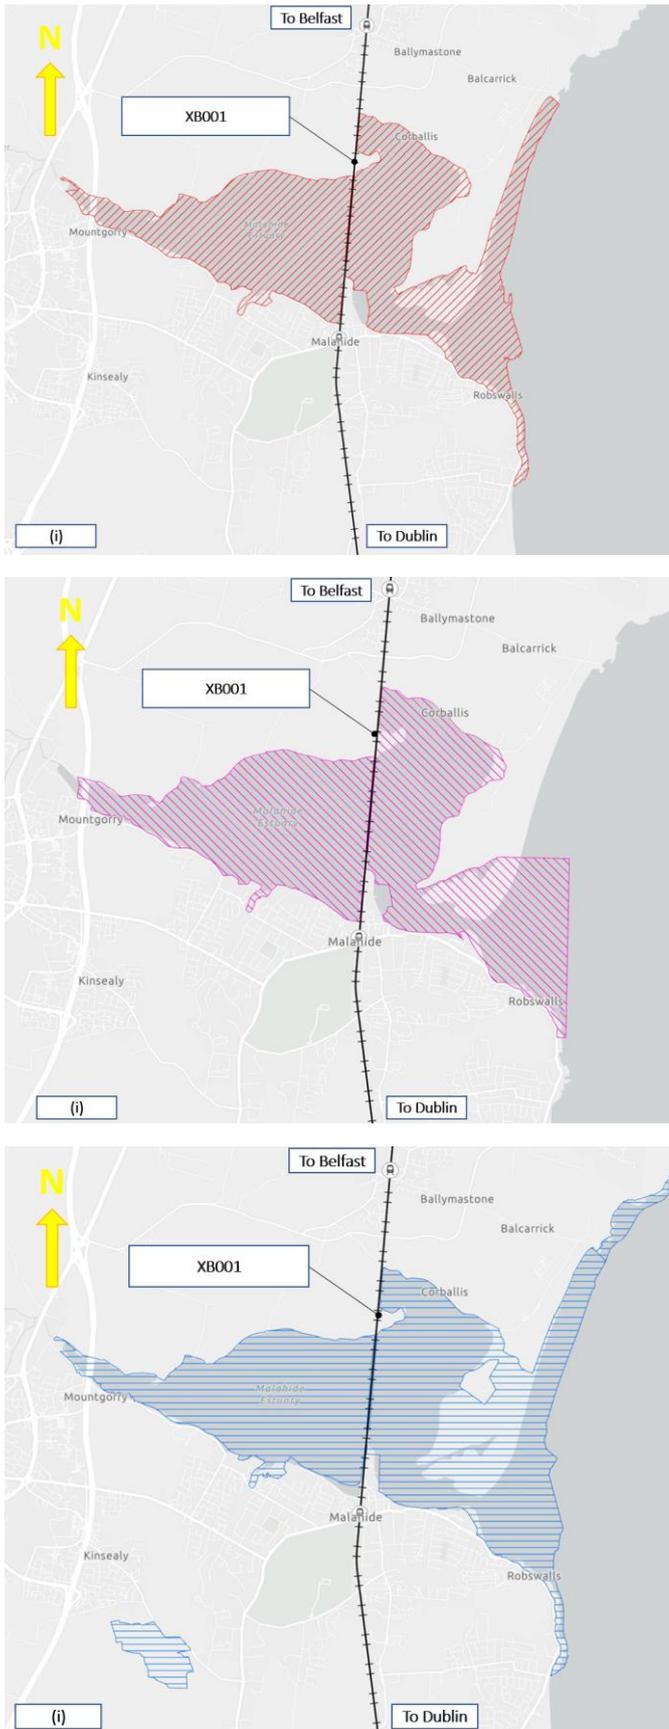

Figure 2-12: Malahide estuary extents of (i) SAC (ii) SPA and (iii) pNHA

2.6 Utilities

Utility records have been gathered from the utility providers in the area. The following utility companies have infrastructure within the area of interest:

- Eir;
- BT Ireland;
- Lineside cables running parallel along the length of the railway line.

All utility records should be considered indicative only and must be verified prior to any intrusive works occurring. There are no utility crossings in the area around the level crossing.

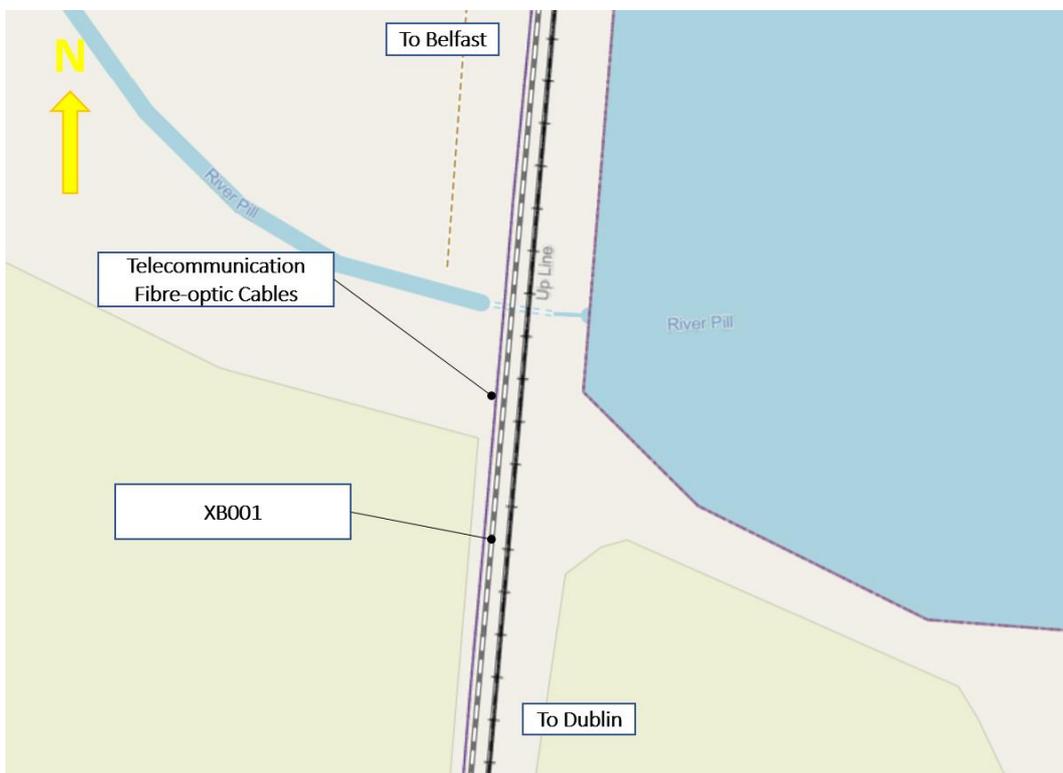

Figure 2-13: Location of utilities close to level crossing XB001

3 Requirements

The current requirement of the crossing is to provide the only means of access to a number of fields in the area. Access is required/used for the following:

- Farming
- Maintenance of drainage ditches
- Maintenance of coastal defences/causeway
- Vegetation management

With the project requirement to electrify the Northern Line from Malahide to Drogheda, mitigation solutions will need to be implemented to reduce the risk to traffic and users due to:

1. Increased train traffic – Train traffic is to increase by approximately 200%
2. Hazards related to electrification

3.1 Specific Requirements

There are no specific requirements relating to crossing opening times i.e. the availability to cross. However, farm machinery likely to use the crossing will potentially require longer to cross and could pose risks to train traffic unless strict procedures are followed for slow moving vehicles. Machine operators are required to follow the procedures regarding crossing, including assuring the safe clearance height.

3.2 Systems Infrastructure and Integration

As this is a level crossing to access farmland, the road traffic levels are sparse and amount to few or no crossings per day. During the hours of peak traffic, trains will pass the location on average every 3-4 minutes meaning that opportunities to use the level crossing that do not affect train traffic are limited.

The standard design for level crossings currently includes automatic barriers operated by the approaching train with CCTV (Closed circuit television) monitoring from the central traffic control located near Connolly station. Such crossing designs are specifically for public roads to protect both vehicular and pedestrian traffic but are carefully designed to minimise impact on the train service by ensuring that the barriers are down well before the arrival of the train to avoid having to reduce train speed on approach.

Even so, level crossings are not preferred in high rail traffic areas due to the increasing risk of conflict between the road traffic users and trains where there are short opening times and long waits in between.

3.3 Design Standards

The Commission for Rail Regulation (CRR) guidelines recommend, but do not require, closure due to electrification.

4 Constraints

Relevant constraints are listed within this section, under relevant headings.

4.1 Technical

The current constraints are as follows:

- Increased DART train frequency (Train Service Specification) as part of the DART+ programme
- Electrification - According to CRR guidelines, user worked crossings are not normally suitable for electrified areas;
- Currently limited signalling/monitoring capability installed at crossing;

4.1.1 Permanent Way and Track

No constraints have been identified. The area uses standard track units.

4.1.2 Geotechnical

Based on the desk study information retrieved from historic ground investigations along the railway line, there is the risk of contamination due to the presence of made ground as highlighted in nearby ground investigations and with respect to the historic and industrial use of the site as a railway. Subsequently, material excavated during the works may not be suitable for reuse on site and subject to testing may require disposal or recovery to a suitably licensed facility.

Moreover, there is the possibility of soft ground (alluvium deposit) associated with River Pill and its historic estuary to the north of the site.

A site-specific ground investigation is a prerequisite at the location of the proposed works to investigate the current ground and groundwater conditions. There is limited information on depth to bedrock, groundwater and geo-environmental from existing ground investigations.

4.1.3 Structures

This area currently accommodates a two-track railway. Any reconfiguration of the horizontal track alignment or increase in the number of tracks may require alternation to the structures in the area as described in the table below.

Table 4-1: Structure constraints along the site

| Name | ID | Function | Constraint |
|-----------------------|-------|-------------|----------------------------------------------------------------------------------------------------------------------------------|
| UBB31 - Tidal Outflow | UBB31 | Underbridge | Any alteration to the tracks at this location may require a modification to the bridge should additional width be required here. |

4.1.4 Utilities

Existing utilities are a constraining factor to the project when considering the various design options. It is often cheaper, easier, and quicker for a project to change the design than to divert a utility. Existing utilities should be taken into consideration from an early stage in the project, and where possible worked around and only diverted where necessary.

Utility locations should be taken into consideration when constructing or designing bridges, underpasses, or automatic barrier crossings, as this may require utilities in the area to be diverted. Any construction work taking place in the vicinity of the level crossing must take the existing lineside and telecommunication cables into consideration. Appropriate arrangements must be made with Irish Rail, BT Ireland and Eir.

Currently the only known utilities in the vicinity are the telecommunication and signalling cables associated with the railway

4.1.5 Other Railway Facilities

No constraints have been identified.

4.1.6 Roads

No road constraints have been identified in the permanent scenario. During construction access to nearby residential and business areas must be maintained. Traffic diversions may be necessary.

4.2 Environmental

For an overview of the existing environmental constraints for DART+ Coastal North refer to Annex 3.1 Constraints Report.

Section 2.5 above describes the baseline environment for the various options being considered under this study pack. Building on this information, the key constraints associated with the options being considered, under the various environmental criteria, are summarised below.

4.2.1 Traffic and Transportation

The crossing is immediately beside the route of the proposed Broadmeadow Greenway. As such there is an increased risk of members of the public being in the vicinity of the crossing and trespassing/crossing the line. Furthermore, any interfaces will need to be considered, particularly during construction works.

4.2.2 Landscape and visual impact

The level crossing is in broadly flat, visually open lands adjacent to the estuary. The lands around the level crossing are zoned 'High Amenity' and there is an objective to preserve views along Corballis Cottages Road east of the rail line (Sheet No. 7 Fingal County Council Development Plan).

The planned Broadmeadow Way (see section 2.5.1) is another constraint that must be considered. The Broadmeadow Way forms part of the Fingal Coastal Way, the NTA's Greater Dublin Area Cycle Network and East Coast Trail. The route will run alongside the west side of the railway line currently crossing the estuary and will include a 280m long bridge to be placed on existing piers immediately west of the railway viaduct.

4.2.3 Archaeology and cultural heritage

While there are no archaeological monuments located in the vicinity of the proposed works for any of the options, the area is considered to be of archaeological potential. This is due to the potential to identify or record buried archaeological features, finds or deposits from within the estuarine silts upon which the railway infrastructure is built. This is evidenced from the finds of a flint blade and flint flakes in Kilcrea townland (NMI 1067:182-184).

4.2.4 Architectural heritage

One protected structure has been identified in the vicinity of the level crossing. This is the railway bridge over Corballis Cottages (FCC RPS 0502). The bridge is also included in the NIAH (NIAH 11336027) where it is rated of regional importance for reasons of architectural and technical interest.

No other features of built-heritage interest have been identified as part of the preliminary desk-based baseline review.

4.2.5 Noise and vibration

Noise and vibration constraints are nearby sensitive receptors. The nearest sensitive receptors are approximately 500m from the site and are unlikely to be affected by noise or vibration from level crossing works for most options. Construction and operational noise and vibration limits will have to be set at the nearby receptors for the options proposed.

4.2.6 Air quality and climate

The existing level crossing is located at the northern end of Malahide Estuary surrounded by agricultural land. No dwellings or other human sensitive receptors are located in proximity.

The River Pill discharges to the estuary just north of the level crossing, running under the railway line. The Malahide Estuary is designated as both a Special Protection Area (SPA), Special Area of Conservation (SAC) and a proposed Natural Heritage Area (pNHA) in this area. The Estuary is therefore considered sensitive in the context of potential dust emissions during any construction phase.

4.2.7 Agricultural

The agricultural constraints in this area are low-to-medium sensitivity based on the criteria in Table 4-2. There is a medium sensitivity beef farm (Folio DN6626) on the east side of the crossing and a tillage and vegetable growing enterprise just south of this. Tillage farms are generally medium sensitivity and while vegetable cropping is a higher value use of the land, and therefore potentially more sensitive from an agricultural perspective, the rotation of such high value crops is such that the land will be used for conventional cropping for the majority of cropping seasons and therefore is assessed as medium sensitivity. The grassland to the east of the railway line is low sensitivity due to restricted access and medium land quality.

Table 4-2: Farm Sensitivity²

| Farm enterprise type | Intensity / Scale | Sensitivity |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|-----------------|
| Stud farms, farm shops/open farms/agri tourism farms are generally high or very high sensitivity. Intensive horticulture (mushroom farms) is generally high or very high sensitivity. Intensive agriculture (pigs and poultry) is high sensitive. | High | Very High |
| | Medium | High |
| | Low | Medium |
| Dairy farms and equine enterprises. | High | High |
| | Medium | High |
| | Low | Medium |

4.2.8 Geology and soils

Based on the historic and industrial use of the site as a railway, there are likely to be some sources of contamination within the made ground throughout the study area.

² The sensitivity of typical Irish agricultural enterprises is based on the author’s professional judgement

4.2.9 Water resources

The constraints to the development in terms of water resources include the Malahide Bay, River Pill, the underlying locally important aquifer, areas at medium to high risk of flooding and the protected water dependant ecological sites where changes to the water flow and quality could have a negative impact.

The site is at close proximity to the Malahide Bay SAC, SPA and pNHA. One of the objectives of the SAC relates to the flooding regime, and specifically the natural tidal regime. The pioneer saltmarsh community at the SAC requires regular tidal inundation. Changes to the hydrological regime as part of the proposals could therefore have a negative impact.

4.2.10 Biodiversity

The key ecological constraints in this area are the Malahide Estuary SAC, Malahide Estuary SPA and pNHA designation (located immediately adjacent to and overlapping with the works area) which are designated for marine habitats and overwintering birds. These designated areas are of international and national biodiversity importance. The reasons for designation are listed in Table 4-3 below.

Table 4-3: Qualifying interests (reasons for designation) of the Malahide Estuary SAC and SPA

| Malahide Estuary SAC | Malahide Estuary SPA |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"> ● 1140 Mudflats and sandflats not covered by seawater at low tide ● 1310 <i>Salicornia</i> and other annuals colonising mud and sand ● 1320 <i>Spartina</i> swards (<i>Spartinion maritima</i>) ● 1330 Atlantic salt meadows (<i>Glaucopuccinellietalia maritima</i>) ● 1410 Mediterranean salt meadows (<i>Juncetalia maritimi</i>) ● 2120 Shifting dunes along the shoreline with <i>Ammophila arenaria</i> (white dunes) ● 2130 Fixed coastal dunes with herbaceous vegetation (grey dunes) | <ul style="list-style-type: none"> ● A005 Great Crested Grebe <i>Podiceps cristatus</i> ● A046 Brent Goose <i>Branta bernicla hrota</i> ● A048 Shelduck <i>Tadorna</i> ● A054 Pintail <i>Anas acuta</i> ● A067 Goldeneye <i>Bucephala clangula</i> ● A069 Red-breasted Merganser <i>Mergus serrator</i> ● A130 Oystercatcher <i>Haematopus ostralegus</i> ● A140 Golden Plover <i>Pluvialis apricaria</i> ● A141 Grey Plover <i>Pluvialis squatarola</i> ● A143 Knot <i>Calidris canutus</i> ● A149 Dunlin <i>Calidris alpina</i> ● A156 Black-tailed Godwit <i>Limosa</i> ● A157 Bar-tailed Godwit <i>Limosa lapponica</i> ● A162 Redshank <i>Tringa totanus</i> ● A999 Wetlands |

Other potential ecological constraints include:

- The River Pill which drains to the Malahide estuary;
- Vegetation (scrub, hedgerows or treelines) which may provide foraging, nesting, and commuting corridors for fauna species (e.g. birds, bats, small mammals);
- Potential for the railway to support interesting flora species and habitats due to the calcareous nature of the ballast and their often relatively undisturbed nature;
- Potential for invasive species to occur along the railway line.

Also of note are Fingal County Council’s proposals for the Broadmeadow Greenway adjacent to the railway line. The environmental assessments for the Broadmeadow Greenway set out specific environmental and ecological mitigation and any works in this area should be cognisant of those plans and ensure there are no conflicts between the Irish Rail works and the Broadmeadow Greenway proposals (e.g. timings of works to avoid sensitive periods for species, or control of access by people to the adjacent designated sites).

4.3 Planning

XB001 is located within the administrative area of Fingal County Council. The Fingal Development Plan 2017-2023 sets out the Council’s proposed policies and objectives for the development of the County over the Plan period. The Development Plan seeks to develop and improve, in a sustainable manner, the social, economic, environmental and cultural assets of the County.

The Strategic Vision for the plan contains a number of sectoral policies, the following of which are relevant:

“Consolidate urban areas to provide a vibrant, attractive environment for living and working, facilitating efficient movement by sustainable modes of transport throughout the County.

Make better use of key resources such as land, water, energy, waste and transportation infrastructure.

Reduce climate change through settlement and travel patterns and reduced use of non-renewable resources.”

The Strategic Vision intends to deliver on the Main Aims of the Plan by, inter alia:

“Seek the development of a high quality public transport system throughout the County and linking to adjoining counties, including the development of the indicative route for New Metro North and Light Rail Corridor, improvements to railway infrastructure including the DART Expansion Programme, Quality Bus Corridors (QBCs) and Bus Rapid Transit (BRT) systems, together with enhanced facilities for walking and cycling.”

The following objectives in relation to transportation are also relevant:

“Objective MT01

Support National and Regional transport policies as they apply to Fingal. In particular, the Council supports the Government’s commitment to the proposed new Metro North and DART expansion included in Building on Recovery: Infrastructure and Capital Investment 2016-2021. The Council also supports the implementation of sustainable transport solutions.

Objective MT02

Support the recommendations of the National Transport Authority’s Transport Strategy for the Greater Dublin Area 2016-2035 to facilitate the future sustainable growth of Fingal.

Objective MT05

Integrate land use with transportation by allowing higher density development along higher capacity public transport corridors.

Objective MT30

Support Iarnród Éireann and the NTA in implementing the DART Expansion Programme, including the extension of the DART line to Balbriggan, the design and planning for the expansion of DART services to Maynooth, and the redesign of the DART Underground.”

5 Options

The following section runs through the optioneering process from the longlist of options through to the selection of the Draft Emerging Preferred Option.

The option selection process is described in the option selection process section of the Preliminary Option Selection Report.

5.1 Longlist of options

This section describes the options which have been considered for the level crossing. The discussion is limited to items which will have a bearing on the development or selection of an option. A more detailed technical description of the works is included for the shortlisted options.

The options which have been considered are summarised in Table 5-1 below.

Table 5-1: Longlist of options considered

| Option | Description |
|----------|-------------------------------------------------------------------------------------------------|
| Option 0 | Do Nothing |
| Option 1 | New automatic barrier crossing interlocked with signalling |
| Option 2 | Close the crossing |
| Option 3 | Close the crossing and provide new access from Corballis cottages along estuary side of railway |
| Option 4 | Close the crossing and IÉ purchase the adjacent land to remove any third-party access |
| Option 5 | Construct new overbridge |
| Option 6 | Construct new underbridge |

5.1.1 Option 0 – Do nothing

This option involves doing nothing to the level crossing, following electrification and service frequency increases to the railway line.

5.1.2 Option 1 – New automatic barrier crossing interlocked with signalling

This option involves installation of a new automatic barrier crossing interlocked with signalling. The current standardised design includes the installation of barriers which are dropped to close the crossing on the approach of trains, raised when the line is clear and are monitored by CCTV in accordance with CRR guidelines. Such designs are adapted specifically for public roads and less suited to level crossings such as this.

5.1.3 Option 2 - Close the crossing

This option involves closure of the crossing due to the increased perceived risk from electrification and service frequency increases. It proposes no further mitigation nor means of access to the land east of the railway.

5.1.4 Option 3 – Close the crossing and provide new access

This option involves provision of access to the agricultural land east of the crossing via a new access road from Corballis cottages, along the estuary side of the railway. The existing level crossing would be closed. The proposed route of this road is shown in Figure 5-1 below.

The works would likely require creation of a retaining structure along the length of the road, supporting this up from the estuary. Additionally, widening to the existing underbridge would likely be required.

Figure 5-1: Level crossing option 3 access road sketch (Source: OSI aerial mapping)

5.1.5 Option 4 - Close the crossing and IÉ purchase the adjacent land

This option involves purchase of the land east of the crossing such that third-party access requirements are removed. The existing level crossing would be closed. Consideration would need to be given as to the access method for maintenance

activities in the field/to the estuary shoreline. The option presents the opportunity to improve biodiversity/ecological value of the area of land in question.

5.1.6 Option 5 - Construct new overbridge

This option comprises removal of the level crossing and construction of a new overbridge to provide access to the adjacent farmland. A level difference of 6.6 m would be required, coming from 5.8 m clearance to rail level plus a structural depth of 0.8 m for the bridge. Considering a maximum 7% gradient, this would result in 95m long approach earthen ramps either side.

A two-span arrangement would be necessary to accommodate both the proposed Greenway and the railway, resulting in an overall length in excess of 25 m. The deck would be approximately 4 m wide between parapets. It is likely the bridge would be constructed of prestressed concrete girders sat upon reinforced soil wall embankments. The ground is likely to be soft, necessitating an amount of ground improvement for the embankment and bridge works.

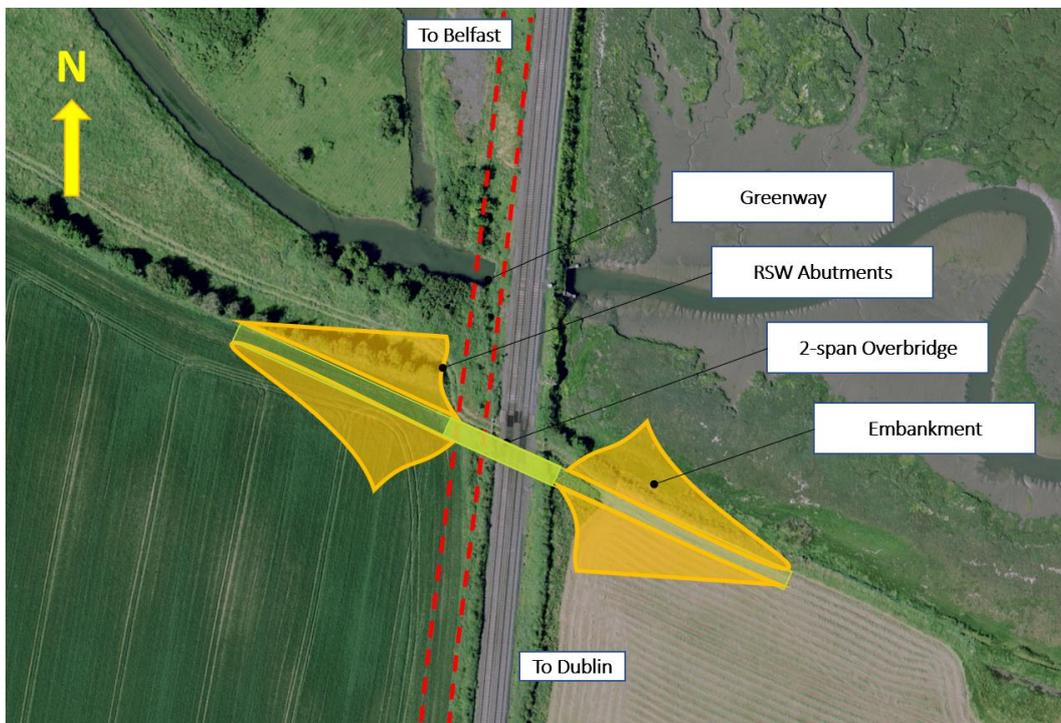

Figure 5-2: Level cross option 5 overbridge layout sketch (Source: OSI aerial mapping)

5.1.7 Option 6 - Construct new underbridge

This option comprises removal of the level crossing and construction of a new underpass to provide access to the adjacent farmland. A level difference of 3.5 m would be required, coming from 2.7 m clearance for vehicles in the underpass, plus 0.4 m of structural depth and 0.4 m of ballast. Considering a maximum 7% gradient, this would result in 50m long approach ramps either side.

The underpass would likely be formed from a precast reinforced concrete box culvert, with an overall length in excess of 25m to pass under both the proposed Greenway and railway. Wingwalls to the structure would likely be formed from reinforced concrete. The underpass would be approximately 4 m wide internally.

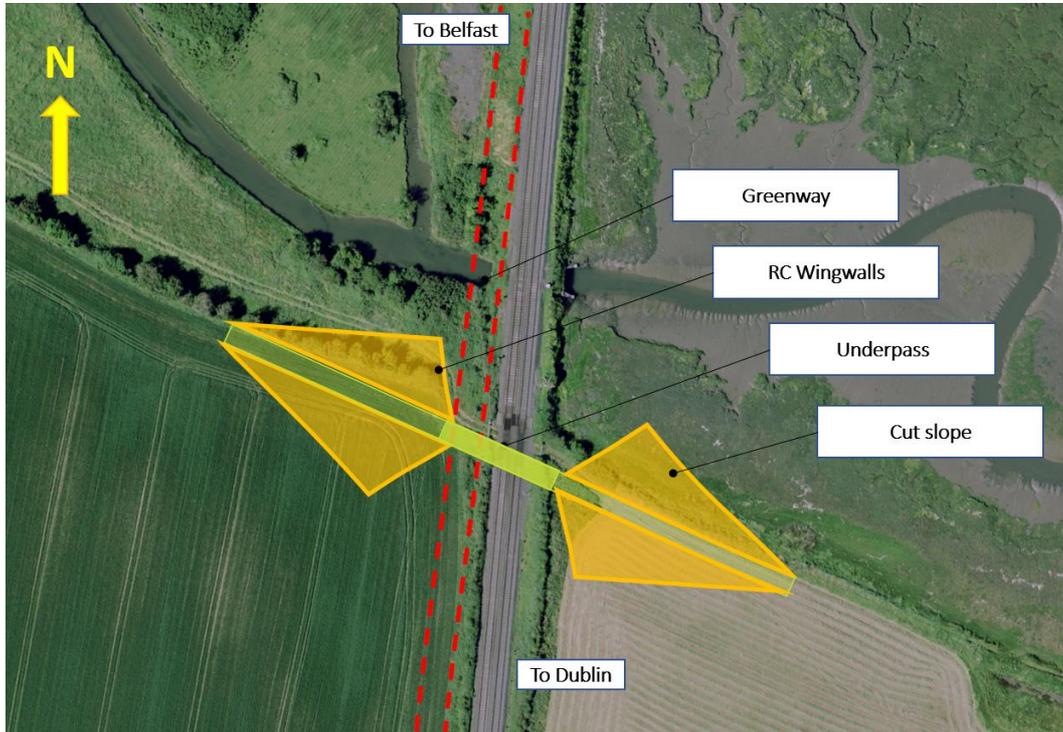

Figure 5-3: Level crossing option 6 underpass layout sketch (Source: OSI aerial mapping)

5.2 Sifting of longlist of options

This sifting process considers the project objectives and project requirements. Each option presented in section 5.1 will be assessed on its ability to meet the project objectives and requirements.

Assessment of the options is provided in Table 5-2 and Table 5-3 below.

Table 5-2: Assessment of longlist of options against project objectives and requirements (Options “do-nothing” 1 to 4)

| Project objectives and requirements | Description | Option “do-nothing” | | Option 1 - New automatic barrier crossing interlocked with signalling | | Option 2 – Close the crossing | | Option 3 – Close the crossing and provide new access from Corballis cottages along estuary side of railway | | Option 4 – Close the crossing and IE purchase the adjacent land to remove any third-party access | |

5.3 Summary of Longlist Sifting

Table 5-4: Summary of longlist sifting

| Option | Screening Result | Summary |
|--------------|------------------|------------------------------------------------------------------------------------------------------|
| “Do-Nothing” | FAIL | Does not meet project objective: a high-risk crossing considering the train frequency and line speed |
| Option 1 | FAIL | Does not meet project objective – not appropriate for a user worked crossing to access farmland |
| Option 2 | FAIL | Fails to consider third-party landowner by closing crossing and removing their access |
| Option 3 | PASS | Met project objectives and requirements |
| Option 4 | PASS | Met project objectives and requirements |
| Option 5 | PASS | Met project objectives and requirements |
| Option 6 | PASS | Met project objectives and requirements |

5.4 Shortlisted options

The following sections describe the shortlisted options in further detail.

Note for all options some adjustments to the OHLE design will be necessary to accommodate infrastructural changes, however these are seen to be minor.

5.4.1 Option 3 - Close the crossing and provide new access description

This option will have no impact on the electrification works assuming that it does not constrain installation of new OHLE structures. It will likely require the widening of the tidal overflow bridge and the inclusion of a substantial length of retaining structure along the estuary side – approximately 460 m long . This will result in substantial structural and geotechnical interventions.

5.4.2 Option 4 - Close the crossing and IÉ purchase the adjacent land description

This option will have no impact on the electrification design, nor will it require modification of signalling systems or structural/geotechnical interventions.

5.4.3 Option 5 - Construct new overbridge description

This option will require construction of an overbridge with geometry and soffit height such that all electrical clearances can be achieved with standard OHLE geometry. It will, therefore, only affect the electrification design in locating OHLE structures longitudinally such that they do not clash with the new structure. It is assumed that the overbridge will be constructed prior to the electrification works.

The proposed 2-span overbridge bridge will be approximately 25m in length which includes spanning over the Broadmeadow Way and 4m wide between parapets. It will require approximately 95m long ramps at either edge of the bridge with a 7% gradient. Note an embankment will be built either side of this ramp construction. The level difference is around 6.6m: 5.8m rail clearance + 0.8m structural depth. Note this 5.8m clearance will be sufficient for the 25kv passive provision, if this is required.

5.4.4 Option 6 - Construct new underbridge

This option will require construction of a new underbridge prior to the electrification works. It will affect the OHLE design in terms of locating structures longitudinally along the track. The option will result in significant structural and geotechnical interventions.

The proposed underpass will be approximately 25m in length which includes passing the Broadmeadow Way with a 4m wide passage. It will require approximately 50m long ramps at either edge of the underpass with a 7% gradient. Note an embankment will be built either side of this ramp construction. The level difference is approximately 3.5m: 2.7m clearance + 0.4m ballast allowance.

The lowest road level will be approximately 1.4m OD, assuming a 2.7m vertical clearance height within the underpass. The potential for the road level of the underpass to be below water level will depend on the high tide levels and the ground water levels in the area (including potential fluctuations in water table levels).

High tide is at 2.52m OD Malin therefore there will times when the underpass will be below sea level. This will be reviewed and developed during preliminary design stage, should this option be chosen as the emerging preferred option.

5.5 Multi-criteria analysis

5.5.1 Methodology

For each individual entity an assessment has been made against the MCA criteria. Each option has been relatively compared against each other based on the five-point colour coded ranking scale as shown in Table 5-7.

5.5.2 MCA summary table

A multi-criteria analysis table is presented in this section. This has been developed to reflect the relative rankings for all sub-criteria for each of the options assessed and is presented as a summary of the key issues considered.

A more detailed table is provided in the appendix to this report with the full detailed rationale behind the scoring of each criteria and option.

Table 5-5: MCA Summary table

| Criteria | Sub-Criteria | Option 3 | Option 4 | Option 5 | Option 6 |
|----------------------------------|----------------------------------------------------------------------------|-------------------------------------------|---------------------------------------------------|--------------------------|---------------------------|
| | | Close the crossing and provide new access | Close the crossing and purchase the adjacent land | Construct new overbridge | Construct new underbridge |
| Economy | CAPEX | Orange | Green | Orange | Orange |
| | OPEX | Orange | Green | Light Green | Light Orange |
| | Train operations functionality/economic benefit | Yellow | Yellow | Yellow | Yellow |
| | Traffic functionality and associated economic activities and opportunities | Light Orange | Light Green | Light Orange | Light Orange |

Table 5-7: Legend for MCA Summary Table

| |
|---------------------------------------------------------|
| Significant comparative advantage over other options |
| Some comparative advantage over other options |
| Comparable to other options / neutral |
| Some comparative disadvantage over other options |
| Significant comparative disadvantage over other options |

5.5.3 Economy

Economy has been divided into four sub-criteria which are considered below.

CAPEX

Option 4 has significant advantages over the other options as there is no construction and temporary works costs associated with this option. The only CAPEX costs incurred is the cost of purchasing the farmland to remove the requirement for any 3rd party access.

Options 3, 5 and 6 have significant disadvantages over Option 4 due to costs associated with construction of new structures. Option 3 requires a construction of a new access road and widening of UBB31, Option 5 is the construction of a new overbridge and Option 6 is the construction of a new underpass

OPEX

Option 4 has significant advantages over the other options due to minimal to no operational costs would be incurred with this option.

Option 3 has significant disadvantages due to the maintenance costs required for the access road and the retaining road.

Option 5 has some comparative advantages over Option 6. There is limited maintenance foreseen for the over bridge however the underpass will likely require greater maintenance, such as for drainage and retained earth.

Train operations functionality/economic benefit

All options are comparable as they all provide fully segregated farm and rail traffic. The options increase timetable resilience by removing the risk of delays due to farm traffic interference.

There is a possibility of road traffic impacting rail services through bridge strikes by oversized vehicles, which could decrease timetable resilience and negatively impact performance. However, this risk is low and does not affect the scoring.

Traffic functionality and associated economic activities and opportunities

Option 4 has some comparative advantages over the other options as there is no change or increase in construction traffic and operational traffic will likely be reduced. For Options 3, 5 and 6 there will be traffic associated with the construction works.

5.5.4 Safety

Safety has been divided into two sub-criteria which are considered below. It should be noted that all options are safe, but some will have the potential for greater residual risks to remain. This criterion considers relative advantages of each option on the criteria of safety.

Employer's Safety

All options are comparable as all options do not require IÉ staff on the track apart from existing track/formation maintenance.

Public Safety

Option 4 has significant advantages for public safety as public access to the track and to the land on the eastern side of the track has been eliminated. Option 3 does eliminate the access to the track however the public can still gain access to the land on the eastern side of the track by the new road. Option 5 and 6 both have risks associated with the new structure. Option 5 carries the risk of overpassing machinery to fall onto the track and option 6 has some disadvantages with the risk of bridge strike from farm machinery.

5.5.5 Environment

Section 2.5 sets out a description of the existing environment, under key environmental criteria, while section 4.2 considers the key environmental constraints associated with this study area. Below is a summary of the key findings of the MCA under the various environmental criteria, with an emphasis on differentiating aspects for the options considered.

Landscape and Visual Qualitative

Option 3 involves major construction to provide the access along the estuary (east) side of the existing rail line embankment. Post construction it is likely that the existing largely planted eastern embankment will be replaced by a structural wall along the new access. Option 3 has some comparative disadvantages over other options.

Option 4 will close the crossing and the adjacent land will be purchased to remove the requirement for third-party access. There will be relatively minor physical works of fencing off the level crossing and removing track crossing panels, as well as likely providing a gate access from the railway corridor to the east to allow for maintenance. The acquisition / severance of the land will likely result in a change of land use / land management which will change the visual character of the landscape. Nevertheless, option 4 has some comparative advantages over other options.

Option 5 involves provision of a new overbridge across the rail line. The structure is located in a high amenity landscape and will be visible from the protected views on Corballis Cottages Road. Option 5 has significant comparative disadvantages over other options.

Option 6 involves provision of a new underbridge beneath the rail line. While located in a high amenity landscape the structure will not be particularly visible from the wider landscape or protected views on Corballis Cottages Road. Option 6 has some comparative disadvantages over other options.

Biodiversity

Options 3, 5 and 6 have potential to significantly impact on the Malahide estuary internationally and nationally important designated sites, either directly or indirectly.

Option 3 would require significant works within the designated sites. It would also introduce people into an area currently inaccessible which may cause disturbance to overwintering birds. Although ranked the same as Options 5 and 6 (significant comparative disadvantage over other options), Option 3 is the least preferred option from a biodiversity perspective.

Options 5 and 6 would require works within the designated sites. Additional potential indirect impacts include construction related impacts (e.g. potential for water quality impacts or disturbance to birds). Although ranked the same (significant comparative disadvantage over other options), Option 5 may be less preferable than Option 6 from a biodiversity perspective due to the larger scale of works within the designated sites.

Determining the precise location of the Malahide Estuary SAC and SPA boundaries would be important for Options 3, 5 and 6 given that works for these options will come near and/or within these designated sites. This may take time and require consultation with the NPWS and even then, may prove difficult.

Option 4 offers significant comparative advantages over other options and is the preferred option from a biodiversity perspective. This option does not introduce any

direct/indirect impacts and provides opportunity for significant biodiversity benefit by managing the purchased lands for biodiversity.

There are several other potential ecological constraints for Options 5 and 6 but these are similar across the options and do not differentiate the preference between them. These include:

- Vegetation removal with potential for removal of habitat of value (scrub, hedgerows or treelines) and which may provide foraging, nesting, and commuting corridors for fauna species (e.g. birds, bats, small mammals).
- It is not known whether invasive species may occur in this works area. If present, there would be the risk of spreading these to the adjacent SAC and SPA which would be particularly sensitive receptors.

Noise and Vibration

Option 4 is, comparatively, the best option from a noise and vibration point of view as there are no noise or vibration impacts to the surrounding sensitive community.

Options 5 and 6 have the potential to impact the surrounding community during construction but will have less of an impact than Option 3, where construction will occur in close proximity to the residents on the Corballis Cottages Road. Construction for Options 5 and 6 will occur approximately 500 m away from the nearest residents, which means that the potential for negative impact is reduced compared to Option 3. However when compared to Option 4, Options 3, 5 and 6 are significant comparable disadvantages.

Water resources

The comparative differences across the options relate mainly to development adjacent to or within areas at flood risk from the River Pill or the Malahide Estuary, as well as development adjacent to and within the Malahide Estuary SAC/SPA and the impact this might have in terms of water pollution and changes to the hydrological regime.

Option 3 would require construction works on the edge of the estuary, in an environmentally sensitive area. A retaining structure is likely to be required along the length and the bridge over the River Pill would most likely need to be widened. These works have the potential to have an impact on the groundwater and surface water flow regimes as well as the water quality. Therefore, this option is considered to have significant comparative disadvantage over the other options in terms of water resources.

Option 4 does not propose any construction and would have no impact on the existing water resources in the area and is considered to have significant advantage over other options.

Option 5 would require works parallel to the River Pill and Malahide Estuary which are environmentally sensitive waterbodies. The construction of the ramps could have a negative impact on the waterbodies in terms of water pollution during construction and might cause changes to the groundwater and the surface water

flow regimes as well as the water quality and therefore is considered to have significant comparative disadvantage over the other options in terms of water resources.

Finally, option 6 would require works parallel to the River Pill and Malahide Estuary. The construction of the underpass could have a negative impact on the waterbodies in terms of water pollution during construction and has the potential to impact the groundwater and surface water flow regimes. The construction of the underpass will require considerably more excavation than the other options. This presents a greater impact to the groundwater flow regime and groundwater quality and their receiving waterbodies compared to the other options. This option is considered to have a significant comparative disadvantage over other options.

Archaeology, Architectural & cultural heritage

Option 3 involves the closing of the level crossing and the provision of a new access from Corballis Cottages along the estuary side of the railway. No archaeological monuments are located in proximity to the proposed works, however the area is of archaeological potential. Extensive works will be required with this option including earthmoving and excavation. This potential is borne out by the finds of a flint blade and flint flakes in Kicrea (1967:182-184).

Archaeological monitoring (11E0060) of works took place at a residential development to the west of the railway immediately before the railway overbridge and east-west trending road that extends to Corballis Cottages. As a result of this exercise no archaeological features or finds were identified. Option 3 also blocks the historic access and creates a new access road which will also impact on Kilcrea Bridge (NIAH 11336027 - Regional Importance). NOTE: the significance of impact on Kilcrea Bridge is likely to be Low.

Due to the extent of works required including excavation, option 3 has a significant comparative disadvantage over other options. As a mitigation measure, archaeological monitoring will be required during any earthmoving activities.

Option 5 involves localised excavation works to construct an overbridge. It would be a significant intervention into the landscape. Relative to the other proposed options, it would have a negative visual impact on the historic character of the surrounding landscape including the setting of the Malahide Viaduct - a Protected Structure (FCC RPS 0420), and Kilcrea Bridge (NIAH 11336027 - Regional Importance). Option 5 therefore also has a significant comparative disadvantage over other options.

Option 6 involves localised excavation works to construct an underbridge. It would also be a significant intervention into the landscape. Relative to Option 5 however, it would have less visual impact on the historic character of the surrounding landscape including the setting of the Malahide Viaduct - a Protected Structure (FCC RPS 0420), and Kilcrea Bridge (NIAH 11336027 - Regional Importance). As a mitigation measure, archaeological monitoring will be required during any construction works.

Option 4 will close the crossing and the adjacent land will be purchased to remove any third-party access. There are no physical works required and as such there is no opportunity to reveal below ground remains at this location. While this option blocks the historic access, it is considered that this will have a negligible impact on the architectural heritage value of the site. As a result, this option has a significant comparative advantage over other options.

Geology and Soils

The comparative differences across the four options relate mainly to construction related activities and the expected interaction with the underlying geology and soils as opposed to the operational considerations where there are no discernible differences.

The main construction impact relates to the earthworks required for the proposed option and the potential generation of earthworks material requiring recovery or disposal on or off the site.

Option 3 requires the provision for a new access along the estuary side of the railway which may result in the potential loss of topsoil. The access to be provided from Corballis Cottages along the estuary side of the railway may require the excavation and replacement of soft ground associated with the estuary to accommodate access (specification and type of access to be confirmed which will influence the earthworks volume required). Moreover, additional earthworks and interaction with the underlying soils and geology and existing railway ballast will be associated with construction of a new retaining wall (extending for approximately 500m) and widening of an existing underbridge. There is also the potential for encountering ground contamination associated with the current railway use and the subsequent construction and operational impacts to be considered as a result of the proposed works and their proximity to a designated site.

For Option 4, it is proposed that the crossing is closed and there will be no/minor works associated.

For both Options 5 and 6 respectively, the construction of a new overbridge and underbridge will require major earthworks and foundations, thereby increasing the risk for ground contamination. An additional disadvantage of option 6 is the proximity of the new underbridge with the estuary.

As such, from a geology and soils perspective, Options 3, 5 and 6 respectively are deemed to have a significant comparative disadvantage over Option 4.

Agricultural and Non-Agricultural

There are no significant comparative differences for agriculture between any of the options.

Air quality and Climate

All options are comparable from an air quality perspective as they each have good separation from the nearest human sensitive receptors.

All options are comparable from a climate perspective as they all increase timetable resilience by removing the risk of delays due to farm traffic interference.

However, Option 4 is preferable as it provides opportunity for carbon sequestration due to the purchased lands for biodiversity.

5.5.6 Accessibility and Social Inclusion

All options are comparable as there is not impact or improvement to accessibility and social inclusion. It will be necessary to ensure the safety of vulnerable population subsets using the cycleway, for example children and children or adults with physical or intellectual disabilities. This protection could, in principle, be provided by each of the options.

5.5.7 Integration

Integration is assessed using the five sub-criteria described below.

Adaptability in the future

All options are comparable as there is no improvement in terms of future internal transport links

Transport integration

All options are comparable as there is no impact on integration with other existing transport modes.

Land use integration

In all options the proposal complies with regional and local policies to improve public transport services including DART services, encouraging modal shift and allowing for increased density of development in certain areas. The development is contained within the existing ‘envelope’ of the railway line. There is no impact on existing land uses.

Government policy integration

All international, national, regional and local policies encourage improvements in relation to the efficiency of public transport. All the proposed options will facilitate this.

Geographical integration

All international, national, regional and local policies encourage improvements in relation to the efficiency of public transport. All the proposed options will facilitate this.

5.5.8 Physical Activity

All options are comparable. It is assumed that the Broadmeadow Way would be safely accommodated and then there is no temporary or long-term impact foreseen on walking or cycling opportunities.

5.6 Construction Considerations

Constructability considerations for the shortlisted options are as follows:

5.6.1 Option 3

It is assumed the retaining wall would be sheet piles, driven from the track during weekend possessions. At the same time bridge works would be undertaken. It is currently unknown what mitigation works are required to safeguard estuary features but assumed to be minimal.

Construction access is viable from the rail track and along the new road track once it has been sufficiently progressed. There will be disruption to the new cycleway, including probably short-term closures.

This option would also require a sizable construction compound to be installed temporarily during the works

5.6.2 Option 4

Any works required to close the crossing are expected to be minor and undertaken with no disruption to trains. Works will be either offline or during non-disruptive possessions.

5.6.3 Option 5

This option has significant civil engineering works, with challenges for construction access. It is assumed all plant, materials and labour would be delivered along the rail track in possessions but arrangements for road vehicles across farmland appears to be viable too (there being some farm tracks visible in Google imagery). Several weekend track possessions are anticipated to be needed, depending upon design.

There will be disruption to the new cycleway, including probably short-term closures.

This option would also require a sizable construction compound to be installed temporarily during the works

5.6.4 Option 6

Option 6 is similar to Option 5 from a construction perspective, but with the added risk of needing to lift and relay tracks. Significant civil engineering works are required, with challenging construction access. It is assumed all plant, materials and labour would be delivered along the rail track in possessions but arrangements for road vehicles across farmland appears to be viable too (there being some farm tracks visible in Google imagery). Several weekend track possessions are anticipated to be needed, depending upon design.

There will be disruption to the new cycleway, including probably short-term closures.

This option would also require a sizable construction compound to be installed temporarily during the works.

6 Summary and conclusions

6.1 Non-preferred options

Option 3 is not preferred due to:

- The large number of negative environmental impacts this option would result in.
- the construction costs of the access road and retaining wall on the west of the causeway would be significant.

Option 5 is not preferred due to:

- The large number of negative environmental impacts this option would result in.
- the construction costs of the overbridge would be significant.

Option 6 is not preferred due to:

- The large number of negative environmental impacts this option would result in.
- the construction costs of the underbridge would be significant.
- The long-term maintenance and management of water would be a significant challenge

6.2 Draft Emerging Preferred Option

Option 4 has been chosen as the Draft Emerging Preferred Option as it:

- Incurs minimal to no CAPEX and OPEX costs
- It's significant advantages over the other options on the environmental impacts, such as water resources, air quality and climate change.

6.3 Key Risks/Next Steps

The following risks have been identified:

- The purchasing process and appropriate valuation of the land needs to be assessed.
- Any ongoing obligations of being the landowner of this parcel of land need to be assessed.

A.1 Detailed MCA table

| Comparison Criteria Legend | |
|---------------------------------------------------------|--|
| Significant comparative advantage over other options | |
| Some comparative advantage over other options | |
| Comparable to other options / neutral | |
| Some comparative disadvantage over other options | |
| Significant comparative disadvantage over other options | |

| Economy | | | | | | | | | | | |
|--------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|---------------|-------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| Package of Work Description | Summary of requirements | Option Number | Description of Option | Capital Expenditure (CAPEX): Construction, land acquisition, temporary works | | OPEX: Operational costs (IÉ or other entities), Technology advancements and future proofing / obsolescence | | Train Operations Functionality/Economic Benefit | | Traffic functionality and associated economic activities and opportunities | |
| | | | | Quantitative appraisal of potential infrastructure costs of proposed options | Rationale | Qualitative appraisal of potential ongoing infrastructure maintenance costs of proposed options | Rationale | Qualitative appraisal of potential ongoing operational costs of proposed options | Rationale | Quantitative appraisal of potential wider benefits of proposed options | Rationale |
| | | | | Estimate high level cost of construction of option Extent and type of 3rd party lands required permanently Extent and type of 3rd party lands required temporarily for temporary works during construction | | Cost to maintain the infrastructure over the whole life. Effects of infrastructure maintenance to services. Provision of ways of undertaking routine inspections and maintenance activities while minimising the effect on service to customers. | | Potential improvement or deterioration of the operational conditions of the line (reduction or increase of the risk of interruption of service) Increased DART service improving connectivity and economy (leading to increased competition in economy, increased output of firms, increased tax revenue). | | Potential benefit to vehicular traffic flows in the vicinity of the works during construction and associated economic activities and opportunities in the vicinity Consideration of duration of traffic disruption and length of diversions To minimise the impacts on traffic and transportation during the construction and operational stages | |
| Electrification of Northern Line: XB001 Level Crossing | Electrification of the line from the end of the current electrified section at Malahide to Drogheda with 1500V DC overhead. | 3 | Close the crossing and provide new access from Corballis cottages along estuary side of railway | [Significant comparative disadvantage] | This option will likely require the widening of the tidal overflow bridge and the inclusion of a substantial length of wall along the estuary side. This will involve substantial structural and geotechnical solutions. | [Significant comparative disadvantage] | Maintenance required for the access road and retaining wall | [Comparable to other options] | Option 3 involves fully segregating road and rail traffic, increasing timetable resilience by removing the risk of delays due to road traffic interference. | [Significant comparative disadvantage] | Assume construction activities associated with constructing a new access off Corballis cottages will require a retaining structure and bridge widening. |
| | | 4 | Close the crossing and IÉ purchase the adjacent land to remove any third party access | [Significant comparative advantage] | The only cost incurred for this option is the cost of purchasing the land. | [Significant comparative advantage] | Ongoing maintenance costs of the land purchased are expected to be low. Existing ditches will need to be maintained | [Comparable to other options] | Option 4 involves fully segregating road and rail traffic, increasing timetable resilience by removing the risk of delays due to road traffic interference. | [Significant comparative advantage] | No change or increase in construction traffic. Very small change in operational traffic for maintenance - operational traffic will probably reduce. |
| | | 5 | Construct new overbridge | [Significant comparative disadvantage] | New overbridge and approach embankments required to span both the railway and the proposed greenway crossing. Significant civil engineering works, with challenge for construction access. Assumed all plant, materials and labour would be delivered along track in possessions but arrangements across farmland/tracks appear viable too. Several weekend possessions anticipated, depending upon design. Cycleway disrupted. | [Some comparative advantage] | Limited maintenance costs for the bridge | [Comparable to other options] | Option 5 involves fully segregating road and rail traffic, increasing timetable resilience by removing the risk of delays due to road traffic interference. | [Significant comparative disadvantage] | Construction traffic for overbridge |
| | | 6 | Construct new underbridge | [Significant comparative disadvantage] | New underbridge and approach embankments required to span both the railway and the proposed greenway crossing. Similar to Option 5 but with added risk of needing to lift and relay track. There are significant civil engineering works, with challenge for construction access. Assumed all plant, materials and labour would be delivered along track in possessions but arrangements across farmland/ tracks appear viable too. Several weekend possessions anticipated, depending upon design. Cycleway disrupted. | [Significant comparative disadvantage] | Maintenance required, such as drainage, linked with the underbridge | [Comparable to other options] | Option 6 involves fully segregating road and rail traffic, increasing timetable resilience by removing the risk of delays due to road traffic interference. There is a possibility of road traffic impacting rail services through bridge strikes by oversized vehicles, which could decrease timetable resilience and negatively impact performance. However this risk is low and does not affect the scoring | [Significant comparative disadvantage] | Construction traffic for underbridge |

| | | | | Safety | | | |
|--------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|---------------|-------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Package of Work Description | Summary of requirements | Option Number | Description of Option | Employer's Safety | | Public safety | |
| | | | | Qualitative appraisal on the safety impacts on IÉ or railway staff | Rationale | Qualitative appraisal on the safety impacts on the public (road/rail/cycle/pedestrian) | Rationale |
| | | | | To reduce safety risks associated with construction, maintenance and operations. To reduce the potential for incidents or near-misses for IÉ/construction staff. | | To reduce safety risks associated with passengers at platforms, public adjacent to the railway, and road, pedestrian and cycle users at level crossings. To reduce the potential for accidents for members of the public/passengers on railway infrastructure. To reduce the potential for conflict between rail and road users. | |
| Electrification of Northern Line: XB001 Level Crossing | Electrification of the line from the end of the current electrified section at Malahide to Drogheda with 1500V DC overhead. | 3 | Close the crossing and provide new access from Corballis cottages along estuary side of railway | | No further need for IÉ staff on track apart from existing track/formation maintenance. | | Public access to track is eliminated however public can still access the land on the eastern side of the track. Therefore risk is not fully removed to the public, unlike option 4. |
| | | 4 | Close the crossing and IÉ purchase the adjacent land to remove any third party access | | No further need for IÉ staff on track apart from existing track/formation maintenance. | | Public access to track and the land on eastern side is eliminated. |
| | | 5 | Construct new overbridge | | Maintenance of new infrastructure will require additional manpower on site and on track. | | Risk of overpassing machinery to fall onto the tracks. |
| | | 6 | Construct new underbridge | | Maintenance of new infrastructure will require additional manpower on site and on track. | | Risk of bridge strike from farm machinery. |

| | | | | Environment | | | | | | | | | | | | | | | |
|--------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|---------------|-------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------|-----------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Package of Work Description | Summary of requirements | Option Number | Description of Option | Landscape and Visual Quality | | Biodiversity (Flora and Fauna) | | Noise and Vibration | | Water resources | | Archaeology, Architectural and Cultural Heritage | | Geology and Soils (includes Waste) | | Agricultural and non-agricultural | | Air Quality & Climate Change | |
| | | | | Appraisal of landscape and visual impacts of options based on the sensitive viewpoints | Rationale | Qualitative appraisal on the impact on biodiversity | Rationale | Qualitative appraisal of the potential noise and vibration impact | Rationale | Qualitative appraisal on the potential impacts to surface, ground or coastal waters | Rationale | Qualitative appraisal of the potential impacts of proposed options on potential sub surface archaeology and impact on foundations and above ground elements of architectural heritage | Rationale | Qualitative appraisal of the potential impacts of the proposed options on waste and material resources including the reuse of site won materials. | Rationale | Qualitative appraisal of impacts on valued resources either from a human or natural origin with value arising for economic or cultural reasons. These assets can be existing utilities or non-renewable resources | Rationale | Qualitative appraisal of air quality and climate impacts both on the operational and construction phases | Rationale |
| | | | | To avoid / minimise impact on designated amenities, landscapes, protected trees or views. To avoid / minimise visual impact on properties & amenities. To avoid / minimise removal of trees / hedgerows. To avoid / minimise impact from light pollution. To provide opportunities to enhance the local amenity and green infrastructure. | | To ensure that the solution provided minimises the effects on biodiversity of the area and/or provides opportunities to enhance it. | | To provide a solution which ensures minimum levels of noise and vibration | | To minimise the impact or provide opportunities to enhance the quality of surface waters and associated floodplains, ground waters and coastal waters. | | To minimise the impact on cultural heritage such as on below ground archaeological remains, historic buildings (individual and areas), and historic landscapes and parks. | | | | | | To provide a solution which comprises a reduction in greenhouse gas emissions. To ensure that the chosen solution preserves or enhances the local air quality | |
| Electrification of Northern Line: XB001 Level Crossing | Electrification of the line from the end of the current electrified section at Malahide to Drogheda with 1500V DC overhead. | 3 | Close the crossing and provide new access from Corballis cottages along estuary side of railway | | Works in context of objective to preserve views from Corballis Cottage Road. Moderate / Significant change in landscape / visual environment. | | Would require significant works (including a new retaining structure) within the designated sites. It would also introduce people into an area currently inaccessible which may cause disturbance to overwintering birds. Although ranked the same as Options 5 and 6 this option is the least preferred option from a biodiversity perspective. | | Construction noise would affect residents at Corballis cottages | | Will require construction works on the edge of estuary, in an environmentally sensitive area. Retaining structure is likely to be required along the length. The bridge over the River Pili will most likely need to be widened. These works have the potential to have an impact on the groundwater and surface water flow regimes as well as the water quality | | No archaeological monuments are located in proximity of the proposed works, however the area is of archaeological potential. Extensive works are required including earth moving and excavation to construct new access from Corballis cottages along the estuary side of the railway. This would require archaeological monitoring of the wetland / dryland interface potential. This potential is borne out by the finds of a flint blade and flint flakes in Kilcrea (1967:182-184). Monitoring (11E0060) of works took place at a residential development to the west of the railway immediately before the railway overbridge and east west road that extends to Corballis Cottages. No archaeological features or finds were identified. This option blocks the historic access, and creates a new access road which will also impact on Kilcrea Bridge (NIAH 11336027 - Regional Importance). NOTE: the significance of impact on Kilcrea Bridge is likely to be Low. | | Construction related activities will have the main impact on soils and geology with the potential loss of topsoil through provision of access route. Access to be provided from Corballis Cottages along estuary side of railway may require the excavation and replacement of soft ground associated with the estuary to accommodate access route (specification and type of access to be confirmed which will influence the earthworks volume required. Additional earthworks and interaction with the underlying soils and geology and existing railway ballast will be associated with construction of a new retaining wall (extending for approximately 500m) and widening of existing underbridge. There is also the potential for encountering ground contamination associated with the current railway use and the subsequent construction and operational impacts to be considered as a result of the proposed works and their proximity to a designated site. | | Improved independent access benefit balanced by increased land-take and permanent disturbance (additional travel time) | | Construction works adjacent to estuary and cottages has the potential to generate dust impacts. |
| | | 4 | Close the crossing and if purchase the adjacent land to remove any third party access | | Likely to result in change in visual character of land use for acquired /severed lands. | | Offers significant comparative advantages over other options and is the preferred option from a biodiversity perspective. This is because not only does it avoid introducing any new significant impacts, either direct or indirect, it also provides opportunity for a significant biodiversity benefit by managing the purchased lands for biodiversity. | | No noise/vibration impacts | | No change | | No archaeological monuments are located in proximity to the proposed works. No works are required and there is no opportunity to reveal below ground remains at this location due to excavation. Blocks the historic access, though it is considered that this will have a negligible impact on the architectural heritage value of the site | | Crossing closed & no/very minor works planned | | Improved access balanced by increased land-take | | No impact on air quality as no works likely to generate dust required. The purchase of land offers the opportunity for planting which can have a positive impact on climate through carbon sequestration depending on the species planted. |
| | | 5 | Construct new overbridge | | Visually intrusive new structure in sensitive landscape / visual environment. | | Would require works within the designated sites. Additional potential indirect impacts include construction related impacts (e.g. potential for water quality impacts or disturbance to birds). Although ranked the same as Option 6 this option may be less preferable than Option 6 from a biodiversity perspective due to the larger scale of works within the designated sites. | | Construction noise may affect receptors, but closest receptor is 500 m away | | Construction of an overbridge over the crossing parallel to River Pili and Malahide Estuary which are environmentally sensitive waterbodies. The construction of the ramps could have a negative impact on the waterbodies in terms of water pollution during construction and might cause changes to the groundwater and the surface water flow regimes as well as the water quality | | No archaeological monuments are located in proximity to the proposed works. Localised excavation and construction work required in proximity to NIAH 11226027 bridge. Archaeological monitoring will be required as works are being carried out in an area considered to be of potential as borne out by the finds of a flint blade and flint flakes in Kilcrea (1967:182-184). This option would be a significant intervention into the landscape. Relative to the other proposed options, it would have a negative visual impact on the historic character of the surrounding landscape including the setting of the Malahide Viaduct - a Protected Structure (FCC RPS 0420), and Kilcrea Bridge (NIAH 11336027 - Regional Importance) | | Major earthworks and foundations associated with overbridge. Potential ground contamination | | Improved access balanced by increased land-take | | Construction works adjacent to estuary has the potential to generate dust impacts. |
| | | 6 | Construct new underbridge | | Limited visibility of new structure in sensitive landscape / visual environment. | | Would require works within the designated sites. Additional potential indirect impacts include construction related impacts (e.g. potential for water quality impacts or disturbance to birds). Although ranked the same as Option 5 this option may be more preferable than Option 5 from a biodiversity perspective due to the lesser scale of works within the designated sites. | | Construction noise may affect receptors, but closest receptor is 500 m away | | The construction of the underpass will require considerably more excavation than the other options. This presents a greater impact to the groundwater flow regime and groundwater quality and their receiving surface waterbodies. | | No archaeological monuments are located in proximity to the proposed works. Localised excavation and construction work required in proximity to NIAH 11226027 bridge. Archaeological monitoring will be required as works are being carried out in an area considered to be of potential as borne out by the finds of a flint blade and flint flakes in Kilcrea (1967:182-184). This option would also be a significant intervention into the landscape. Relative to the Option 5, it would have less visual impact on the historic character of the surrounding landscape including the setting of the Malahide Viaduct - a Protected Structure (FCC RPS 0420), and Kilcrea Bridge (NIAH 11336027 - Regional Importance) | | Major earthworks and foundations associated with underbridge. Potential ground contamination. Proximity with estuary. | | Improved access for livestock balanced by increased land-take and restriction of machinery access. | | Construction works adjacent to estuary has the potential to generate dust impacts. |
