Scottish Government Windfarm Carbon Assessment Tool - Version 2.14.1

27/01/2023

This spreadsheet calculates payback time for windfarm sited on peatlands using methods given in Nayak et al, 2008 (http://www.scotland.gov.uk/Publications/2008/06/25114657/0) and revised equations for GHG emissions (Nayak, D.R., Miller, D., Nolan, A., Smith, P. and Smith, J.U., 2010, Calculating carbon budgets of wind farms on Scottish peatland. Mires and Peat 4: Art. 9. Online: (http://www.mires-and-peat.net/map04/map_04_09.htm)

Version 2.0.0 - Adapted to include detail of forestry management, Smith et al., 2011.
http://www.scotland.gov.uk/WindFarmsAndCarbon

Version 2.14.0 - Corrections to calcualtion of peat removed for hardstanding
plus corrections to emission factors and changes as detailed in previous worksheets
Revised by J.U.Smith to correct forestry and restoration sheets

Version 2.14.1 - Equivalent to version 2.14.0 but with worksheets unprotected for your own use. Do not use this version in planning applications.

INSTRUCTIONS

A There are 6 worksheets giving instructions, data entry and outputs, ...

- Instructions
- Do I need to use this tool? ....Click here to find out [Click here]
- Core input data .... Data needed in all calculations [Click here]
- Forestry input data .... Extra details sometimes needed for forestry calculations
- Construction input data .... Extra details sometimes needed for construction calculations
- Payback time and CO2 emissions [Click here]

...and 8 numbered worksheets showing calculations:

1. Windfarm CO_2 emission saving
2. CO_2 loss due to turbine life
3. CO_2 loss due to backup
4. Loss of CO_2 Fixing Pot.
5. Loss of soil CO_2
   - 5a. Volume of peat removed
   - 5b. CO_2 loss from removed peat
   - 5c. Volume of peat drained
   - 5d. CO_2 loss from drained peat
   - 5e. Emission rates
6. CO_2 loss by DOC & POC loss
7. i. Forestry CO_2 loss - simple
7. ii. Forestry CO_2 loss - detailed
   - 7a. C sequest. in trees (3PG)
   - 7b. C seq. in soil under trees
   - 7c. Average stand data
   - 7d. Windspeed ratios
8. CO_2 gain - site improvement

In addition, there are spreadsheets containing references and requesting feedback.

- References
- Frequently asked questions

Notes on calculations are given in pale green text boxes.... [Click here to see example of Notes Box]

Protocols for measurements are given in pale yellow comment boxes..... [Click here to see example of Protocol Box]

Assumptions are given in pale blue text boxes.... [Click here to see example of Assumptions Box]

Note on official version number

Version X.Y.Z

X refers to the release number
Y refers to released updates on release X
Z refers to unreleased updates on release X.Y

Officially released versions will always have Z=0

If you make changes of your own, please do not refer to your modified spreadsheet using the official version number.

The latest version is published at www.scotland.gov.uk/WindFarmsAndCarbon
Please check you are using the latest official version with Z=0 before

Do I need to use this tool?

1. Will the site be drained on construction of the windfarm? Yes

2. Is the soil at the site highly organic? Yes
i.e. is the soil organo-mineral or organic, (i.e. a peaty gley or peat)?

3. Does windfarm construction require a significant amount of deforestation? Yes
i.e. is removal in excess of keyholing the turbines within the forest boundary?

You should use this tool because the soil is highly organic.
Please move to the Core input data sheet and complete the form to obtain an estimate of C payback time

Existing track length (m)	3565		3565		3565	
Length of access track that is floating road (m)	1770		1770		1770	
Floating road width (m)	5		5		5	
Floating road depth (m)	0.00		0.00		0.00	
Length of floating road that is drained (m)	1770		1771		1770	
Average depth of drains associated with floating roads (m)	0.75		0.75		0.75	
Length of access track that is excavated road (m)	8390		8390		8390	
Excavated road width (m)	5		5		5	
Average depth of peat excavated for road (m)	0.00		0.00		0.00	
Length of access track that is rock filled road (m)	0		0		0	
Rock filled road width (m)	5		5		5	
Rock filled road depth (m)	0.8		0.5		1	
Length of rock filled road that is drained (m)	0		0		0	
Average depth of drains associated with rock filled roads (m)	0.75		0.75		0.75	
Cable Trenches						
Length of any cable trench on peat that does not follow access tracks and is lined with a permeable medium (eg. sand) (m)	8390		8390		8390	
Average depth of peat cut for cable trenches (m)	1.20		1.00		1.20	
Additional peat excavated (not already accounted for above)						
Volume of additional peat excavated (m^3)	0		0		0	
Area of additional peat excavated (m^2)	0.0		0.0		0.0	
Peat Landslide Hazard						
Weblink: Peat Landslide Hazard and Risk Assessments: Best Practice Guide for Proposed Electricity Generation Developments						
Improvement of C sequestration at site by blocking drains, restoration of habitat etc						
Improvement of degraded bog						
Area of degraded bog to be improved (ha)						
Water table depth in degraded bog before improvement (m)						
Water table depth in degraded bog after improvement (m)						
Time required for hydrology and habitat of bog to return to its previous state on improvement (years)						
Period of time when effectiveness of the improvement in degraded bog can be guaranteed (years)						
Improvement of felled plantation land						
Area of felled plantation to be improved (ha)						
Water table depth in felled area before improvement (m)						
Water table depth in felled area after improvement (m)						
Time required for hydrology and habitat of felled plantation to return to its previous state on improvement (years)						
Period of time when effectiveness of the improvement in felled plantation can be guaranteed (years)						
Restoration of peat removed from borrow pits						
Area of borrow pits to be restored (ha)						
Depth of water table in borrow pit before restoration with respect to the restored surface (m)						
Depth of water table in borrow pit after restoration with respect to the restored surface (m)						
Time required for hydrology and habitat of borrow pit to return to its previous state on restoration (years)						
Period of time when effectiveness of the restoration of peat removed from borrow pits can be guaranteed (years)						
Early removal of drainage from foundations and hardstanding						
Water table depth around foundations and hardstanding before restoration (m)						
Water table depth around foundations and hardstanding after restoration (m)						
Time to completion of backfilling, removal of any surface drains, and full restoration of the hydrology (years)						
Restoration of site after decomissioning						
Will the hydrology of the site be restored on decommissioning?	Yes		Yes		Yes	
Will you attempt to block any gullies that have formed due to the windfarm?	Yes		Yes		Yes	
Will you attempt to block all artificial ditches and facilitate rewetting?	Yes		Yes		Yes	
Will the habitat of the site be restored on decommissioning?	Yes		Yes		Yes	
Will you control grazing on degraded areas?	Yes		Yes		Yes	
Will you manage areas to favour reintroduction of species	Yes		Yes		Yes	

Choice of methodology for calculating emission factors	Site specific (required for planning applications)

Note: Capacity factor. The capacity factor of any power plant is the proportion of energy produced during a given period with respect to the energy that would have been produced had the wind farm been running continually and at maximum output (DECC (2004); see also www.bwea.com/ref/capacityfactors.html).
Capacity Factor = Electricity generated during the period [kWh]/ (Installed capacity [kW] x number of hours in the period [h])
We recommend that a site-specific capacity factor ~~site~~ should be used (as measured during planning stage), and should represent the average emission factor expected over the lifetime of the windfarm, accounting for decline in efficiency with age (Hughes, 2012). The 5 year average capacity factor (or "load factor") for UK onshore wind between 2010 and 2014, based on average beginning and end of year capacity, was 29.2% (DUKES, 2015).

Note: Extra capacity required for backup. If 20% of national electricity is generated by wind energy, the extra capacity required for backup is 5% of the rated capacity of the wind plant (Dale et al 2004). We suggest this should be 5% of the actual output. If it is assumed that less than 20% of national electricity is generated by wind energy, a lower percentage should be entered (0%). The House of Lords Economic Affairs Committee report on The Economics of Renewable Energy (Parliamentary Business, 2008) notes that to cover peak demand a '20% margin of extra capacity has been sufficient to keep the risk of a power cut due to insufficient generation at a very low level.' The estimate provided by BERR was a range of 10% to 20% of installed capacity of wind energy. E.ON is reported as proposing that the capacity credit of wind power should be 8%, and The Renewable Energy Foundation proposed the use of the square root of the wind capacity (in GW) as conventional capacity (e.g. 36 GW of wind plant to match 6 GW of conventional plant).

Note: Extra emissions due to reduced thermal efficiency of the reserve power generation ≈ 10%

Note: Emissions from turbine life. If total emissions for the windfarm are unknown, emissions should be calculated according to turbine capacity. The normal range of CO_2 emissions is 394 to 8147 t CO_2 MW (White & Kulcinski, 2000; White, 2007).

Note: Type of peatland An 'acid bog' is fed primarily by rainwater and often inhabited by sphagnum moss, thus making it acidic (Stoneman & Brooks,1997).
A 'fen' is a type of wetland fed by surface and/or groundwater (McBride et al., 2011).

Note: Time required for regeneration of previous habitat. Loss of fixation should be assumed to be over lifetime of windfarm only. This time could be longer if plants do not regenerate. The requirements for after-use planning include the provision of suitable refugia for peat-forming vegetation, the removal of structures, or an assessment of the impact of leaving them in situ. Methods used to reinstate the site will affect the likely time for regeneration of the previous habitat. This time could also be shorter if plants regenerate during lifetime of windfarm. If so, enter number of years estimated for regeneration.

Note: Carbon fixation by bog plants
Apparent C accumulation rate in peatland is 0.12 to 0.31 t C ha^{-1} yr^{-1} (Turunen et al., 2001; Botch et al., 1995). The SNH guidance uses a value of 0.25 t C ha^{-1} yr^{-1}.

Note: Area of forestry plantation to be felled. If the forestry was planned to be removed, with no further rotations planted, before the windfarm development, the area to be felled should be entered as zero.

Note: Plantation carbon sequestration. This is dependent on the yield class of the forestry. The SNH technical guidance assumed yield class of 16 m^3 ha^{-1} yr^{-1}, compared to the value of 14 m^3 ha^{-1} yr^{-1} provided by the Forestry Commission. Carbon sequestered for yield class 16 m^3 ha^{-1} y^{-1} = 3.6 tC ha^{-1} yr^{-1} (Cannell, 1999).

Note: Coal-Fired Plant and Grid Mix Emission Factors. Coal-fired plant emission factor (EF) from electricity supplied in 2014 = 0.093 t CO_2 $MWh^{-1.}$ Grid-Mix EF for 2014 = 0.394 t CO_2 $MWh^{-1.}$ Source = DUKES, 2015b.

Note: Fossil Fuel-Mix Emission Factor. The emission factor from electricity supplied in 2014 from all fossil fuels = 0.642 t CO_2 MWh^{-1}. Source = DUKES, 2015b.

Note: Total length of access track. If areas of access track overlap with hardstanding area, exclude these from the total length of access track to avoid double counting of land area lost.

Note: Floating road depth. Accounts for sinking of floating road. Should be entered as the average depth of the road expected over the lifetime of the windfarm. If no sinking is expected, enter as zero.

Note: Length of floating road that is drained. Refers to any drains running along the length of the

Note: Rock filled roads. Rock filled roads are assumed to be roads where no peat has been removed and rock has been placed on the surface and allowed to settle.

Note: Depth of peat cut for cable trenches. In shallow peats, the cable trenches may be cut below the peat. To avoid overestimating the depth of peat affected by the cable trenches, only enter the depth of the peat that is cut.

Note: Peat Landslide Hazard. It is assumed that measures have been taken to limit damage (Scottish Executive, 2006, Peat Landslide Hazard and Risk Assessments. Best Practice Guide for Proposed Electricity Generation Developments. Scottish Executive, Edinburgh. pp. 34-35) so that C losses due to peat landslide can be assumed to be negligible. Link: http://www.scotland.gov.uk/Publications/2006/12/21162303/1.

Note: Period of time when improvement can be guaranteed. This guarantee should be absolute. Therefore, if you enter a value beyond the lifetime of the windfarm you should provide strong supporting evidence that this improvement can be guaranteed for the full period given. This includes the time requirement for the improvement to become effective. For example if time required for hydrology and habitat to return to its previous state is 10 years and the restoration can be guaranteed over the lifetime of the windfarm (25 years), the period of time when the improvement can be guaranteed should be entered as 25 years, and the improvement will be effective for (25 -10) = 15 years.

Note: Period of time when improvement can be guaranteed. This guarantee should be absolute. Therefore, if you enter a value beyond the lifetime of the windfarm you should provide strong supporting evidence that this improvement can be guaranteed for the full period given. This includes the time requirement for the improvement to become effective. For example if time required for hydrology and habitat to return to its previous state is 10 years and the restoration can be guaranteed over the lifetime of the windfarm (25 years), the period of time when the improvement can be guaranteed should be entered as 25 years, and the improvement will be effective for (25 -10) = 15 years.

Note: Period of time when improvement can be guaranteed. This is assumed to be the lifetime of the windfarm as restoration after windfarm decommissioning is already accounted for in restoration of the site

Note: Restoration of site. If the water table at the site is returned to its original level or higher on decommissioning, and habitat at the site is restored, it is assumed that C losses continue only over the lifetime of the windfarm. Otherwise, C losses from drained peat are assumed to be 100%.

Note: Choice of methodology for calculating emission factors. The IPCC default methodology is the internationally accepted standard (IPCC, 1997). However, it is stated in IPCC (1997) that these are rough estimates, and "these rates and production periods can be used if countries do not have more appropriate estimates". Therefore, we have developed more site specific estimates for use here based on work from the Scottish Government funded ECOSSE project (Smith et al, 2007. ECOSSE: Estimating Carbon in Organic Soils - Sequestration and Emissions. Final Report. SEERAD Report. ISBN 978 0 7559 1498 2. 166pp.).

(Carbon : Biomass) ratio of felled forestry						
Replanting regime						
Years after felling when replanting occurs						
Age of seedlings on planting (yr)						
Area replanted around each turbine (ha)						

Note: Estimated downtime. Estimated downtime for maintenance etc. Few reports on downtime of wind turbines are publically available. However, one review by Garrad Hassan (2011) suggests that the minimum downtime reported was 2% for the annual moving average for between 8 to 9 years of operation of new turbines, for a sample of 240 turbines. For a summary of findings see Garrad Hassan (2011).

Note: Emissions from felling and timber removal. Based on emissions factors from UK taken from Morison et al (2011), if clearfelling assumed to be performed by harvester and timber is assumed extracted with forwarder, the emissions are 6675 g CO_2 m^{-3}

Note: Emissions associated with transportation. Assuming trasportation by trucks running on diesel and 20% of journey taken on forest roads, emissions factor obtained from Morison et al (2011) is 39.33 g CO_2 km^{-1} t^{-1} (range 38.5 – 40.15 g CO_2 km^{-1} t^{-1} - average = 39.33 g CO_2 km^{-1} t^{-1})

Note: Power curve. Based on Vestas 2.0MW Optispeed turbine with roughness class C2, modelled over wind speed of 5-10 m s^{-1}. To define a the power curve for a different turbine type, plot annual power output, *P* (MW) against annual windspeed, W (m s^{-1}) and fit a linear regression to obtain slope, *a*, and intercept, *b*:

$$P = aW + b$$

Note: Soil sub-group. Used in determination of forestry characteristic. Peaty gley = Peaty Soils (5-50cm) e.g. peaty gley, peaty podsol. Deep peat = Deep Peat (>50cm) e.g. basin and blanket bogs

Note: Species. So far only Scots pine and Sitka spruce included.

Note: Value of felled forestry. Values available in Mason et al., 2009.

Note: Carbon : Biomass ratio of felled forestry. Wood biomass can be converted to dry weight using wood density based values from Lavers (1983) with a subsequent assumption that C:dry matter ratio is 50% (Matthews 1993). For simplicity an integrated factor, the 'wood density to biomass factor' taken from Mason et al (2009) can be used.

Assumption: Backup assumed to be by fossil-fuel-mix of electricity generation. Note that hydroelectricity may also be used for backup, so this assumption may make the value for backup generation too high. These assumptions should be revisited as technology develops.

Note: Wind generated electricity is inherently variable, providing unique challenges to the electricity generating industry for provision of a supply to meet consumer demand (Netz, 2004). Backup power is required to accompany wind generation to stabilise the supply to the consumer. This backup power will usually be obtained from a fossil fuel source. At a high level of wind power penetration in the overall generating mix, and with current grid management techniques, the capacity for fossil fuel backup may become strained because it is being used to balance the fluctuating consumer demand with a variable and highly unpredictable output from wind turbines (White, 2007). The Carbon Trust (Carbon Trust/DTI, 2004) concluded that increasing levels of intermittent generation do not present major technical issues at the percentages of renewables expected by 2010 and 2020, but the UK renewables target at the time of that report was only 20%. When national reliance on wind power is low (less than ~20%), the additional fossil fuel generated power requirement can be considered to be insignificant and may be obtained from within the spare generating capacity of other power sectors (Dale et al, 2004). However, as the national supply from wind power increases above 20%, without improvements in grid management techniques, emissions due to backup power generation may become more significant. The extra capacity needed for backup power generation is currently estimated to be 5% of the rated capacity of the wind plant if wind power contributes more than 20% to the national grid (Dale et al 2004). Moving towards the SG target of 50% electricity generation from renewable sources, more short-term capacity may be required in terms of pumped-storage hydro-generated power, or a better mix of offshore and onshore wind generating capacity. Grid management techniques are anticipated to reduce this extra capacity, with improved demand side management, smart meters, grid reinforcement and other developments. However, given current grid management techniques, it is suggested that 5% extra capacity should be assumed for backup power generation if wind power contributes more than 20% to the national grid. At lower contributions, the extra capacity required for backup should be assumed to be zero. These assumptions should be revisited as technology improves.

Emissions due to backup power generation

Note: CO_2 loss due to back up is calculated from the extra capacity required for backup of the windfarm given in the input data.

Emissions due to loss of bog plants

Note: Annual C fixation by the site is calculated by multiplying area of the windfarm by the annual C accumulation due to bog plant fixation

	Expected	Minimum	Maximum
Area where carbon accumulation by bog plants is lost			
Total area of land lost due to windfarm construction (m^2)	158091	158091	158091
Total area affected by drainage due to windfarm construction (m^{-2})	8850	8855	8850
Total area where fixation by plants is lost (m^2)	166941	166946	166941

Assumptions:
1. Bog plants are 100% lost from the area where peat is removed for construction.
2. Bog plants are 100% lost from the area where peat is drained.
3. The recovery of carbon accumulation by plants on restoration of land is as given in inputs.

Total loss of carbon accumulation			
Carbon accumulation in undrained peats (tC ha^{-1} yr^{-1})	0.25	0.25	0.25
Lifetime of windfarm (years)	30	30	30
Time required for regeneration of bog plants after restoration (years)	2	2	2

Volume of Peat Removed

Note: % site lost by peat removal is estimated from peat removed in borrow pits, turbine foundations, hard-standing and access tracks.
If peat is removed for any other reason, this must be added in to the volume of peat removed, area of land lost and % site lost at the bottom of this worksheet.

CO_2 loss from removed peats

Note: If peat is treated in such a way that it is permanently restored, so that less than 100% of the C is lost to the atmosphere, a lower percentage can be entered in cell C10

	Expected	Minimum	Maximum
CO_2 loss from removed peat			
C Content of dry peat (% by weight)	62	49	62
Dry soil bulk density (g cm^{-3})	0.25	0.20	0.45
% C contained in removed peat that is lost as CO_2	100	100	100
Check Total volume of peat removed (m^3) due to windfarm construction	135186	135186	135186
CO_2 loss from removed peat (t CO_2)	76838	48581	138308

Assumption: If peat is not restored, 100% of the carbon contained in the removed peat is lost as CO_2

CO_2 loss from undrained peat left in situ			
Total area of land lost due to windfarm construction (ha)	16	16	16
CO_2 loss from undrained peat left in situ (t CO_2 ha^{-1})	751	749	754
CO_2 loss from undrained peat left in situ (t CO_2)	11875	11837	11912

CO_2 loss attributable to peat removal only			
CO_2 loss from removed peat (t CO_2)	76838	48581	138308

Volume of peat drained

Note: Extent of site affected by drainage is calculated assuming an average extent of drainage around each drainage feature as given in the input data.

CO_2 loss due to drainage

Note: Note, CO_2 losses are calculated using two approaches: IPCC default methodology and more site specific equations derived for this project. The IPCC methodology is included because it is the established approach, although it contains no site detail. The new equations have been derived directly from experimental data for acid bogs and fens (see Nayak et al, 2008 - Final report).

Will the hydrology of the site be restored on decommissioning?	Yes	Yes	Yes
Will the habitat of the site be restored on decommissioning?	Yes	Yes	Yes

Calculations of C Loss from Drained Land if Site is NOT Restored after Decommissioning

	Expected	Minimum	Maximum
Check Total volume affected by drainage due to wind farm (m^3)	3319	3321	3319
C Content of dry peat (% by weight)	62	49	62
Dry soil bulk density (g cm^{-3})	0.25	0.20	0.45
Total GHG emissions from Drained Land (t CO_2 equiv.)	1886	1193	3395
Total GHG Emissions from Undrained Land (t CO_2 equiv.)	1886	1193	3395

Assumption: Losses of GHG from drained and undrained land have the same proportion throughout the emission period.

Calculations of C loss from Drained Land if Site IS Restored after Decommissioning

1. Losses if Land is Drained

	Expected	Minimum	Maximum
Flooded period (days $year^{-1}$)	0	0	0
Lifetime of windfarm (years)	30	30	30
Time required for regeneration of bog plants after restoration (years)	2	2	2
Methane Emissions from Drained Land			
Check Rate of methane emission in drained soil ((t CH_4-C) ha^{-1} yr^{-1})	-0.004	-0.005	-0.003
Conversion factor: CH_4-C to CO_2 equivalents	30.67	30.67	30.67
CH_4 emissions from drained land (t CO_2 equiv.)	-4	-4	-3
Carbon Dioxide Emissions from Drained Land			
Check Rate of carbon dioxide emission in drained soil (t CO_2 ha^{-1} yr^{-1})	23.60	23.55	23.65
CO_2 emissions from drained land (t CO_2)	668	667	670
Total GHG emissions from Drained Land (t CO_2 equiv.)	665	663	667

Assumption: The drained soil is not flooded at any time of the year.

Note:Conversion = (23 x 16/12) = 30.67 CO_2 equiv. $(CH_4\text{-}C)^{-1}$

2. Losses if Land is Undrained

	Expected	Minimum	Maximum
Flooded period (days $year^{-1}$)	178	178	178
Lifetime of windfarm (years)	30	30	30
Time required for regeneration of bog plants after restoration (years)	2	2	2
Methane Emissions from Undrained Land			
Check Rate of methane emission in undrained soil ((t CH_4-C) ha^{-1} yr^{-1})	0.00	0.00	0.00
Conversion factor: CH_4-C to CO_2 equivalents	30.67	30.67	30.67
CH_4 emissions from undrained land (t CO_2 equiv.)	-4	-4	-3
Carbon Dioxide Emissions from Undrained Land			
Check Rate of carbon dioxide emission in undrained soil (t CO_2 ha^{-1} yr^{-1})	23.60	23.55	23.65
CO_2 emissions from undrained land (t CO_2)	668	667	670
Total GHG Emissions from Undrained Land (t CO_2 equiv.)	665	663	667

Note:Conversion = (23 x 16/12) = 30.67 CO_2 equiv. $(CH_4\text{-}C)^{-1}$

3. CO_2 Losses due to Drainage

	Expected	Minimum	Maximum
Total GHG emissions from drained land (t CO_2 equiv.)	665	663	667
Total GHG emissions from undrained land (t CO_2 equiv.)	665	663	667
RESULTS			
Total GHG emissions due to drainage (t CO_2 equiv.)	**0**	**0**	**0**

Rate of methane emission in undrained soil ((t CH_4-C) ha^{-1} yr^{-1})	0.00	0.00	0.00

Assumption: The period of flooding is taken to be 178 days yr^{-1} for acid bogs and 169 days yr^{-1} based on the monthly mean temperature and the lengths of inundation (IPCC, 1997, Revised 1996 IPCC guidelines for national greenhouse gas inventories, Vol 3, table 5-13)

Assumption: The CH_4 emission rate provided for acid bogs is 11 (1-38) mg CH_4-C m^{-2} day^{-1} x 365 days; and for fens is 60 (21-162) mg CH_4-C m^{-2} day^{-1} x 365 days. (Aselmann & Crutzen ,1989. J.Atm.Chem. 8, 307-358)

Assumption: CO_2 emissions on drainage of organic soils for upland crops (e.g., grain, vegetables) are 3.667x9.6 (7.9-11.3) t CO_2 ha^{-1} yr^{-1} in temperate climates (Armentano and Menges, 1986, J. Ecol. 74, 755-774).

Note: Carbon dioxide emissions from acid bogs. Equation derived by regression analysis against 60 measurements (Nayak et al, 2009). The equation derived was
$R_{CO2} = (3.667/1000) \times ((6700 \times \exp(-0.26 \times \exp(-0.0515 \times ((Wx100)-50)))) + ((72.54 \times T) - 800))$
where R_{CO2} is the annual rate of CO_2 emissions (t CO_2 (ha)$^{-1}$ yr^{-1}),
T = average annual peat temperature (°C) and
W is the water table depth (m).
The equation shows a significant correlation with measurements (r^2 =0.53 P > 0.05).
Evaluation against 29 independent experiments shows a significant association (r^2 = 0.21; P=0.05) and an average error of 30231 CO_2 ha^{-1} yr^{-1} which is non-significant (P=0.05) (Smith et al, 1997).

measurements (Nayak et al, 2009). The equation derived was
$R_{CH4} = (1/1000) \times (500 \times \exp(-0.1234 \times (Wx100)) + ((3.529 \times T) - 36.67))$
where R_{CH4} is the annual rate of CH_4 emissions (t CH_4-C (ha)$^{-1}$ yr^{-1}),
T = average annual air temperature (°C) and
W is the water table depth (m).
The equation shows a significant correlation with measurements (r^2 = 0.54 ,P > 0.05).
Evaluation against 7 independent experiments shows a significant association (r^2 = 0.81, P=0.05) and an average error of 271 CH_4-C ha^{-1} yr^{-1} (significance not defined due to lack of replicates - Smith et al, 1997).

Note: Carbon dioxide emissions from fens. Equation derived by regression analysis against 44 measurements (Nayak et al, 2009). The equation derived was
$R_{CO2} = (3.667/1000) \times (16244 \times \exp(-0.175 \times \exp(-0.073 \times ((Wx100)-50)))) + (153.23 \times T))$
where R_{CO2} is the annual rate of CO_2 emissions (t CO_2 (ha)$^{-1}$ yr^{-1}),
T = average annual peat temperature (°C) and
W is the water table depth (m).
The equation shows a significant correlation with measurements (r^2 = 0.42 ,P > 0.05).
Evaluation against 18 independent experiments shows a significant association (r^2 = 0.66; P=0.05) and an average error of 21081 CO_2 ha^{-1} yr^{-1} (significance not defined due to lack of replicates-Smith et al, 1997).

Note: Methane emissions from fens. Equation derived by regression analysis against experimental data from 36 measurements (Nayak et al, 2009). The equation derived was
$R_{CH4} = (1/1000) \times (-10+563.62 \times \exp(-0.097 \times (Wx100)+0.552 \times T))$
where R_{CH4} is the annual rate of CH_4 emissions (t CH_4-C (ha)$^{-1}$ yr^{-1}),
T = average annual air temperature (°C) and
W is the water table depth (m).
The equation shows a significant correlation with measurements (r^2 = 0.41, P=0.05).
Evaluation against 7 independent experiments shows a significant association (r^2 = 0.89, P=0.05) and an average error of 1541 CH_4-C ha^{-1} yr^{-1} (significance not defined due to lack of replicate-Smith et al, 1997).

Emission rates from soils

Note: Note, CO_2 losses are calculated using two approaches: IPCC default methodology and more site specific equations derived for this project. The IPCC methodology is included because it is the established approach, although it contains no site detail. The new equations have been thoroughly tested against experimental data (see Nayak et al, 2008 - Final report).

Emissions due to loss of DOC and POC

Note: Note, CO_2 losses from DOC and POC are calculated using a simple approach derived from generic estimates of the percentage of the total CO2 loss that is due to DOC or POC leaching

No POC losses for bare soil included yet. If extensive areas of bare soil is present at site need modified calculation (Birnie et al, 1991)

	Expected	Minimum	Maximum
Total C loss			
Gross CO_2 loss from restored drained land (t CO_2)	0	0	0
Gross CH_4 loss from restored drained land (t CO_2 equiv.)	0	0	0
Gross CO_2 loss from improved land (t CO_2)			
Degraded Bog	0	0	0
Felled Forestry	0	0	0
Borrow Pits	0	0	0
Foundations & Hardstanding	0	0	0
Gross CH_4 loss from improved land (t CO_2 equiv.)			
Degraded Bog	0	0	0
Felled Forestry	0	0	0
Borrow Pits	0	0	0
Foundations & Hardstanding	0	0	0
Conversion factor: CH_4-C to CO_2 equivalents	30.6667	30.6667	30.6667
% total soil C losses, lost as DOC	26	7	40
% DOC loss emitted as CO_2 over the long term	100	100	100
% total soil C losses, lost as POC	8	4	10
% POC loss emitted as CO_2 over the long term	100	100	100
Total gaseous loss of C (t C)	0	0	0
Total C loss as DOC (t C)	0	0	0
Total C loss as POC (t C)	0	0	0

Note: Only restored drained land included because if land is not

Assumption: DOC loss ranges between 7 - 40% of the total gaseous loss if calculated from the reported (minimum and maximum) values in Worrall 2009 and is **26%** of the total gaseous loss if calculated from the mean of reported maximum and minimum value in Worrall 2009. These DOC values are flux based on soil water concentration (i.e. 12.5 - 85.9 $MgC/KM^2/yr$) and not on flux at catchment outlet (i.e. 10.3 - 21.8 $MgC/KM^2/yr$)

Worrall, F. et al., 2009. The multi-annual carbon budget of a peat-covered catchment. *Science of The*

Assumption: In the long term, 100% of leached DOC is assumed to be lost as CO_2

Assumption: POC loss ranges between 4-10% of the total gaseous loss if calculated from the reported values and is **8%** of the total gaseous loss if calculated from the mean of reported maximum and minimum value in Worrall 2009. POC range is (7 - 22.4 $MgC/KM^2/yr$) (Worrall et al, 2009).

Assumption: In the long term, 100% of leached POC is assumed to be lost as CO_2

RESULTS	
Total CO_2 loss due to DOC leaching (t CO_2)	**0**
Total CO_2 loss due to POC leaching (t CO_2)	**0**
Total CO_2 loss due to DOC & POC leaching (t CO_2)	**0**
Additional CO_2 payback time of windfarm due to DOC & POC	
…coal-fired electricity generation (months)	0
…grid-mix of electricity generation (months)	0
…fossil fuel - mix of electricity generation (months)	0

Emissions due to loss of DOC and POC

Note: Note, CO_2 losses from DOC and POC are calculated using a simple approach derived from generic estimates of the percentage of the total CO2 loss that is due to DOC or POC leaching

No POC losses for bare soil included yet. If extensive areas of bare soil is present at site need modified calculation (Birnie et al, 1991)

Emissions due to forest felling - calculation using simple management data

Note: Emissions due to forestry felling are calculated from the reduced carbon sequestered per crop rotation. If the forestry was due to be removed before the planned development, this C loss is not attributable to the wind farm and so the area of forestry to be felled should be entered as zero.

	Expected	Minimum	Maximum
Emissions due to forestry felling			
Area of forestry plantation to be felled (ha)	0.54	0.54	0.54
Carbon sequestered (tC ha^{-1} yr^{-1})	3.6	3.6	3.6
Lifetime of windfarm (years)	30	30	30
Carbon sequestered over the lifetime of the windfarm (t C ha^{-1})	108	108	108
RESULTS			
Total carbon loss due to felling of forestry (t CO_2)	**214**	**214**	**214**
Additional CO_2 payback time of windfarm due to management of forestry			
…coal-fired electricity generation (months)	0	0	0
…grid-mix of electricity generation (months)	0	0	0
…fossil fuel - mix of electricity generation (months)	0	0	0

CO_2 loss from forests - calculation using detailed management information

Forest carbon calculator (Perks et al, 2009)

Carbon sequestration in trees

Simplified version of the 3PG model (Xenakis et al, 2008). This version, doesn't require climate data as no explicit environmental modifier is calculated. Instead, it uses a factor (from 0 to 1) representing the total effect of environment on growth. The simplified model requires a value of annual incoming solar radiation, a modifier for the age-related decline in productivity, a light-extinction coefficient and specific leaf area.

The model calculates gross primary productivity (GPP) and then net primary production (NPP) through a standard ratio. It allocates NPP to roots, wood and foliage. A soil model calculates the size of old and young carbon pools, respiration losses from these pools and from this net ecosystem productivity (NEP).

The model does not need temp/rain/sr/sd data: the impact of the environment at the site is included by adjusting the environmental modifier, based on site yield class and temperature. Light use efficiency (LUE), rather than quantum use efficiency (QYA) is used, making it easier to develop the model for many species even for a grouping such as "conifers" or "deciduous".

Carbon sequestration in trees

Simplified version of the 3PG model (Xenakis et al, 2008). This version, doesn't require climate data as no explicit environmental modifier is calculated. Instead, it uses a factor (from 0 to 1) representing the total effect of environment on growth. The simplified model requires a value of annual incoming solar radiation, a modifier for the age-related decline in productivity, a light extinction coefficient and specific leaf area.

The model calculates gross primary productivity (GPP) and then net primary production (NPP) through a standard ratio. It allocates NPP to roots, wood and foliage. A soil model calculates the size of old and young carbon pools, respiration losses from these pools and from this net ecosystem productivity (NEP).

The model does not need temp/rain/solrad data: the impact of the environment at the site is included by adjusting the environmental modifier, based on site yield class and temperature. Light use efficiency (LUE), rather than quantum use efficiency (QYE) is used, making it easier to develop the model for many species even for a grouping such as "conifers" or "deciduous".
Calibration for Sitka Spruce gives QYE = 0.08 (mol/mol) => LUE = 2.21 (kC/MJ), and for SP QYE = 0.05 (mol/mol) => LUE = 1.37 (kC/MJ).

Carbon sequestration in soil under trees

Note. More data needed. This should be the respiration from newly felled and disturbed soil, so as to include respiration from fresh plant inputs, from background soil organic matter decomposition, and from the disturbance of soil resulting in the release of additional C from soil aggregates. Different types of management disturbance should be considered. This information is not yet available, but will become available following experiments to be done by Mike Perks during 2009-2012. As an interim measure, C sequestration in soil under trees is used, so including background respiration from soil organic matter decomposition and respiration from fresh plant input.

Carbon Sequestration in Soil Under Trees: Lookup Table

Peaty Gley (t C ha^{-1} yr^{-1})	Deep Peat (t C ha^{-1} yr^{-1})
3.98	5.00

Average stand data

Data obtained from Forestry Commission growth and yield tables (Edwards & Christie, 1981)

STAND_ID **ForestGALES**
SPECIES **Sitka Spruce**

Note: Methane emissions from acid bogs. Equation derived by regression analysis against 57 measurements (Nayak et al., 2009). The equation derived was:
$R_{CH4} = ((10000) \times (500 \times \exp(-0.1234 \times (Wx100)) + ((3.529 \times T) - 36.67))$
where R_{CH4} is the annual rate of CH_4 emissions (t CH_4-C ha^{-1} yr^{-1}),
T = average annual air temperature (°C) and
W is the water table depth (m).
The equation shows a significant correlation with measurements (r^2 = 0.54, P > 0.05).
Evaluation against 7 independent experiments shows a significant association (r^2 - 0.81, P<0.05) and an average error of 27 t CH_4-C ha^{-1} yr^{-1} (significance not defined due to lack of replicates - Smith et al, 1997).

Note: Methane emissions from fens. Equation derived by regression analysis against experimental data from 30 measurements (Nayak et al, 2009). The equation derived was:
$R_{CH4} = ((10000) \times (-5H-563.62 \times \exp(-0.087 \times (W \times 100)) + 0.662 \times T))$
where R_{CH4} is the annual rate of CH_4 emissions (t CH_4-C ha^{-1} yr^{-1}),
T = average annual air temperature (°C) and
W is the water table depth (m).
The equation shows a significant correlation with measurements (r^2 = 0.41, P <0.05).
Evaluation against 7 independent experiments shows a significant association (r^2= 0.69, P<0.05) and an average error of 164 t CH_4-C ha^{-1} yr^{-1} (significance not defined due to lack of replicate-Smith et al, 1997)

$R_{CO2} = [(-667)/1000) \times ((6700 \times \exp(-0.26 \times \exp(-0.0515 \times ((Wx100)-50))) + ((72.54 \times T) - 800))]$
where R_{CO2} is the annual rate of CO_2 emissions (t CO_2 $(ha)^{-1}$ yr^{-1}).
T = average annual peat temperature (°C) and
W is the water table depth (m).
The equation shows a significant correlation with measurements (r^2 =0.53 P > 0.05).
Evaluation against 29 independent experiments shows a significant association (r^2 0.11; P<0.05) and an average error of 3023 t CO_2 ha^{-1} yr^{-1} which is non-significant (P<0.05) (Smith et al, 1997).

Note: Carbon dioxide emissions from fens. Equation derived by regression analysis against 44 measurements (Nayak et al, 2009). The equation derived was:
$R_{CO2} = [(-667)/1000) \times ((16344 \times \exp(-0.175 \times \exp(-0.073 \times ((Wx100)-50))) + ((153.23 \times T))]$
where R_{CO2} is the annual rate of CO_2 emissions (t CO_2 $(ha)^{-1}$ yr^{-1}),
T = average annual peat temperature (°C) and
W is the water table depth (m).
The equation shows a significant correlation with measurements (r^2 = 0.42, P > 0.05).
Evaluation against 18 independent experiments shows a significant association (r^2= 0.54; P<0.05) and an average error of 2108 t CO_2 ha^{-1} yr^{-1} (significance not defined due to lack of replicates-Smith et al, 1997)

Note: Methane emissions from acid bogs. As above
Note: Methane emissions from fens. As above

Frequently Asked Questions

Click here to email question

GENERAL

Syin Yi Phoon (Senior Hydrologist, EnviroCentre Ltd)

Comment: I could see the benefit of protected feature on the all the sheets, but it this means we cannot even copy the equations for testing sensitivity of a parameter without changing the entire sheet. The protection should be removed as it reduces the usefulness of the tool.

Response: Protection of sheets removed

Syin Yi Phoon (Senior Hydrologist, EnviroCentre Ltd)

Comment: We miss the carbon payback table that used to be at the bottom of every carbon gain/loss component. Our clients like to see how quickly they can payback C emitted due to individual components. This is useful in planning and should be replaced.

Response: This feature has been replaced

CORE INPUT DATA

Cameron McIver (Cameron Ecology Ltd)

Question: The note on "extra capacity required for backup (%)" suggests there is a choice of % capacity or % output – I'm not clear how you know which you have chosen.

Response: The note is misleading. The number that should be entered is the percentage of the actual output of the windfarm (MWh yr^{-1}) that is required for backup. Text has been added to the note to clarify this.

Stephen Lockett (AECOM)

Question:

Average extent of drainage around drainage features at site (m)
We have reviewed the guidance but are still unsure of what this variable means. We have used a standard input of 100m but the sheet appears to be extremely sensitive to this variable and we have limited confidence on the value chosen. The note in the cell refers to obtaining data on the ground water level but I am unsure how this relates to extent of drainage around drainage features.

Response: Average extent of drainage around each drainage feature can be measured following the method by Stewart and Lance (1991). In order to determine the extent of drainage, the undrained water table depth, and the 95% confidence interval of the measurements are needed.
Possible approach:
1. Install a series of dipwells or boreholes both upslope and downslope from the drainage feature.
2. In the first instance, assume that all dipwells are from undrained areas of the site. This incorrect assumption is used to initialise the iterative process that calculated the water table depth of the undrained soil.
3. For a particular sampling occasion, calculate the mean water table depth and 95% confidence interval from all the available data.
4. Assume all dipwells with water table depths deeper than the calculated mean water table depth plus the 95% confidence interval are within the area that is drained by a ditch and so exclude these from the calculation.
5. Calculate a new mean water table depth and 95% confidence interval using only data from undrained area.
6. Repeat the process until the calculation of the mean water table depth and 95% confidence interval has stabilised, and no further data points need to be excluded. This gives the water table depth of the undrained soil.
7. The distance from the drain to the first dipwell where the water table depth of the undrained soil occurred (to within the 95% confidence interval) can then be assumed to be the total extent of the drainage impact.

Question: Our drainage strategy is to mimic the existing drainage patterns as closely as possible by intercepting surface run-off and discharging at regular intervals downstream of the tracks back onto natural ground. As such, is there an argument this value could be effectively zero?

Response: No – removing water increases the drainage of the site, and this needs to be accounted for. However, if you are following existing drainage patters, it will be easier to determine the extent of drainage because the drains are already established.

Question: For our example site there is a significant difference in pay back when using site specific and IPCC default values (ranging from 3 to 15 years). Would you be able to provide a brief description of what is being ignored when selecting IPCC default?

Response: The IPCC default takes no account of the previous condition of the site. It provides the result for a typical acid bog or fen across Europe.
Therefore, if you are working with an unusually pristine peat or a badly drained peat, you would expect the result to be very different to the average.

Tanya Ogilvy (SEPA)

Question:

Response:

5c. Volume of peat drained

Stephen Lockett (AECOM)

Question: Our new drainage will be surface swales above the ground water table so should not have any effect on the ground water table.

Response: If the surface swales will just convey storm water that would not otherwise have percolated into the soil, these swales will have no impact on the water table of the soil profile, but will only impact the water that would have runoff the surface, causing erosion. However, if the swales also reduce the amount of water entering the soil profile, then they could have an impact on the wetness of the soil. This should really be accounted for in the calculation. However, there is nothing to describe this in the carbon calculator, so you would be justified in neglecting this effect but need to indicate this in the notes.

5e. Emission rates from soils

Stephen Lockett (AECOM)

Question: Rate of carbon dioxide emission
We would expect the rate of emission in undrained soil to be worse than the rate in drained soil. This is only the case when the ground water level is very shallow. Does the output define 'drained soil' as soil which is being drained by our engineering activities and 'undrained soil' as excavated soil which was dry to start with?

Response: I think the confusion comes about due to the definition of terms.
The "drained soil" refers to the soil after it has been drained for the windfarm development. The "undrained soil" refers to the soil before it was drained for the development. This doesn't refer to the status of the site before the development. Agreed, where a "drained site" refers to a site that has already been drained for a number of years, much of the labile carbon would already have been lost, and so losses due to the windfarm construction would be much less than the losses from an "undrained site" where the peat was still in pristine condition.
Worksheet 5e calculates the rate of emissions of CO2 and CH4 for the soil
1. when drained (ie dry soil);
2. when undrained (ie wet soil).
In a drained (dry) soil, we expect high rates of CO2 emissions and low rates of CH4 emissions.
In an undrained (wet) soil, we expect high rates of CH4 emissions and low rates of CO2 emissions.
These rates are then used in sheet 5d to calculate the net GHG emissions (in CO2 equivalents) attributable to the windfarm development. This is taken as the difference between the losses following drainage for the development and the losses that were occurring before the soil was drained for the development. Because the net emissions are usually higher in the drained (dry) soil than in the undrained (wet) soil, the net emissions due to draining the site usually come out as positive. If we were to compare a "drained site" and an "undrained site" in sheet 5d, the net CO2 emissions calculated for the drained site would be much less than for the undrained site because a smaller volume of soil is being further drained by the development.

Scottish Government Windfarm Carbon Assessment Tool - Version 2.14.1

27/01/2023

This spreadsheet calculates payback time for windfarm sited on peatlands using methods given in Nayak et al, 2008 (http://www.scotland.gov.uk/Publications/2008/06/25114657/0) and revised equations for GHG emissions (Nayak, D.R., Miller, D., Nolan, A., Smith, P. and Smith, J.U., 2010, Calculating carbon budgets of wind farms on Scottish peatland. Mires and Peat 4: Art. 9. Online: (http://www.mires-and-peat.net/map04/map_04_09.htm)

Version 2.0.0 - Adapted to include detail of forestry management, Smith et al., 2011.
http://www.scotland.gov.uk/WindFarmsAndCarbon

Version 2.14.0 - Corrections to calcualtion of peat removed for hardstanding
plus corrections to emission factors and changes as detailed in previous worksheets
Revised by J.U.Smith to correct forestry and restoration sheets

Version 2.14.1 - Equivalent to version 2.14.0 but with worksheets unprotected for your own use. Do not use this version in planning applications.

INSTRUCTIONS

A There are 6 worksheets giving instructions, data entry and outputs, ...

- Instructions
- Do I need to use this tool? ....Click here to find out [Click here]
- Core input data .... Data needed in all calculations [Click here]
- Forestry input data .... Extra details sometimes needed for forestry calculations
- Construction input data .... Extra details sometimes needed for construction calculations
- Payback time and CO2 emissions [Click here]

...and 8 numbered worksheets showing calculations:

1. Windfarm CO_2 emission saving
2. CO_2 loss due to turbine life
3. CO_2 loss due to backup
4. Loss of CO_2 Fixing Pot.
5. Loss of soil CO_2
   - 5a. Volume of peat removed
   - 5b. CO_2 loss from removed peat
   - 5c. Volume of peat drained
   - 5d. CO_2 loss from drained peat
   - 5e. Emission rates
6. CO_2 loss by DOC & POC loss
7. i. Forestry CO_2 loss - simple
7. ii. Forestry CO_2 loss - detailed
   - 7a. C sequest. in trees (3PG)
   - 7b. C seq. in soil under trees
   - 7c. Average stand data
   - 7d. Windspeed ratios
8. CO_2 gain - site improvement

In addition, there are spreadsheets containing references and requesting feedback.

- References
- Frequently asked questions

Notes on calculations are given in pale green text boxes.... [Click here to see example of Notes Box]

Protocols for measurements are given in pale yellow comment boxes..... [Click here to see example of Protocol Box]

Assumptions are given in pale blue text boxes.... [Click here to see example of Assumptions Box]

Note on official version number

Version X.Y.Z

X refers to the release number
Y refers to released updates on release X
Z refers to unreleased updates on release X.Y

Officially released versions will always have Z=0

If you make changes of your own, please do not refer to your modified spreadsheet using the official version number.

The latest version is published at www.scotland.gov.uk/WindFarmsAndCarbon
Please check you are using the latest official version with Z=0 before

Do I need to use this tool?

1. Will the site be drained on construction of the windfarm? Yes

2. Is the soil at the site highly organic? Yes
i.e. is the soil organo-mineral or organic, (i.e. a peaty gley or peat)?

3. Does windfarm construction require a significant amount of deforestation? Yes
i.e. is removal in excess of keyholing the turbines within the forest boundary?

You should use this tool because the soil is highly organic.
Please move to the Core input data sheet and complete the form to obtain an estimate of C payback time

Click here to return to Instructions sheet Click here

Enter estimated capacity factor (percentage efficiency)	35.0		35.0		35.0	
Backup						
Extra capacity required for backup (%)	5		5		5	
Additional emissions due to reduced thermal efficiency of the reserve generation (%)	10		10		10	
Carbon dioxide emissions from turbine life - (eg. manufacture, construction, decommissioning)	Calculate wrt installed cap		Calculate wrt installed cap		Calculate wrt installed cap	
Characteristics of peatland before windfarm development						
Type of peatland	Acid b		Acid b		Acid b	
Average annual air temperature at site (°C)	9.2		9		9.4	
Average depth of peat at site (m)	2.28		2.00		2.50	
C Content of dry peat (% by weight)	62		49		62	
Average extent of drainage around drainage features at site (m)						
Average water table depth at site (m)	1.00		1.00		1.00	
Dry soil bulk density (g cm^{-3})	0.25		0.20		0.45	
Characteristics of bog plants						
Time required for regeneration of bog plants after restoration (years)	2		2		2	
Carbon accumulation due to C fixation by bog plants in undrained peats (tC ha^{-1} yr^{-1})	0.25		0.25		0.25	
Forestry Plantation Characteristics						
Method used to calculate CO_2 loss from forest felling	Enter simple data		Enter simple data		Enter simple data	
Area of forestry plantation to be felled (ha)	0.54		0.54		0.54	
Average rate of carbon sequestration in timber (tC ha-1 yr-1)	3.60		3.60		3.60	
Counterfactual emission factors						
To update counterfactual emission factors from the web: Click here (not yet operational)	0.45		0.45		0.45	
Coal-fired plant emission factor (t CO_2 MWh^{-1})	1.002		1.002		1.002	
Grid-mix emission factor (t CO_2 MWh^{-1})	0.193		0.193		0.193	
Fossil fuel-mix emission factor (t CO_2 MWh^{-1})	0.432		0.432		0.432	
Borrow pits						
Number of borrow pits	0		0		0	
Average length of pits (m)	0		0		0	
Average width of pits (m)	0		0		0	
Average depth of peat removed from pit (m)	0.00		0.00		0.00	
Foundations and hard-standing area associated with each turbine						
Method used to calculate CO_2 loss from foundations and hard-standing	Rectangular with vertical v		Rectangular with vertical v		Rectangular with vertical v	
Average length of turbine foundations (m)	21.3		21.3		21.3	
Average width of turbine foundations (m)	21.3		21.3		21.3	
Average depth of peat removed from turbine foundations (m)	1.26		1.26		1.26	
Average length of hard-standing (m)	186		186		186	
Average width of hard-standing (m)	50		50		50	
Average depth of peat removed from hard-standing (m)	1.26		1.26		1.26	
Access tracks						
Total length of access track (m)	13275		13275		13275	
Existing track length (m)	3565		3565		3565	
Length of access track that is floating road (m)	1770		1770		1770	
Floating road width (m)	5		5		5	
Floating road depth (m)	0.00		0.00		0.00	
Length of floating road that is drained (m)	1770		1771		1770	
Average depth of drains associated with floating roads (m)	0.75		0.75		0.75	
Length of access track that is excavated road (m)	8390		8390		8390	
Excavated road width (m)	5		5		5	
Average depth of peat excavated for road (m)	0.00		0.00		0.00	
Length of access track that is rock filled road (m)	0		0		0	
Rock filled road width (m)	5		5		5	
Rock filled road depth (m)	0.8		0.5		1	
Length of rock filled road that is drained (m)	0		0		0	
Average depth of drains associated with rock filled roads (m)	0.75		0.75		0.75	
Cable Trenches						
Length of any cable trench on peat that does not follow access tracks and is lined with a permeable medium (eg. sand) (m)	8390		8390		8390	
Average depth of peat cut for cable trenches (m)	1.20		1.00		1.20	
Additional peat excavated (not already accounted for above)						
Volume of additional peat excavated (m^3)	0		0		0	
Area of additional peat excavated (m^2)	0.0		0.0		0.0	
Peat Landslide Hazard						
Weblink: Peat Landslide Hazard and Risk Assessments: Best Practice Guide for Proposed Electricity Generation Developments						
Improvement of C sequestration at site by blocking drains, restoration of habitat etc						
Improvement of degraded bog						
Area of degraded bog to be improved (ha)						
Water table depth in degraded bog before improvement (m)						
Water table depth in degraded bog after improvement (m)						
Time required for hydrology and habitat of bog to return to its previous state on improvement (years)						
Period of time when effectiveness of the improvement in degraded bog can be guaranteed (years)						
Improvement of felled plantation land						
Area of felled plantation to be improved (ha)						
Water table depth in felled area before improvement (m)						
Water table depth in felled area after improvement (m)						
Time required for hydrology and habitat of felled plantation to return to its previous state on improvement (years)						
Period of time when effectiveness of the improvement in felled plantation can be guaranteed (years)						
Restoration of peat removed from borrow pits						
Area of borrow pits to be restored (ha)						
Depth of water table in borrow pit before restoration with respect to the restored surface (m)						
Depth of water table in borrow pit after restoration with respect to the restored surface (m)						
Time required for hydrology and habitat of borrow pit to return to its previous state on restoration (years)						
Period of time when effectiveness of the restoration of peat removed from borrow pits can be guaranteed (years)						
Early removal of drainage from foundations and hardstanding						
Water table depth around foundations and hardstanding before restoration (m)						
Water table depth around foundations and hardstanding after restoration (m)						
Time to completion of backfilling, removal of any surface drains, and full restoration of the hydrology (years)						
Restoration of site after decomissioning						
Will the hydrology of the site be restored on decommissioning?	Yes		Yes		Yes	
Will you attempt to block any gullies that have formed due to the windfarm?	Yes		Yes		Yes	
Will you attempt to block all artificial ditches and facilitate rewetting?	Yes		Yes		Yes	
Will the habitat of the site be restored on decommissioning?	Yes		Yes		Yes	
Will you control grazing on degraded areas?	Yes		Yes		Yes	
Will you manage areas to favour reintroduction of species	Yes		Yes		Yes	

Note: Capacity factor. The capacity factor of any power plant is the proportion of energy produced during a given period with respect to the energy that would have been produced had the wind farm been running continually and at maximum output (DECC (2004); see also www.bwea.com/ref/capacityfactors.html).
Capacity Factor = Electricity generated during the period [kWh]/ (Installed capacity [kW] x number of hours in the period [h])
We recommend that a site-specific capacity factor ~~site~~ should be used (as measured during planning stage), and should represent the average emission factor expected over the lifetime of the windfarm, accounting for decline in efficiency with age (Hughes, 2012). The 5 year average capacity factor (or "load factor") for UK onshore wind between 2010 and 2014, based on average beginning and end of year capacity, was 29.2% (DUKES, 2015).

Note: Extra capacity required for backup. If 20% of national electricity is generated by wind energy, the extra capacity required for backup is 5% of the rated capacity of the wind plant (Dale et al 2004). We suggest this should be 5% of the actual output. If it is assumed that less than 20% of national electricity is generated by wind energy, a lower percentage should be entered (0%). The House of Lords Economic Affairs Committee report on The Economics of Renewable Energy (Parliamentary Business, 2008) notes that to cover peak demand a '20% margin of extra capacity has been sufficient to keep the risk of a power cut due to insufficient generation at a very low level.' The estimate provided by BERR was a range of 10% to 20% of installed capacity of wind energy. E.ON is reported as proposing that the capacity credit of wind power should be 8%, and The Renewable Energy Foundation proposed the use of the square root of the wind capacity (in GW) as conventional capacity (e.g. 36 GW of wind plant to match 6 GW of conventional plant).

Note: Extra emissions due to reduced thermal efficiency of the reserve power generation ≈ 10%

Note: Emissions from turbine life. If total emissions for the windfarm are unknown, emissions should be calculated according to turbine capacity. The normal range of CO_2 emissions is 394 to 8147 t CO_2 MW (White & Kulcinski, 2000; White, 2007).

Note: Type of peatland. An 'acid bog' is fed primarily by rainwater and often inhabited by sphagnum moss, thus making it acidic (Stoneman & Brooks,1997).
A 'fen' is a type of wetland fed by surface and/or groundwater (McBride et al., 2011).

Note: Time required for regeneration of previous habitat. Loss of fixation should be assumed to be over lifetime of windfarm only. This time could be longer if plants do not regenerate. The requirements for after-use planning include the provision of suitable refugia for peat-forming vegetation, the removal of structures, or an assessment of the impact of leaving them in situ. Methods used to reinstate the site will affect the likely time for regeneration of the previous habitat. This time could also be shorter if plants regenerate during lifetime of windfarm. If so, enter number of years estimated for regeneration.

Note: Carbon fixation by bog plants
Apparent C accumulation rate in peatland is 0.12 to 0.31 t C ha^{-1} yr^{-1} (Turunen et al., 2001; Botch et al., 1995). The SNH guidance uses a value of 0.25 t C ha^{-1} yr^{-1}.

Note: Area of forestry plantation to be felled. If the forestry was planned to be removed, with no further rotations planted, before the windfarm development, the area to be felled should be entered as zero.

Note: Plantation carbon sequestration. This is dependent on the yield class of the forestry. The SNH technical guidance assumed yield class of 16 m^3 ha^{-1} yr^{-1}, compared to the value of 14 m^3 ha^{-1} yr^{-1} provided by the Forestry Commission. Carbon sequestered for yield class 16 m^3 ha^{-1} y^{-1} = 3.6 tC ha^{-1} yr^{-1} (Cannell, 1999).

Note: Coal-Fired Plant and Grid Mix Emission Factors. Coal-fired plant emission factor (EF) from electricity supplied in 2014 = 0.093 t CO_2 MWh^{-1}. Grid-Mix EF for 2014 = 0.394 t CO_2 MWh^{-1}. Source = DUKES, 2015b.

Note: Fossil Fuel-Mix Emission Factor. The emission factor from electricity supplied in 2014 from all fossil fuels = 0.642 t CO_2 MWh^{-1}. Source = DUKES, 2015b.

Note: Total length of access track. If areas of access track overlap with hardstanding area, exclude these from the total length of access track to avoid double counting of land area lost.

Note: Floating road depth. Accounts for sinking of floating road. Should be entered as the average depth of the road expected over the lifetime of the windfarm. If no sinking is expected, enter as zero.

Note: Length of floating road that is drained. Refers to any drains running along the length of the

Note: Rock filled roads. Rock filled roads are assumed to be roads where no peat has been removed and rock has been placed on the surface and allowed to settle.

Note: Depth of peat cut for cable trenches. In shallow peats, the cable trenches may be cut below the peat. To avoid overestimating the depth of peat affected by the cable trenches, only enter the depth of the peat that is cut.

Note: Peat Landslide Hazard. It is assumed that measures have been taken to limit damage (Scottish Executive, 2006, Peat Landslide Hazard and Risk Assessments. Best Practice Guide for Proposed Electricity Generation Developments. Scottish Executive, Edinburgh. pp. 34-35) so that C losses due to peat landslide can be assumed to be negligible. Link: http://www.scotland.gov.uk/Publications/2006/12/21162303/1.

Note: Period of time when improvement can be guaranteed. This gurantee should be absolute. Therefore, if you enter a value beyond the lifetime of the windfarm you should provide strong supporting evidence that this improvement can be guaranteed for the full period given. This includes the time requirement for the improvement to become effective. For example if time required for hydrology and habitat to return to its previous state is 10 years and the restoration can be guaranteed over the lifetime of the windfarm (25 years), the period of time when the improvement can be guaranteed should be entered as 25 years, and the improvement will be effective for (25 -10) = 15 years.

Note: Period of time when improvement can be guaranteed. This gurantee should be absolute. Therefore, if you enter a value beyond the lifetime of the windfarm you should provide strong supporting evidence that this improvement can be guaranteed for the full period given. This includes the time requirement for the improvement to become effective. For example if time required for hydrology and habitat to return to its previous state is 10 years and the restoration can be guaranteed over the lifetime of the windfarm (25 years), the period of time when the improvement can be guaranteed should be entered as 25 years, and the improvement will be effective for (25 -10) = 15 years.

Note: Period of time when improvement can be guaranteed. This gurantee should be absolute. Therefore, if you enter a value beyond the lifetime of the windfarm you should provide strong supporting evidence that this improvement can be guaranteed for the full period given. This includes the time requirement for the improvement to become effective. For example if time required for hydrology and habitat to return to its previous state is 10 years and the restoration can be guaranteed over the lifetime of the windfarm (25 years), the period of time when the improvement can be guaranteed should be entered as 25 years, and the improvement will be effective for (25 -10) = 15 years.

Note: Period of time when improvement can be guaranteed. This is assumed to be the lifetime of the windfarm as restoration after windfarm decommissioning is already accounted for in restoration of the site

Note: Restoration of site. If the water table at the site is returned to its original level or higher on decommissioning, and habitat at the site is restored, it is assumed that C losses continue only over the lifetime of the windfarm. Otherwise, C losses from drained peat are assumed to be 100%.

Choice of methodology for calculating emission factors	Site specific (required for planning applications)

Note: Choice of methodology for calculating emission factors. The IPCC default methodology is the internationally accepted standard (IPCC, 1997). However, it is stated in IPCC (1997) that these are rough estimates, and "these rates and production periods can be used if countries do not have more appropriate estimates". Therefore, we have developed more site specific estimates for use here based on work from the Scottish Government funded ECOSSE project (Smith et al, 2007. ECOSSE: Estimating Carbon in Organic Soils - Sequestration and Emissions. Final Report. SEERAD Report. ISBN 978 0 7559 1498 2. 166pp.).

(Carbon : Biomass) ratio of felled forestry						
Replanting regime						
Years after felling when replanting occurs						
Age of seedlings on planting (yr)						
Area replanted around each turbine (ha)						

Note: Estimated downtime. Estimated downtime for maintenance etc. Few reports on downtime of wind turbines are publically available. However, one review by Garrad Hassan (2011) suggests that the minimum downtime reported was 2% for the annual moving average for between 8 to 9 years of operation of new turbines, for a sample of 240 turbines. For a summary of findings see Garrad Hassan (2011).

Note: Emissions from felling and timber removal. Based on emissions factors from UK taken from Morison et al (2011), if clearfelling assumed to be performed by harvester and timber is assumed extracted with forwarder, the emissions are 6675 g CO_2 m^{-3}

Note: Emissions associated with transportation. Assuming trasportation by trucks running on diesel and 20% of journey taken on forest roads, emissions factor obtained from Morison et al (2011) is 39.33 g CO_2 km^{-1} t^{-1} (range 38.5 – 40.15 g CO_2 km^{-1} t^{-1} - average = 39.33 g CO_2 km^{-1} t^{-1})

Note: Power curve. Based on Vestas 2.0MW Optispeed turbine with roughness class C2, modelled over wind speed of 5-10 m s^{-1}. To define a the power curve for a different turbine type, plot annual power output, *P* (MW) against annual windspeed, W (m s^{-1}) and fit a linear regression to obtain slope, *a*, and intercept, *b*:

$$P = aW + b$$

Note: Soil sub-group. Used in determination of forestry characteristic. Peaty gley = Peaty Soils (5-50cm) e.g. peaty gley, peaty podsol. Deep peat = Deep Peat (>50cm) e.g. basin and blanket bogs

Note: Species. So far only Scots pine and Sitka spruce included.

Note: Value of felled forestry. Values available in Mason et al., 2009.

Note: Carbon : Biomass ratio of felled forestry. Wood biomass can be converted to dry weight using wood density based values from Lavers (1983) with a subsequent assumption that C:dry matter ratio is 50% (Matthews 1993). For simplicity an integrated factor, the 'wood density to biomass factor' taken from Mason et al (2009) can be used.

Results

PAYBACK TIME AND CO_2 EMISSIONS

Note: The carbon payback time of the windfarm is calculated by comparing the loss of C from the site due to windfarm development with the carbon-savings achieved by the windfarm while displacing electricity generated from coal-fired capacity or grid-mix.

PAYBACK TIME AND CO_2 EMISSIONS

Note: The carbon payback time of the windfarm is calculated by comparing the loss of C from the site due to windfarm development with the carbon-savings achieved by the windfarm while displacing electricity generated from coal-fired capacity or grid-mix.

…fossil fuel - mix of electricity generation (months)	5	5	5

Assumption: Backup assumed to be by fossil-fuel-mix of electricity generation. Note that hydroelectricity may also be used for backup, so this assumption may make the value for backup generation too high. These assumptions should be revisited as technology develops.

Note: Wind generated electricity is inherently variable, providing unique challenges to the electricity generating industry for provision of a supply to meet consumer demand (Netz, 2004). Backup power is required to accompany wind generation to stabilise the supply to the consumer. This backup power will usually be obtained from a fossil fuel source. At a high level of wind power penetration in the overall generating mix, and with current grid management techniques, the capacity for fossil fuel backup may become strained because it is being used to balance the fluctuating consumer demand with a variable and highly unpredictable output from wind turbines (White, 2007). The Carbon Trust (Carbon Trust/DTI, 2004) concluded that increasing levels of intermittent generation do not present major technical issues at the percentages of renewables expected by 2010 and 2020, but the UK renewables target at the time of that report was only 20%. When national reliance on wind power is low (less than ~20%), the additional fossil fuel generated power requirement can be considered to be insignificant and may be obtained from within the spare generating capacity of other power sectors (Dale et al, 2004). However, as the national supply from wind power increases above 20%, without improvements in grid management techniques, emissions due to backup power generation may become more significant. The extra capacity needed for backup power generation is currently estimated to be 5% of the rated capacity of the wind plant if wind power contributes more than 20% to the national grid (Dale et al 2004). Moving towards the SG target of 50% electricity generation from renewable sources, more short-term capacity may be required in terms of pumped-storage hydro-generated power, or a better mix of offshore and onshore wind generating capacity. Grid management techniques are anticipated to reduce this extra capacity, with improved demand side management, smart meters, grid reinforcement and other developments. However, given current grid management techniques, it is suggested that 5% extra capacity should be assumed for backup power generation if wind power contributes more than 20% to the national grid. At lower contributions, the extra capacity required for backup should be assumed to be zero. These assumptions should be revisited as technology improves.

Emissions due to backup power generation

Note: CO_2 loss due to back up is calculated from the extra capacity required for backup of the windfarm given in the input data.

Emissions due to loss of bog plants

Note: Annual C fixation by the site is calculated by multiplying area of the windfarm by the annual C accumulation due to bog plant fixation

	Expected	Minimum	Maximum
Area where carbon accumulation by bog plants is lost			
Total area of land lost due to windfarm construction (m^2)	158091	158091	158091
Total area affected by drainage due to windfarm construction (m^{-2})	8850	8855	8850
Total area where fixation by plants is lost (m^2)	166941	166946	166941

Assumptions:
1. Bog plants are 100% lost from the area where peat is removed for construction.
2. Bog plants are 100% lost from the area where peat is drained.
3. The recovery of carbon accumulation by plants on restoration of land is as given in inputs.

Total loss of carbon accumulation			
Carbon accumulation in undrained peats (tC ha^{-1} yr^{-1})	0.25	0.25	0.25
Lifetime of windfarm (years)	30	30	30
Time required for regeneration of bog plants after restoration (years)	2	2	2
Carbon accumulation up to time of restoration (tCO_2 eq. ha^{-1})	29	29	29

RESULTS

Volume of peat drained

Note: Extent of site affected by drainage is calculated assuming an average extent of drainage around each drainage feature as given in the input data.

CO_2 loss due to drainage

Note: Note, CO_2 losses are calculated using two approaches: IPCC default methodology and more site specific equations derived for this project. The IPCC methodology is included because it is the established approach, although it contains no site detail. The new equations have been derived directly from experimental data for acid bogs and fens (see Nayak et al, 2008 - Final report).

	Expected	Minimum	Maximum
Drained Land			
Total area affected by drainage due to wind farm construction (ha)	1	1	1
Will the hydrology of the site be restored on decommissioning?	Yes	Yes	Yes
Will the habitat of the site be restored on decommissioning?	Yes	Yes	Yes

Calculations of C Loss from Drained Land if Site is NOT Restored after Decommissioning

Check Total volume affected by drainage due to wind farm (m^3)	3319	3321	3319
C Content of dry peat (% by weight)	62	49	62
Dry soil bulk density (g cm^{-3})	0.25	0.20	0.45
Total GHG emissions from Drained Land (t CO_2 equiv.)	1886	1193	3395
Total GHG Emissions from Undrained Land (t CO_2 equiv.)	1886	1193	3395

Assumption: Losses of GHG from drained and undrained land have the same proportion throughout the emission period.

Calculations of C loss from Drained Land if Site IS Restored after Decommissioning

1. Losses if Land is Drained

Flooded period (days $year^{-1}$)	0	0	0
Lifetime of windfarm (years)	30	30	30
Time required for regeneration of bog plants after restoration (years)	2	2	2
Methane Emissions from Drained Land			
Check Rate of methane emission in drained soil ((t CH_4-C) ha^{-1} yr^{-1})	-0.004	-0.005	-0.003
Conversion factor: CH_4-C to CO_2 equivalents	30.67	30.67	30.67
CH_4 emissions from drained land (t CO_2 equiv.)	-4	-4	-3
Carbon Dioxide Emissions from Drained Land			
Check Rate of carbon dioxide emission in drained soil (t CO_2 ha^{-1} yr^{-1})	23.60	23.55	23.65
CO_2 emissions from drained land (t CO_2)	668	667	670
Total GHG emissions from Drained Land (t CO_2 equiv.)	665	663	667

Assumption: The drained soil is not flooded at any time of the year.

Note:Conversion = (23 x 16/12) = 30.67 CO_2 equiv. $(CH_4\text{-}C)^{-1}$

2. Losses if Land is Undrained

Flooded period (days $year^{-1}$)	178	178	178
Lifetime of windfarm (years)	30	30	30
Time required for regeneration of bog plants after restoration (years)	2	2	2
Methane Emissions from Undrained Land			
Check Rate of methane emission in undrained soil ((t CH_4-C) ha^{-1} yr^{-1})	0.00	0.00	0.00
Conversion factor: CH_4-C to CO_2 equivalents	30.67	30.67	30.67
CH_4 emissions from undrained land (t CO_2 equiv.)	-4	-4	-3
Carbon Dioxide Emissions from Undrained Land			
Check Rate of carbon dioxide emission in undrained soil (t CO_2 ha^{-1} yr^{-1})	23.60	23.55	23.65
CO_2 emissions from undrained land (t CO_2)	668	667	670
Total GHG Emissions from Undrained Land (t CO_2 equiv.)	665	663	667

Note:Conversion = (23 x 16/12) = 30.67 CO_2 equiv. $(CH_4\text{-}C)^{-1}$

3. CO_2 Losses due to Drainage

Total GHG emissions from drained land (t CO_2 equiv.)	665	663	667
Total GHG emissions from undrained land (t CO_2 equiv.)	665	663	667
RESULTS			
Total GHG emissions due to drainage (t CO_2 equiv.)	**0**	**0**	**0**

RESULTS			
Selected Emission Rates			
Rate of carbon dioxide emission in drained soil (t CO_2 ha^{-1} yr^{-1})	23.60	23.55	23.65
Rate of carbon dioxide emission in undrained soil (t CO_2 ha^{-1} yr^{-1})	23.60	23.55	23.65
Rate of methane emission in drained soil ((t CH_4-C) ha^{-1} yr^{-1})	-0.004	-0.005	-0.003
Rate of methane emission in undrained soil ((t CH_4-C) ha^{-1} yr^{-1})	0.00	0.00	0.00

Assumption: The period of flooding is taken to be 178 days yr^{-1} for acid bogs and 169 days yr^{-1} based on the monthly mean temperature and the lengths of inundation (IPCC, 1997, Revised 1996 IPCC guidelines for national greenhouse gas inventories, Vol 3, table 5-13)

Assumption: The CH_4 emission rate provided for acid bogs is 11 (1-38) mg CH_4-C m^{-2} day^{-1} x 365 days; and for fens is 60 (21-162) mg CH_4-C m^{-2} day^{-1} x 365 days. (Aselmann & Crutzen ,1989. J.Atm.Chem. 8, 307-358)

Assumption: CO_2 emissions on drainage of organic soils for upland crops (e.g., grain, vegetables) are 3.667x9.6 (7.9-11.3) t CO_2 ha^{-1} yr^{-1} in temperate climates (Armentano and Menges, 1986, J. Ecol. 74, 755-774).

Note: Carbon dioxide emissions from acid bogs. Equation derived by regression analysis against 60 measurements (Nayak et al, 2009). The equation derived was
$R_{CO2} = (3.667/1000) \times ((6700 \times \exp(-0.26 \times \exp(-0.0515 \times ((Wx100)-50)))) + ((72.54 \times T) - 800))$
where R_{CO2} is the annual rate of CO_2 emissions (t CO_2 (ha)$^{-1}$ yr^{-1}),
T = average annual peat temperature (°C) and
W is the water table depth (m).
The equation shows a significant correlation with measurements (r^2 =0.53 P > 0.05).
Evaluation against 29 independent experiments shows a significant association (r^2 = 0.21; P=0.05) and an average error of 30231 CO_2 ha^{-1} yr^{-1} which is non-significant (P=0.05) (Smith et al, 1997).

measurements (Nayak et al, 2009). The equation derived was
$R_{CH4} = (1/1000) \times (500 \times \exp(-0.1234 \times (Wx100)) + ((3.529 \times T) - 36.67))$
where R_{CH4} is the annual rate of CH_4 emissions (t CH_4-C (ha)$^{-1}$ yr^{-1}),
T = average annual air temperature (°C) and
W is the water table depth (m).
The equation shows a significant correlation with measurements (r^2 = 0.54 ,P > 0.05).
Evaluation against 7 independent experiments shows a significant association (r^2 = 0.81, P=0.05) and an average error of 271 CH_4-C ha^{-1} yr^{-1} (significance not defined due to lack of replicates - Smith et al, 1997).

Note: Carbon dioxide emissions from fens. Equation derived by regression analysis against 44 measurements (Nayak et al, 2009). The equation derived was
$R_{CO2} = (3.667/1000) \times (16244 \times \exp(-0.175 \times \exp(-0.073 \times ((Wx100)-50)))) + (153.23 \times T))$
where R_{CO2} is the annual rate of CO_2 emissions (t CO_2 (ha)$^{-1}$ yr^{-1}),
T = average annual peat temperature (°C) and
W is the water table depth (m).
The equation shows a significant correlation with measurements (r^2 = 0.42 ,P > 0.05).
Evaluation against 18 independent experiments shows a significant association (r^2 = 0.66; P=0.05) and an average error of 21081 CO_2 ha^{-1} yr^{-1} (significance not defined due to lack of replicates-Smith et al, 1997).

Note: Methane emissions from fens. Equation derived by regression analysis against experimental data from 36 measurements (Nayak et al, 2009). The equation derived was
$R_{CH4} = (1/1000) \times (-10+563.62 \times \exp(-0.097 \times (Wx100)+0.552 \times T))$
where R_{CH4} is the annual rate of CH_4 emissions (t CH_4-C (ha)$^{-1}$ yr^{-1}),
T = average annual air temperature (°C) and
W is the water table depth (m).
The equation shows a significant correlation with measurements (r^2 = 0.41, P=0.05).
Evaluation against 7 independent experiments shows a significant association (r^2 = 0.89, P=0.05) and an average error of 1541 CH_4-C ha^{-1} yr^{-1} (significance not defined due to lack of replicate-Smith et al, 1997).

Emission rates from soils

Note: Note, CO_2 losses are calculated using two approaches: IPCC default methodology and more site specific equations derived for this project. The IPCC methodology is included because it is the established approach, although it contains no site detail. The new equations have been thoroughly tested against experimental data (see Nayak et al, 2008 - Final report).

Emissions due to loss of DOC and POC

Note: Note, CO_2 losses from DOC and POC are calculated using a simple approach derived from generic estimates of the percentage of the total CO2 loss that is due to DOC or POC leaching

No POC losses for bare soil included yet. If extensive areas of bare soil is present at site need modified calculation (Birnie et al, 1991)

	Expected	Minimum	Maximum
Total C loss			
Gross CO_2 loss from restored drained land (t CO_2)	0	0	0
Gross CH_4 loss from restored drained land (t CO_2 equiv.)	0	0	0
Gross CO_2 loss from improved land (t CO_2)			
Degraded Bog	0	0	0
Felled Forestry	0	0	0
Borrow Pits	0	0	0
Foundations & Hardstanding	0	0	0
Gross CH_4 loss from improved land (t CO_2 equiv.)			
Degraded Bog	0	0	0
Felled Forestry	0	0	0
Borrow Pits	0	0	0
Foundations & Hardstanding	0	0	0
Conversion factor: CH_4-C to CO_2 equivalents	30.6667	30.6667	30.6667
% total soil C losses, lost as DOC	26	7	40
% DOC loss emitted as CO_2 over the long term	100	100	100
% total soil C losses, lost as POC	8	4	10
% POC loss emitted as CO_2 over the long term	100	100	100
Total gaseous loss of C (t C)	0	0	0
Total C loss as DOC (t C)	0	0	0
Total C loss as POC (t C)	0	0	0

Note: Only restored drained land included because if land is not

Assumption: DOC loss ranges between 7 - 40% of the total gaseous loss if calculated from the reported (minimum and maximum) values in Worrall 2009 and is **26%** of the total gaseous loss if calculated from the mean of reported maximum and minimum value in Worrall 2009. These DOC values are flux based on soil water concentration (i.e. 12.5 - 85.9 $MgC/KM^2/yr$) and not on flux at catchment outlet (i.e. 10.3 - 21.8 $MgC/KM^2/yr$)

Worrall, F. et al., 2009. The multi-annual carbon budget of a peat-covered catchment. *Science of The*

Assumption: In the long term, 100% of leached DOC is assumed to be lost as CO_2

Assumption: POC loss ranges between 4-10% of the total gaseous loss if calculated from the reported values and is **8%** of the total gaseous loss if calculated from the mean of reported maximum and minimum value in Worrall 2009. POC range is (7 - 22.4 $MgC/KM^2/yr$) (Worrall et al, 2009).

Assumption: In the long term, 100% of leached POC is assumed to be lost as CO_2

RESULTS	
Total CO_2 loss due to DOC leaching (t CO_2)	**0**
Total CO_2 loss due to POC leaching (t CO_2)	**0**

CO_2 loss from forests - calculation using detailed management information

Forest carbon calculator (Perks et al, 2009)

Carbon sequestration in trees

Simplified version of the 3PG model (Xenakis et al, 2008). This version, doesn't require climate data as no explicit environmental modifier is calculated. Instead, it uses a factor (from 0 to 1) representing the total effect of environment on growth. The simplified model requires a value of annual incoming solar radiation, a modifier for the age-related decline in productivity, a light extinction coefficient and specific leaf area.

The model calculates gross primary productivity (GPP) and then net primary production (NPP) through a standard ratio. It allocates NPP to roots, wood and foliage. A soil model calculates the size of old and young carbon pools, respiration losses from these pools and from this net ecosystem productivity (NEP).

The model does not need temp/rain/solrad data: the impact of the environment at the site is included by adjusting the environmental modifier, based on site yield class and temperature. Light use efficiency (LUE), rather than quantum use efficiency (QYE) is used, making it easier to develop the model for many species even for a grouping such as "conifers" or "deciduous".

Calibration for Sitka Spruce gives QYE = 0.08 (mol/mol) => LUE = 2.21 (kGM1), and for SP QYE = 0.05 (mol/mol) => LUE = 1.37 (kGM1)

Carbon sequestration in trees

Simplified version of the 3PG model (Xenakis et al, 2008). This version, doesn't require climate data as no explicit environmental modifier is calculated. Instead, it uses a factor (from 0 to 1) representing the total effect of environment on growth. The simplified model requires a value of annual incoming solar radiation, a modifier for the age-related decline in productivity, a light extinction coefficient and specific leaf area.

The model calculates gross primary productivity (GPP) and then net primary production (NPP) through a standard ratio. It allocates NPP to roots, wood and foliage. A soil model calculates the size of old and young carbon pools, respiration losses from these pools and from this net ecosystem productivity (NEP).

The model does not need temp/rain/solrad data: the impact of the environment at the site is included by adjusting the environmental modifier, based on site yield class and temperature. Light use efficiency (LUE), rather than quantum use efficiency (QYE) is used, making it easier to develop the model for many species even for a grouping such as "conifers" or "deciduous".
Calibration for Sitka Spruce gives QYE = 0.08 (mol/mol) => LUE = 2.21 (kC/MJ), and for SP QYE = 0.05 (mol/mol) => LUE = 1.37 (kC/MJ).

Carbon sequestration in soil under trees

Note. More data needed. This should be the respiration from newly felled and disturbed soil, so as to include respiration from fresh plant inputs, from background soil organic matter decomposition, and from the disturbance of soil resulting in the release of additional C from soil aggregates. Different types of management disturbance should be considered. This information is not yet available, but will become available following experiments to be done by Mike Perks during 2009-2012. As an interim measure, C sequestration in soil under trees is used, so including background respiration from soil organic matter decomposition and respiration from fresh plant input.

Carbon Sequestration in Soil Under Trees: Lookup Table

Gains due to site improvement

Note: Note, CO_2 losses are calculated using two approaches: IPCC default methodology and more site-specific equations derived for this project. The IPCC methodology is included because it is the established approach, although it contains no site detail. The new equations have been thoroughly tested against experimental data (see Nayak et al. 2009 - Final report).

Selected Methodology = Site specific (required for planning applications)
Type of peatland = Acid Bog

Reduction in GHG emissions due to improvement of site	Expected result				Minimum result				Maximum result			
Improvement of ...	Degraded Bog	Felled Forestry	Borrow Pits	Foundations & Hardstanding	Degraded Bog	Felled Forestry	Borrow Pits	Foundations & Hardstanding	Degraded Bog	Felled Forestry	Borrow Pits	Foundations & Hardstanding

Note: Methane emissions from acid bogs. Equation derived by regression analysis against 57 measurements (Nayak et al., 2009). The equation derived was:
$R_{CH4} = ((10000) \times (500 \times \exp(-0.1234 \times (Wx100)) + ((3.529 \times T) - 36.67))$
where R_{CH4} is the annual rate of CH_4 emissions (t CH_4-C ha^{-1} yr^{-1}),
T = average annual air temperature (°C) and
W is the water table depth (m).
The equation shows a significant correlation with measurements (r^2 = 0.54, P > 0.05).
Evaluation against 7 independent experiments shows a significant association (r^2 - 0.81, P<0.05) and an average error of 27 t CH_4-C ha^{-1} yr^{-1} (significance not defined due to lack of replicates - Smith et al, 1997).

Note: Methane emissions from fens. Equation derived by regression analysis against experimental data from 30 measurements (Nayak et al, 2009). The equation derived was:
$R_{CH4} = ((10000) \times (-5H-563.62 \times \exp(-0.087 \times (W \times 100)) + 0.662 \times T))$
where R_{CH4} is the annual rate of CH_4 emissions (t CH_4-C ha^{-1} yr^{-1}),
T = average annual air temperature (°C) and
W is the water table depth (m).
The equation shows a significant correlation with measurements (r^2 = 0.41, P <0.05).
Evaluation against 7 independent experiments shows a significant association (r^2= 0.69, P<0.05) and an average error of 164 t CH_4-C ha^{-1} yr^{-1} (significance not defined due to lack of replicate-Smith et al, 1997)

$R_{CO2} = [(-667)/1000) \times ((6700 \times \exp(-0.26 \times \exp(-0.0515 \times ((Wx100)-50))) + ((72.54 \times T) - 800))]$
where R_{CO2} is the annual rate of CO_2 emissions (t CO_2 $(ha)^{-1}$ yr^{-1}).
T = average annual peat temperature (°C) and
W is the water table depth (m).
The equation shows a significant correlation with measurements (r^2 =0.53 P > 0.05).
Evaluation against 29 independent experiments shows a significant association (r^2 0.11; P<0.05) and an average error of 3023 t CO_2 ha^{-1} yr^{-1} which is non-significant (P<0.05) (Smith et al, 1997).

Note: Carbon dioxide emissions from fens. Equation derived by regression analysis against 44 measurements (Nayak et al, 2009). The equation derived was:
$R_{CO2} = [(-667)/1000) \times ((16344 \times \exp(-0.175 \times \exp(-0.073 \times ((Wx100)-50))) + ((153.23 \times T))]$
where R_{CO2} is the annual rate of CO_2 emissions (t CO_2 $(ha)^{-1}$ yr^{-1}),
T = average annual peat temperature (°C) and
W is the water table depth (m).
The equation shows a significant correlation with measurements (r^2 = 0.42, P > 0.05).
Evaluation against 18 independent experiments shows a significant association (r^2= 0.54; P<0.05) and an average error of 2108 t CO_2 ha^{-1} yr^{-1} (significance not defined due to lack of replicates-Smith et al, 1997)

Gains due to site improvement

Note: Note, CO_2 losses are calculated using two approaches: IPCC default methodology and more site-specific equations derived for this project. The IPCC methodology is included because it is the established approach, although it contains no site detail. The new equations have been thoroughly tested against experimental data (see Nayak et al. 2009 - Final report).

Frequently Asked Questions

Click here to email question

GENERAL

Syin Yi Phoon (Senior Hydrologist, EnviroCentre Ltd)

Comment: I could see the benefit of protected feature on the all the sheets, but it this means we cannot even copy the equations for testing sensitivity of a parameter without changing the entire sheet. The protection should be removed as it reduces the usefulness of the tool.

Response: Protection of sheets removed

Syin Yi Phoon (Senior Hydrologist, EnviroCentre Ltd)

Comment: We miss the carbon payback table that used to be at the bottom of every carbon gain/loss component. Our clients like to see how quickly they can payback C emitted due to individual components. This is useful in planning and should be replaced.

Response: This feature has been replaced

CORE INPUT DATA

Cameron McIver (Cameron Ecology Ltd)

Question: The note on "extra capacity required for backup (%)" suggests there is a choice of % capacity or % output – I'm not clear how you know which you have chosen.

Response: The note is misleading. The number that should be entered is the percentage of the actual output of the windfarm (MWh yr^{-1}) that is required for backup. Text has been added to the note to clarify this.

Stephen Lockett (AECOM)

Question:

Average extent of drainage around drainage features at site (m)
We have reviewed the guidance but are still unsure of what this variable means. We have used a standard input of 100m but the sheet appears to be extremely sensitive to this variable and we have limited confidence on the value chosen. The note in the cell refers to obtaining data on the ground water level but I am unsure how this relates to extent of drainage around drainage features.

Response: Average extent of drainage around each drainage feature can be measured following the method by Stewart and Lance (1991). In order to determine the extent of drainage, the undrained water table depth, and the 95% confidence interval of the measurements are needed.
Possible approach:
1. Install a series of dipwells or boreholes both upslope and downslope from the drainage feature.
2. In the first instance, assume that all dipwells are from undrained areas of the site. This incorrect assumption is used to initialise the iterative process that calculated the water table depth of the undrained soil.
3. For a particular sampling occasion, calculate the mean water table depth and 95% confidence interval from all the available data.
4. Assume all dipwells with water table depths deeper than the calculated mean water table depth plus the 95% confidence interval are within the area that is drained by a ditch and so exclude these from the calculation.
5. Calculate a new mean water table depth and 95% confidence interval using only data from undrained area.
6. Repeat the process until the calculation of the mean water table depth and 95% confidence interval has stabilised, and no further data points need to be excluded. This gives the water table depth of the undrained soil.
7. The distance from the drain to the first dipwell where the water table depth of the undrained soil occurred (to within the 95% confidence interval) can then be assumed to be the total extent of the drainage impact.

Question: Our drainage strategy is to mimic the existing drainage patterns as closely as possible by intercepting surface run-off and discharging at regular intervals downstream of the tracks back onto natural ground. As such, is there an argument this value could be effectively zero?

Response: No – removing water increases the drainage of the site, and this needs to be accounted for. However, if you are following existing drainage patters, it will be easier to determine the extent of drainage because the drains are already established.

Question: For our example site there is a significant difference in pay back when using site specific and IPCC default values (ranging from 3 to 15 years). Would you be able to provide a brief description of what is being ignored when selecting IPCC default?

Response: The IPCC default takes no account of the previous condition of the site. It provides the result for a typical acid bog or fen across Europe.
Therefore, if you are working with an unusually pristine peat or a badly drained peat, you would expect the result to be very different to the average.

Tanya Ogilvy (SEPA)

Question:

Response:

5c. Volume of peat drained

Stephen Lockett (AECOM)

Question: Our new drainage will be surface swales above the ground water table so should not have any effect on the ground water table.

Response: If the surface swales will just convey storm water that would not otherwise have percolated into the soil, these swales will have no impact on the water table of the soil profile, but will only impact the water that would have runoff the surface, causing erosion. However, if the swales also reduce the amount of water entering the soil profile, then they could have an impact on the wetness of the soil. This should really be accounted for in the calculation. However, there is nothing to describe this in the carbon calculator, so you would be justified in neglecting this effect but need to indicate this in the notes.

5e. Emission rates from soils

Stephen Lockett (AECOM)

Question: Rate of carbon dioxide emission
We would expect the rate of emission in undrained soil to be worse than the rate in drained soil. This is only the case when the ground water level is very shallow. Does the output define 'drained soil' as soil which is being drained by our engineering activities and 'undrained soil' as excavated soil which was dry to start with?

Response: I think the confusion comes about due to the definition of terms.
The "drained soil" refers to the soil after it has been drained for the windfarm development. The "undrained soil" refers to the soil before it was drained for the development. This doesn't refer to the status of the site before the development. Agreed, where a "drained site" refers to a site that has already been drained for a number of years, much of the labile carbon would already have been lost, and so losses due to the windfarm construction would be much less than the losses from an "undrained site" where the peat was still in pristine condition.
Worksheet 5e calculates the rate of emissions of CO2 and CH4 for the soil
1. when drained (ie dry soil);
2. when undrained (ie wet soil).
In a drained (dry) soil, we expect high rates of CO2 emissions and low rates of CH4 emissions.
In an undrained (wet) soil, we expect high rates of CH4 emissions and low rates of CO2 emissions.
These rates are then used in sheet 5d to calculate the net GHG emissions (in CO2 equivalents) attributable to the windfarm development. This is taken as the difference between the losses following drainage for the development and the losses that were occurring before the soil was drained for the development. Because the net emissions are usually higher in the drained (dry) soil than in the undrained (wet) soil, the net emissions due to draining the site usually come out as positive. If we were to compare a "drained site" and an "undrained site" in sheet 5d, the net CO2 emissions calculated for the drained site would be much less than for the undrained site because a smaller volume of soil is being further drained by the development.

	I13, M13	Similar to above		
	F13	='5c. Volume of peat drained'!C34/10000 changed to =IF('Core input data'!C95>'Core input data'!C96,'5c. Volume of peat drained'!C34/10000,0)		
	J13, N13	Similar to above		

CHANGES IN VERSION 2.8.0

Worksheet	Cells	Change	Comment	Thanks to...
5C. Volume of peat drained	Rows 67 - 76	Inserted rows to included additional excavated peat in volume of peat drained	Include additional excavated peat in volume of peat drained	Susana Sebastian, SEPA
	C67-C68; D67-D68; E67-E68	Title lines		
	C69	='Core input data'!C74		
	D69,E69	Similar to above		
	C70	='Core input data'!C75		
	D70,E70	Similar to above		
	C71	=IF(C70>0,C69/C70,0)		
	D71,E71	Similar to above		
	C72	=SQRT(C70/PI())		
	D72,E72	Similar to above		
	C73	=C72+C9		
	D73,E73	Similar to above		
	C74	=(PI()*C73*C73)-C70		
	D74,E74	Similar to above		
	C75	=C74*C71		
	D75,E75	Similar to above		
	C79	=C18+C34+C57+C64 changed to =C18+C34+C67+C64+C74		
	D79,E79	Similar to above		
	C80	=C19+C35+C58+C65 changed to =C19+C35+C68+C65+C75		
	D80,E80	Similar to above		
7ii. Forestry CO_2 loss - detail	F62	=F60*F61 changed to =F60*F61*F55	Calculation of emissions associated to the transport of wood to biomass plant should account for number of trips to plant	Susana Sebastian, SEPA
	G62-T62	Similar to above		
Forestry input data	C23	Units changed from g CO_2 km^{-2} to g CO_2 km^{-2} t^{-1}		
Core input data	Row 25	Insert input for average depth of peat at site	Limit improvements following restoration to the depth of the peat	Susana Sebastian, SEPA
8. CO_2 gain - site improvement	Row 10	Insert average depth of peat at site		
	C15	='Core input data'!C25		
	D15-N15 (excl. E15, I15 & M15)	Similar to above		
	E15	='Core input data'!C46		
	I15,M15	Similar to above		
	C16	Core input data'!C82 changed to =IF('Core input data'!C82<C15,'Core input data'!C82,C15)		
	D16-N16	Similar to above		
	C17	='Core input data'!C83 changed to =IF('Core input data'!C83<C15,'Core input data'!C83,C15)		
	D17-N17	Similar to above		
	C21	C12-C20 changed to =IF(C12-C20>0,C12-C20,0)		
	D21-N21	Similar to above		
Core input data	Rows 84, 91, 97	Insert period of time when the improvement can be quaranteed to work (years)	Improvements in C sequestration should continue for as long as the improvement can be quaranteed.	Rob McCall, NRW
8. CO_2 gain - site improvement	C12	='Core input data'!C12 changed to ='Core input data'!C84		
	D12-N12 (excl. E12, I12 & M12)	Similar to above		
Payback Time and CO_2 emissions	Row 17	Insert ratio of soil carbon loss to gain by restoration	Include calculation of ratio of soil losses to gains	Rob McCall, NRW
	C17	=IF(C26<0,-(C17+C18)/C26,0)		
	D617,E17	Similar to above		
Payback Time and CO_2 emissions	Row 18	Insert ratio of C emissions to power generation	Include calculation of C emissions to power generation	Susana Sebastian, SEPA
	C18	=((C20+C26)*1000000)/(C12*1000)		
	D617,E17	Similar to above		
5. Loss of soil CO_2	D11	=D8+D9 changed to =MIN(D8+D9,E8+E9)	Correct use of minimum and maximum wrt water table depth at very low depths	Peter Batten
	E11	=E8+E9 changed to =MAX(D8+D9,E8+E9)		
9e. Emission rates from soils	D31	='Core input data'!E24 changed to ='Core input data'!G24		
	E31	='Core input data'!G24 changed to ='Core input data'!E24		
	D33	='Core input data'!E28 changed to ='Core input data'!G28		
	E33	='Core input data'!G28 changed to ='Core input data'!E28		
8. CO_2 gain - site improvement	G17	=IF('Core input data'!E83>G15,'Core input data'!E83,G15) changed to =IF('Core input data'!G83>G15,'Core input data'!G83,G15)	Correct use of minimum and maximum depth of water table after restoration	Jo Smith, University of Aberdeen
	H17-J17	Similar to above		
	K17	=IF('Core input data'!G83<K15,'Core input data'!G83,K15) changed to =IF('Core input data'!E83<K15,'Core input data'!E83,K15)		
	L17-N17	Similar to above		
8. CO_2 gain - site improvement	G12	='Core input data'!E85 changed to ='Core input data'!G85	Correct use of min/max period when restoration can be restored	Jo Smith, University of Aberdeen
	H12-J12	Similar to above		
	K12	='Core input data'!G85 changed to ='Core input data'!E85		
	L12-N12	Similar to above		
8. CO_2 gain - site improvement	C34	=IF('Core input data'!$C$112=2,'8. CO_2 gain - site improvement'!C30,'8. CO_2 gain - site improvement'!C32) changed to =IF('Core input data'!$C$112=2,IF('Core input data'!$C$23=1,C30,C31),IF('Core input data'!$C$23=1,C32,C33))	Correct selection of emission factor when soil type is fen	Elizabeth Keen, Peter Brett Associates LLP
	D34-N34	Similar to above		
	C53	=IF('Core input data'!$C$112=2,'8. CO_2 gain - site improvement'!C49,'8. CO_2 gain - site improvement'!C51) changed to =IF('Core input data'!$C$112=2,IF('Core input data'!$C$23=1,C49,C50),IF('Core input data'!$C$23=1,C51,C52))		
	D53-N53	Similar to above		

CHANGES IN VERSION 2.9.0

Worksheet	Cells	Change	Comment	Thanks to...
Core input data	B94	"Water table depth in borrow pit before restoration (m)" changed to "Depth of water table in borrow pit before restoration with respect to the restored surface (m)"	Confusing wording as water table depth may always be entered as zero.	Clare Wharmby - Carbon Forecast
	B95	"Water table depth in borrow pit after restoration (m)" changed to "Depth of water table in borrow pit after restoration with respect to the restored surface (m)"		
8. CO_2 gain - site improvement	C47	=(23*16/12)*C213*C440*C46*(C$19/365) changed to =(23*16/12)*C$13*C440*C46*(C$38/365)	Error in formula using the improved flooded period instead of the unimproved flooded period	Elizabeth Keen - Peter brett Associates
	D47-N47	Similar to above		
7c. Average stand data	Rows 13-29	Stand data extended from 17 year to 0 years	If forest stand is less than 17 years old, the calculations fail	Brenda Park - AMEC
	Rows 168-86	Similar to above		
7ii. Forestry CO_2 loss - detail	F31	=IF (F29>0,IF(F27="Deep Peat",(VLOOKUP(F29,'7c. Average stand data'!$D$87:$G$118,3)),(VLOOKUP(F29,'7c. Average stand data'!$D$30:$G$63,3))),0) changed to =IF(F29>0,IF(F27="Deep Peat",(VLOOKUP(F29,'7c. Average stand data'!$D$68:$G$118,3)),(VLOOKUP(F29,'7c. Average stand data'!$D$30:$G$63,3))),0)		
	G31-T31	Similar to above		
7ii. Forestry CO_2 loss - detail	G35	=IF('Forestry input data'!$F$33=1,"Yes", "No") changed to =IF('Forestry input data'!$D$33=1,"Yes", "No")	Use of felled wood as biofuel not correctly read in min and max calculations	Jo Smith - University of Aberdeen
	H35,J35,K35,M35,N35,P35,Q35,S35,T35	Similar to above		
7ii. Forestry CO_2 loss - detail	F16	='7a. C sequest. in trees (3PG)'!$F$24 changed to =IF(F12>0,'7a. C sequest. in trees (3PG)'!F$24,0)	Avoid #NA	Claire Frost - AECOM
	G16-T16	Similar to above		
Forestry input data	Note: Emissions from felling and timber removal.	"the emissions are 6657 g CO_2 m^{-2}" changed to "the emissions are 6675 g CO_2 m^{-2}"		Jonathon Davison - Mott MacDonald
Forestry input data	Note: Emissions associated with transportation	"3933000 g CO_2 km^{-2} (range 3850000 – 4015000 g CO_2 km^{-2} - average = 39.33 g CO_2 km^{-2} t^{-1})" changed to "39.33 g CO_2 km^{-2} t^{-1} (range 38.5 – 40.15 g CO_2 km^{-2} t^{-1} - average = 39.33 g CO_2 km^{-2} t^{-1}"		Jonathon Davison - Mott MacDonald
Payback Time and CO_2 emissions	C17	=IF(C26<0,-(C17+C18)/C26,"No gains!")	Ensure no restoration is highlighted as no gains rather than appearing	Sarah Lister, Natural Power
	D617,E17	Similar to above		
Payback Time and CO_2 emissions	C18	=((12/44)*(C20+C26)*1000000)/(C12*1000)	Express ratio as CO_2 rather than C emissions to power generation	Sarah Lister, Natural Power
	D617,E17	Similar to above		

CHANGES IN VERSION 2.10.0

Worksheet	Cells	Change	Comment	Thanks to...
8. CO_2 gain - site improvement	K13	=IF('Core input data'!G82>'Core input data'!G83,'Core input data'!G81,0) changed to =IF('Core input data'!G82>'Core input data'!E82,'Core input data'!G81,0)	Change to correct test for improvement in restored area.	Sarah Lister, Natural Power
	L13-N13	Similar to above		
	G13	=IF('Core input data'!E82>'Core input data'!E83,'Core input data'!E81,0) changed to =IF('Core input data'!E82>'Core input data'!G82,'Core input data'!E81,0)		
	H13-J13	Similar to above		
Payback Time and CO_2 emissions	B22	"8a. Gains due to improvement of degraded bogs" changed to "8a. Change in emissions due to improvement of degraded bogs"	Confusion over labelling of "gains" due to restoration and improvement	Sarah Lister, Natural Power
	B23 - B26	Similar to above		
	D38	=((D20+D26)*1000000)/(D12*1000) changed to =(D32*1000)/(E12)	Error in min / max calculation	Peter Batten
	C38, E38	Similar to above		
1. Windfarm CO_2 emission saving	H39	='Forestry input data'!$F28 changed to =G39	The power curve code for Min and Max were not correctly retrieved, because the dropdowns located in the tab Forestry Input Data cells F28 and H28 do not have any value associated to them.	Carlos Ruiz, SEPA
	I39-U39	Similar to above		
	H40	=OFFSET($D$24,H39,1) changed to =OFFSET($D$24,H39,2)	Column in offset incorrectly specified	
	I40-U40	Similar to above		
	H44	=OFFSET($D$24,H39,4) changed to =OFFSET($D$24,H39,5)	Column in offset incorrectly specified	
	I40-U40	Similar to above		
	G49	=24*365*G11*G10*G48/100 changed to =IF(G10<=0,0,24*365*G11*G10*G48/100)	Incorrect calculation of annual energy output when less than 5 areas of forestry included.	
	H48-U49	Similar to above		
2. CO_2 loss due to turbine life	C19-T19	0.173 changed to 0.316	The emission rate of 173kg/m3 is the rate for "mass foundations". However foundations for wind turbines are reinforced, so the rate is changed to that for Reinforced Foundations, and revised to the new emission rate, from the Table 7 in http://www.concretecentre.com/sustainability/energy_efficiency/embodied_co2.asox	Carlos Ruiz, SEPA
	C23	=IF('Core input data'!$C$20=1,$C9+C20,$C13+C20) changed to =IF('Core input data'!$C$20=1,$C9,$C13+C20)	Direct input of emissions includes cement already	
	D23-E23	Similar to above		
5a. Volume of peat removed	F26	=F20*((F23*F24)+(F22*(F21-F23)/2)+(F21*(F22-F24)/2)+((F21-F23)*(F22-F24))/2) changed to =IF(F25>0,(F20*(F25/3 * (F21*F22 + F23*F24 + SQRT(F21*F22*F23*F24))))/F25,0)	Error in formula	Carlos Ruiz, SEPA
	G26-T26	Similar to above		
5c. Volume of peat drained	C34	=C33*C23 changed to =F34+I34+L34+O34+R34		Carlos Ruiz, SEPA
	D34-T34	Similar to above		
	C55	='Core input data'!C70 changed to =C52*(C9+C9)		
	D55-E55	Similar to above		
	C73	=C72+C9 changed to =IF(C70>0,C72+C9,0)		
	D73-E73	Similar to above		
5d. CO_2 loss from drained peat	C43	=C8*(C35+C36)*(((C42*(365-C34)))/365 changed to =C8*(C35+C36)*((((C42*C34)/365)+(C29*(365-C34))/365))	Accounts for emissions during both flooded and unflooded times of the year in an undrained soil	Carlos Ruiz, SEPA
	D43,E43	Similar to above		
	C40	=C8*(C35+C36)*C39*((C38*C34))/365 changed to =C8*(C35+C36)*C39*((((C38*C34)/365)+(C25*(365-C34))/365))		
	D40,E40	Similar to above		
	D50	=D47-D48 changed to =IF(D47-D48<E47-E48,D47-D48,E47-E48)	Protection against unusual conditions that result in incorrect order for min and max calculations	Carlos Ruiz, SEPA
	E50	Similar to above		
5e. Emission rates from soils	D31	='Core input data'!G24 changed to ='Core input data'!E24	Correction from previous min/max change	Carlos Ruiz, SEPA
	E31	='Core input data'!E24 changed to ='Core input data'!G24		
Core input data	C103	=IF(C105=2,IF(C106=2,2,1),1) changed to =IF(C105>1,IF(C106>1,2,1),1)		Carlos Ruiz, SEPA
	E103, G103, C107, E107, G107	Similar to above		
7a. C sequest. in trees (3PG)	E24	=AVERAGE(F24,I24,L24,O24,R24) changed to =AGGREGATE(1,6,F24,I24,L24,O24,R24)	Correction to avoid error when some areas of forestry are not filled.	Carlos Ruiz, SEPA
	F24, G24, E25-G25, E26-G26	Similar to above		
	F25	=VLOOKUP(F15,$C62:$AQ212,9,TRUE) changed to =VLOOKUP(F15,$B62:$AQ212,10,TRUE)	Correction to formula so that it looks in the age column	
	G25-T25	Similar to above		
	F26	=SUM(OFFSET(((INDIRECT(ADDRESS(MATCH(F19,$B62:$B112,0)+61,9,4)))),0,1, F19,1)) changed to =SUM(OFFSET(((INDIRECT(ADDRESS(MATCH(F18,$B62:$B112,0)+61,9,4)))),0,1, F19,1))	Change to correct lookup of net primary production of replanted forestry	
	G26-T26	Similar to above		
7d. Wind speed ratios	Insert row 9	Years after planting when felling occurs	Changes to calculate final height of replanted forestry by accounting for years after felling when replanting occurs and age of seedlings as well as lifetime of windfarm - previously only accounted for lifetime of windfarm.	Carlos Ruiz, SEPA
	C9	='Forestry input data'!D41		
	D9-Q9	Similar to above		
	Insert row 10	Age of seedings on plant (yr)		
	C10	='Forestry input data'!D42		
	D10-Q10	Similar to above		
	C21	=VLOOKUP(C11,'7c. Average stand data'!$D$30:$H$63,2,TRUE) changed to =VLOOKUP(C11-C9+C10,'7c. Average stand data'!$D$30:$H$61,2,TRUE)		
	D21-Q21	Similar to above		
	C22	=OFFSET('7c. Average stand data'!$D30,C8-'7c. Average stand data'!$D30+C11,1,1) changed to =IF(C8+C11<=50,OFFSET('7c. Average stand data'!$D30,C8-'7c. Average stand data'!$D30+C11,1,1),OFFSET('7c. Average stand data'!$D30,C8-'7c. Average stand data'!$D30+C11-C10+C10-C9,1,1))	Change to allow for normal harvesting of forestry during the lifetime of the windfarm	
	D22-Q22	Similar to above		
	C52	=IF((0.75+0.03*(LN(C43/C44)))*C44*POWER(C18/C44,0.8)+C46<C49,(0.75+0.03*(LN(C43/C44)))*C44*POWER(C18/C44,0.8)+C46,C49) changed to =IF((0.75+0.03*(LN(C42/C44)))*C44*POWER(C18/C44,0.8)+C46<C49,(0.75+0.03*(LN(C42/C44)))*C44*POWER(C18/C44,0.8)+C46,C49)	Changes to correct formula for height of new internal boundary layer over forest - previously used roughness of group in gap instead of roughness of ground in forested area	
	D52-Q52	Similar to above		
	C54	=IF((0.75+0.03*LN(C44/C43))*C45*POWER(C19/C21,0.8)+C47<C49,(0.75+0.03*LN(C44/C45))*C45*POWER(C19/C45,0.8)+C47,C49) changed to =IF((0.75+0.03*LN(C44/C45))*C45*POWER(C19/C45,0.8)+C47<C49,(0.75+0.03*LN(C44/C45))*C45*POWER(C19/C4,0.8)+C47,C49)	Changes to correct the calculation of height of boundary layer in replanted area	
	D54-Q54	Similar to above		
Construction input data	C13	"Depth of hole dug when constructing foundations (m)" changed to "Average depth of peat removed when constructing foundations (m)"	Changes in wording to improve clarity of input data	Carlos Ruiz, SEPA
	C20, C34, C41, C55, C62, C76, C83, C97, C104	Similar to above		
1. Windfarm CO_2 emission saving	H17	='Core input data'!$C$41 changed to ='Core input data'!$E$41	Correction of error	Carlos Ruiz, SEPA
	D48	=AVERAGE(G48,J48,M48,P48,S48) changed to =AGGREGATE(1,6,G48,J48,M48,P48,S48)	Changes to average capacity factor only over forestry areas that have valid data	Jo Smith, University of Aberdeen
	E48,F48	Similar to above		
2. CO_2 loss due to turbine life	D9	='Core input data'!E21*D12*'Core input data'!E14*'1. Windfarm CO_2 emission saving'!D48/100 changed to ='Core input data'!E21*D12*'Core input data'!E14*'1. Windfarm CO_2 emission saving'!E48/100	Changed so that minimum and maximum emission factors are used	Carlos Ruiz, SEPA
	E9	Similar to above		
Forestry input data	F11	Dropdown menu linked to cell D11	Change to set soil type in forestry areas of exp., min and max to same value	Carlos Ruiz, SEPA
	H11	Similar to above		
	F10	Dropdown menu linked to cell D50		
	H10	Similar to above		
	F69	Dropdown menu linked to cell D69		
	H69	Similar to above		
	F88	Dropdown menu linked to cell D88		
	H88	Similar to above		
	F107	Dropdown menu linked to cell D107		
	H107	Similar to above		
7ii. Forestry CO_2 loss - detail	F17	='7a. C sequest. in trees (3PG)'!$F$25 changed to ='7a. C sequest. in trees (3PG)'!F$25	Change to correctly reference different forestry areas	Carlos Ruiz, SEPA
	G17-T17	Similar to above		
	F12	='7a. C sequest. in trees (3PG)'!$F19 changed to ='7a. C sequest. in trees (3PG)'!F19		
	G12-T12	Similar to above		
	F13	='7a. C sequest. in trees (3PG)'!F26 changed to ='7a. C sequest. in trees (3PG)'!$F26		
	G53-T53	Similar to above		
	I38	='Forestry input data'!$D39 changed to ='Forestry input data'!$D18	Change to refer to different forestry areas	
	J38-T38	Similar to above		
	D61	='Forestry input data'!$D23/1000000 changed to ='Forestry input data'!$F23/1000000	Change to reference the correct cell	
	G61,J61,M61,P61,S61	Similar to above		
	E61	='Forestry input data'!$D23/1000000 changed to ='Forestry input data'!$H23/1000000		
	H61,K61,N61,Q61,T61	Similar to above		
	G63	=IF(G55>0,(G57*'Core input data'!$C41)-G62,0) changed to =IF(G55>0,(G57*'Core input data'!$E41)-G62,0)		
	H83-T63	Similar to above		
Core input data	E23	Menu linked to cell C23	Change to allow only one soil type	Carlos Ruiz, SEPA
	G23	Similar to above		
8. CO_2 gain - site improvement	D62	=-12*D60/1. Windfarm CO_2 emission saving'!$D53 changed to =-12*D60/'1. Windfarm CO_2 emission saving'!$E53	Change to allow use of different counterfactual emission factors	Carlos Ruiz, SEPA
	E62-N62,D63-N63,D64-N64	Similar to above		

CHANGES IN VERSION 2.11.0

Worksheet	Cells	Change	Comment	Thanks to...
9e. Emission rates from soils	D21	=IF('Core input data'!D23=1,D11,D16) changed to =IF('Core input data'!C23=1,D11,D16)		Peter Batten
	E21	=IF('Core input data'!E23=1,D11,D16) changed to =IF('Core input data'!C23=1,D11,D16)		
	D22,E22,D23,E23	Similar to above		

CHANGES IN VERSION 2.12.0

Worksheet	Cells	Change	Comment	Thanks to...
Core input data	C27,E27,G27	Cell validated to be betweeen 0.01 and 1000	Avoids incorrect entry of zero for extent of drainage	Carlos Ruiz, SEPA
Payback and CO_2 emissions	C37	=IF(C26>0,(C17+C18)/C26,"No gains!") changed to =IF(C26>0,(C17+C18)/C26,"No gains!")	Error introduced by change in sign of C26	
	D37	=IF(D26<0,-(D17+D18)/D26,"No gains!") changed to	Error introduced by change in sign of D26 plus correction in use of minimum and maximum values	Alexa Morrison, RSPB
	E37	Similar to D37		
2. CO_2 loss due to turbine life	C9,D9,E9	='Core input data'!C21*C12*'Core input data'!C14*1. Windfarm CO_2 emission saving'!D48/100 to ='Core input data'!C21*C12*'Core input data'!C14	Corrected to remove dependence on capacity factor	Clare Wharmby

CHANGES IN VERSION 2.13.0

CHANGES MADE BY SEPA - REPLICATED IN VERSION 2.14

CHANGES IN VERSION 2.14.0

Worksheet	Cells	Change	Comment	Thanks to...
5a. Volume of peat removed	F37	=IF($C$31=1,'Core input data'!C54,'Construction input data'!D13) -> =IF($C$31=1,'Core input data'!C14,'Construction input data'!D20)	Correction to use depth of hardstanding instead of depth of foundations	Clare Wharmby - Carbon Forecast
	G37,H37	Similar to above		
	I37	=IF($C$31=1,0,'Construction input data'!$D34) -> =IF($C$31=1,0,'Construction input data'!D41)		
	J37 - T37	Similar to above
