3.1 INTRODUCTION

In March 2021, Priority Geotechnical (PGL) were requested by Irish Water, to undertake a ground investigation as part of Water Supply Project (WSP), Eastern and Midlands Region, project. Mott McDonald were acting as consulting engineers for the employer.

The proposed WSP scheme comprises of 171km of large diameter pipeline and several major infrastructure sites.

The aim of the detailed ground investigation is to provide a sufficient level of geotechnical information on the underlying ground conditions, groundwater regimes geotechnical and geo-chemical hazards that allows for the detailed design of the scheme to be completed.

This project is divided into separate Ground Investigation (GI) Lots which are to be completed in 'Seasonal' phases. PGL were awarded Lot 1 of the project consisting of the Water Treatment Plant.

The fieldworks were carried out between the 05th July, 2021 and 09th November, 2021 under the supervision of PGL, Engineering Geologist(s). Details of the plant and equipment used are outlined on the relevant exploratory records, attached herein.

3.1.1 Scope of works

The Water Treatment Plant ground investigation as originally specified by Irish Water comprised of the following:

- Cable percussion boreholes;
- Rotary cored boreholes;
- GeoBore S boreholes;
- Trial pits;
- Dynamic samples;
- In-situ testing including;
    - Standard Penetration Tests (SPT's);
    - Hand vane tests;
    - Permeability testing;
    - California Bear Ratio (CBR) determination;
    - Plate load tests.

- Construction of groundwater monitoring standpipes;
- Geophysical surveying comprised of;
    - Seismic refraction and;
    - Electrical resistivity tomography (ERT).
- All associated sampling;
- All associated lab testing and;
- Reporting.

The final works as completed during the period of investigation are detailed in Section 3.3 of this factual report. The full scope of works was not completed by PGL due to resourcing issues during the period of investigation.

This investigation was carried out in accordance with the contract specification: The ground investigation was carried out in general accordance with *Specification and Related Documents for Ground Investigation in Ireland, 2nd Edition*, Engineers Ireland (2016), Eurocode 7- Geotechnical Design Part 2, ground investigation and testing (BS EN 1997 2: 2007) and the relevant British Standards.

3.1.2 Reporting

This geotechnical data report: ref: P21060_Rp_F01 presents the factual records of the fieldwork with respect to the ground investigation works for the Water Supply Project – Eastern and Midlands Region Ground Investigation Contract – Lot 1 - Water Treatment Plant and should be read in conjunction with the exploratory logs attached.

In-Situ Site Investigation Limited (In-Situ) carried out a geotechnical site investigation on behalf of Priority Geotechnical Ltd. The findings are accompanying this factual report, **APPENDIX 3F**.

The findings of the geophysical survey are presented in **APPENDIX 3G** of this factual report.

This report should be read in conjunction with its appendices and the associated electronic data files (*.dwg, *.pdf,*.ags, *.xls and *.jpg).

No responsibility can be held by PGL for ground conditions between exploratory locations. The exploratory logs provide for ground profiles and configuration of strata relevant to the investigation depths achieved during the fieldworks. Caution shall be taken when extrapolating between such exploratory locations. No liability is accepted for ground conditions extraneous to the exploratory locations.

No account has been taken of potential subsidence or ground movement due to mineral extraction, mining works or karstification below or in proximity to the site, unless specifically addressed.

This report has been prepared for the Employer and their Representative as outline, herein. The information should not be used without their prior written permission. PGL accepts no responsibility or liability for this document being used other than for the purposes for which it was intended.

3.2 SITE & GEOLOGY

3.2.2 Location & Description

The Water Treatment Plant (WTP) site is situated approximately 2.3km's south east of Ballina and 2.75km north east of Birdhill, Co. Tipperary. The site is largely open farmland predominantly used for grazing livestock and crop production.

The site has ground conditions comprising predominantly glacial till deposits. Underlying bedrock is was determined to be Limestone.

The purpose of the Ground Investigation Contract (intrusive and non-intrusive) is to adequately characterise the ground conditions in order to inform the next stage design and construction of the scheme. The GI has been designed to identify and investigate geotechnical risks such that adequate mitigation may be implemented to manage those risks in the next stage of works.

3.2.3 Published Geology

A search of the Geological Survey data base and 1:100,000 mapping (Sheet 18) identified two lithological units defining the Lot 1 WTP study area. The majority of the site is underlain by the Ballysteen Formation (BA), described as irregularly bedded and nodular bedded argillaceous bioclastic Limestones (wackestones and packstones), interbedded with fossiliferous calcareous Shales. Lower Limestone Shale (LLS) is mapped to the north and east, defined by Sandstone, Mudstone and thin Limestones.

Teagasc Subsoil mapping indicated the study area was made up of two soil types. The majority of the area is defined by Glacial Till derived from Lower Paleozoic and Devonian Sandstones and Shales (TLPDSs). Alluvial deposits (A) are mapped to the south in the Knockadromin townland, to the east in the Greenhills townland and west in the Kilmaglasderry townland. The national groundwater vulnerability mapping indicated the area was of low vulnerability.

3.2.4 Encountered Geology

The ground model was such that: Topsoil being 100mm to 1000mm thick with Made Ground identified at two exploratory locations being 500mm to 600mm in thickness. Natural deposits were predominantly described as Glacial Till; soft to stiff, (slightly) sandy (slightly) gravelly CLAY/ SILT with varying Cobble content extending to depths 9.60m bgl to 28.00m bgl. Less common deposits of clayey gravelly Sand and clayey sandy Gravel were also identified. Top of Limestone bedrock was encountered during borings at depths 9.6m bgl (WTP-BH070) to 35.10m bgl (WTP-BH013). Instances of Granular deposits, Sands, Gravels and Cobbles overlying LIMESTONE bedrock showed an assumed zone of weathered rock. Localised organic PEAT deposits were noted in the upper 2.00m.

3.3 FIELDWORK

3.3.1 General

The fieldworks were undertaken under the supervision of PGL, Engineering Geologist(s). Details of the plant and equipment used are detailed on the relevant exploratory records, attached and are presented hereafter.

The exploration records are presented in **APPENDIX 3A, 3B** and **3C** of this factual report and should be read in conjunction with the key sheets included. The records provide descriptions, in accordance with BS 5930 (2015) and Eurocode 7, Geotechnical Investigation and Testing, Identification and classification of soils, Part 1, Identification and description (EN ISO 14688-1: 2002),– Identification and Classification of Soil, Part 2: Classification Principles (EN ISO 14688-2:2004) and Identification and Classification of Rock, Part 1: Identification & Description (EN ISO 14689-1:2004) of the materials encountered, *in situ* testing and details of the samples taken, together with any observations made during the ground investigation.

SUMMARY OF PLANT AND EQUIPMENT

Operation	Equipment	Nominal diameter, mm	Flush	Comments
Cable Percussion Boring	Dando 2000	200mm	N/A	Standard Penetration Test, Nspt values obtained, bulk sampling. Visual observations of ground and groundwater conditions. Installation of standpipe wells, in-situ permeability testing, pressuremeter test.
Rotary boring	Soilmech PSM & Delta base 520	131mm, 104mm, 76mm	Compressed air mist	Standard Penetration Test, Nspt values obtained, bulk sampling, core sampling. Visual observations of ground and groundwater conditions. Geobore S coring, Installation of standpipe wells, in-situ packer tests, permeability tests, pressuremeter testing.
Dynamic Sampler Probes	Competitor DP Rig	100mm	N/A	Disturbed sampling of ground conditions

Operation	Equipment	Nominal diameter, mm	Flush	Comments
Trial Pits	12t tracked excavator	N/A	N/A	Bulk sampling, visual description of deposits

The exploratory locations were selected by Mott McDonald and set out using GPS co-ordinates subject to work space restrictions and available access. The 'as constructed' exploratory locations were subsequently surveyed using Trimble V8 GPS equipment to the Ordinance Survey, Irish Transverse Mercator (ITM) system of co-ordinates and elevations to Malin Head datum. These locations are shown on the Exploration Location Layout and Plans (dwgs ref; P21060-SI-A and P21060-SI-01 & P21060-SI-02) presented in **APPENDIX 3K** of this factual report.

3.3.2 Cable Percussion Boreholes

A total of thirty two (32) cable percussion boreholes were advanced to depths between 2.0m below ground level (bgl) and 9.8m bgl using PGL's Dando 2000 cable percussion rig and 200mm diameter. casing. The records are presented in **APPENDIX 3A.**

3.3.3 Cable Percussion with Rotary Follow-on

Thirty four (34) cable percussion with rotary follow on boreholes were advanced to depths between 12.40m bgl and 38.30m bgl using PGL's Dando 2000 rig and Soilmech PSM rotary rig and 131mm dia. boring. The records are presented in **APPENDIX 3A.**

3.3.4 Geobore S Boreholes

Twenty two (22) Geobore S Boreholes were advanced to depths between 4.90m bgl and 31.70m bgl using PGL's Soilmech PSM rotary rig. The records are presented in **APPENDIX 3A.**

3.3.5 Dynamic Sampler Boreholes

Forty six (46) dynamic sampler boreholes were advanced to depths between 0.55m bgl and 4.8m bgl using PGL's Competitor DP Rig and 100mm diameter casing. The records are presented in **APPENDIX 3A.**

3.3.6 Trial Pits

A total of ninety three (93) trial pits and two (02) pits for the purpose of infiltration testing were excavated to depths 0.30m bgl to 4.60m bgl using a 12t tracked excavator. Trial pits terminated for a variety of reasons as outlined on the exploratory logs presented in **APPENDIX 3C** of this factual report.

3.3.7 Sampling

A total of nine hundred and twenty five (925) bulk disturbed samples (B), seven hundred and sixty three (763) small disturbed samples (D), twenty six (26) undisturbed samples (U), eighty eight (88) standard penetration test liner samples (SPTLS), thirty five (35.1) lin.m of cored soil, three hundred and seventy two (371.9) lin.m of Geobore S core and one hundred and thirty three (133.2) lin.m of rock core were taken during the fieldworks in accordance with Geotechnical Investigation and Sampling – Sampling Methods and Groundwater Measurements (EN ISO 22475-1:2006).

3.3.8 Groundwater Monitoring

Groundwater was recorded when encountered during boring over a period of 20 minutes, noting any changes that may occur. Groundwater levels were also monitored at start and end of the drilling shifts.

It should be noted that the normal rate of boring may not permit the recording of equilibrium groundwater levels for any one groundwater water strike where casing may exclude low volume flows as the borehole progresses. Groundwater conditions observed in the borings and excavations are those appertaining to the period of the investigation. Groundwater levels may be subject to diurnal, seasonal and climatic variations and can also be affected by drainage conditions, tidal variations etc. The groundwater regime should be assessed from standpipe well installations, where available. Groundwater was noted during borings and excavations at a depth range of 0.3m bgl to 34.6m bgl during the period of works.

Twenty (23) number 50mm diameter HDPE standpipe well installations were constructed in exploratory boreholes. Details of the ground water encountered are presented on the relevant exploratory logs within **APPENDIX 3A** of this factual report.

3.3.9 Standard Penetration Tests

A total of eight hundred and seventy five (875) number Standard Penetration Tests, N values, were carried out in the boreholes using the 60º solid cone (CPT) and the standard split barrel sampler (SPT). Standard Penetration Testing was carried out in accordance with Geotechnical Investigation and Testing, Part 3 Standard penetration test, BS EN ISO 22476-3:2005+A1:2011. The data was presented on the relevant logs in **APPENDIX 3A**.

3.3.10 Plate Load Tests

Ten (10) plate loading/ bearing tests were undertaken using 600mm diameter plates and a 12t tracked excavator for reaction, in accordance with BS 1377-9:1990+A2 for the purpose of determining settlement. The data from the testing is attached, herein, **APPENDIX 3E**.

3.3.11 California Bearing Ratio Tests

Fifteen (15) tests to determine California Bearing Ratio (CBR) were undertaken using 450mm diameter plates and 12t tracked excavator for reaction, in accordance with Testing undertaken in accordance with BS 1377-9:1990+A2. Nineteen (19) tests were originally specified in the scope of works. CBR determination at locations WTP-TP055, WTP-TP119 and WTP-TP120 was omitted in error by site engineer during excavation of associated trial pit. A return visit to the locations at a later date was not possible due to land owner issues. Additional tests were undertaken at locations WTP-TP038 and WTP-TP060 in error. The data from the testing is attached, herein, **APPENDIX 3E**.

3.3.12 Falling Head Tests

Six (06) *in situ* falling head permeability tests were carried out in accordance with BS5930: 2015, Section 4: Cl. 25.4, within the superficial deposits over duration of one (1) hour. The processed test data was presented in **APPENDIX 3E**, of this factual report. The shape or intake factor, f was derived from the condition at the base of the borehole at the test depth and test geometry as per Hvorslev (1951).

$$k = \frac{A}{fd} \frac{\log_e (H_0 / H_t)}{t}$$

Generally for all tests the specific depth range of the test was the deposits below the depth of casing. A mean k measured ($k_H = k_V$), permeability in the soil was assumed equal in both horizontal and vertical direction, ($k_H/ k_V = 1.$). The test geometry provided a shape factor, f for the test undertaken in the standpipe wells.

3.3.13 Packer Tests

In situ packer permeability tests were undertaken in two (02) of the boreholes within the Limestone bedrock. A double packer was used over a test sections 2.0m in length at 5 number pressures; 1, 2, 3, 2, 1bar. The results for packer tests are presented in **APPENDIX 3E**, of this factual report.

3.3.14 Cone Penetrometer Testing

Sixteen (16) pressuremeter tests were carried out in boreholes constructed using either a cable percussion rig or rotary drilling rig, operated by PGL. The tests were carried out using a high-pressure dilatometer (HPD) and a reaming pressuremeter (RPM). The testing was carried out in general accordance with BS EN ISO 22476-5 (2012) and BS 5930 (2020). The findings are accompanying this factual report, **APPENDIX 3F**.

3.3.15 Geophysical Survey

A geophysical survey consisting of seismic refraction and electrical resistivity tomography was undertaken by PGL between 22nd June and 11th August 2021. The survey was carried out in accordance with BS5930 and BS7022 and the Geological Society Engineering Group Working Party Report on Engineering Geophysics. The findings are presented in **APPENDIX 3G** of this factual report.

3.3.16 Backfill

Exploratory boreholes with monitoring standpipes were backfilled with gravel and bentonite (grout). Elsewhere exploratory locations were backfilled with their arisings and bentonite.

3.4 LABORATORY TESTING

3.4.1 General

All samples were transported to Priority Geotechnical's laboratory in Midleton, Co. Cork examined, logged and prepared for scheduled testing. Laboratory testing was scheduled by Mott McDonald. Testing was carried out by PGL, in accordance with BS1377 (1990), Methods of test for soils for civil engineering purposes.

Specialist chemical testing was carried out by UKAS Accredited (2183) lab Eurofins Chemtest UK Ltd. on behalf of PGL.

UKAS Accredited (2788) lab GSTL carried out specialist geotechnical testing on behalf of PGL.

3.4.2 Summary of Testing

Soil – Test Type	Nr.
Natural moisture content	488
Atterberg limits	450
Particle size distribution	501
pH	88
Sulphate content SO_4 (water soluble)	88
Sulphide content	88
Organic matter	21
Loss on ignition	10
Suite B testing	56
California Bearing Ratio – Relationship	26
Dry density/ Moisture Content Relationship (Light 2.5kg)	09
Dry density/ Moisture Content Relationship (Heavy 4.5kg)	15
Dry density/ Moisture Content Relationship (vibrating hammer)	01
Moisture Condition Value (MCV) Single	54
MCV Relationship	12
Unconsolidated Undrained Triaxial – single specimen (QUT)	47
Unconsolidated Undrained Triaxial – multi stage (UUT)	38
Consolidated drained triaxial 100mm dia – multi stage (CD)	03

Soil – Test Type	Nr.
Consolidated drained triaxial 102mm dia – single stage (CUT)	03
Consolidated drained triaxial 100mm dia – single stage (CD)	01
Consolidated drained triaxial 38mm dia– single stage (CD)	02
One dimensional consolidation Tests – 5 pressures	11
One dimensional consolidation Tests – 6 pressures	20
One dimensional consolidation Tests – 7 pressures	24
One dimensional consolidation Tests – 8 pressures	01
Shear strength determination by Small direct shearbox	02

Rock – Test Type	Nr.
Point Loads (I_{S50})	116
Unconfined compressive strength	51
Petrographic Analysis – Awaiting Results	12

Water – Test Type	Nr.
Water test suite	23

The laboratory test results were presented in **APPENDIX 3H**.

Please note that all samples shall be retained for a period no longer than 28 days from the date of the final report. Thereafter all remaining samples shall be appropriately disposed of unless a written instruction to the contrary is received by PGL prior to the date of this reporting and within the 28 day period outlined above. Laboratory testing will result in a reduction of sample quantity and in some cased the use of the full sample mass. Samples already tested may not be suitable or available for further testing.

APPENDIX 3A

BOREHOLE RECORDS

Type	Quantity, Nr.	Depth Range, m bgl	Comment
Cable Percussion Boreholes	32	2.0 – 9.8	WTP-BH007, WTP-BH007A, WTP-BH007B, WTP-BH013A, WTP-BH021, WTP-BH021A, WTP-BH023, WTP-BH024, WTP-BH025, WTP-BH028, WTP-BH029, WTP-BH031, WTP-BH035A, WTP-BH037, WTP-BH039, WTP-BH040, WTP-BH048, WTP-BH048A, WTP-BH048B, WTP-BH050, WTP-BH052, WTP-BH053, WTP-BH055A, WTP-BH062, WTP-BH065, WTP-BH065A, WTP-BH068, WTP-BH075, WTP-BH077, WTP-BH079, WTP-BH081 & WTP-BH085.
Cable Percussion & Rotary Boreholes	34	12.40 – 38.30	WTP-BH003, WTP-BH012, WTP-BH013, WTP-BH014, WTP-RO014, WTP-BH016, WTP-BH020, WTP-BH022, WTP-BH026, WTP-BH034, WTP-BH035, WTP-BH036, WTP-BH041, WTP-BH042, WTP-BH043, WTP-BH044, WTP-BH046, WTP-BH054, WTP-BH055, WTP-BH056, WTP-BH058, WTP-BH059, WTP-BH061, WTP-BH063, WTP-BH066, WTP-BH069, WTP-BH070, WTP-BH072, WTP-BH074, WTP-BH076, WTP-BH079A, WTP-BH083, WTP-BH084, WTP-BH086 & WTP-BH087.

Project Name: Water Supply Project - Ground Investigation Contract - Lot 1	**Project No.** P21060_F01	**Co-ords:** 572409E - 670679N **Level:** 55.52m OD	**Date** 20/07/2021
Location: Water Treatment Plant		**Dimensions (m):** 4.10 x 0.90	**Scale** 1:25
Client: Irish Water		**Depth:** 3.60m BGL	**Logged** OD

Water Strike & Backfill	Samples & In Situ Testing: Depth (m)	Type	Results	Depth (m)	Level (m OD)	Legend	Stratum Description
				0.20	55.32		(TOPSOIL) Light brown, slightly gravelly sandy SILT. Sand is fine to coarse. Gravel is fine to coarse, sub--rounded to rounded, Sandstone lithology. TPS
	0.50 - 1.50 0.50 - 1.50	B D					Firm to stiff, light brown, gravelly very sandy SILT with low cobble content. Sand is fine to coarse. Gravel is fine to coarse, sub-angular to sub-rounded, Sandstone lithology. Cobbles are sub-rounded to rounded, 200mm dia., Sandstone lithology. TLs
	1.50 - 1.80 1.50 - 1.80	B D		1.50	54.02		Light brown, slightly gravelly SAND. Sand is fine to coarse. Gravel is fine to coarse, sub-rounded to rounded, Sandstone lithology. TLs
	2.00 - 3.00 2.00 - 3.00	B D		1.80	53.72		Stiff to very stiff, light brown, sandy gravelly SILT with low cobble content and low boulder content. Sand is fine to coarse. Gravel is fine to coarse, sub-rounded to rounded, Sandstone and Siltstone lithology. Cobbles are sub-rounded to rounded, 200mm dia., Sandstone lithology. Boulders are sub-rounded to rounded, 300mm dia., Sandstone lithology. TLs
	3.00 - 3.60 3.00 - 3.60	B D					
				3.60	51.92		End of Pit at 3.600m

Stability: Good.
Plant: 12t tracked excavator.
Backfill: Arisings.

Groundwater: None encountered.

Remarks: Trial pit terminated at 3.60m bgl, boulder obstruction. Unable to drive vanes into soil at 0.50m bgl and 1.00m bgl. Tests not carried out. Excavated 20m away from original location due to fenced off badger area.

Sheet 1 of 1

Project Name: Water Supply Project - Ground Investigation Contract - Lot 1	**Project No.** P21060_F01	**Co-ords:** 572456E - 669886N **Level:** 37.33m OD	**Date** 05/08/2021
Location: Water Treatment Plant		**Dimensions (m):** 5.00 × 0.80 **Depth:** 3.80m BGL	**Scale** 1:25
Client: Irish Water			**Logged** AO

Water Strike & Backfill	Samples & In Situ Testing: Depth (m)	Type	Results	Depth (m)	Level (m OD)	Legend	Stratum Description
				0.10	37.23		(TOPSOIL) Brown, slightly organic slightly sandy SILT with rootlets. Sand is fine to medium. TPS
	0.40 - 0.60	B					Firm, brown with grey and orange mottling, slightly organic sandy CLAY. Sand is fine to medium. TLs
	0.50	D					
	0.50		HVP=72kPa				
	0.50		HVP=80kPa	0.60	36.73		Dark brown, plastic, slightly clayey fibrous PEAT.
	0.50		HVP=90kPa				
	0.60 - 1.00	B					
	0.80	D					
	1.00		HVP=45kPa	1.00	36.33		Soft, light brown, slightly organic slightly sandy slightly gravelly CLAY with low cobble content. Sand is fine to coarse. Gravel is fine to coarse, angular to sub-rounded, various lithologies. Cobbles are sub-rounded, Limestone lithology. TLs
	1.00		HVP=50kPa				
	1.00		HVP=60kPa				
	1.50	D					
	1.50 - 1.80	B					
				1.80	35.53		Grey, slightly clayey gravelly SAND with low cobble content. Sand is fine to coarse. Gravel is fine to coarse, angular to sub-rounded. Cobbles are sub-angular to sub-rounded, various lithologies. TLs
	2.50 - 3.00	B					
	3.50 - 3.80	B		3.50	33.83		Grey, gravelly SAND with low cobble content. Sand is fine to coarse. Gravel is fine to coarse, sub-angular to rounded, various lithologies. Cobbles are sub-angular to sub-rounded, various lithologies. TLs
				3.80	33.53		End of Pit at 3.800m

Stability: Good (0.00m - 1.50m) to Poor (1.50m - 3.50m)
Plant: 12t tracked excavator
Backfill: Arisings.

Groundwater: 2.80m: Steady flow rate. Rose to 2.50m at end of excavation.

Remarks: Trial pit terminated at 3.80m bgl due to instability. Hand vane test carried out at 0.50m bgl and 1.00m bgl using 33mm blade

APPENDIX 3D

PEAT PROBE & RUSSIAN CORE RECORDS*

*Not carried out during period of investigation

APPENDIX 3E

FIELD/ IN-SITU TEST RESULTS

California Bearing Ratio Test Result

Plate Load Test Result

JOB REF:	P21060	
JOB Name:	Water Supply Project Eastern & Midlands region - Lot 1	
Location	WTP-TP047	
Test Number	1	
Depth	0.50	**m bgl**
Bedding Material	Sand	
Date	03/08/2021	**DD/MM/YYYY**
Ambient Temperature	19	**°C**
Ground Conditions	Light brown with grey and orange brown mottling, slightly sandy slightly gravelly CLAY	
Working load	120	**KN/m^2**
Plate Diameter	600	**mm**
Plate Area	0.2826	**m^2**

E: 572208.28	
N: 670693.64	
mOD	**48.46**

Zero gauge	**G1**	**G2**	**G3**
	0.00	**41.25**	**35.30**

% Working Load	Force (kN)	Pressure (KN/M^2)	Time (min)	Div (mm)	Div (mm)	Div (mm)	Average	Δ h, mm
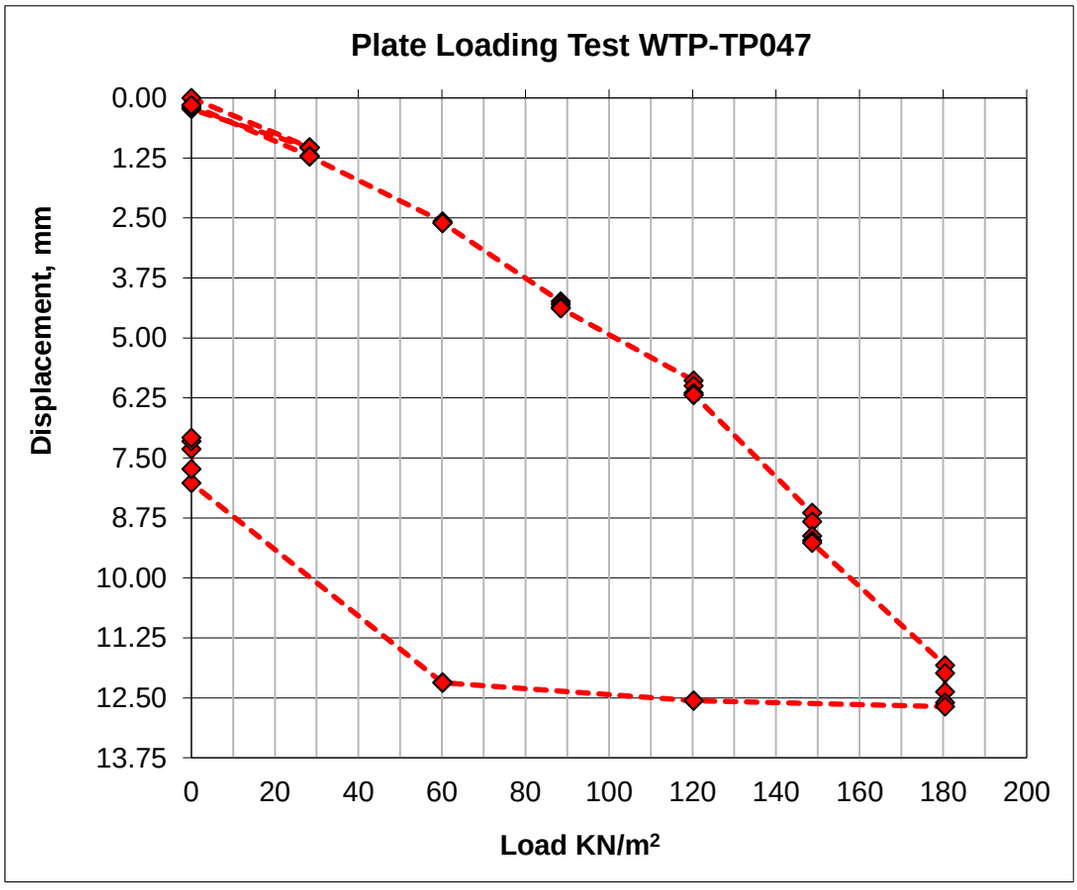
0	0	0	1	-8.75	33.75	28.36	17.79	7.73
0	0	0	4	-8.37	34.18	28.79	18.20	7.32
0	0	0	8	-8.20	34.33	28.96	18.36	7.15
0	0	0	16	-8.15	34.42	29.04	18.44	7.08

Load to Achieve 1.25mm of Settlement:	**33** kPa
Subgrade Modulus (MN/m^2/m) k $_{750}$:	**22**
Estimated CBR (NRA DMRB HD25-26 3.62)	**2.1** %
Plate scaling factor	**0.83**
Plate rigidity factor	**1.00**



Testing undertaken in accordance with BS 1377-9:1990+A2

Falling Head Permeability Test

ABBREVIATIONS

Pressuremeter types	
HPD	High pressure dilatometer
SBP	Self-boring pressuremeter
RPM	Reaming pressuremeter

In situ horizontal stress (σho)	
p_o	Cavity reference pressure
$\sigma ho_{(M\&R)}$	In situ horizonal stress from Marsland & Randolph (1977) analysis (where $P_{yield} = P_L - S_u$)
$\sigma ho_{(LO)}$	In situ horizonal stress from lift-off analysis (SBP)
$\sigma ho_{(H\&W)}$	In situ horizonal stress from unloading curve (Houlsby & Withers, 1988; RPM)
$\sigma ho_{(CM)}$	In situ horizonal stress from curve modelling (Whittle, 1999; SBP)

Undrained shear strength (kPa)	
$S_{u\ (loading)}$	Shear strength from loading curve, via Gibson & Anderson (1961) analysis
$S_{u\ (M\&R)}$	Shear strength from Marsland & Randolph (1977) analysis (where $S_u = P_{yield} - P_L$)
$S_{u\ (unloading)}$	Shear strength from unloading curve, via Jefferies (1988) analysis (RPM & SBP)
$S_{u\ (H\&W)}$	Shear strength from unloading curve, via Houlsby & Withers (1988) analysis (RPM)
P_L	Limit pressure via Gibson & Anderson (1961) analysis
$P_{L\ (H\&W)}$	Limit pressure via Houlsby & Withers (1988) analysis (RPM)

Shear modulus parameters	
G_i	Initial shear modulus (MPa) derived from steep linear section of loading path, prior to yield
G_{ur}	Shear modulus (MPa) derived from unload-reload loop
ε_c	Cavity strain range over the unload-reload loop
β	Exponent of elasticity, after Bolton & Whittle (1999), where 1 is linear elastic
α	Shear stress constant (MPa), after Bolton & Whittle (1999)

Other	
P_{max}	Maximum test pressure reached prior to instrument unloading (MPa)
P_{yield}	Pressure at which material yield is assessed, defined as end of linear loading curve

1.0 INTRODUCTION

1.1 Site Details

At the request of Priority Geotechnical Ltd, In Situ Site Investigation Limited (In Situ S.I. carried out pressuremeter testing as part of the Water Supply Project – Eastern and Midlands Region project. The works form part of the proposed scheme to transport water from the Parteen Basin in North Tipperary to Peamount Reservoir in West Dublin.

The project was split into three lots, with this report presenting pressuremeter testing carried out on Lot 1. Testing was centred around the Water Treatment Plant Site to the northeast of Limerick city centre.

The pressuremeter testing was attempted in seven boreholes. The fieldwork was carried out on site from 5th to 20th October 2021.

This report presents the factual records of the pressuremeter testing, together with an interpretation of the test results to derive material parameters. Further specific details relating to the ground investigation, i.e., borehole locations and exploratory hole logs, are provided in the Priority Geotechnical Ltd report, Project No. P21060.

2.0 FIELDWORK

2.1 General

Sixteen pressuremeter tests were carried out in boreholes constructed using cable percussion boring and rotary drilling rigs, operated by Priority Geotechnical Ltd. The tests were carried out using a high-pressure dilatometer (HPD) and a reaming pressuremeter (RPM). The testing was conducted in general accordance with BS EN ISO 22476-5 (2012) and BS 5930 (2020). The test depths were scheduled by the Client. A summary table of the tests is presented below.

Table 2.1. *Summary of pressuremeter tests.*

Borehole Reference	Test Reference	Date	Test Depth	Probe	Operator	Remarks

2.2 High Pressure Dilatometer (HPD)

The HPD is a cylindrical 95mm diameter probe which is inserted into a cored 99 diameter test pocket, drilled using a T6-H core barrel. The HPD is therefore termed a pre-bored type instrument. The probe, approximately 1.5m in length, has a central section which is covered by a rubber membrane. Pressure applied to the inside of the instrument, via compressed air, forces the membrane to expand against the test pocket wall. The radial displacement of the inside boundary of the membrane is measured at six points equally distributed around the centre of the expanding section, by free moving arms. This displacement, and the pressure necessary to cause the movement, is continuously monitored by transducers contained within the instrument. The HPD is linked to the ground surface via a combined pressure hose and electrical power/communication umbilical cable which connects the instrument to the pressure source and readout unit.

Analogue to digital conversion of the displacement and pressure transducers is carried out within the pressuremeter electronics package. The pressuremeter output comprises a multiplexed signal which connects through the pressuremeter interface unit to the USB port of a laptop computer. Software, supplied by Cambridge Insitu Ltd, is used to record the data, convert the received signals to engineering units (using the pressure and displacement transducer calibrations) and display these in real time on the laptop computer during testing to allow control of the test by the operator. Plotting these readings of displacement against pressure produces a loading curve for the material being tested. A number of mathematical analyses are applied to translate this loading curve into material strength and stiffness parameters.

The testing on this project was undertaken using probes manufactured by Cambridge Insitu Ltd. Details of the instruments are provided below. Corrections measured for membrane stiffness (essentially resistance to inflation in air were carried out during the testing program.

2.3 Reaming Pressuremeter (RPM)

The RPM is a cylindrical 47mm diameter probe which is placed into a pre-drilled pocket. The RPM is termed a full displacement type instrument. The probe, approximately 0.60m in length, has a central section which is covered by a rubber membrane. Pressure applied to the inside of the instrument, via compressed air, forces the membrane to expand against the test pocket wall. The radial displacement of the inside boundary of the membrane is measured at three points equally distributed around the centre of the expanding section, by free moving arms. This displacement, and the pressure necessary to cause the movement, is continuously monitored by transducers contained within the instrument. The RPM is linked to the ground surface via a combined pressure hose and electrical power/communication umbilical cable which connects the instrument to the pressure source and readout unit.

Analogue to digital conversion of the displacement and pressure transducers is carried out within the pressuremeter electronics package. The pressuremeter output comprises a multiplexed signal which connects through the pressuremeter interface unit to the USB port of a laptop computer. Software, supplied by Cambridge Insitu Limited, is used to record the data, convert the received signals to engineering units (using the pressure and displacement transducer calibrations and display these in real time on the laptop computer during testing to allow control of the test by the operator.

The testing on this project was undertaken using probes manufactured by Cambridge Insitu Limited. Corrections measured for membrane stiffness (essentially resistance to inflation in air were carried out during the testing programme.

Table 2.2. *Pressuremeter instrument details.*

Instrument	Diameter (mm)	Pressure Capacity (MPa)	Displacement Measurement	ID & Serial No.
HPD	95	20	6 arms at 60° 3 opposite pairs	Kylie (HPD06)
RPM	47	10	3 arms at 120°	Felicity (RPM01)

2.4 HPD Testing Procedure

The boreholes were constructed using a rotary drilling rig by conventional rotary coring at nominal 146mm diameter, using water flush, to approximately 1.5m above the scheduled pressuremeter test depth. A 2 to 3m long section was then drilled using a T6-H size core barrel to provide a test pocket of nominal diameter 99.2mm. The HPD was inserted into the test pocket as soon as practicably possible using 2⅜ API drill rods, lowered in via the drilling rig winch.

The pressuremeter tests were carried out in a stress-controlled manner using a manually operated gas control box to pressurise the HPD at an appropriate rate for the ground conditions. During the tests a number of unload-reload loops were performed. Before carrying out the loops, a short holding period was maintained to allow reduction of creep on the ground. The loading was continued until either the ground had failed, maximum arm displacement had occurred, or if at lower pressure, expansion around the probe was uneven, such that in the opinion of the operator, continuation of the loading would result in risk of damage to the probe. Upon unloading and deflation of the membrane, the instrument was withdrawn from the tested section and recovered back to the ground surface. The boreholes were then advanced to the next specified test depth and the sequence repeated, until the testing program was completed.

2.5 RPM Testing Procedure

The borehole was constructed using a cable percussion boring rig with 8” & 6” casing. The RPM testing was carried out in natural superficial deposits with the borehole being advanced to approximately 0.4m above the scheduled pressuremeter test depth. A 0.8m long section was then created using an SPT split spoon, with a nominal diameter of 51mm. The RPM was inserted into the test pocket as soon as practicably possible using the drill rods, on the cable of the drilling rig.

The pressuremeter tests were carried out in a stress controlled manner using a manually operated gas control box to pressurise the RPM at an appropriate rate for the ground conditions. During the tests a number of unload-reload loops were performed. Before carrying out the loops a short holding period was maintained to allow reduction of creep on the ground.

The loading was continued until either the strain or pressure capacity of the RPM was approached (typically 60%), or if at lower pressure, expansion around the probe was uneven such that in the opinion of the operator, continuation of the loading would result in risk of damage to the probe via a membrane burst. Upon unloading and deflation of the membrane, the RPM was recovered back to the ground surface.

3.0 TEST INTERPRETATION

3.1 Introduction

The pressure / cavity strain curve has been analysed to determine various material parameters, as appropriate, including:

Cavity reference pressure	p_o
Initial shear modulus	G_i
Yield	P_{yield}
Unload-reload shear modulus	G_{ur}
Undrained shear strength	s_u
Limit Pressure	P_L

The analysis methodologies used have followed the industry accepted practice for interpretation of pressuremeter tests (e.g., Clarke, 1996; Mair & Wood, 1987). The nature of the material tested can result in some limitations in the application and appropriateness of the interpretation methods. Any such limitations, if present, are discussed below and should be considered when selecting material parameters for engineering design purposes.

3.2 Description of Material Tested

An indication of the geology at the depth of each test completed is provided on the plots in Appendix A. The ground conditions encountered in the boreholes typically comprised brown, slightly sandy slightly gravelly CLAY. For more detail refer to the Priority Geotechnical Ltd report, Project No. P21060.

3.3 Cavity Reference Pressure

The act of drilling into undisturbed ground relieves the in situ horizontal stress, which is then effectively restored as the instrument membrane is initially pressurised. During this initial loading, a linear pressure / displacement response is anticipated as the pressure is increased and then exceeds the cavity reference pressure. With the HPD instrument, the direct correlation between the cavity reference pressure and in situ horizontal stress is problematic and should be treated with caution. This is due to the large potential for disturbance during test pocket formation and probable relaxation or stress relief of the ground following drilling of the open test pocket.

Marsland and Randolph (1977) proposed that in the vicinity of in situ horizontal stress, soil behaves elastically and therefore the initial loading curve is linear. This elastic behaviour will cease when the undrained shear strength of the soil in the cavity wall is reached, and hence the loading curve will then begin to curve away from linearity. The point at which the loading curve becomes non-linear (or the onset of yield, P_{yield}), represents the in situ horizontal stress plus the undrained shear strength at this point:

$$P_{yield} = \sigma_{ho} + s_u.$$

The tests performed at the site were in CLAY. The analysis method used to determine the undrained shear strength assumes the material is a perfectly elastic prior to failure and perfectly plastic post failure.

3.4 Shear Modulus

A pressuremeter test, in an elastic, perfectly plastic material, imparts a pure shear failure, hence it is normal to report shear modulus in preference to an elastic modulus. Shear modulus is determined from the initial loading curve, and from unload reload loops, performed at intervals during the test progression. The relationship used to determine shear modulus (G) is below, where ε_c is the cavity strain range:

$$G = \frac{1}{2}\frac{dp}{d\varepsilon c}$$

Note is made that often in clays and sands some hysteresis is generally evident, and it is possible to determine a secant shear modulus from the reloading portion of an unload reload loop. A high degree of consistency is often possible when plotting secant shear modulus results from individual tests. This may be further extended to a series of tests in a geological formation by normalising via undrained shear strength, or in situ stress. The various plots for both initial loading shear modulus (G_i) and the shear modulus derived from unload reload loops (G_{ur}) are presented graphically in the test results.

Individual unload reload loops can also be analysed to determine small strain stiffness parameters. This is achieved by taking a secant modulus from the base of the loop, to the individual points on the reloading curve. Plotting the cavity strain range against modulus, gives an indication of how stiffness varies with strain. Further, a Bolton and Whittle (1999) analysis can be performed to investigate the non-linear elastic / plastic behaviour.

The secant modulus (G) can be converted to an undrained elastic (Youngs) modulus (E_u) by use of the following relationship:

$$E_u = 2.G(1 + \upsilon) \qquad \text{Where } \upsilon = \text{Poisson's ratio}$$

The Poisson's ratio can be either undrained (υ_u) or drained (υ'). For undrained elastic soil (clay) a υ_u value of 0.5 can be taken. For drained conditions in any soil, the value of υ' is typically 0.1 to 0.3. The Poisson's ratio for weak rocks is also generally taken as 0.1 to 0.3, with the difference between drained or undrained behaviour being relatively insignificant (Mair and Wood, 1987).

Plots of calculated secant modulus values at varying shear strain % are provided within the analysis results. It is noted that any user of this analysis should satisfy themselves that it is appropriate to the material tested.

3.5 Strength

Undrained shear strength has been determined using Gibson and Anderson (1961) for the loading portion of the test curve. This is the generally accepted method for the determination of strength and are based on the assumption of an elastic - perfectly plastic material. The analysis of Gibson and Anderson (1961) also provides a Limit Pressure (P_L). This is a limiting pressure defined as the pressure at which the change in volume (ΔV) divided by the current volume (V) is equal to one. While this is not achieved in practice, it can be determined by extrapolation. Note is also made that the definition of P_L is different to that associated with a Ménard Limit Pressure, and the two should not be interchanged.

In those tests using the RPM, the undrained shear strength analysis of Jefferies (1988) was attempted, although in it generally provides lower values than other methods. This method is based on contraction of the instrument during unloading, and is more applicable to plastic cohesive material, where in theory the instrument is often in direct contact with the tested material during both the loading and unloading phases of the test. A further method for assessing shear strength with the RPM instrument is that of Houlsby and Withers (1988). Their approach, formulated for tests in plastic clay, is similar to the method of Jefferies (1988), in that it uses the post-yield and unload path to provide shear strength and limit pressure evaluation, which is also linked with an assessment of the in situ horizontal stress.

3.6 Summary of Results

Summary tables of the analysis results for each borehole location are presented in Appendix A, followed by the individual full graphical analyses for the tests completed.

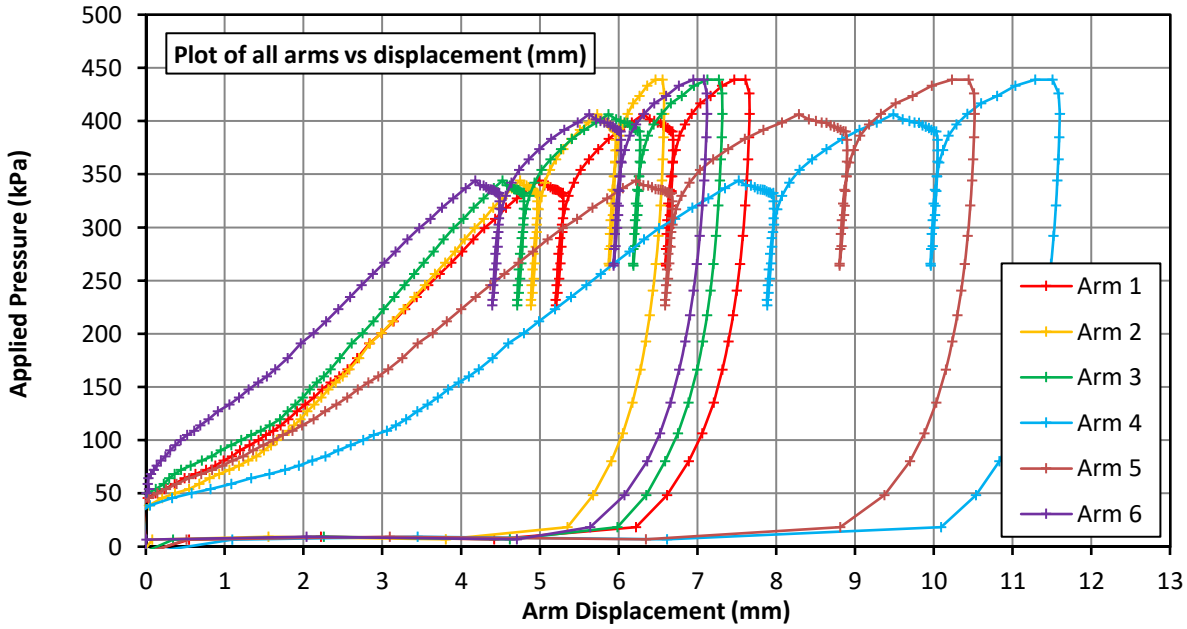
Pressuremeter Test Overview
High Pressure Dilatometer (HPD)

IN SITU SITE INVESTIGATION

Test Date	20/10/2021		**Test No.**	1
Borehole	WTP-BH010		**Test Depth (m)**	3.50
Coordinates (m)	571851 (E)	670505 (N)	**Elevation (m)**	61.70



Material description from borehole log:

Brown, slightly sandy slightly gravelly CLAY. Sand is fine to coarse. Gravel is fine to coarse, sub-angular to subrounded.
TLs

Test pocket conditions:

Total core recovery:	40 %	Test pocket depth range:	
Solid core recovery:	- %	From: 2.00 m	to: 3.90 m
Rock quality designation:	- %	Flush: Water	

Test comment:

The test pocket was slightly oversize with some softened material evident from the initial arm response. The arms lifted off at 1.5 to 4.3mm. The po was estimated to be at 167kPa, with the following loading section being relatively short. Material yield was interpreted at 318kPa, with the test taken to a maximum pressure of 439kPa. Analysis of two unload reload loops provides modulus values of 23.7 to 28.2MPa. Derived undrained shear strength analysis provides a value of 151kPa.

Material description from borehole log:

Brown, slightly sandy slightly gravelly CLAY. Sand is fine to coarse. Gravel is fine to coarse, sub-angular to subrounded.
TLs

Test pocket conditions:

Total core recovery:	25 %	Test pocket depth range:	
Solid core recovery:	- %	From: 6.60 m	to: 8.60 m
Rock quality designation:	- %	Flush: Water	

Test comment:

The test pocket was oversize, with arms lifting off at 3.0 to 8.0mm. The po was estimated to be at 550kPa, with the following loading section being relatively short. Material yield was interpreted at 1030kPa, with the test taken to a maximum pressure of 1090kPa. The displacement-pressure response shown by the arms was variable with uneven arm expansion. Analysis of two unload reload loops provides modulus values of 65 to 91MPa. Derived undrained shear strength analysis provides a value of 480kPa.

Pressuremeter Test Overview
High Pressure Dilatometer (HPD)

IN SITU SITE INVESTIGATION

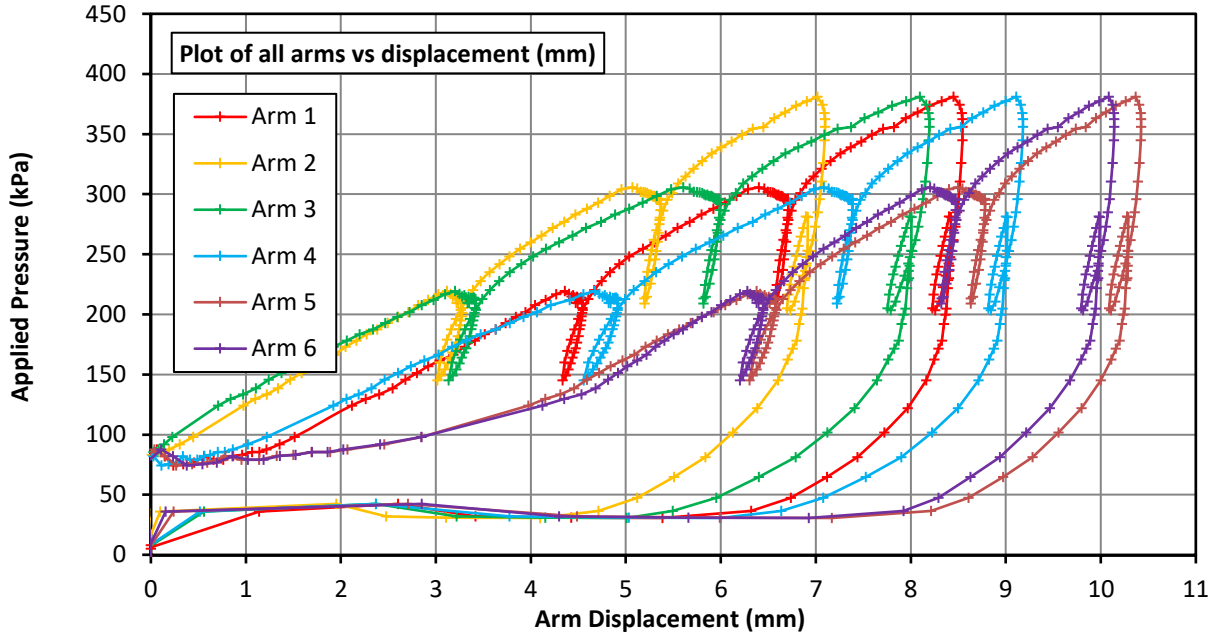
Test Date	05/10/2021		**Test No.**	1
Borehole	WTP-BH045		**Test Depth (m)**	6.40
Coordinates (m)	572238 (E)	670757 (N)	**Elevation (m)**	48.41



Material description from borehole log:

Brown, slightly sandy slightly gravelly CLAY with low cobble content. Sand is fine to coarse. Gravel is fine to coarse, sub-angular to sub-rounded, Limestone lithology. Cobbles are subrounded, 63-70mm dia., Limestone lithology. TLs

Test pocket conditions:

Total core recovery:	0 %	Test pocket depth range:	
Solid core recovery:	- %	From: 5.00 m	to: 7.00 m
Rock quality designation:	- %	Flush: Air	

Test comment:

The test pocket was softened and disturbed with arms lifting off at 0.9 to 4.6mm. The po was estimated to be at 139kPa, with the following loading section being short. Material yield was interpreted at 312kPa, with the test taken to a maximum pressure of 381kPa. The displacement-pressure response shown by the arms was slightly variable in terms of expansion. Analysis of three unload reload loops provides modulus values of 5.6 to 11.3MPa. Derived undrained shear strength analysis provides a value of 173kPa.

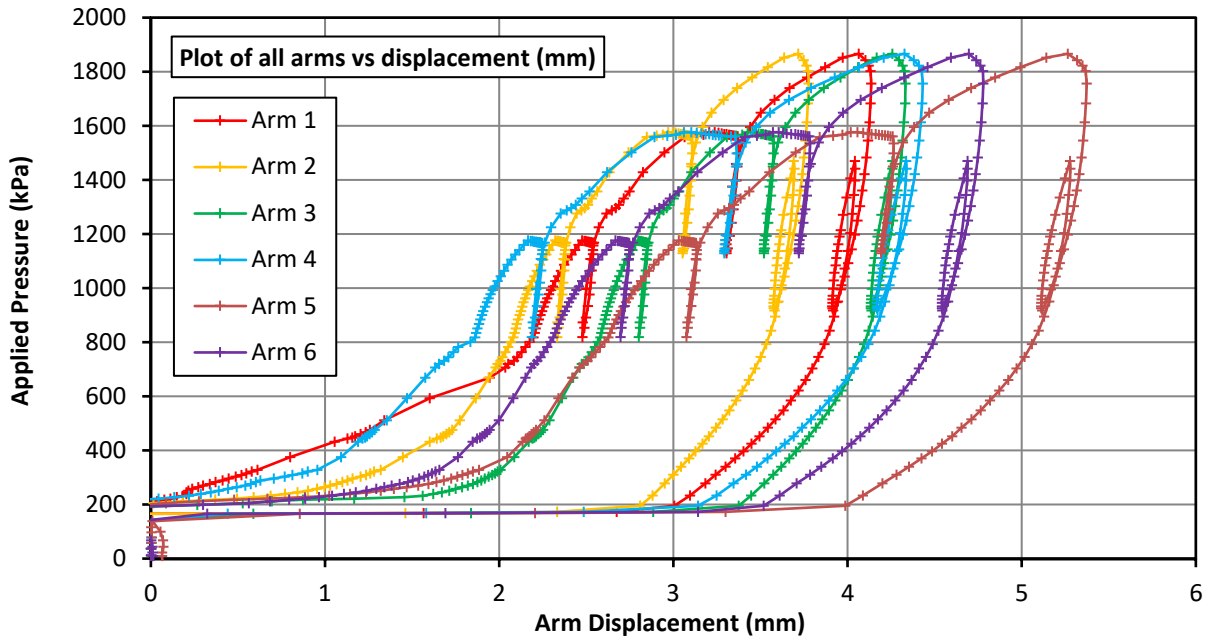
Coordinates (m)	572238 (E)	670757 (N)	**Elevation (m)**	48.41



Material description from borehole log:

Brown, slightly sandy slightly gravelly CLAY. Sand is fine to coarse. Gravel is fine to coarse, sub-angular to subrounded, Limestone lithology.
TLs

Test pocket conditions:

Total core recovery:	100 %	Test pocket depth range:	
Solid core recovery:	- %	From: 13.00 m	to: 15.00 m
Rock quality designation:	- %	Flush: Water	

Test comment:

The test pocket was a good size but softened, with arms lifting off at 1.2 to 2.2mm. The po was estimated to be at 476kPa, with the following loading section being relatively short. Material yield was interpreted at 1064kPa, with the test taken to a maximum pressure of 1886kPa. The displacement-pressure response shown by the arms was slightly variable in terms of expansion, with some disturbance indicated by arm 1. Analysis of three unload reload loops provides decreasing modulus values of 145 to 96MPa. Derived undrained shear strength analysis provides a value of 588kPa.

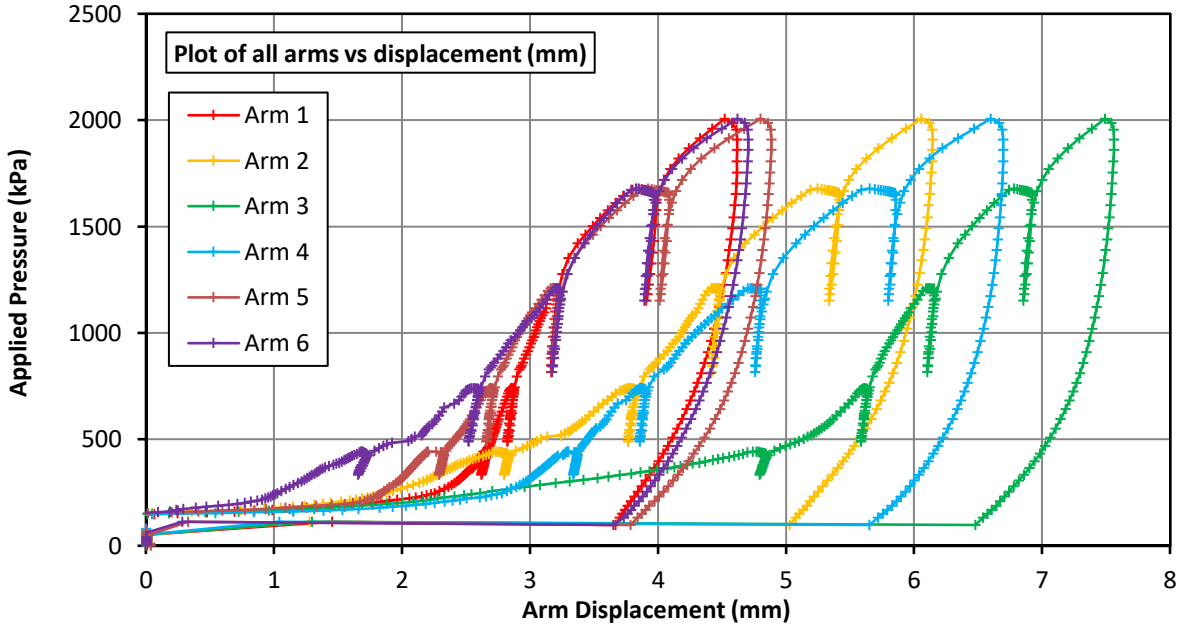
Borehole	WTP-BH051		**Test Depth (m)**	10.50
Coordinates (m)	572210 (E)	670527 (N)	**Elevation (m)**	45.18



Material description from borehole log:

Brown, slightly sandy slightly gravelly CLAY. Sand is fine to coarse. Gravel is fine to coarse, sub-angular, Limestone lithology.
TLs

Test pocket conditions:

Total core recovery:	67 %	Test pocket depth range:	
Solid core recovery:	- %	From:	9.50 m to: 11.40 m
Rock quality designation:	- %	Flush:	Air

Test comment:

The test pocket was reasonable in size, albeit with some disturbance, and arms lifting off at 2.2 to 3.5mm. The po was estimated to be at 594kPa, with the following loading section being relatively short. Material yield was interpreted at 1333kPa, with the test taken to a maximum pressure of 2006kPa. The displacement-pressure response shown by the arms was variable in terms of expansion. Analysis of three unload reload loops provides modulus values of 103 to 157MPa. The first loop attempted was ignored. Derived undrained shear strength analysis provides a value of 739kPa.

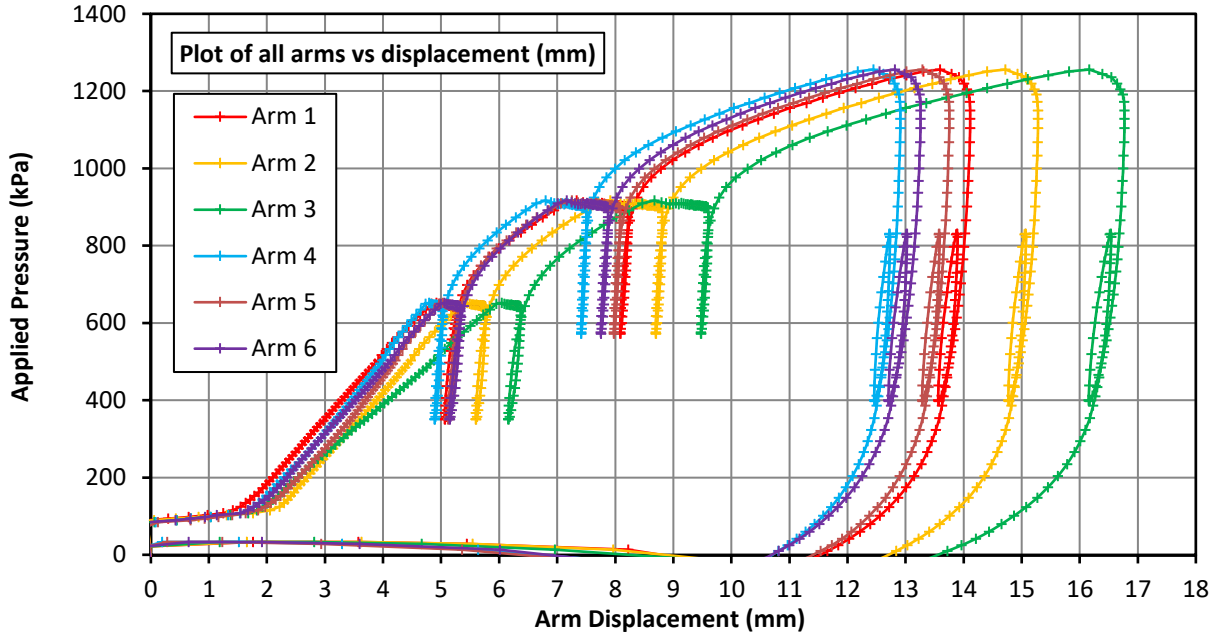
Pressuremeter Test Overview
High Pressure Dilatometer (HPD)

IN SITU SITE INVESTIGATION

Test Date	08/01/1900		**Test No.**	1
Borehole	WTP-BH064		**Test Depth (m)**	10.00
Coordinates (m)	572327 (E)	670574 (N)	**Elevation (m)**	50.43



Material description from borehole log:

Light brown, slightly sandy slightly gravelly CLAY with low cobble content. Sand is fine to coarse. Gravel is fine to coarse, subangular to sub-rounded, Limestone lithology. Cobbles are sub-angular, Limestone lithology.
TLs

Test pocket conditions:

Total core recovery:	0 %	Test pocket depth range:	
Solid core recovery:	- %	From: 8.00 m	to: 10.50 m
Rock quality designation:	- %	Flush: Water	

Test comment:

The test pocket was reasonable in size, but probably squeezed and softened with arms lifting off at 2.0 to 2.8mm. The po was estimated to be at only 182kPa, with the following loading section being relatively short. Material yield was interpreted at 727kPa, with the test taken to a maximum pressure of 1256kPa. The displacement-pressure response shown by the arms was variable in terms of expansion. Analysis of three unload reload loops provides modulus values of 38 to 63MPa. Derived undrained shear strength analysis provides a value of 545kPa.

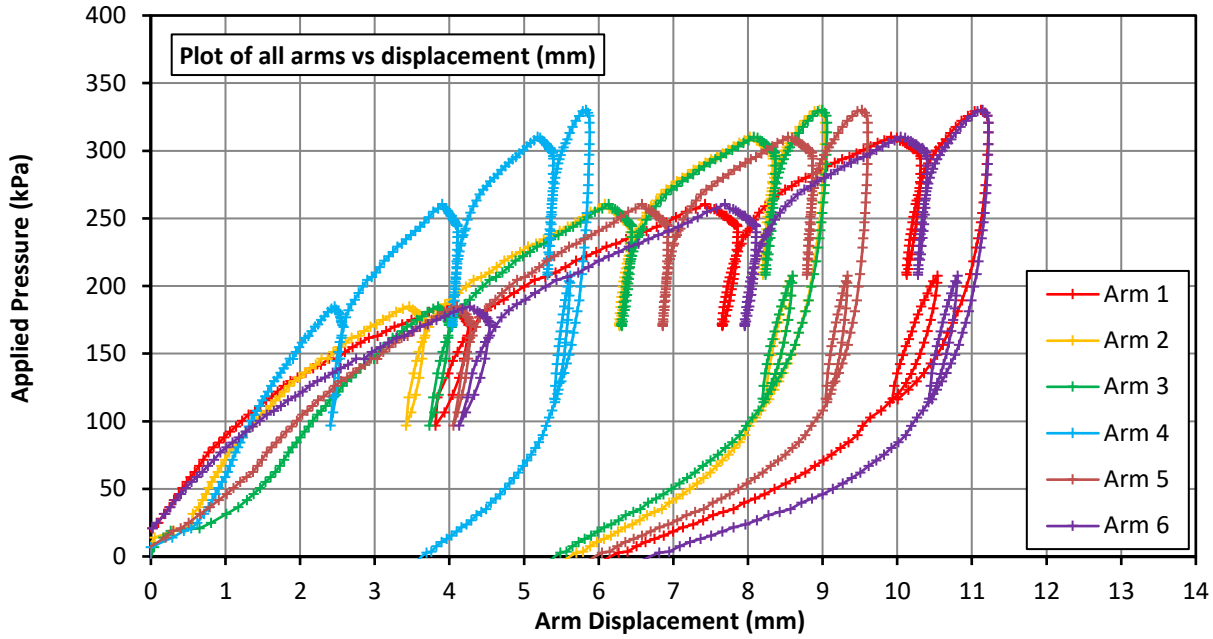
Test Date	05/10/2021		**Test No.**	1
Borehole	WTP-BH073		**Test Depth (m)**	9.00
Coordinates (m)	572376 (E)	670561 (N)	**Elevation (m)**	49.90



Material description from borehole log:

Brown, slightly sandy slightly gravelly CLAY. Sand is fine to coarse. Gravel is fine to coarse, sub-angular to subrounded, Limestone lithology.

Test pocket conditions:

Total core recovery:	10 %	Test pocket depth range:	
Solid core recovery:	- %	From: 8.30 m	to: 9.80 m
Rock quality designation:	- %	Flush: Air	

Test comment:

The test pocket was disturbed by utilisation of air flush. The arms lifted off at 0.3 to 1.4mm, with soft disturbed material indicated by the initial response of arms 2, 3, 4 & 5. The po was estimated to be low at 39kPa, with the following loading section being short. Material yield was interpreted at 126kPa from the stiffest arm 4 , with the test taken to a maximum pressure of 330kPa. The displacement-pressure response shown by the arms was variable with large expansion into softened material. Analysis of three unload reload loops provides increasing modulus values of 5.8 to 15.5MPa, with the final loop on the unload section providing a value of 6.8MPa. Derived undrained shear strength analysis provides a value of 82kPa. The analysis should be treated with caution due to likely disturbance.

Material description from borehole log:

Brown, slightly sandy slightly gravelly CLAY. Sand is fine to coarse. Gravel is fine to coarse, sub-angular to subrounded,Limestone lithology

Test pocket conditions:

Total core recovery:	0 %	Test pocket depth range:	
Solid core recovery:	- %	From: 12.80 m	to: 14.80 m
Rock quality designation:	- %	Flush: Water	

Test comment:

The test pocket was extremely oversize, drilled with water flush. The arms lifted off at 9.3 to 15.5mm, with disturbed material indicated by the initial response of most arms. The po was estimated to be at 376kPa, with the following loading section being relatively short. The onset of material yield was interpreted at 757kPa, with the test taken to a maximum pressure of 991kPa. The displacement-pressure response shown by the arms was reasonably consistent, albeit at varying expansion. Analysis of two unload reload loops provides increasing modulus values of 71 to 76MPa. Derived undrained shear strength analysis provides a value of 381kPa.

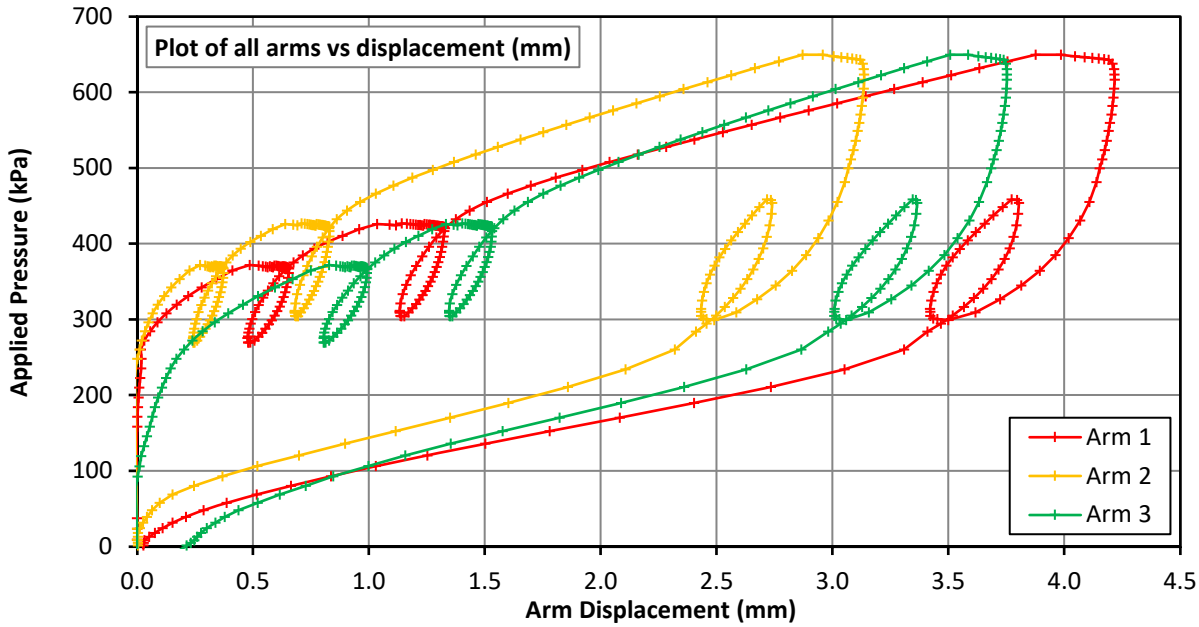
Pressuremeter Test Overview
Reaming Pressuremeter (RPM)

IN SITU SITE INVESTIGATION

Test Date	06/10/2021		**Test No.**	1
Test Location	WTP-BH075		**Test Depth (m)**	6.50
Coordinates (m)	572402 (E)	670566 (N)	**Elevation (m)**	49.97



Material description:

Stiff, brown, slightly sandy slightly gravelly CLAY with low cobble content. Sand is fine to coarse. Gravel is fine to coarse, sub-angular to sub-rounded, Limestone lithology. Cobbles are sub-rounded, 63-80mm dia., Limestone lithology.

Test pocket conditions:

Test pocket formed by:
SPT driven
SPT blows -

Test pocket depth range:
From: 6.00 m to: 6.80 m

Test comment:

Initial average arm lift off is interpreted at 235kPa, with some disturbance noted on arm 3. The loading curve was short, with yield interpreted at 303kPa, and the test taken to maximum pressure of 650kPa. The displacement-pressure response shown by the arms was variable in terms of expansion. Analysis of three unload-reload loops provides modulus values of 6.1 to 7.6MPa. Undrained shear strength analysis provide values of 68kPa from the expansion and 56kPa from the contraction.

Material description from borehole log:

Driller described: CLAY

Test pocket conditions:

Total core recovery:	0 %	Test pocket depth range:	
Solid core recovery:	- %	From: 6.00 m to: 8.00 m	
Rock quality designation:	- %	Flush: Water	

Test comment:

The test pocket was reasonable in size with arms lifting off at 2.2 to 3.0mm. The po was estimated to be at 288kPa, with the following loading section being relatively short. Material yield was interpreted at 703kPa, with the test taken to a maximum pressure of 1226kPa. The displacement-pressure response shown by the arms was variable in terms of expansion. Analysis of three unload reload loops provides modulus values of 42 to 61MPa. Derived undrained shear strength analysis provides a value of 415kPa.

Material description from borehole log:

Driller described: Boulder Clay.

Test pocket conditions:

Total core recovery:	0 %	Test pocket depth range:	
Solid core recovery:	- %	From: 9.10 m	to: 10.50 m
Rock quality designation:	- %	Flush: Water	

Test comment:

The test pocket was oversize with some disturbance noted during initial loading. The arms lifted off at 4.4 to 7.1mm. The po was estimated to be at 668kPa, with the following loading section being relatively short. Material yield was interpreted at 1333kPa, with the test taken to a maximum pressure of 1609kPa, where the membrane burst. The displacement-pressure response shown by the arms was variable in terms of expansion. Analysis of three unload reload loops provides modulus values of 60 to 94MPa. Derived undrained shear strength analysis provides a value of 665kPa.

Pressuremeter Test Overview
High Pressure Dilatometer (HPD)

IN SITU SITE INVESTIGATION

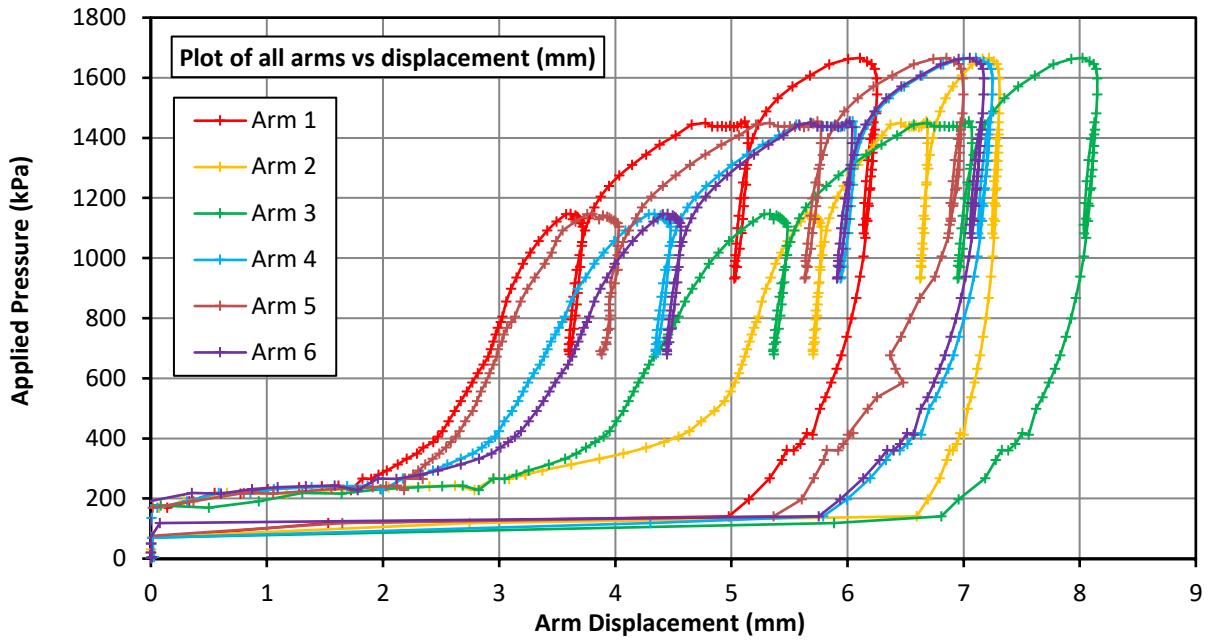
Test Date	11/10/2021		**Test No.**	4
Borehole	WTP-BH080		**Test Depth (m)**	18.40
Coordinates (m)	572420 (E)	670685 (N)	**Elevation (m)**	59.07



Material description from borehole log:

Light brown, slightly sandy slightly gravelly CLAY with low cobble content. Sand is fine to coarse. Gravel is fine to coarse, angular to sub-angular, Limestone & Sandstone lithology. Cobbles are 63mm to100mm dia., Limestone lithology.

Test pocket conditions:

Total core recovery:	80 %	Test pocket depth range:	
Solid core recovery:	- %	From: 17.00 m	to: 19.00 m
Rock quality designation:	- %	Flush: Air	

Test comment:

The test pocket was oversize with arms lifting off at 2.6 to 5.0mm. The po was estimated to be at 556kPa, with the following loading section being relatively short. Material yield was interpreted at 1072kPa, with the test taken to a maximum pressure of 1629kPa. The displacement-pressure response shown by the arms was variable. Arm 5 was noisy and has been removed from the analysis. Analysis of three unload reload loops provides modulus values of 82 to 111MPa. Derived undrained shear strength analysis provides a value of 516kPa.

A) Executive Summary

Priority Geotechnical Ltd. was instructed by Mott MacDonald on behalf of Irish Water to undertake a geophysical investigation at the Water Treatment Plant site at Incha Beg, Ballina, Co. Tipperary. The geophysical survey is in conjunction with an overall site investigation project.

The survey consisted of seismic refraction and electrical resistivity tomography in accordance with BS5930 and BS7022 and the Geological Society Engineering Group Working Party Report on Engineering Geophysics. The survey locations are shown in Figure B-1 below.

The survey was carried out from 22nd June 2021 through to 11th August 2021.

The survey consisted of 43 ERT profiles totaling a total linear distance of 5416.5m, and 93 SRP profiles with a total linear distance of 5247m. The survey profile positions, modelled profiles and geophysical interpretations are shown in APPENDIX A: Drawing No. P21060_GP_D01 to D20. These drawings are plotted at paper size ISO A3 and can be supplied in AutoCAD format on request.

The geophysical survey achieved a depth of penetration of c. 15m bgl. The dominant overburden in all interpretations has been interpreted as Sandy Gravelly CLAY. This is indicative of CLAY dominant material with varying content of Sand, Gravel, or Boulders as given in the logs from direct investigation. High p-wave velocities near the surface on all profiles were interpreted as overburden becoming stiff to very stiff within 1-3m bgl. Rock is interpreted at depth as LIMESTONE in some profiles based on p-wave and resistivity values in conjunction with borehole records, however for many profiles rock lies outside the range or resolution of the survey.

B) Introduction

B.1) Scope of Works

Priority Geotechnical Ltd. was instructed by Mott MacDonald on behalf of Irish Water to undertake a geophysical investigation at Eastern and Midlands Region Water Supply Project - Contract 1 Water Treatment Plant Site, Incha Beg, Ballina, Co. Tipperary. The geophysical survey is in conjunction with an overall site investigation project.

The survey consisted of seismic refraction and electrical resistivity tomography in accordance with BS5930 and BS7022 and the Geological Society Engineering Group Working Party Report on Engineering Geophysics. The survey locations are shown in Figure B-1 below.

The survey was carried out from 22nd June 2021 through to 11th August 2021.

Figure B-1: Satellite image showing surveyed geophysical profiles

B.2) Survey Objectives

The survey objectives were to provide information on the following:

- Provide information on the type and thickness of the overburden.
- Estimate the overburden stiffness.
- Assess the depth to bedrock, the weathering and excavatability of the bedrock.
- Identify the type of bedrock.
- Identify any potential faults/fissure/karst zones within the bedrock.

B.3) Site Topography

The proposed water treatment plant and associated survey area is located in Incha Beg, approximately 2km southeast of Ballina, Co. Tipperary. The geophysical profiles are situated in arable fields, ranging from flat to gently sloping pastures. These profiles are bounded by hedgerows and ditches, with densely vegetated planted coniferous forest to the south of the site.

B.4) Coordinate System and Datum

All coordinates are given in Irish Transverse Mercator (ITM). All elevations are given in metres Ordnance Datum Malin (OD Malin) corrected using geoid model OSGM15.

B.5) Intrusive Works

This report considers all relevant site investigation results. Relevant site investigation results have been overlaid on the interpretive drawings; relevance has been determined by proximity to profiles. In the case where the proximity is c. >10m this has been marked on the interpretive drawings.

B.6) Site Geology

According to the GSI 100k Geology Map (see Figure B-2) the survey area is underlain by one main formation known as the Ballysteen Formation (BA) shown in light blue, described as “dark, muddy Limestone and Shale””. To the north and east of the survey area lies the Lower Limestone

Shales (LLS), shown in green and described as “Sandstones, Mudstones and thin Limestones”. A synclinal axis trending in a SW-NE orientation is present through the centre of the survey area.

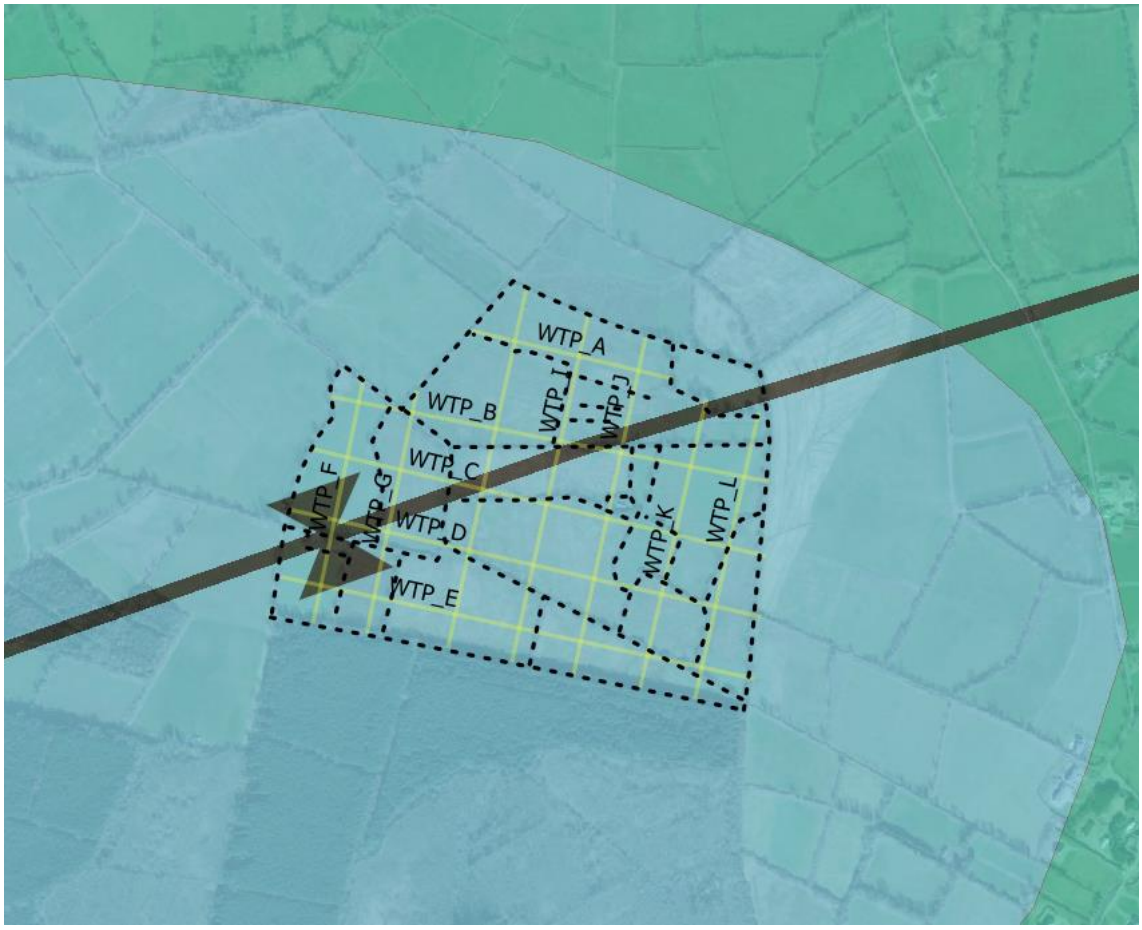

Figure B-2: GSI 100k Bedrock Geology Map of the site.

According to the GSI Quaternary Soils Map (see Figure B-3) most of the survey area is underlain by “till derived from Lower Palaeozoic and Devonian Sandstones”, show in purple. North of the survey area the soils are described as “till derived from Lower Palaeozoic Sandstones and Shales”, show in pale purple. Area of soils outside the survey area described as “Alluvium” are shown in orange.

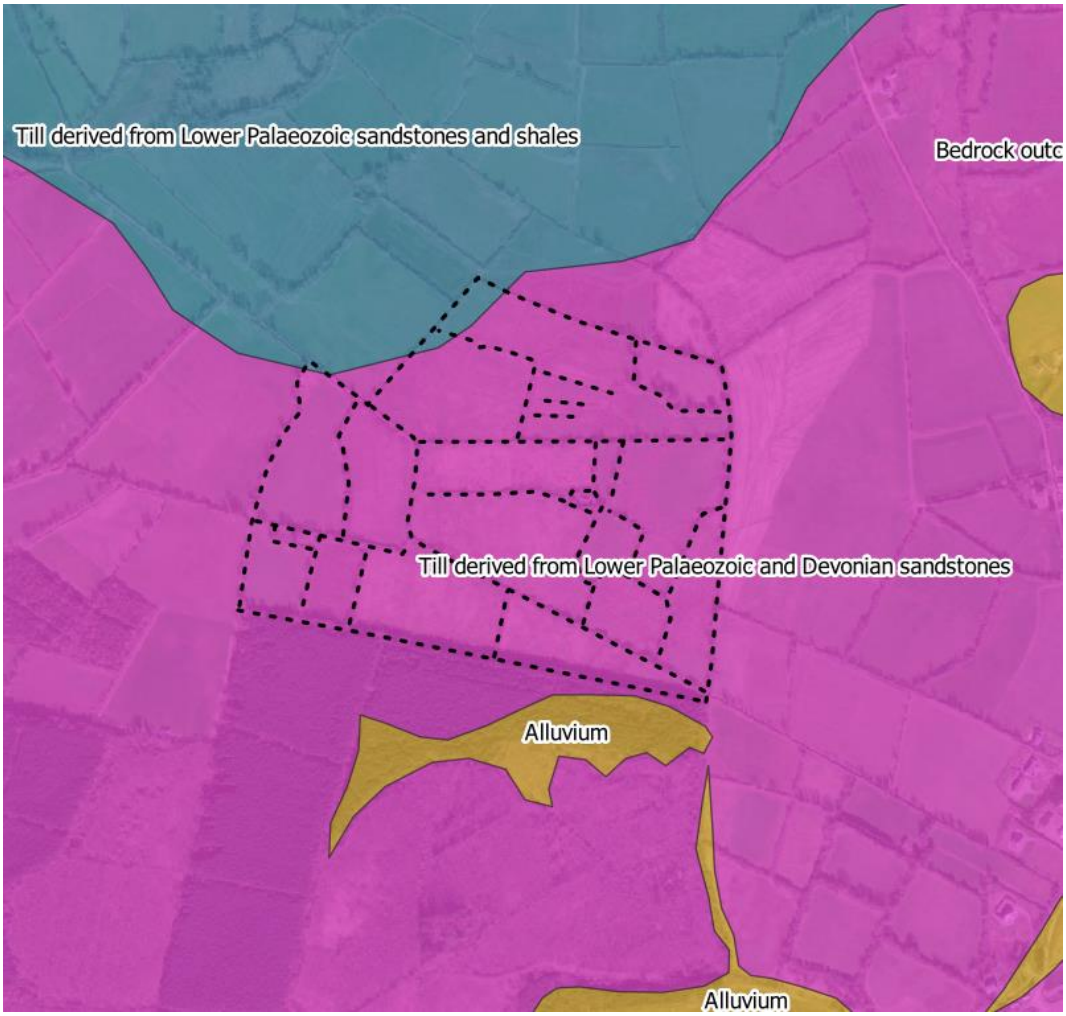

Figure B-3: Quaternary Sediments Map of the site.

All above mapping is available for free viewing on the Geological Survey of Ireland website at *https://www.gsi.ie/en-ie/Pages/default.aspx.* Both Figure B-2 and Figure B-3 contain Irish Public Sector Data (Geological Survey) licensed under a Creative Commons Attribution 4.0 International (CC BY 4.0) licence.

C) Methodology

The below details the geophysical technique background and the exact specification with which each methodology was used.

C.1) 2D Electrical Resistivity Tomography

The geophysical survey comprised of 2D electrical resistivity tomography (ERT) a technique commonly used for imaging sub surface structures through electrical resistivity measurements taken at the ground surface.

The resistivity survey was comprised of 43 no. profiles along pre-determined lines which were named R1 through R43. These profiles were collected with an electrode spacing of 3m and ranged in length from 33m to 270m. Profiles were terminated at ditches/field boundaries where clearing for access was not feasible or permitted. All termination of profiles related to hedgerows was in consultation with the client's representative on site.

2 no. profiles, R16 and R32, were collected with of 33m length with 12 active electrodes. The short length of the profiles and the low number of data points made the tomographic inversion fail. These two profiles have been omitted from the interpretation.

C.1.i) Data Acquisition

Survey data was collected using a 64-channel Allied Tigre resistivity meter. The Tigre has a maximum power of 36 watts and maximum current output of 200mA (manually selected). The receiver incorporates automatic gain steps providing a range of measurements from 0.001ohm to 360kohm.

Multicore resistivity cables with 32 take-outs were used with stainless steel electrodes. Contact resistivities were checked prior to running the survey, to ensure an adequate electrical contact between the ground and the electrodes were made. Electrodes with poor contacts were treated with saline solution and rechecked till an optimum contact resistance were obtained.

The Tigre was connected to a laptop running Imager Pro 2006 acquisition software. All data was checked on site subsequently by viewing and inverting using Res2DInv software. Any spurious readings were repeated until satisfactory results were achieved.

C.1.ii) Array Type

The Wenner Alpha Array protocol was utilized during this survey. The Wenner Array uses four equally spaced electrodes. Current is injected through the two outer electrodes and the resulting voltage difference at two inner electrodes. From the current (I) and the voltage (V) an apparent resistivity (p_a) value is calculated.

$$p_a = k\,V/I$$

Where k is the geometric factor which depends on the arrangement of the 4 electrodes. This calculated resistivity value is not the true resistivity of the subsurface but an "apparent" resistivity value, i.e. the resistivity of a homogenous ground which would give the same resistance value for the same electrode arrangement. To determine "true" ground resistivity an inversion of the measured apparent resistivity is undertaken, in this case using Res2DInv software.

The Wenner array is relatively sensitive to vertical changes (i.e. horizontal structures), but relatively poor in detecting horizontal changes (i.e. narrow vertical structures). Among the common array types for ERT profiling the Wenner alpha array has the strongest signal strength (Loke, 2000).

C.1.iii) Data Processing

Survey data was processed using Res2DInv, where the raw files were edited and inverted. The software does this by first dividing the subsurface 2D model into rectangular blocks and then calculates the resistivity of these blocks such that the calculated apparent resistivity measurements of the blocks agree with the measured values from the field survey.

Up to 5 iterations of the inversion of the measured data were carried out for each profile to obtain a 2D pseudosection of the apparent resistivities. The least squares inversion was used to produce the apparent resistivity depth model.

A degree of fit between the measured apparent resistances and the inverted resistances is calculated by the program, allowing an assessment of the degree of confidence of the inverted data. A damping factor can be applied to smooth erroneous data points; however, resolution lessens with an increased damping factor. A moderate damping factor was used during all inversions.

The below Table C-1 details RMS errors involved in the inversions.

ERT Profile	RMS Error Inversion (%)	Iteration Number
R1	1.83%	5
R2	2.64%	5
R3	1.92%	5
R4	2.35%	5
R5	1.53%	5
R6	1.64%	5
R7	2.36%	5
R8	3.20%	5
R9	2.28%	5
R10	2.40%	5
R11	2.71%	5
R12	3.67%	5
R13	5.41%	5
R14	2.64%	5
R15	2.20%	5
R16	-	-
R17	8.04%	5
R18	6.32%	4
R19	2.77%	5
R20	2.30%	5
R21	1.54%	5
R22	1.57%	5
R23	1.69%	5
R24	1.75%	5
R25	1.89%	5
R26	1.63%	5
R27	2.98%	5
R28	3.04%	5
R29	2.87%	5
R30	2.73%	5
R31	1.44%	5
R32	-	-
R33	2.79%	5
R34	3.29%	5
R35	4.70%	5
R36	4.97%	5
R37	7.10%	5
R38	2.12%	5
R39	3.58%	5

R40	1.55%	5
R41	2.89%	5
R42	9.28%	5
R43	4.48%	5

Table C-1: RMS Errors for ERT inversion through RES2Dinv software (<10% low divergence inversion) * see C1 for comment on R16 and R32.

Resistivity values in the inverted profiles varied from approximately 30 to 5000 Ohm-m.

C.2) Seismic Refraction Profiling (SRP)

Seismic refraction measurements are made by measuring the travel time of direct and refracted acoustic waves as they travel from the surface through one layer to another and back to the surface where their arrival times are recorded. The travel time is a function of the seismic or acoustic velocity and geometry of the subsurface layers of soil and rock.

PGL recorded 93 no. SRP profiles in total across the survey which are named S1 to S93. The SRP profiles followed the same lines as the ERT profiles.

C.2.i) Data Acquisition

A 24-channel Geometrics Geode seismic system was utilized with a 24-channel seismic multicore cable and 4.5Hz geophones. A sledgehammer and a HDPE plate were used as a seismic source. Geophone spacings of 2m, 2.5m, 3m, 3.5m were used during acquisition and ranged in length through 46m, 57.5m, 69m to 80.5m respectively (dependant on geophone spacing).

Data was recorded using SGOS Seismodule Controller software. A total of 7 shots were undertaken on each seismic line: 2 end-shots, 2 off-shots and 3 mid-shots. To improve signal to noise ratio, individual hammer shots were stacked at each shot location where necessary.

C.2.ii) Data Processing

Data processing was undertaken utilizing Seisimager Seismic 2D software programs. Surveyed topography was input for each seismic spread. First breaks were picked after which a time term inversion was computed using travel-time computation via raytracing. Velocity modeling and travel time plots were constructed for each spread. Seismic velocity phases were picked, and the thickness of each velocity unit calculated using the intercept-time method.

Modelled seismic velocities (Vp) ranged from 260 to 5167 ms^{-1} over two or three separate layers. The resulting layer boundaries and seismic velocities are shown as thick dashed lines on cross sections in the attached drawings. The model was developed with average velocities and boundaries moved to minimise the model deviation.

The below is a table of RMS errors involved in the inversions.

Seismic Profile	RMS Error Inversion (ms)	RMS Error Ray-Tracing (ms)
S1	0.58	1.23
S2	0.35	1.24

Table C-2: RMS Errors for seismic refraction inversion through Plotrefa software

C.2.iii) Data Interpretation

It should be noted that when layer thicknesses are modelled from the seismic data the areas of greatest coverage (i.e., the centre of the spread) will have the greatest accuracy. At the edges of the spread less ray coverage reduces the accuracy of layer interpretation and thickness calculation.

Approximate errors for velocities are estimated to be +/-10%. Errors for the calculated layer thickness are of the order of +/-15%. Possible errors due to the "hidden layer" and "velocity" effects may also occur (Soske, 1959). Seismic refraction generally determines the depth to horizontal or near horizontal layers where the compaction/strength/rock quality changes. Where low velocity layers are present or where layers dip with more than 20 degrees angle the accuracy becomes less.

C.3) Geospatial Relocation

Horizontal control and elevation were provided by a Trimble VRS (Real Time Kinematic/Virtual Reference Station) enabled GPS. Trimble Access Survey Controller software was used to provide high-accuracy, GNSS positioning. All positions are plotted in ITM. Elevations are to OD Malin using geoid model OSGM15.

D) Results and Geophysical Interpretation

The survey profile positions, modelled profiles and geophysical interpretations are shown in APPENDIX A: Drawing No. P21060_GP_D01 to D20. These drawings are plotted at paper size ISO A3 and can be supplied in AutoCAD format on request.

D.1) Geophysical Interpretation Summary

The interpretation was created with a combination of both geophysical techniques, the direct investigation, and the experience of the author. The ERT was used to interpret the overburden and bedrock material composition on the general basis outlined in Table D 1. In general, the SRP refracted boundaries were used to establish top of rock and overburden / rock material strength characteristics. SRP velocities > c. 3000m/s are generally interpreted as rock velocity. In many cases across the survey area rockhead has been proven deeper through the direct investigation than the elevation of the high velocity SRP boundary. As referred to in C.2.iii) low velocity layers within the overburden may give rise to hidden layers falsely increasing elevation on the picked boundaries. This is thought to be a contributing factor to the resolved rock velocity boundaries.

The direct investigation showed similar, generally CLAY dominant overburden composition across all profiles. Bedrock is proven as LIMESTONE across all areas.

Resistivity (Ohm-m)	Interpretation
<50	Silty CLAY
50- 400	Sandy Gravelly CLAY
400-1000	Sandy Gravelly SILT
>1000 (near surface)	Sandy GRAVEL
>1000 (at depth)	LIMESTONE

Table D-1: Interpretation based on electrical resistivity.

In general, the overburden is seen to have low resistivity values <400Ωm. This, in conjunction with direct investigation records, leads the overburden to be interpreted mainly as Sandy Gravelly CLAY. This is indicative of CLAY dominant material with varying content of Sand, Gravel, or Boulders, as shown in the borehole and trial pit logs. Some small overburden zones within the profiles showing very low resistivity <40Ωm are interpreted as Silty CLAY. Areas of subsurface overburden with higher resistivity values are interpreted as Sandy Gravelly SILT (c.400-c.1000Ωm) or Sandy GRAVEL (>1000Ωm). Changes in p-wave velocities indicate a change in stiffness within the overburden. High p-wave velocities near the surface on all profiles are interpreted as overburden becoming stiff within c.3m bgl, with higher velocities at depth

indicating a stiff to very stiff CLAY dominant material. At depth, rockhead within the profiles is interpreted based on high p-wave velocities indicating a transition to rockhead and higher resistivity values (>1000-5000Ωm, variable) in conjunction with borehole records and the authors experience.

Interpretation of results from individual geophysical lines is as follows:

WTP_A: Seismic p-wave velocities along the profile R20 show a transition from relatively low velocities c.466-556ms^{-1} to higher velocities c.1952-2015ms^{-1}. At depth, p-wave velocities become higher c.2511-3123ms^{-1}. Throughout the profile resistivity values remain low <400Ωm. In conjunction with records from BH021A, BH024 and BH062, the low resistivity values are interpreted as an overburden comprised of Sandy Gravelly CLAY to a depth of 29moD. Seismic p-wave boundaries indicate a change in overall stiffness of the overburden as depth increases. No rock is resolved within the scope of the profile.

WTP_B: Seismic p-wave velocities along the profiles R7, R5, R4 and R33 west to east show a transition from relatively low velocities c.326-407ms^{-1} to higher velocities c.1770-2184ms^{-1}. At depth, p-wave velocities become higher up to c.3256ms^{-1} on R5. General resistivity values remain low <400Ωm, though higher values are seen subsurface on R7, R33 and at depth on R5. In conjunction with records from nearby exploratory holes, the low resistivity values are interpreted as an overburden comprised of Sandy Gravelly CLAY to a depth c.32moD on R4. Seismic p-wave boundaries indicate a change in overall stiffness of the overburden as depth increases. High resistivity subsurface areas on R7 and R33 are interpreted as Gravelly SILT (c.400-c.1000Ωm) or Sandy GRAVEL (>1000Ωm). Higher resistivity values at depth on R5 in conjunction with higher p-wave velocities are interpreted as LIMESTONE with rockhead c.30-32moD.

WTP_C: Seismic p-wave velocities along the profiles R8, R21, R1, R41, R42 and R30 west to east show a transition from relatively low velocities c.413-500ms^{-1} to higher velocities c.1800-2227ms^{-1}. At depth, p-wave velocities become higher up to c.3960ms^{-1} on R41. Overall resistivity values remain low <400Ωm, though higher values are seen at depth on R41. In conjunction with records from nearby exploratory holes, the low resistivity values are interpreted as an overburden comprised of Sandy Gravelly CLAY to a depth c.19moD on R41. Seismic p-wave boundaries indicate a change in overall stiffness of the overburden as depth increases. High resistivity at depth on R41 (>1000Ωm) is interpreted as LIMESTONE, with rockhead c.19-21moD.

WTP_D: Seismic p-wave velocities along the profiles R9, R22, R38 and R18 west to east show a transition from relatively low velocities c.345-558ms^{-1} to higher velocities c.1630-2650ms^{-1}. At depth, p-wave velocities become higher up to c.5167ms^{-1} on R38. Overall resistivity values remain low <400Ωm, though higher values are seen at depth on R38 and R18. In conjunction with records from nearby exploratory holes, the low resistivity values are interpreted as an overburden comprised of Sandy Gravelly CLAY to a depth c.30moD towards the eastern end of R38. Seismic p-wave boundaries indicate a change in overall stiffness of the overburden as depth increases. High resistivity at depth on R38 and R18 (>1000Ωm) is interpreted as LIMESTONE, in association with very high p-wave velocities and records from BH051, with rockhead c.34moD falling off to the east of R38.

WTP_E: Seismic p-wave velocities along the profiles R12, R13, R26, R35, R43 and R17 west to east show a transition from relatively low velocities c.372-500ms^{-1} to higher velocities c.1810-2466ms^{-1}. At depth, p-wave velocities become higher up to c.4800ms^{-1} on R26. Overall resistivity values remain low <400Ωm, though higher values are seen subsurface on R12, R13, R17 and at depth from R26 eastwards. In conjunction with records from nearby exploratory holes, the low resistivity values are interpreted as an overburden comprised of Sandy Gravelly CLAY to a depth c.24moD towards the western end of R35. Higher resistivity subsurface zones are interpreted as Gravelly SILT c.30m, c.130m and c.610m along the WTP_or Sandy GRAVEL subsurface on R17. Seismic p-wave boundaries indicate a change in overall stiffness of the overburden as depth increases. High resistivity at depth on R26, R35, R43 and R17 (>1000Ωm) is interpreted as LIMESTONE, this in conjunction with very high p-wave velocities and direct investigation records, with rockhead ranging in depth c.24moD on R35 to c.36moD on R26.

WTP_F: Seismic p-wave velocities along the profiles R11 and R10 south to north show a transition from low velocities c.260-420ms^{-1} to higher velocities c.1970-2183ms^{-1}. At depth, p-wave velocities become higher up to c.3609ms^{-1} on R10. Overall resistivity values remain low <400Ωm, though zones of higher values are seen at subsurface. In conjunction with records from nearby exploratory holes, the low resistivity values are interpreted as an overburden comprised of Sandy Gravelly CLAY. Higher resistivity subsurface zones are interpreted as Gravelly SILT at c.50m and c.260m along the length of the line. Seismic p-wave boundaries indicate a change in overall stiffness of the overburden as depth increases. High p-wave values at depth on R10 are interpreted as rock velocities, with LIMESTONE rockhead c38.5-34moD.

WTP_G: Seismic p-wave velocities along the profiles R14 and R23 south to north show a transition from low velocities c.386-478ms^{-1} to higher velocities c.1987-2105ms^{-1}. Overall resistivity values remain low <400Ωm. In conjunction with records from nearby exploratory holes, the low resistivity values are interpreted as an overburden comprised of Sandy Gravelly CLAY to a depth c.22moD on R23. Seismic p-wave boundaries indicate a change in overall stiffness of the overburden as depth increases.

WTP_H: Seismic p-wave velocities along the profiles R24, R39, R2 and R6 south to north show a transition from low velocities c.364-477ms^{-1} to higher velocities c.1969-2333ms^{-1}. At depth, p-wave velocities become higher up to c.4741ms^{-1} on R39. Overall resistivity values remain low <400Ωm, though zones of higher values are seen at depth. In conjunction with records from nearby exploratory holes, the low resistivity values are interpreted as an overburden comprised of Sandy Gravelly CLAY. Seismic p-wave boundaries indicate a change in overall stiffness of the overburden as depth increases. High p-waves at depth on R24 and R39 are interpreted as rock velocities, with rockhead c.31-c.36moD.

WTP_I: Seismic p-wave velocities along the profiles R25, R40, R3 and R27 south to north show a transition from relative low velocities c.347-556ms^{-1} to higher velocities c.1821-2162ms^{-1}. At depth, p-wave velocities become higher up to c.4331ms^{-1} on R25. Overall resistivity values remain low <400Ωm, though higher values are seen at depth. In conjunction with records from nearby exploratory holes, the low resistivity values are interpreted as an overburden comprised of Sandy Gravelly CLAY. Seismic p-wave boundaries indicate a change in overall stiffness of the overburden as depth increases. At depth, higher p-wave velocities in conjunction with an increase in resistivity values are interpreted as LIMESTONE, with rockhead ranging from c23moD on R27 to c.33moD on R40.

WTP_J: Seismic p-wave velocities along the profiles R36, R34 and R28 south to north show a transition from relative low velocities c.379-478ms^{-1} to higher velocities c.1637-2276ms^{-1}. At depth, p-wave velocities become higher up to c.3164ms^{-1}. Overall resistivity values remain low <400Ωm, though higher values are seen at depth. In conjunction with records from nearby exploratory holes, the low resistivity values are interpreted as an overburden comprised of Sandy Gravelly CLAY. Seismic p-wave boundaries indicate a change in overall stiffness of the overburden as depth increases.

WTP_K: Seismic p-wave velocities along the profiles R37, R19 and R29 south to west show a transition from relatively low velocities c.348-663ms^{-1} to higher velocities c.1717-2585ms^{-1}. At depth, p-wave velocities become higher up to c.3788ms^{-1}. Overall resistivity values remain low <400Ωm, though higher values are seen subsurface on R29 and at depth on R19. In conjunction with records from nearby exploratory holes, the low resistivity values are interpreted as an overburden comprised of Sandy Gravelly CLAY. Higher resistivity subsurface zones are interpreted as Gravelly SILT c.300m and c.370m along the line. Seismic p-wave boundaries indicate a change in overall stiffness of the overburden as depth increases. High resistivity at depth on R19 (>1000Ωm) is interpreted as LIMESTONE, this in conjunction with very high p-wave velocities and direct investigation records from BH069, with rockhead as shallow as c.33moD towards the south and becoming deeper northwards.

WTP_L: Seismic p-wave velocities along the profiles R15 and R31 south to north show a transition from low velocities c.364-429ms^{-1} to higher velocities c.1717-2531ms^{-1}. At depth, p-wave velocities become higher up to c.5134ms^{-1}. Overall resistivity values remain low <400Ωm, though higher values are seen subsurface on towards the south of R15, towards the north of R31 and at depth on R15. In conjunction with records from nearby exploratory holes, the low resistivity values are interpreted as an overburden comprised of Sandy Gravelly CLAY. Higher resistivity subsurface zones are interpreted as Gravelly SILT c.20m and c.240m along the WTP_or Sandy GRAVEL subsurface towards the north of R31, c.250-310m along the line. Seismic p-wave boundaries indicate a change in overall stiffness of the overburden as depth increases. High resistivity at depth on R15 (>1000Ωm) is interpreted as LIMESTONE, this in conjunction with very high p-wave velocities and direct investigation records, with rockhead c.29-31moD.

SCALE: 1:1000

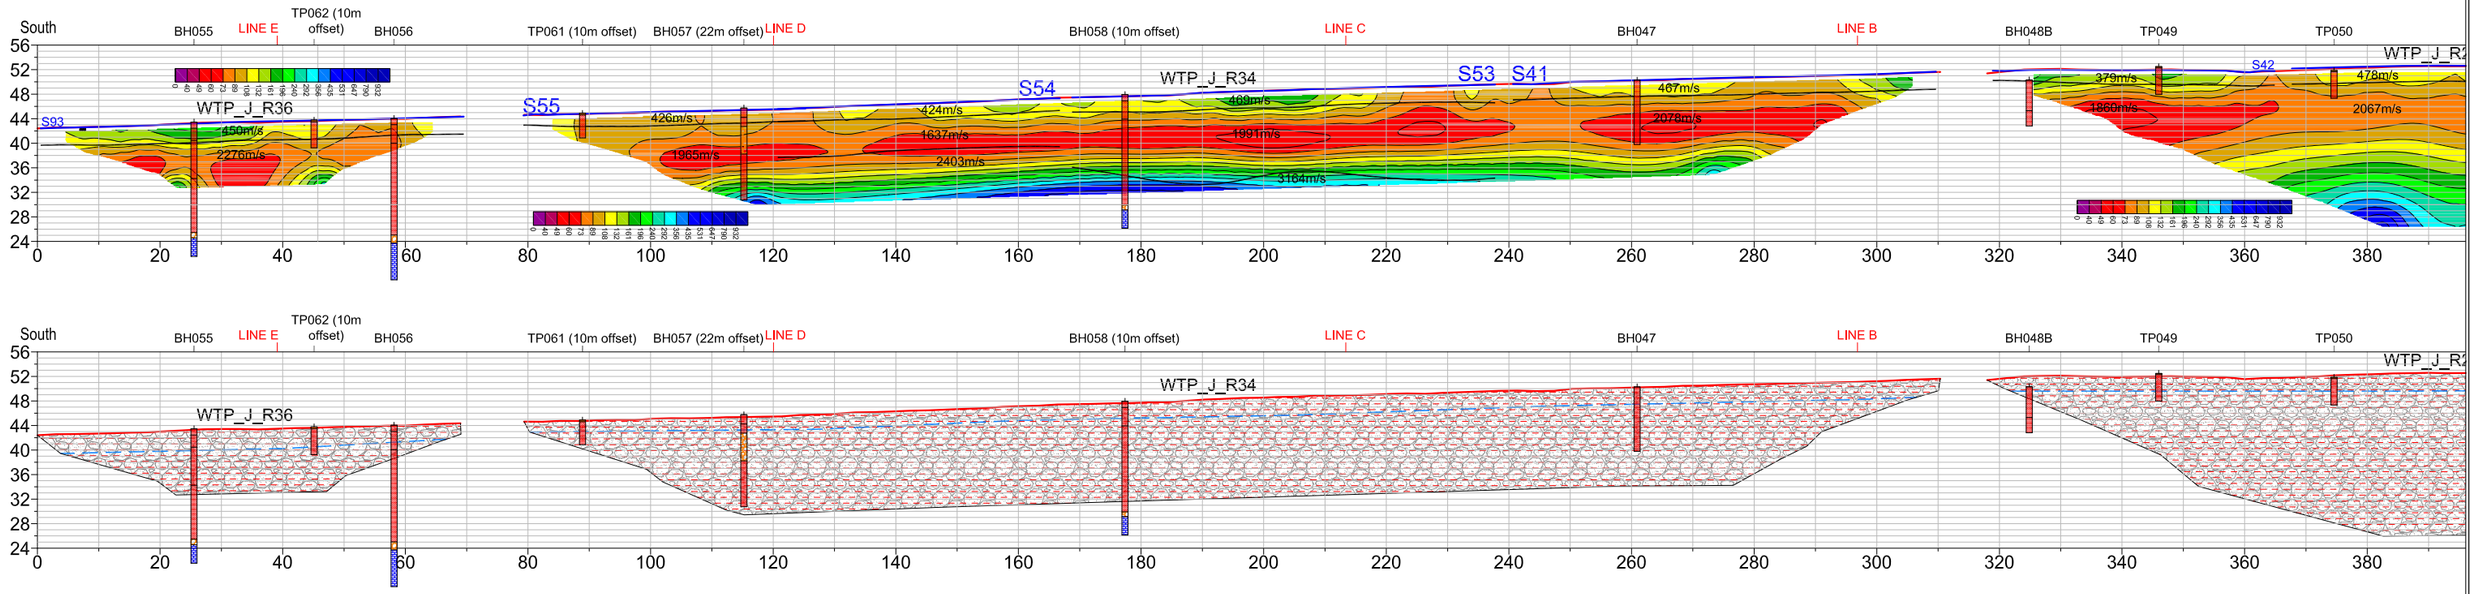

FIGURE J2: GEOPHYSICAL PROFILE LOCATION MAP
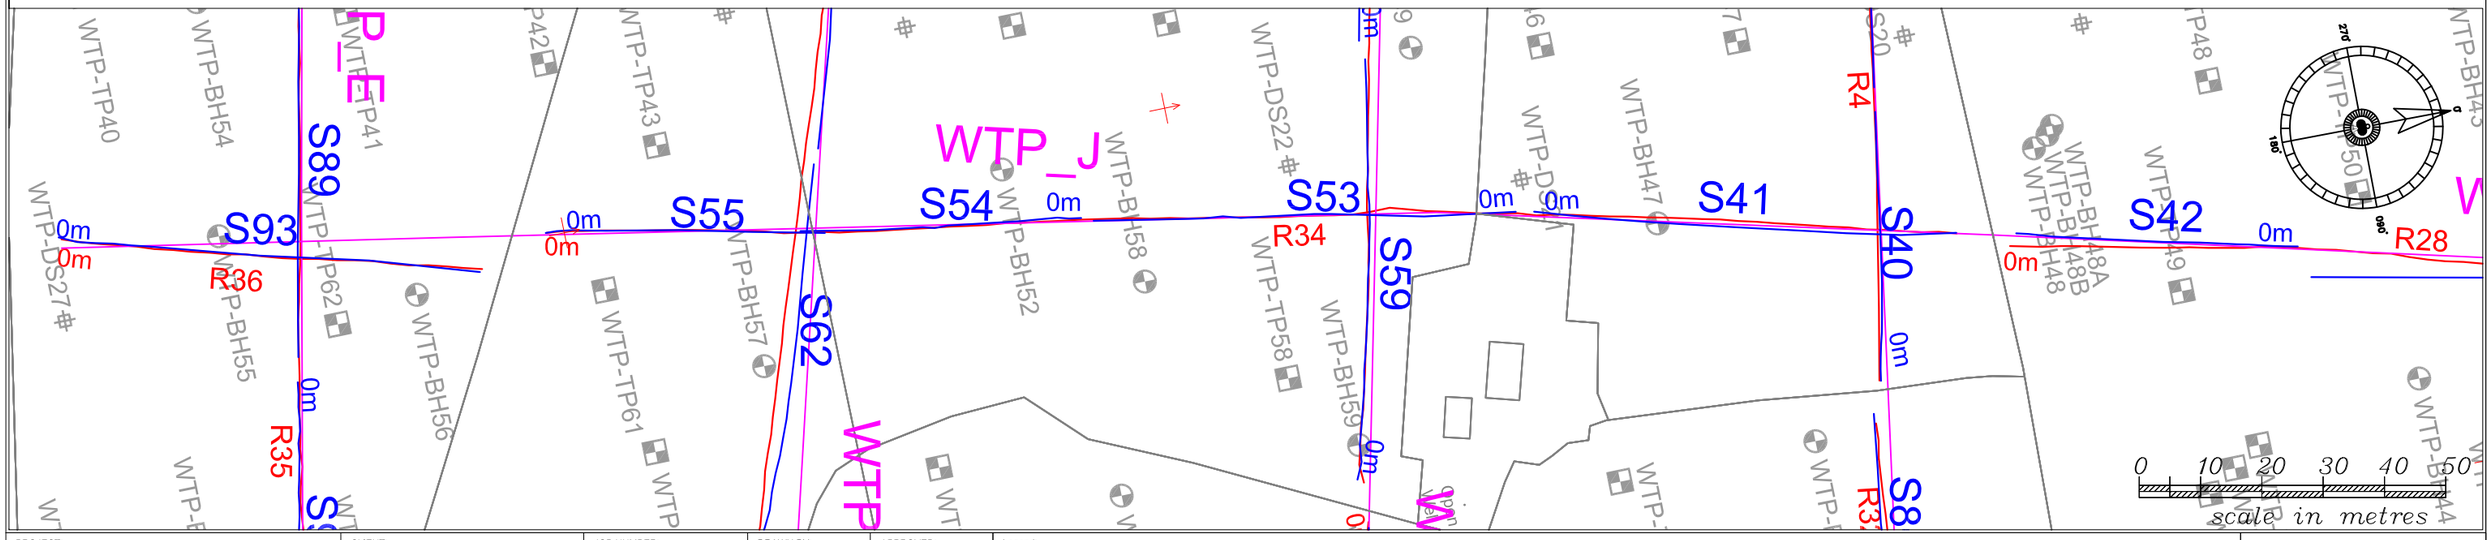
SCALE: 1:1000



PROJECT: EASTERN AND MIDLANDS REGIONAL WATER SUPPLY PROJECT - CONTRACT 1 WATER TREATMENT PLANT	CLIENT: IRISH WATER CONSULTING ENGINEER: MOTT MACDONALD	JOB NUMBER: P21060	DRAWN BY: HP	APPROVED: GH	
			COORDINATE SYSTEM: ITM	VERTICAL DATUM: OD MALIN	
Sheet Title: GEOPHYSICAL PSEUDOSECTION, INTERPRETATION AND LOCATION MAP - LINE WTP_J_1	SURVEYED BY: PRIORITY GEOTECHNICAL LTD.	DRAWING NUMBER: P21060_D17_WTP_J_1	SCALE: 1:1000 @ A3	ISSUE DATE: 27/07/2022	
			REVISION: D03		

Legend:

Seismic refraction boundaries with P-wave velocities (m/s)
- 300 m/s — ground surface
- 1000 m/s — layer 1 / layer 2 boundary
- 3000 m/s — layer 2 / layer 3 boundary

ERT boundaries
- Ground surface

ERT color scales (3 seperate scales) to ohm-m, as per displayed below profiles

Interpretation
- LINE A — Intersection of another named profile line
- BH22 — Approx location of named direct investigation work
- Change in overburden stiffness
- Change in overburden type boundary
- Top of rock surface boundary
- Change in rock lithology boundary

Overburden types: Sand, Gravel, Clay, Silt, Silty CLAY, Sandy Gravel CLAY, Sandy Gravel SILT, Sandy GRAVEL

Rock types: LIMESTONE

Location Map
- Seismic profile
- ERT profile
- Planned geophysical profiles
- RC01 — Rotary core
- BH01 — Borehole
- TP01 — Trial pit

APPENDIX 3H

LABORATORY RESULTS

KEY TO SYMBOLS - LABORATORY TEST RESULT

U	Undisturbed Sample	
P	Piston Sample	
TWS	Thin Wall Sample	
B	Bulk Sample - Disturbed	
D	Jar Sample - Disturbed	
W	Water Sample	
pH	Acidity/Alkalinity Index	
SO_3	% - Total Sulphate Content (acid soluble)	
SO_3	g/ltr - Water Soluble Sulphate (Water or 2:1 Aqueous Soil Extract)	
+	Calcareous Reaction	
Cl	Chloride Content	
PI	Plasticity Index	
<425	% of material in sample passing 425 micron sieve	
LL	Liquid Limit	
PL	Plastic Limit	
MC	Water Content	
NP	Non Plastic	
Yb	Bulk Density	
Yd	Dry Density	
Ps	Particle Density	
U/D	Undrained/Drained Triaxial	
U/C	Unconsolidated/Consolidated Triaxial	
T/M	Single Stage/Multistage Triaxial	
100/38	Sample Diameter (mm)	
REM	Remoulded Triaxial Test Specimen	
TST	Triaxial Suction Test	
V	Vane Test	
DSB	Drained Shear Box	
RSB	Residual Shear Box	
RS	Ring Shear	
σ_3	Cell Pressure	
σ_1-σ_3	Deviator Stress	
c	Cohesion	
c_	Effective Cohesion Intercept	
ϕ	Angle of Shearing Resistance - Degrees	
ϕ_	Effective Angle of Shearing Resistance	
εf	Strain at Failure	
*	Failed under 1st Load	
**	Failed under 2nd Load	
#	Untestable	
##	Excessive Strain	
p_o	Effective Overburden Pressure	
m_v	Coefficient of Volume Decrease	
c_v	Coefficient of Consolidation	
Opt	Optimum	
Nat	Natural	
Std	Standard Compaction - 2.5kg Rammer	(¶ CBR)
Hvy	Heavy Compaction - 4.5kg Rammer	(§ CBR)
Vib	Vibratory Compaction	
CBR	California Bearing Ratio	
Sat m.c.	Saturation Moisture Content	
MCV	Moisture Condition Value

Preparation

Particle density assumed 2.65 Mg/m3

Specimen details	Initial	Final	
Diameter	75.00	-	mm
Height	20.00	18.54	mm
Moisture Content	10.4	11.2	%
Bulk density	2.21	2.40	Mg/m3
Dry density	2.00	2.16	Mg/m3
Voids Ratio	0.324	0.227	
Saturation	85	131	%
Average temperature for test	18.0		oC
Swelling Pressure			kPa
Settlement on saturation			%

Remarks

Final values should be used with caution
Cv plotted at mid point of load increments
Cv corrected to 20oC

Printed : 07/09/2022 12:25
