**Re: Observation to the proposed development of open-cycle gas turbine (OCGT) and generator with ancillary equipment.**

Location: Pollnagroagh and Rathmorrissy (Townlands), Athenry, Co. Galway

Applicant: Bord Gáis Energy Limited

Dear Sir/Madam,

I am 38 and have lived all my life in Athenry. I live and farm within view of this proposed peaker plant. I also work locally in Athenry Golf Course. There are weeks during the Spring when Calving is in full swing I do not go any farther a field than the golf club for work. I have seen lots of development around Athenry over the years. This proposed development is the first that has me genuinely afraid. Afraid for me, my family and my Community.

## **High-Intensity Emissions and Diesel Impacts**

I am concerned about the potential impact of air pollution from this proposed development. Pollutants such as nitrogen oxides (NOx) and fine particulate matter (PM2.5 and PM10) are known to damage air quality, irritate the lungs, and contribute to long-term harm to both human health and the environment. Although the plant would not operate continuously, it may run at extremely high output when required, leading to short but intense bursts of pollution, particularly during start-up and peak demand periods. The possible use of diesel during these times is especially worrying, as it produces higher levels of harmful emissions, including nitrogen

oxides, sulphur dioxide, and particulate matter.

These pollutants can penetrate deep into the lungs and enter the bloodstream, increasing the risk of respiratory and cardiovascular illness, particularly for vulnerable groups such as children, older people, and those with existing health conditions. Fine particulate matter can also travel long distances and accumulate over time, meaning the impacts may extend beyond the immediate area and persist in the long term. In summary, I have reservations regarding the thoroughness of the assessment of these emissions. This issue presents significant implications for public health and environmental protection, especially in relation to EU air quality standards established by Directive 2008/50/EC.

### **Cumulative Health Impacts Over Time**

I have serious concerns about how this proposed peaker plant would operate over time. Although it would run intermittently, it would do so at extremely high intensity, and the potential use of diesel adds to these concerns, as it could result in repeated short-term spikes in air pollution. While individual emission events may be brief, the fact that they could occur repeatedly over many years—potentially up to 2050—raises concerns about ongoing exposure and cumulative health impacts.

Pollutants such as nitrogen oxides and fine particulate matter are known to worsen asthma, trigger respiratory symptoms, and contribute to long-term conditions including chronic respiratory and cardiovascular disease. This is particularly concerning for nearby residents, especially vulnerable groups such as children, older people, and those with existing health conditions. There is still uncertainty regarding whether the lasting and cumulative effects of these emissions have been fully studied, which leads to real concerns that continued exposure during the development's lifetime could affect public health and wellbeing in the future.

### **Protection of Agricultural Livelihoods**

Farmers work diligently within stringent environmental guidelines and uphold rigorous standards of environmental stewardship, fully recognising the importance of these obligations. There is concern that an industrial development of this nature—particularly one involving diesel use and long-term emissions, potentially until 2050—could introduce risks that undermine that work by affecting land quality and increasing environmental pressures. This situation presents significant challenges for farmers, who should not face penalties for problems caused by factors beyond their control. There are concerns that agricultural risks remain overlooked and the development may affect local farming long-term.

### **Conflict with National and EU Climate Targets**

There are serious concerns regarding Ireland's legally binding obligations to reduce greenhouse gas emissions under the Climate Action and Low Carbon Development (Amendment) Act 2021, as well as wider EU climate frameworks. The continued development of gas-fired generation, including peaker plants, will result in additional carbon dioxide emissions over the lifetime of the project, raising questions about alignment with national carbon budgets and emissions reduction targets. In this context, there is concern that the proposal may undermine the State's ability to meet its climate commitments and transition to a low-carbon energy system.

### **Lack of Worst-Case Assessment**

The Environmental Impact Assessment bases its findings on expected operating scenarios instead of evaluating the worst-case possibilities. Because the plant's operation will depend on electricity demand, it's unclear how often or how intensely it might run. This uncertainty also applies to diesel usage, which could

produce higher emissions than those estimated. Without a thorough assessment of the most severe potential impacts, it is impossible to guarantee that major environmental effects will not happen.

### **Conclusion**

This proposal presents important concerns regarding people, public health, agriculture, and the surrounding environment. Because the documentation is complex and community engagement has been limited, many individuals have found it challenging to take part in the decision-making process. Communities should not face uncertain or potentially substantial environmental risks. Therefore, it is strongly recommended that planning permission be refused.

Yours Sincerely,
