**Re: Observation to the proposed development of open-cycle gas turbine (OCGT) and generator with ancillary equipment.**

Location: Pollnagroagh and Rathmorrissy (Townlands), Athenry, Co. Galway

Applicant: Bord Gáis Energy Limited

Dear Sir/Madam,

My family have been part of the fabric of society in Athenry, for over one hundred years. Our family has been business owners and residents of this beautiful town, and we strongly object to the proposed construction of the peaker plant. It is widely accepted that these plants are more polluting and less efficient than other energy sources. If this plant were allowed to proceed, it would no doubt lead to increased health risks and the devastation of the local environment. It has been scientifically proven that the emissions from these peaker plants can cause severe long-term damage to respiratory systems, especially those suffering from health conditions such as asthma, and can also affect cardiovascular and nervous systems. I am very concerned for my special needs brother, who suffers from asthma and resides within a mile of this proposed peaker plant location

## **High-Intensity Emissions and Diesel Impacts**

I am concerned about the potential impact of air pollution from this proposed development. Pollutants such as nitrogen oxides (NOx) and fine particulate matter (PM2.5 and PM10) are known to damage air quality, irritate the lungs, and contribute to long-term harm to both human health and the environment. Although the plant would not operate continuously, it may run at extremely high output when required, leading to short but intense bursts of pollution, particularly during start-up and peak demand periods. The possible use of diesel during these times is especially worrying, as it produces higher levels of harmful emissions, including nitrogen oxides, sulphur dioxide, and particulate matter.

These pollutants can penetrate deep into the lungs and enter the bloodstream, increasing the risk of respiratory and cardiovascular illness, particularly for vulnerable groups such as children, older people, and those with existing health conditions. Fine particulate matter can also travel long distances and accumulate over time, meaning the impacts may extend beyond the immediate area and persist in the long term. In summary, I have reservations regarding the thoroughness of the assessment of these emissions. This issue presents significant implications for public health and environmental protection, especially in relation to EU air quality standards established by Directive 2008/50/EC.

## **Short-Term Exposure**

I'm concerned that emissions from the planned peaker plant could impact the environment, particularly if diesel is used at start-up or during periods of high demand. Diesel exhaust releases various dangerous pollutants, such as nitrogen oxides, fine particles, and other toxic chemicals. These substances are associated with respiratory issues, impaired lung function, and heart disease. What is especially worrying is that these emissions may occur in short but intense bursts rather than in a steady, predictable way, particularly during start-up and peak operation. The average-based modelling used in the assessment seems not to capture this kind of real-world operation completely.

There are worries that residents in nearby areas might face greater pollution levels than expected, especially when the weather is calm and pollutants linger instead of spreading out. There is considerable uncertainty regarding how accurate these air quality forecasts are, which makes it hard for the community to be sure that both public health and the environment are truly safeguarded.

## **Cumulative Health Impacts Over Time**

I have serious concerns about how this proposed peaker plant would operate over time. Although it would run intermittently, it would do so at extremely high intensity, and the potential use of diesel adds to these concerns, as it could result in repeated short-term spikes in air pollution. While individual emission events may be brief, the fact that they could occur repeatedly over many years—potentially up to 2050—raises concerns about ongoing exposure and cumulative health impacts.

Pollutants such as nitrogen oxides and fine particulate matter are known to worsen asthma, trigger respiratory symptoms, and contribute to long-term conditions including chronic respiratory and cardiovascular disease. This is particularly concerning for nearby residents, especially vulnerable groups such as children, older people, and those with existing health conditions. There is still uncertainty regarding whether the lasting and cumulative effects of these emissions have been fully studied, which leads to real concerns that continued exposure during the development's lifetime could affect public health and wellbeing in the future.

## **Public Health Protection**

There is significant concern within the community about the potential impact of air pollution from this proposed peaker plant on human health, particularly during periods when it is operating at full capacity and emissions are highest. The possible use of diesel is especially worrying, as it introduces additional harmful

pollutants that can travel long distances and accumulate in the environment.

There is ongoing uncertainty concerning the operational frequency of the plant, its emission rates, and the extent of public exposure to pollutants through 2050. Because these issues remain unresolved, it is difficult to verify that all risks have been considered. Given these unknowns, it is wise to adopt a careful strategy to protect public health; unless definitive evidence proves no harm, any dangers to residents should be considered as part of the planning process.

### **Organic Farming**

As a local organic farmer, I am very concerned about the potential impact this proposed peaker plant could have on my farm and others in the area. Organic farming is governed by strict European standards and requires high environmental quality, including keeping soil, crops, and water free from contamination. Airborne pollutants from the plant, particularly those linked to diesel such as nitrogen oxides and fine particulate matter, could settle onto land and crops, posing a risk to organic certification even at low levels.

There are also concerns about contamination through water and soil pathways, including runoff or accidental spills from fuel storage. Organic farming relies on healthy soil, clean water, and a balanced ecosystem, and any disruption to these could undermine the integrity of production. The consequences of losing organic certification would be severe, including loss of premium markets, significant financial impacts, and a re-conversion period of up to two years. Overall, there is serious concern that this development poses a disproportionate and inadequately assessed risk to organic farming and sustainable livelihoods in the area.

### **Derogation Limits**

As a derogation farmer, I operate under strict environmental limits and take compliance very seriously, but there is concern that this proposed development could make it much harder to remain within those limits. Additional environmental pressure from nearby industrial activity, including emissions or contamination linked to diesel use, could increase nitrate levels in the area, which is entirely outside my control. This could result in penalties, reduced stocking levels, or even the loss of derogation status, despite full compliance with regulations, leading to serious financial and operational consequences. Overall, this creates an unfair situation where farmers may be penalised for environmental impacts arising from a development beyond their control.

### **Protection of Agricultural Livelihoods**

Farmers work diligently within stringent environmental guidelines and uphold rigorous standards of environmental stewardship, fully recognising the importance of these obligations. There is concern that an industrial development of this nature—particularly one involving diesel use and long-term emissions, potentially until 2050—could introduce risks that undermine that work by affecting land quality and increasing environmental pressures. This situation presents significant challenges for farmers, who should not face penalties for problems caused by factors beyond their control. There are concerns that agricultural risks remain overlooked and the development may affect local farming long-term.

### **Vulnerability to Diesel-Related Air Pollution**

As a parent living in the area, I am particularly concerned about the potential impact of this proposed development on children's health. Children are particularly susceptible to the effects of air pollution because of their developing respiratory systems, elevated respiration rates, and greater exposure to outdoor environments. Although peaker plants do not function on a continuous basis, they can produce significantly elevated levels of output during initial start-up phases or times of peak energy demand. This may lead to brief yet significant emissions of pollutants, particularly when diesel fuel is utilised. These emissions contain fine

particles and nitrogen oxides that can penetrate deep into the lungs, which may affect lung development and increase the risk of respiratory conditions such as asthma. Overall, this raises serious concerns about the health and wellbeing of children and whether these risks have been fully considered.

### **Exposure During Daily Activities and School Times**

As a parent in the area, I am concerned that children living nearby or attending local schools will be exposed to higher levels of air pollution when the plant is operating at peak times, particularly when they are outdoors during school drop-off, break times, and after-school activities. During physical activity, children breathe more rapidly, increasing their intake of pollutants and making them more vulnerable to harmful effects. What is especially worrying is the potential for repeated exposure during key stages of development, which could have lasting impacts on their health and wellbeing. Overall, this raises serious concerns as to whether these risks have been fully considered.

### **Cumulative Impact on Child's Development**

As a parent in the area, I am concerned about the impact of fine particulate matter over time. These pollutants can travel long distances and accumulate, meaning children may be exposed not only during peak pollution events but also through ongoing low-level exposure. The cumulative effect of this is particularly worrying, as repeated exposure during key stages of growth and development could have lasting impacts on lung development and overall health. From a community perspective, this raises serious concerns about the long-term safety of this development for children, and it is not clear that these cumulative impacts have been fully considered.

### **Need for Precaution Due to Uncertainty**

There is significant concern regarding the insufficient assessment of long-term health impacts on children, particularly with respect to repeated exposure associated with intermittent plant operation and diesel utilisation. Since children are especially susceptible to air pollution, uncertainty surrounding these effects warrants scrutiny. It is inadequate to presume minimal risk without substantial, transparent evidence. Given these circumstances, it is recommended that a precautionary approach be adopted to prioritise the health and wellbeing of children and to ensure that all potential risks are thoroughly evaluated and mitigated.

### **Lock-in of Fossil Fuel Infrastructure**

There are serious concerns that the proposed development represents new fossil fuel infrastructure with a long operational lifespan, potentially extending to at least 2050, which risks locking in carbon-intensive energy generation at a time when national and EU policy require rapid decarbonisation. Investment in gas-fired infrastructure of this nature may delay or displace the development of renewable energy and energy storage solutions, leading to continued reliance on fossil fuels over the long term. Overall, there is concern that the proposal is not aligned with current climate objectives and may undermine the transition to a low-carbon energy system.

### **Conflict with National and EU Climate Targets**

There are serious concerns regarding Ireland's legally binding obligations to reduce greenhouse gas emissions under the Climate Action and Low Carbon Development (Amendment) Act 2021, as well as wider EU climate frameworks. The continued development of gas-fired generation, including peaker plants, will result in additional carbon dioxide emissions over the lifetime of the project, raising questions about alignment with national carbon budgets and emissions reduction targets. In this context, there is concern that the proposal may undermine the State's ability to meet its climate commitments and transition to a low-carbon energy system.

### **Underestimation of Operational Emissions**

There are concerns that the Environmental Impact Assessment may underestimate the emissions associated with the proposed development by relying on assumed operating patterns. As a demand-led facility, the plant may operate more frequently or for longer periods than predicted, particularly during times of pressure on the energy system. This creates uncertainty around the total level of greenhouse gas emissions over the lifetime of the project and raises concerns that the full climate impact of the development has not been adequately assessed.

### **Availability of Cleaner Alternatives**

Although cleaner and more sustainable alternatives to fossil fuels—such as renewable energy, energy storage, demand response, and grid flexibility measures—are available, building new gas infrastructure may lessen the urgency to invest in these solutions. Given the climate crisis, emphasis should be placed on low-carbon and renewable options instead of furthering dependence on fossil fuels; this proposal could delay the shift toward a more sustainable energy system.

### **Operational Uncertainty and Lack of Enforceable Limits**

There are concerns that the Environmental Impact Assessment relies on assumed operational scenarios rather than fully assessing worst-case conditions. As the plant will operate in response to electricity demand, there is uncertainty regarding how frequently or intensively it may run, including periods when diesel will be used, potentially resulting in higher emissions than those modelled. Without a thorough evaluation of the worst-case scenario, it is not possible to confidently rule out the possibility of major environmental impacts.

### **Conclusion**

This proposal presents important concerns regarding people, public health, agriculture, and the surrounding environment. Because the documentation is complex and community engagement has been limited, many individuals have found it challenging to take part in the decision-making process. Communities should not face uncertain or potentially substantial environmental risks. Therefore, it is strongly recommended that planning permission be refused.

Yours Sincerely,

A handwritten signature in black ink that reads "Kevin Kelly". The word "Kevin" is written in a simple, slightly cursive style. "Kelly" is written in a more fluid, cursive script with a large, sweeping underline that extends under the end of the word.
