Operations Manager: MICHAEL MAHON Registered Office: OLD GALWAY ROAD, LOUGHREA, CO. GALWAY Registered No. 379801

FOREWORD

The borehole, trial pit and dynamic sampling records have been compiled from an examination of the samples by a Geotechnical Engineer and from the Drillers' descriptions.

The report presents an opinion on the configuration of the strata within the site based on the borehole trial pit and dynamic sampling results. The assumptions, though reasonable, are given for guidance only and no liability can be accepted for changes in conditions not revealed by the boreholes, trial pits and dynamic samples.

The fieldwork was carried out in accordance with IS EN 1997-2 and BS5930, 2015 Code of Practice for Site Investigations with precedence given to IS EN 1997-2 where applicable.

6.1 Introduction.

The Water Supply Project (WSP) – Eastern and Midlands Region is a scheme to provide water from the River Shannon and pipe it east to the Dublin Region.

The proposed scheme extends from Parteen Basin in North Tipperary to Peamount Reservoir in West Dublin with a proposal to transport water approximately 170km.

The proposed civil works will include the construction of some or all of the following:

- Raw Water Abstraction Point.
- Raw Water Intake and Pumping Station.
- Raw Water Rising Main.
- Water Treatment Plant connected to the Raw Water Rising Main.
- A pressurised pipeline extending from the WTP to a new Break Pressure Tank (BPT).
- A gravity fed pipeline from the BPT to a Terminal Point Reservoir (TPR).

The geotechnical investigation works for the overall project has been divided into three lots as follows:

Lot 1 (Contract 1):

- Raw Water Intake
- Raw Water Rising Main
- Water Treatment Plant
- Pipeline Ch.0 to Ch36,000 (36km)

Lot 2 (Contract 2):

- Break Pressure Tank
- Pipeline Ch.36,000 to Ch. 103,000 (67km)

Lot 3 (Contract 3):

- Termination Point Reservoir
- Pipeline Ch. 103,000 to 170,000 (67km)

Irish Drilling Ltd. (IDL) has been awarded Lot 2 (Contract 2) and as part of this contract IDL has been instructed by Mott Macdonald Ireland, Consulting Engineers, on behalf of Irish Water to carry out a site investigation along the proposed pipeline route from Chainage 36,000m to Chainage 103,000m (a distance of circa 67km).

This site investigation was carried out to provide detailed factual geotechnical information of the underlying ground conditions along the route.

The factual report issued here for the pipeline route will be collated with all other factual reports generated for the WSP Project (Lots 1 to 3) to provide the client with a factual report for the overall WSP Eastern and Midlands Region Project.

The fieldwork commenced on September 27th 2021 and was completed on June 15th 2022.

6.2 Site & Geology

The proposed pipeline route commences adjacent to the proposed Break Pressure Tank site at Chainage 36,000m and ends at Chainage 103,000m.

The fieldwork was carried out predominantly on agricultural lands. Weather conditions in general were quite variable with the majority of the fieldwork carried out over a typical winter period in Ireland.

A Site Plan, prepared by the client's representatives and showing approximate 'As-Built' fieldwork locations, is included with this report.

The following were the main published information sources used:
Geological Map of Ireland: 1:500,000 scale map series.

Site investigation data is available as point source data along the proposed route, and the majority of the ground in between the points can only be assumed to follow the characteristics of the nearest available data.

Overview of Subsoil Geology

Peat:
The deposition of peat occurred in post-glacial periods and is generally associated with the start of warmer and wetter climatic conditions. Peat is an unconsolidated usually dark brown to black organic material comprising a mixture of decomposed and undecomposed plant matter that accumulated in an acidic waterlogged environment. Peat has an extremely high-water content generally averaging over 90% by volume.

Estuarine Deposits:
These comprise of estuarine sands, gravels and silts from water borne deposits.

Glacial Till:
Glacial Till is what was often referred to as Boulder Clay. It is a diverse material that is largely deposited sub-glacially and has a wide range of characteristics due to the variety of parent materials and different processes of deposition. Tills are tightly packed, unsorted, heterogeneous, unbedded, and can have a wide range of particle sizes and types, which are often but not exclusively angular or sub-angular.

The type of parent material plays a critical role in providing the particles that create different subsoil permeability with sandstones giving rise to a high proportion of sand sized grains in the till matrix.

The Quarternary sediments are Till derived from limestone (Map Reference GSI: 1:50000).

Solid Geology
The Geological Map of Ireland: (GSI 1:100,000 scale map series) indicate that the site is underlain by mudstone and limestone rock of the Dinantian Waulsortian Limestone Formation.

Ground conditions encountered during the completion of the fieldwork were typical and as expected for this region and predominantly consisted of Glacial Tills.

The Glacial Tills in general consisted of slightly gravelly sandy silt/clay with cobbles and boulders and/or silty sands and/or gravels with cobbles and boulders.

Intact bedrock was encountered in the boreholes at depths ranging from 1.10m to 12.10m below ground level. Weathered bedrock was also encountered in many of the borehole at shallower depths while a number of boreholes were terminated at target depth without bedrock being encountered.

Bedrock is predominantly described as very strong, thinly-bedded, grey, fine and medium grained Limestone.

6.3 Fieldwork.

6.3.1 Fieldwork Plant:

The following plant was mobilised to site by IDL to carry out fieldwork operations:
1nr. Zaxis LCV 12T Tracked Excavator.
1nr. Dando 2000 Cable Percussive Boring Rig.
1nr. DeltaBase 520 Rotary Core Drilling Rig.
1nr. GEO 602 Rotary Core Drilling Rig.
1nr. LMSR-V(k) Geotool Dynamic Probing Rig.
3nr. Yanmarr All-Terrain Support Vehicle.
1nr. GeoboreS Drill String.
1nr. HQ Rotary Core Drill String.
1nr. Permeability Test Equipment.
1nr. Honda Water Supply Pump.
1nr. Drilling Water Recirculation Tank Syatem.

Fieldwork carried out to date has included the following:

6.3.2 Fieldwork Operations:

A general summary of fieldwork operations carried out to date includes the following:

- Ecological Survey prior to mobilisation to site.
- Completion of 15nr GeoboreS Boreholes.
- Completion of 5nr Rotary Core Boreholes.
- Completion of 61nr Cable Percussive Boreholes.
- Completion of 117nr Cable Percussive with Rotary Core 'follow-on' Boreholes.
- Completion of 14nr dynamic (window) sampling locations.
- Completion of 447nr Peat Probes and 123nr Russian Core Samples.
- Excavation of 455nr Trial Pits with in-situ hand shear vane tests.
- Completion of 14nr Dynamic Probes.
- Completion of 13nr In-Situ Shear Vane Tests using H70 Shear Vane.
- Completion of Standard Penetration Tests in overburden at borehole locations. SPT Hammer Certificates included in Appendix 6A.
- Completion of 18nr Variable Head Permeability Tests at borehole locations.
- Installation of 35nr 50mm diameter standpipes at borehole locations.
- Completion of Geophysical Survey.

6.3.3 Ecological Survey:

Prior to mobilisation of plant and personnel to site an ecological survey was commissioned by IDL. The survey was carried out by Moore Group, Environmental Consultants, and their scope included a study/review of any ecological and/or environmental issues on site that may have been influenced by fieldwork operations.

A record of their observations was presented as a 'stand-alone' report and presented to the client's consultants prior to mobilisation to site.

6.3.4 Archaeological Survey:

Prior to mobilisation of plant and personnel to site an archaeological desktop study was commissioned by IDL. The study was carried out by Through Time Ltd and a summary of their study has been presented to the client as a 'stand-alone' report.

6.3.5 Cable Percussive Boreholes:

Sixty-one cable percussion (Shell & Auger) boreholes were completed using a Dando 2000 Cable Percussive Boring Rig. The boreholes were bored to 'refusal' or to depths as instructed by the client's representatives.

The borehole depths ranged from 0.80m to 10.80m below ground level.

In–Situ testing consisting of Standard Penetration Tests were carried out at regular intervals (predominantly 1.0m intervals) or as instructed by the client's representatives.

Disturbed bulk and jar soil samples were taken at each change in strata and were returned to the laboratory and logged by a Geotechnical Engineer and presented for testing. Groundwater samples were taken where possible and returned to the laboratory for storage and analysis.

A 50mm diameter standpipe was installed in the following boreholes and as instructed by the Client's Engineer, to allow for monitoring of groundwater levels over a prolonged period of time:
BH-38786A
BH-44676
BH-62741
BH-69405
BH-71397
BH-84203

Groundwater readings recorded during the completion of fieldwork activities are included with this report as Appendix 6J.

Variable Head Permeability Tests were carried out at The following borehole locations and the records of same are included as Appendix 6E, Part 2:
BH-49513
BH-49880
BH-54278
BH-62741
BH-69405
BH-77404
BH-89604
BH-98002

Detailed engineering logs for the cable percussive boreholes completed are included with this report in Appendix 7A.

6.3.6 Cable Percussive with Rotary Core 'Follow-On' Boreholes:
One hundred and seventeen cable percussion (Shell & Auger) with rotary core 'follow-on' boreholes were completed using a Dando 2000 Cable Percussive Boring Rig and GEO602/DB520 Rotary Core Drill Rigs.

The borehole depths ranged from 8.00m to 25.20m below ground level. The boreholes were carried out to establish overburden conditions and rockhead and to establish the nature and integrity of the underlying rock.

The cable percussive element of the boreholes were bored to 'refusal' or to depths as instructed by the client's representatives while the rotary core boreholes were carried out as 'follow-on' rotary core boreholes at locations where the cable percussive boreholes encountered relatively 'shallow' refusals.

In–Situ testing consisting of Standard Penetration Tests were carried out at regular intervals (predominantly 1.0m intervals) or as instructed by the client's representatives.

Disturbed bulk and jar soil samples were taken at each change in strata and were returned to the laboratory and logged by a Geotechnical Engineer and presented for testing. Groundwater samples were taken where possible and returned to the laboratory for storage and analysis.

The rotary core drilling was carried out using HQ size (64mm core diameter, 96mm hole diameter) drill strings with wireline drilling techniques were used to recover the core samples.

A water based flush system was used as the drilling medium while a biodegradable polymer gel was also used where necessary to aid the drilling and soil / rock recovery process.
The samples were stored in wooden boxes and returned to the laboratory where there were logged and photographed by a Geotechnical Engineer and presented for testing.

A 50mm diameter standpipe was installed in the following boreholes and as instructed by the Client's Engineer, to allow for monitoring of groundwater levels over a prolonged period of time:
BH-36789
BH-38523
BH-42851A
BH-43817
BH-46402
BH-47262
BH-48139
BH-49214
BH-50608A
BH-50885
BH-56109
BH-56857
BH-59932
BH-60345
BH-69703
BH-72683
BH-76545
BH-78412
BH-78862
BH-79595
BH-83591
BH-94016
BH-96005
BH-97837
BH-97881
BH-102037

Groundwater readings recorded during the completion of fieldwork activities are included with this report as Appendix 6J.

Variable Head Permeability Tests were carried out at the following borehole standpipe locations and the records of same are included as Appendix 6E, Part 2.
BH-61605
BH-63008
BH-69703
BH-76545
BH-92680
BH-97788

Detailed engineering logs for the cable percussive with rotary core 'follow-on' boreholes completed are included with this report in Appendix 6A.

6.3.7 Soils/Rock Rotary Core Boreholes (GeoboreS):
Fifteen rotary core boreholes using GeoboreS drilling techniques were carried out to establish overburden conditions and rockhead and to establish the nature and integrity of the underlying rock.

The borehole depths ranged from 10.00m to 15.10m below ground level.

The rotary core boreholes were carried out as 'stand-alone' rotary core boreholes using wireline drilling techniques to recover soil and rock core samples.

GeoboreS drill strings ((101mm core diameter, 146mm hole diameter) were used to recover soil core samples in the overburden.

A water based flush system was used as the drilling medium while a biodegradable polymer gel was also used where necessary to aid the drilling and soil / rock recovery process.

The samples were stored in wooden boxes and returned to the laboratory where there were logged and photographed by a Geotechnical Engineer and presented for testing.

In-Situ testing consisting of Standard Penetration Tests were carried out in the overburden at regular intervals.

A 50mm diameter standpipe was installed in the following boreholes and as instructed by the Client's Engineer, to allow for monitoring of groundwater levels over a prolonged period of time:
BH-47812
BH-61515
BH-81864

Groundwater readings recorded during the completion of fieldwork activities are included with this report as Appendix 6J.

Detailed engineering logs for the soils/rock rotary core boreholes (GeoboreS) completed are included with this report in Appendix 6A.

6.3.8 Rotary Core Boreholes:
Five rotary core boreholes using were carried out to establish overburden conditions and rockhead and to establish the nature and integrity of the underlying rock.

The borehole depths ranged from 10.00m to 15.00m below ground level.

The rotary core boreholes were carried out as 'stand-alone' rotary core boreholes using wireline drilling techniques to recover soil and rock core samples.

HQ drill strings ((64mm core diameter, 96mm hole diameter) were used to recover soil and rock core samples.

A water based flush system was used as the drilling medium while a biodegradable polymer gel was also used where necessary to aid the drilling and soil / rock recovery process.

The samples were stored in wooden boxes and returned to the laboratory where there were logged and photographed by a Geotechnical Engineer and presented for testing.

In-Situ testing consisting of Standard Penetration Tests were carried out in the overburden at regular intervals.

A 50mm diameter standpipe was installed in the following boreholes and as instructed by the Client's Engineer, to allow for monitoring of groundwater levels over a prolonged period of time:
BH-74851

Groundwater readings recorded during the completion of fieldwork activities are included with this report as Appendix 6J.

Detailed engineering logs for the rotary core boreholes completed are included with this report in Appendix 6A.

6.3.9 Trial Pits:
Four hundred and fifty-six trial pits were excavated on site using a 12T tracked excavator.

The pits were logged and photographed by an Engineer with observations made on ground conditions, pit stability, water ingress and services encountered. The pits were excavated to depths ranging from 1.50m to 4.50m below ground level.

Small and bulk disturbed soil samples were recovered at each change in strata and returned to the laboratory and presented for testing.

In-Situ tests consisting of hand shear vane tests were also carried out where possible in cohesive soils and a summary of the shear vane test results are included on the engineering logs.

Detailed engineering logs for the trial pits completed are included with this report in Appendix 6C.

6.3.10 Dynamic Probing:
Fourteen dynamic probes (Dynamic Probe Heavy, DPH) were carried out to 'refusal' using a LMSR-V(k) Geotool Dynamic Probing Rig.

The dynamic probe was carried out to depths ranging from 0.80m to 10.00m below ground level.

The Dynamic Probing Rig involves the dropping of a 50 kg hammer onto rods from a standard height (500mm) and recording the number of blows it takes to penetrate the rods (with a cone tip) to depth of 100mm increments into the soil.

The dynamic probe engineering logs then graph the number of blow counts required to penetrate each 100mm incremental depth. The probe is considered to have encountered 'refusal' when a blow count of 25 does not achieve the full 100mm incremental depth.

Detailed engineering logs for the dynamic sampling completed are included with this report in Appendix 6B, Part 1.

6.3.11 Dynamic Sampling:
Fourteen dynamic sampling probe holes were carried out to 'refusal' using a LMSR-V(k) Geotool Dynamic Probing Rig.

Windowless samples are retrieved by pushing the rods to depth using rig hydraulics with the sample recovered in a seamless plastic liner contained within the rods. The plastic liner is then extracted from the rods once target sample depth is reached.

The windowless sampling was carried out to depths ranging from 0.90m to 3.00m below ground level.

Detailed engineering logs for the dynamic sampling completed are included with this report in Appendix 6B, Part 2.

6.3.12 Peat Probes and Russian Core Samples:
Four hundred and forty-seven peat probes were carried out using hand-held steel rods pushed by hand to 'refusal'

One hundred and twenty-three Russian Core samples testing were carried out to recover undisturbed soil samples using a core unit pushed by hand to 'refusal'.

The peat probes and Russian core sampling were carried out at soft ground locations and to depths ranging from 0.10m to 3.20m below ground level.

Detailed engineering logs for the peat probes and Russian core sampling completed are included with this report in Appendix 6D.

In-situ test consisting of shear vane test were carried out at thirteen peat probe and/or Russian core locations. The test were carried out using a Geonor H70 Shear Vane and the records of same are included with this report as Appendix 6E, Part 1.

6.3.13 Slit Trenches:
Four slit trenches were completed on roads along the proposed route to ascertain and record existing underground services. The trenches were excavated using a JCB Excavator.

Bulk and/or environmental soil samples were recovered from the slit trenches and presented to the laboratory for testing.

Ground conditions, trench stability and water ingress encountered during the excavation of the slit trenches were also recorded by Geotechnical Engineers and the records of same are included in Appendix 6E of this factual report.

6.3.14 Geophysical Survey:
A geophysical survey along the pipeline route was carried out by Minerex Geophysics Limited.

The survey consisted of Seismic Refraction and 2-D Resistivity and the records of same were presented as a ‘stand-alone’ report and included here with this report as Appendix 6G.

A Ground Penetration Radar(GPR) Utility Survey was also carried out by Scantech Geoscience Ltd at forty-one road locations along the proposed route and the records of this survey have been included as a ‘stand-alone’ report in Appendix 6G of this factual report.

6.3.15 General Summary:
The borehole locations were set out on site using a Trimble CU Bluetooth GPS Surveying Unit and the co-ordinates are included on the logs presented in the appendices.

All fieldwork co-ordinates are reported to Irish Transverse Mercator (ITM) with Reduced Levels recorded relative to Malin Head Datum and with an accuracy level of + or – 0.10m.

The fieldwork was carried out in accordance with IS EN 1997-2 and BS5930:2015+A1:2020 Code of Practice for Site Investigations with precedence given to IS EN 1997-2 where applicable.

6.4 Laboratory Testing

Representative samples recovered from the boreholes and trial pits were scheduled for testing in the laboratory.

The test schedules were prepared by the Client's Engineer and included the following tests on bulk disturbed soil samples, soil core samples and/or undisturbed soil samples:

Test Type:	Number
Moisture Content	1030
Atterberg Limit	991
Particle Density	05
Particle Size Distribution	1258
Sedimentation	633
Organic Content	53
Loss on Ignition	52
Sulphate Total	41
Chemical (pH, Sulphate)	06
Compaction (Light)	08
Compaction (Heavy)	02
Compaction (Vibrating)	02
Moisture Condition Value	113
Moisture Condition Relationship	03
CBR	54
Direct Shearbox (Small)	21
Triaxial (UU, Multistage)	02
BRE, Suite B	366

The test schedules also included the following tests on rock core samples:

Test Type:	Number
UCS	63
Point Load	218
Mohr Hardness	09
LA Abrasion	03
Water Absorption	01
Magnessium Sulphate Soundness	01
AAV	01
Slake Durability	08
Particle Density / Flakiness Index	01
Simplified Petrography	01
Brazilian Tensile Rock Test	02

The test schedules were carried out predominantly at the IDL Laboratory located at Loughrea, County Galway.

A number of specialist tests not available at the IDL laboratory were carried out by designated laboratories on a subcontract basis as follows:

Laboratory chemical tests (BRE Suite) were carried out by ALS Ltd., Hawarden, UK.

Shear Strength, Triaxial and Consolidation (Oedometer) Tests were carried out by NMTL, Carlow, County Carlow.

Groundwater samples tests (Mott MacDonald Groundwater Suite) if scheduled were also carried out by ALS Ltd., Hawarden, UK.

ALS Ltd., Hawarden, UK is accredited to ISO/IEC 17025:2017 (UKAS).

Specialist rock tests including Mohr Hardness, UCS with Young's Modulus and Poisson's Ratio, Magnessium Sulphate Soundness, Brazilian Tensile Strength, Direct Shear and Petrographic Analysis were carried out by Structural Soils Ltd, UK.

Structural Soils Ltd., Castleford, UK is accredited to ISO/IEC 17025:2017 (UKAS).

Soil samples (disturbed and undisturbed) in general were recovered from the excavation of trial pits and completion of cable percussive boreholes. Soil and/or rock core samples were recovered from the completion of rotary core boreholes and the records of the laboratory test results carried out on same are reported in Appendix 7H.

The soil and rock descriptions as noted on the borehole and trial pit logs are in general visual descriptions as observed and logged by our Engineers and are described in accordance with IS EN 1997-2 and BS5930:2015+A1:2020 Code of Practice for Site Investigations.

Soils descriptions (cohesive or otherwise) are also initially assessed based on the texture and 'feel' of the soil materials as witnessed by our Geotechnical Engineers and in accordance with IS EN 1997-2 and BS5930:2015+A1:2020.

Where laboratory classification tests have been carried out on soil and/or rock samples then these visual descriptions have been amended accordingly to take into account the results of these classification tests.

The records of the laboratory test results are included with this report as Appendix 6H.

18.10 3.30	47		102.20		3.30	3.30 - 3.50 m: overburden	Subangular fine to coarse assorted grey limestone GRAVEL with low cobble content. Cobbles are subrounded to rounded of grey limestone	
3.50	- -		102.00		3.50	3.50 - 5.50 Non-intact as possible weathered rock.		
	100 (38) 11	NI			(2.00)		Possible weathered LIMESTONE rock. Very strong and strong thinly bedded grey slightly bioclastic fine and coarse grained limestone recovered as angular fine to coarse gravel cobble and boulder sized clasts.	
5.00			100.00		5.50		Core run - 3.50m to 5.00m: 1 No grey limestone boulder sized clast 300mm in length. Point Load Test - 5.30m to 5.45m: very strong.	
	67 (62) 59	2				5.50 - 10.00 Discontinuities, medium spaced, locally closely spaced, dipping 12 to 14°, stepped, smooth, with 0.5 to 1mm thick orangish brown clay smear.	Very strong thinly bedded 'marbled' white and light grey with coarse grained sparite fine grained and coarse grained LIMESTONE.	
6.50		3						
	100 (96) 83	5			(4.50)		Point Load Test - 7.00m to 7.16m: very strong.	
8.00						8.00 - 8.30 Joint, vertical to 8.15m, then subvertical dip, stepped, smooth, with 0.5 to 1mm thick light brown clay smear, open.	8.00m to 9.00m: becoming massive.	
	100 (98) 81	4						
9.50								
	100 (94)	3					9.70m to 10.00m: 5mm wide vertical calcitic veinlet.	
04.03 10.00	80		95.50		10.00		BH terminated at 10.00m bgl on REs instruction.

STRATA DESCRIPTION

Discontinuities	Detail	Main
4.30 - 7.50 m: overburden		Very dense subangular to subrounded fine to coarse assorted dark grey and grey limestone GRAVEL with boulder and a little grey sandy silt. Sand is fine to coarse.
7.50 - 10.10 Discontinuities, medium spaced, very closely spaced from 8.35m to 8.45m and 9.80m to 10.00m , dipping 10 to 12°, stepped, smooth, with 0.5 to 1mm thick grey silt smear.		Very strong locally medium strong thinly bedded dark grey slightly silty fine and medium grained LIMESTONE. 8.35m to 8.45m: medium strong thinly laminated fissile with visible finely disseminated pyrite. 9.80m to 10.00m: medium strong thinly laminated fissile with visible finely disseminated pyrite.
		BH terminated at 10.10m bgl on REs instruction.

STRATA DESCRIPTION

Discontinuities / Detail	Main
2.20 - 2.90 m: overburden	Very dense brown slightly sandy slightly silty subrounded to subangular fine to coarse assorted dark grey and grey limestone GRAVEL. Sand is medium to coarse.
2.90 - 10.00 Discontinuities, very closely and closely spaced, locally medium spaced, dipping 45 to 47 and 10 to 12°, stepped, smooth, with 0.5 to 3mm thick light brown clay smear. 2.91 - 3.35 Joint, subvertical dip, stepped, smooth, with 0.5 to 2mm thick light brown clay smear, open. 3.65 - 3.80 Joint, subvertical dip, stepped, smooth, with 0.5 to 2mm thick light brown clay smear, open. 4.20 - 4.32 Joint, subvertical dip, stepped, smooth, with 0.5 to 2mm thick light brown clay smear, open.	Strong thinly bedded dark grey fine grained LIMESTONE.
	BH terminated at 10.00m bgl on REs

Subsurface Geophysical Investigations

EXECUTIVE SUMMARY

1. Minerex Geophysics Ltd. (MGX) carried out a geophysical survey consisting of 2D-Resistivity and seismic refraction (p-wave) surveying for the ground investigation for the Water Supply Project, Eastern and Midlands Region – Contract 2.
2. The main objectives of the survey were to determine ground conditions under the site; determine the depth to rock and the overburden thickness in order to estimate the strength or stiffness or compaction of overburden and the rock quality; establish the presence of faults and fracture zones, and to detect possible karstified rock.
3. The main objective of the survey in the first area (Ch36880 – 37080) was to determine the depth of rock and identify any karst features within the area while the other survey areas were mainly concentrated on areas of alluvium with the objective of determining the general subsurface conditions.
4. Most areas surveyed showed deep clay-rich overburden described primarily as sandy gravelly clay and silt with some clayey silty sand and gravel and clay and silt overburden in some places. There was some clean sand and gravel present at 89516-89618 (Map19).
5. There was soft material between Ch63018 – 63895 (Map 11 & 12) up to 3m deep and interpreted as alluvium silts but may also been peat.
6. The area between Ch63018 – 63895 (Map 11 & 12) shows soft material to depths of up to 3m underlain by deep stiff overburden. The soft layer is likely alluvium silts but may also by peat.
7. The shallowest rock encountered within the survey areas were at Ch36880 – 37080 (Map 1) where the top of the good limestone was interpreted between 2 and 4m bgl with weathered rock even shallower. Rock was interpreted at 3.5m bgl at Ch54130 – 54309 (Map 4 & 5) and between 2.5 – 4.5m at Ch61848 – 61868 (Map 7).
8. There was a likely fault zone noted at Ch61848 – 61868 (Map 7).
9. There was a karst feature interpreted between Ch36907 – 36941 (Map 1) within a shallow rock area. Two other areas where possible karst was noted was Between Ch54193 – 54260 (Map 4 & 5) and Ch97703 - Ch97775 (Map 21).
10. This report will be reviewed and finalised after the complete direct ground investigation data has been received.

1. INTRODUCTION

1.1 Background

Minerex Geophysics Ltd. (MGX) carried out a geophysical survey for the Watern Supply Project – Contract 2. The survey consisted of 2D-Resistivity and seismic refraction (p-wave) measurements at 19 specific locations along the pipeline route targeting areas of alluvium overburden. The survey was commissioned by Irish Drilling Ltd.

A previous geophysical report (MGX, 2017) was carried out for this scheme concentrating of water crossings along the full route. This survey was aimed mainly at areas containing alluvium overburden as well as some other targeted locations.

A broad geophysical interpretation covering various geological setting expected across the country was used in the previous survey which is again used in this report and is shown in Table 2. A more refined interpretation based on individual locations are provided on the interpretation figures and in Chapter 4 of this report.

This survey utilized various complimentary geophysical methods to improve final interpretations. The role of geophysics as a non-destructive fast method is to provide a geological interpretation over a wide area to complement direct ground investigations at specific locations. The direct ground investigation results can be used to improve the initial geophysical results and interpretation.

The proposed development is a large 2m diameter water supply pipeline from the River Shannon to Dublin.

1.2 Objectives

The main objectives of the geophysical survey were:

- To determine the ground conditions under the site
- To determine the depth to rock and the overburden thickness
- To estimate the strength or stiffness or compaction of overburden materials and the rock quality
- To determine the type of overburden and rock
- To detect lateral changes within the geological layers
- To determine the presence of possible faults and fracture zones
- To detect possible karstified zones within the rock, karst features

1.3 Site Description

The 19 geophysical survey sites proposed for Contract 2 are located along the proposed pipeline route. 15 of these locations were positions where the quaternary sediments are described as alluvium on the online GSI maps. For naming the locations, the chainage provided at the time of the survey is used in the labelling in this report.

1.4 Geology

The overburden and bedrock geological conditions as taken from the Geological Survey of Ireland (GSI, 2021) are shown in Table 1. The quaternary sediments in most areas are described as alluvium while some areas have limestone till overburden. The bedrock formations are Waulsortian Limestone, Lucan Formation, Old Cherty Limestone or the Ballysteen Formation. There are no karst features noted at any of the survey areas.

1.5 Report

This report includes the results and interpretation of the geophysical survey. Maps, figures and tables are included to illustrate the results of the survey. More detailed descriptions of geophysical methods and measurements can be found in GSEG (2002), Milsom (1989) and Reynolds (1997).

The description of soil, rock and the use of geotechnical terms (soft, stiff, dense etc) follows Eurocode (2007) and BSI (2015) standards. The terms are defined in the standards and the physical parameters are related from experience. This geophysical survey has been acquired, processed, interpreted and reported in accordance with these guidelines.

The client provided maps of the site and the digital version was used as the background map in this report. Elevations were surveyed on site and are used in the vertical sections.

The interpretative nature and the non-invasive survey methods must be taken into account when considering the results of this survey and Minerex Geophysics Limited, while using appropriate practice to execute, interpret and present the data, give no guarantees in relation to the existing subsurface.

2. GEOPHYSICAL SURVEY

2.1 Methodology

The methodology was agreed before surveying and consisted of 2D-Resistivity surveying and Seismic Refraction surveying along a number of lines in each area. In the final Area, shown on Map 22, one 2D-Resistivity lkine was carried out before access was rescinded to the site.

The survey locations are indicated on Maps 1-22. The lines, locations, chainage and parameters are tabulated in Table 1.

2.2 2D-Resistivity (ERT)

2D-Resistivity lines were surveyed with electrode spacing of 3m, up to 64 electrodes per set-up and a maximum length of 189m per set-up. The readings were taken with a Tigre Resistivity Meter, Imager Cables, stainless steel electrodes and a laptop with ImagerPro acquisition software.

Some data was acquired in the roll-along mode where lines extended greater than 189m to achieve continuous coverage to a depth of 15m.

During 2D-Resistivity surveying, data is acquired in the form of linear arrays using a suite of metal electrodes. A current is induced into the ground via a pair of electrodes whilst a potential difference is measured across a second pair of electrodes. This allows for the recording of the apparent resistivity in a two-dimensional arrangement below the line. The data is inverted after the survey to obtain a model of subsurface resistivities. The generated model resistivity values and their spatial distribution can then be related to typical values for different geological materials.

2D-Resistivity has previously proven zones of anomalous or karstified rock with lateral extents of 5m and more.

2.3 Seismic Refraction

Seismic refraction lines were surveyed with geophone spacing of 3m and 24 geophones per set-up resulting in a 69m length per set-up. The recording equipment consisted of a 24 Channel GEOMETRICS ES-3000 engineering seismograph with 4.5Hz vertical geophones. The seismic energy source consisted of a hammer and plate. A zero-delay trigger was used to start the recording. Normally 7 shot points per p-wave set-up were used.

Many set-ups were acquired in longer continuous lines using common shot points between set-ups and concatenating into longer lines at the processing stage.

The seismic refraction survey method focuses on propagating p-waves travelling through the subsurface, which are generated by hitting a hammer on a plate or other source. As the wave propagates through the subsurface, its velocity varies as it travels through overburden, rock with different elastic properties, and along geological boundaries. Velocity data is recorded via the surveying equipment, which is then processed, allowing geological layer thicknesses and boundaries to be established.

Seismic Refraction generally determines the depth to horizontal or near horizontal layers where the compaction or strength or rock quality changes with an accuracy of 10 – 20% of depth to that layer. Where low velocity layers or shadow zones are present (e.g., below solid ground surface) or where layers dip with more than a 20 degree angle the accuracy becomes much less.

The seismic refraction set-ups with 69m individual length have a reasonable penetration depth of around 15m. An internationally accepted maximum depth estimate for a seismic refraction set-up is 1/6 of the set-up length including offshots. The depth penetration varies according to the velocity structure of the subsurface. In this report we used a depth of 15m bgl. where the seismic modelling was ended as deeper modelling becomes less meaningful.

2.4 Site Work

The first phase of data acquisition was carried out between the 8th of November and 9th of December 2021. The second phase of data acquisition was carried out between the 7th and 14th of March 2022. A third visit near the break pressure tank site on the 30th of May 2022. The weather conditions were fair throughout the acquisition period. Health and safety standards were adhered to at all times. The locations and elevations were surveyed with a Carlson NR3 RTK-GPS to accuracy < 0.05m.

3. RESULTS AND INTERPRETATION

The interpretation of geophysical data was executed utilizing the known response of geophysical measurements, typical physical parameters for subsurface features that may underlay the site, and the experience of the authors.

Some ground investigation results were available before and after the survey from surveying carried out in 2017, and the abbreviated borehole logs are indicated on the sections.

3.1 2D-Resistivity (ERT)

The 2D-Resistivity data was positioned and inverted with the RES2DINV inversion package. Lines using the roll-along method were concatenated for a joint inversion. The programme uses a smoothness constrained least-squares inversion method to produce a 2D model of the subsurface resistivities from the recorded apparent resistivity values. Three variations of the least squares method are available and for this project the Jacobian Matrix was recalculated for the first three iterations, then a Quasi-Newton approximation was used for subsequent iterations. Each dataset was inverted using seven iterations resulting in a typical RMS error of <3.0%. The resulting models were colour contoured with the same resistivity scale for all lines and they are displayed as cross sections (Figure 1a – 22a).

Resistivities are characteristic for certain overburden and rock types. If there is a high content of clay minerals (which are electrically conductive) then the overburden resistivity will be lower than as if there is a high content of clastic grains like sand or gravel. The purer the clay and the lower the sand and gravel content, the lower the resistivity. Water content in overburden layers can influence the resistivities, but generally clay content has a more dominating effect.

Within bedrock types like clean limestone, high resistivities indicate a fresh, strong, unweathered rock. As the weathering in the rock increases, the resistivity gets lower because of weathering products, remineralisation of rock and infill of cracks, faults and voids with clay and water. Weathering within rock is typically indicated by lower resistivity values in the cross sections.

In limestone areas, karstified rock is defined in this report as a formerly intact clean limestone rock, liable to karstification, that has been partially dissolved by water over long geological time scales and where the cavities and voids have either remained empty (filled by air) or became filled by overburden sediment (clay, silt, sand), weathering product of the broken rock itself or water. This process would lead to a reduction of the resistivity of the overall rock and therefore karstified rock has a lower resistivity than intact clean limestone rock. This is generally indicated by lower resistivities embedded within high resistivity at depth.

The resistivities cover a range typical for materials from clay rich overburden (low resistivities) to fresh strong unweathered bedrock (high resistivities). The ranges have been taken into the consideration for the interpretation. Within the overburden layers, very low resistivities (<62.5 Ohmm) indicate a clay rich

overburden. Low resistivity values (62.5 - 250 Ohmm) indicates a sandy gravelly clay and silt. Medium values (250 to 500 Ohmm) show a clayey silty sand and gravel while high resistivities (>500 Ohmm) indicate sand and gravel.

Within Rock layers, the resistivities indicate different rock types as well as differing levels of weathering within a rock. Low resistivities (<250 Ohmm) indicate a mudstone or shale bedrock or a very infilled limestone. Medium resistivities (250 – 500 Ohmm) may be a shale or infilled limestone. High resistivities (500 – 2000 Ohmm) are interpreted either as shale or limestone while very high resistivities (>2000 Ohmm) indicate a clean limestone.

3.2 Seismic Refraction

The seismic refraction data was positioned and processed with the SEISIMAGER software package to give a layered model of the subsurface. The number of layers has been determined by analysing the seismic traces and up to 7 layers in total were used in the models ranging from 3 to 4-layer models. All seismic profiles were subject to a standardised processing sequence which consisted of a topographic correction which was based on integrated elevation data, first break picking, tomographic inversion, travel-time computation via ray-tracing and velocity modelling. Residual deviations of typically 0.4 to 1.8 msec RMS have been obtained for each profile. Following each processing stage QC procedures were adhered to. The resulting layer boundaries are shown as thick lines overlaid on the 2D-Resistivity cross sections (Figures 1a to 21a). The average seismic velocities obtained within the layers are annotated on the sections as bold black numbers.

The p-wave seismic velocity is closely linked to the density of subsurface materials and to parameters like compaction, stiffness, strength and rock quality. The higher the density of the subsurface materials the higher the seismic velocity. Similarly for the other parameters it is generally valid that a more compacted, stiffer and stronger material will have a higher seismic velocity. For rock, the seismic velocity is higher when the rock is stronger, less weathered and has a higher quality. If the rock is more weathered, broken, fractured, fissured or karstified then the seismic velocity will be reduced compared to that of intact fresh rock.

Because of the above relationship, the seismic refraction method and seismic velocities are suitable to investigate ground where the layers get denser, more compacted and stronger with depth. A disadvantage is that some materials may have the same seismic velocity: Very stiff to hard or very dense highly consolidated overburden and a weathered rock can have the same seismic velocity range.

3.3 Interpretation of Resistivity and Seismic Refraction

Table 2 summarises the interpretation. The stiffness or compaction and the rock strength or quality have been estimated from the seismic velocity. The estimation of the excavatability for the bedrock has been made according to the caterpillar chart published in Reynolds (1997). The geotechnical assessment for rippability will have to take factors like rock type and jointing into account and the estimation in this report is solely based on the seismic velocities.

Interpreted cross sections are shown in Figure 1b to 22b. The interpretation has been made from all available information. For overburden layers and the top of the rock, the seismic refraction data has been used as seismic refraction is the best method to delineate layer boundaries. The resistivity models have been used to delineate generalised types of overburden and rock. Resistivity data is better suited to show rock types and features within the rock while seismic refraction velocities are indicating the change of compaction, stiffness or rock quality with depth. Along short profile parts where only one data type is available an interpolation for the interpreted layers was made.

Table 2: Summary of Interpretation

Layer	**General Seismic Velocity Range (m/sec)**	**General Resistivity Range (Ohmm)**	**Stiffness/ Compaction or Rock Strength/ Quality**	**Interpretation**	**Estimated Excavation Method**
1	<150	N/A		Peat	Diggable
2	170 – 400	N/A	Soft or loose	Topsoil	Diggable
3A	500 - 900	<62.5	Firm	Clay	Diggable
3B	500 - 900	62.5 - 250	Firm	Sandy gravelly Clay or Silt	Diggable
3C	500 – 900	250 – 500	Medium Dense	Clayey silty Sand or Gravel	Diggable
4A	1000 – 1500	<62.5	Stiff	Clay	Diggable
4B	1000 – 1500	62.5 - 250	Stiff	Sandy gravelly Clay or Silt	Diggable
4C	1000 – 1500	250 - 500	Dense	Clayey silty Sand or Gravel	Diggable
4D	1000 – 1500	500 - 2000	Dense	Sand or Gravel	Diggable

5A	1600 – 2000	<62.5	Very Stiff or Poor	Clay or Very Weathered Mudstone or Shale or very infilled Limestone	Diggable/Rippable
5B	1600 – 2000	62.5 - 250	Very Stiff or Poor	Sandy gravelly Clay or Silt or very Weathered Mudstone or Shale or infilled Limestone	Diggable/Rippable
5C	1600 – 2000	250 - 500	Very Dense or Poor	Clayey silty Sand or Gravel or very Weathered Shale or Limestone	Diggable/Rippable
5D	1600 – 2000	500 – 2000	Very Dense or Poor	Sand or Gravel or very Weathered Shale or Limestone	Diggable/Rippable
6A	2100 – 2900	<62.5	Fair or very stiff	Weathered Mudstone or Shale or very infilled Limestone or Clay	Diggable/Rippable
6B	2100 – 2900	62.5 - 250	Fair or Very Stiff	Weathered Mudstone or Shale or very infilled Limestone or sandy gravelly Clay or Silt	Rippable/Marginal Rippable or Breaking and Blasting
6C	2100 – 2900	250 - 500	Fair or Very Dense	Weathered Shale or infilled Limestone or clayey silty Sand or Gravel	Rippable/Marginal Rippable or Breaking and Blasting
6D	2100 – 2900	500 - 2000	Fair or Very Dense	Weathered Shale or Limestone or Sand or Gravel	Rippable/Marginal Rippable or Breaking and Blasting
7B	>3000	62.5 - 250	Good	Mudstone, Shale or very infilled Limestone	Breaking or Blasting
7C	>3000	250 - 500	Good	Shale or Infilled Limestone	Breaking or Blasting
7D	>3000	500 - 2000	Good	Shale or Limestone	Breaking or Blasting
7E	>3000	>2000	Good	Clean Limestone	Breaking or Blasting

4. INTERPRETATION BY LOCATION

Due to the large distances covered during this project and the space between each survey area, the geology varies greatly throughout the project. In this chapter the interpretations are divided into a section for each box. The layers shown in table 2 are narrowed for each location to provide the most likely geological interpretation for each area using all available information available. The chainages, indicating the survey location indicate the lowest chainage where surveying being.

4.1 Ch36880

Maps and Figures: 1

Lines: 1 – 2, 62 - 63

Location Comments: Two parallel lines were surveyed which were broken at a field boundary.

GI Points: RC197, 70m SE of Line 1

The seismic refraction velocities provide a three-layer model with a shallow good rock layer. The resistivities are generally high across the survey area with one notable section showing lower resistivities at depth.

The top layer is interpreted as soft or loose topsoil. This layer is up to 1m thick and is underlain by 1.5 – 3m of poor, very weathered limestone. This layer becomes thicker on the higher ground towards the west where it is up to 6m thick. This layer may also contain some very stiff or very dense overburden. Good clean limestone is indicated at a depth of 2 – 4.5m below ground level (bgl) and up to 8m deep along line 62 in the west. RC197, shows weathered rock at 1.40m and strong limestone at 2.10m bgl.

On the west side of lines 1 and 2, there is an area of deep weathering within the rock. This is interpreted as a karst feature with infilled limestone. The feature is more pronounced along line 2 in the south and it is therefore recommended to locate the pipeline to the north of the area.

4.2 Ch49615

Maps and Figures: 2 & 3

Lines: 3 - 7

Location Comments: Two areas surveyed on opposite side of the river. A previous survey had been carried out along the banks of the river.

GI Points: BH12

The seismic refraction data is modelled with a four-layer model ranging from soft or loose overburden to good rock while the resistivities also gradually increase with depth from low to high.

The soft and loose topsoil layer is very thin and is underlain by stiff to very still clay and very stiff sandy gravelly clay to depths of 5 – 11m bgl. Where very stiff sandy gravelly clay is present there may also be some poor very weathered rock no shallower than 4m bgl. Good shale is interpreted at 5 – 11m bgl which is shallower towards the SW.

BH12 refuses after 1m but indicates clay rich soil above this.

4.3 Ch54130

Maps and Figures: 4 & 5

Lines: 8 - 12

Location Comments: Lines split at the river with 3 lines to the south and 2 lines to the north to cover the survey area.

GI Points: BH88, 170m SW of line 8

The depth of the seismic layers and the resistivities at depth vary across some of the lines indicating changes in geology across the area.

The soft and loose topsoil layer is underlain by stiff sandy gravelly clay and dense clayey silty sand and gravel to a depth of 1.5 – 3m bgl. This layer is underlain by a 1.5 – 11.5m thick layer characterised by rising resistivities and a seismic velocity range between 2400 – 2500m/s. This layer is likely primarily made up of very stiff and very dense overburden but may also contain some fair infilled limestone.

The good rock layer varies in depths of between 3.5 - 14m bgl and is described as good limestone and good infilled limestone. The shallowest rock is found to the north of the river. The deepest weathering occurs to the south of the river along lines 8 and 9 and may indicate a karst feature.

4.4 Ch61465

Maps and Figures: 6 & 7

Lines: 13 - 17

Location Comments: Lines split at the road with 3 lines to the SW and 2 lines to the NE to cover the survey area. A small section in the SW was not surveyed as access was not available.

GI Points: BH96

The geophysical survey in this area indicates a significant change from the west to east side of the road. The west side of the road is characterised by deep, primarily sandy gravelly clay and silt overburden underlain likely by a shale bedrock while the east side of the road is underlain by shallow limestone bedrock. The sudden change in geology is likely due to a fault of fault zone in this area running roughly N-S near the road.

The west side of the road consists of deep stiff to very stiff sandy gravelly clay and silt. There are some sand and gravel lenses located close to the road. The good rock is generally very deep but is as shallow 6.5m in some areas. Towards the road where resistivities rise there may also be some fair weathered shale at 4m bgl.

The overburden to the east of the road consists of sand and gravel and clayey silty sand and gravel to depths of 2.5 – 4.5m bgl and is underlain by good limestone at this depth.

BH96 shows clay with cobbles to a depth 1.6m before refusing.

4.5 Ch62198

Maps and Figures: 8

Lines: 18 - 20

Location Comments: Three parallel lines cover the survey area.

GI Points: N/A

This area is located 330m NE of the previous area and shows a change back to clay rich overburden and deep rock. There may be other faults causing the rock to drop between this area and the previous area or the rock gradually dips between the two sections.

This area is underlain by stiff to very stiff sandy gravelly clay and silt with some clayey silty sand and gravel lenses near the surface.

4.6 Ch62630

Maps and Figures: 9 & 10

Lines: 21 - 27

Location Comments: Three parallel lines carried out to the SW and NE of the river with a seventh line carried out in a separate field to the NW due to an impenetrable field boundary. A previous survey had been carried out along the banks of the river.

GI Points: RC17

The models in this area show consistent resistivities and seismic velocities across all lines. Soft or loose topsoil and firm sandy gravelly clay and silt extends to depths of 2 – 3.5m bgl and are underlain by deep very stiff sandy gravelly clay and silt.

RC17 shows silt, clay and sand to depths of 10m bgl.

4.7 Ch63842

Maps and Figures: 11 & 12

Lines: 28 - 32

Location Comments: Lines split at river with 2 lines in the south and three in the north. No seismic refraction surveying was carried out along line 32 due to flooding.

GI Points: N/A

The resistivities in this area are very low to low, particularly in the west where the ground was flooded and seismic refraction surveying hence could not be carried out. The low resistivities indicate a silt and clay overburden. This area may also contain deep peat but this was not observed on site and is not indicated on the GSI online mapping.

The soft and loose topsoil extends to depths of 1 - 3m bgl and is thickest to the west. The stiff clay and still sandy gravelly clay and silt layer is up to 7.5m thick in the west but is less than 1m thick in the east. The top of the very stiff sandy gravelly clay layer is between 1.5 – 11m bgl.

It is recommended to keep the pipeline to the east of this area to avoid potential peat or deeper soft materials.

4.8 Ch65801

Maps and Figures: 13

Lines: 33 - 35

Location Comments: Two parallel Lines and one perpendicular line carried out to cover the survey area.

GI Points: BH98, 94m north of line 33

The models in this area show deep clay rich overburden with some areas of more sandy gravelly material.

Soft and loose topsoil is 1 – 2m thick and is underlain by a 1 – 7m thick layer of stiff sandy gravelly clay and silt with some clayey silty sand ang gravel areas. This layer is thickest to the SW. The top of the very stiff sandy gravelly clay and silt layer ranges from 2 – 9m bgl and extends to at least 15m bgl.

4.9 Ch69297

Maps and Figures: 14 - 16

Lines: 36 - 44

Location Comments: lines were terminated at the road as well as impenetrable field boundaries. Nine lines allowed the area to be well covered.

GI Points: BH100

The resistivities and seismic velocities in this area are very consistent with depth and across this area.

The area is underlain by up to 1m of soft and loose topsoil and stiff sandy gravelly clay and silt and dense clayey silty sand and gravel to a depth of 1 – 4m bgl. Below this depth, the overburden is interpreted as very stiff sandy gravelly clay and silt and very dense clayey silty sand and gravel.

4.10 Ch76480

Maps and Figures: 17

Lines: 45 - 47

Location Comments: Three parallel lines carried out as proposed.

GI Points: N/A

The resistivities in this area are very consistent with depth and across this area with the seismic refraction velocities gradually increasing with depth.

The area is underlain by 1 – 1.5m of soft and loose topsoil and 2 – 8m of stiff sandy gravelly clay and silt. At a depth of 4 – 11m, the overburden is interpreted as very stiff sandy gravelly clay and silt. Increases in resistivities may indicate rock at depths over 15m bgl.

4.11 Ch77465

Maps and Figures: 18

Lines: 48

Location Comments: One line perpendicular to the pipeline route to compliment a previous geophysical survey near the site

GI Points: BH21, 52m west of the line

The resistivities in this area are very consistent with depth and across this area with the seismic refraction velocities gradually increasing with depth.

The area is underlain by up to 1m of soft and loose topsoil and 2 – 2.5m of stiff sandy gravelly clay and silt and dense clayey silty sand and gravel. At a depth of 3 - 3.5m the overburden is interpreted as very stiff sandy gravelly clay and silt. There is no rock indicated to a depth of at least 15m

4.12 Ch89516

Maps and Figures: 19

Lines: 49-51

Location Comments: Three parallel line on west bank of the river. No access was available to east bank.

GI Points: BH22, BH23

The resistivities are high near the surface before becoming lower with depth and subsequently increasing within the rock layer.

There is a 2m thick layer of soft or loose topsoil interpreted across survey area. This is underlain by very stiff sandy gravelly clay and silt, very dense clayey silty sand and gravel and very stiff sand and gravel on the higher elevations to a depth of 4 – 6m.

The resistivities decrease across the survey area at this depth and there is a 5 – 9m thick layer of very stiff sandy gravelly clay and silt. Good mudstone or shale is interpreted at a depth of 10 – 14m bgl.

The boreholes in this area are terminated at a depth of 10.10m bgl and show clay, sand, silt and gravel overburden to this depth.

4.13 Ch92560

Maps and Figures: 20

Lines: 52 - 54

Location Comments: Three parallel lines as proposed

GI Points: N/A

The resistivities and seismic velocities show in increase with depth which is interpreted at a change from overburden to rock.

There is a 1m thick layer of soft or loose topsoil underlain by 4 – 6m of stiff sandy gravelly clay and silt. Good clean limestone is indicated at depths of 5 – 7m across the area.

4.14 Ch97683

Maps and Figures: 21

Lines: 55 - 60

Location Comments: Three parallel lines on both banks of the river.

GI Points: BH121, BH122

The resistivities and seismic velocities show in increase with depth which is interpreted at a change from overburden to rock.

There is a 0.5 – 2m thick layer of soft or loose topsoil underlain by 4.5 – 9.5m of very stiff sandy gravelly clay and silt. Good limestone is interpreted at a depth of 5.5 – 11m bgl. The resistivities may indicate shale or limestone but BH121 describes limestone at a depth of 8.6m bgl. Lower resistivities in the west along line 55 may indicate some minor karstification in this area or a more shaley limestone.

4.15 Ch102624

Maps and Figures: 22

Lines: 61

Location Comments: One line perpendicular to the pipeline route consisting solely of 2D-Resistivity before access was rescinded.

GI Points: N/A

The resistivities along the line area generally low. As there is no seismic refraction information, the interpretation here is based solely on the 2D-Resistivity data and no information on the stiffness or density of the materials.

The resistivities are interpreted as primarily sandy gravelly clay and silt with some clay and silt and clayey silty sand and gravel. An alternative interpretation could be mudstone or shale but this is less likely.

5. CONCLUSIONS

The following conclusions are made:

- The large area the survey was carried out across means that the interpretation varies significantly across the project.
- The main geological concerns when constructing a pipeline are soft ground, shallow rock and karstified rock.

Soft Ground:

- The area between Ch63018 – 63895 (Map 11 & 12) shows soft material to depths of up to 3m underlain by deep stiff overburden. The soft layer is likely alluvium silts but may also by peat.

Shallow Rock:

- The shallowest rock encountered was at Ch36880 – 37080 (Map 1) where the top of the good limestone was interpreted between 2 and 4m bgl with weathered rock even shallower.
- In the area between Ch54130 – 54309 (Map 4 & 5) the top of the good rock is as shallow as 3.5m but is significantly deeper in other places.
- Between Ch61848 – 61868 (Map 7), good limestone is identified at 2.5 – 4.5m within a likely fault zone.

Karst Features:

- The clearest karst feature within any of the survey areas is identified between Ch36907 – 36941 (Map 1) within a shallow rock area.
- Between Ch54193 – 54260 (Map 4 & 5), a drop in the rock layer may indicate a karst feature. The top of rock changes from 3.5m to 14m bgl across this area.
- From Ch97703 - Ch97775 (Map 21) to the north of the proposed pipeline route there may be some karstification. This does not extend over the centreline of the proposed route.
- The interpretation presented here should be reviewed once any additional geotechnical data becomes available.

CLIENT	Irish Drilling Ltd. Irish Water
PROJECT	Water Supply Project, Lot 2 Geophysical Survey
TITLE	Figure 10a: Models of Geophysical Survey Ch63018

SCALE:	1:500 @ A3, VE x 2
PROJECT:	6590
DRAWN:	JC
DATE:	08/12/2021
MGX FILE:	6590d_Drawings.dwg
STATUS:	Draft

Layers from Seismic Refraction Model:

- Ground Surface/Top of Layer 1 (<150 m/s)
- Ground Surface/Top of Layer 2 (200 - 400 m/s)
- Top of Layer 3 (500 - 900 m/s)
- Top of Layer 4 (1000 - 1500 m/s)
- Top of Layer 5 (1600 - 2000 m/s)
- Top of Layer 6 (2100 - 2900 m/s)
- Top of Layer 7 (>3000 m/s)

Resistivities (Ohmm) for 2D-Resistivity Model

31.2 62.5 125 250 500 1000 2000 4000
