Re: Observation to the proposed development of open-cycle gas turbine (OCGT) and generator with ancillary equipment.

Location: Pollnagroagh and Rathmorrissy (Townlands), Athenry, Co. Galway

Applicant: Bord Gáis Energy Limited

Dear Sir/Madam,

I am an asthmatic mother of two teenage boys living in the locality. I was born and raised in the area, and I work at a local school. In short, I spend the vast majority of my time within 3km of this proposed pollutant. I have grave concerns regarding the impact of this proposed development on my health and on the health of my sons. The research shows that the emissions will have a negative effect on people living with asthma.

High-Intensity Emissions and Diesel Impacts

I am concerned about the potential impact of air pollution from this proposed development. Pollutants such as nitrogen oxides (NOx) and fine particulate matter (PM2.5 and PM10) are known to damage air quality, irritate the lungs, and contribute to long-term harm to both human health and the environment. Although the plant would not operate continuously, it may run at extremely high output when required, leading to short but intense bursts of pollution, particularly during start-up and peak demand periods. The possible use of diesel during these times is especially worrying, as it produces higher levels of harmful emissions, including nitrogen oxides, sulphur dioxide, and particulate matter.

These pollutants can penetrate deep into the lungs and enter the bloodstream, increasing the risk of respiratory and cardiovascular illness, particularly for vulnerable groups such as children, older people, and those with existing health conditions. Fine particulate matter can also travel long distances and accumulate over time, meaning the impacts may extend beyond the immediate area and persist in the long term. In summary, I have reservations regarding the thoroughness of the assessment of these emissions. This issue presents significant implications for public health and environmental protection, especially in relation to EU air quality standards established by Directive 2008/50/EC.

Cumulative Health Impacts Over Time

I have serious concerns about how this proposed peaker plant would operate over time. Although it would run intermittently, it would do so at extremely high intensity, and the potential use of diesel adds to these concerns, as it could result in repeated short-term spikes in air pollution. While individual emission events may be brief, the fact that they could occur repeatedly over many years—potentially up to 2050—raises concerns about ongoing exposure and cumulative health impacts.

Pollutants such as nitrogen oxides and fine particulate matter are known to worsen asthma, trigger respiratory symptoms, and contribute to long-term conditions including chronic respiratory and cardiovascular disease. This is particularly concerning for nearby residents, especially vulnerable groups such as children, older people, and those with existing health conditions. There is still uncertainty regarding whether the lasting and cumulative effects of these emissions have been fully studied, which leads to real concerns that continued exposure during the development's lifetime could affect public health and wellbeing in the future.

Risk of Groundwater Contamination from Fuel Storage and Handling

I am concerned about the risks of soil and groundwater contamination from this proposed peaker plant. The development would involve the storage and handling of fuels such as diesel, along with lubricating oils and other chemicals, all of which could pose a risk to the surrounding environment. There is a real possibility that these substances could leak, spill, or enter the ground through surface runoff over the long lifetime of the facility, potentially up to 2050, and even small but repeated incidents could lead to a gradual build-up of pollution in soil and groundwater.

This is particularly worrying because once groundwater becomes contaminated, it is extremely difficult and costly to remediate, and the impacts can persist for decades. This raises serious concerns about the long-term protection of local water resources and the surrounding environment. There remains uncertainty about whether these risks have been adequately managed, raising substantial worries that the project might cause permanent damage to water quality. This would violate the obligations under EU Directive 2000/60/EC, which mandates the protection of water bodies and prohibits their deterioration.

Long-Term Accumulation of Pollutants and Chemical Residues

I am particularly concerned about the risk of pollution to soil and groundwater from this proposed development. The inclusion of diesel storage tanks, hardstanding areas, drainage systems, and other infrastructure increases the likelihood that pollutants could gradually enter the ground over time, potentially up to 2050. Substances such as hydrocarbons from diesel and gas, along with other chemical residues, may build up slowly, particularly where there are repeated small leaks, routine operational losses, or occasional spills, with impacts accumulating over time.

What is especially worrying is that this type of pollution may not be immediately visible but could result in long-term damage to groundwater quality and soil health. This has implications not only for environmental protection but also for local agriculture, which depends on clean soil and water. Overall, there is significant concern that these long-term and cumulative risks have not been fully addressed and could have lasting

consequences for the local environment and livelihoods.

Vulnerability to Diesel-Related Air Pollution

As a parent living in the area, I am particularly concerned about the potential impact of this proposed development on children's health. Children are particularly susceptible to the effects of air pollution because of their developing respiratory systems, elevated respiration rates, and greater exposure to outdoor environments. Although peaker plants do not function on a continuous basis, they can produce significantly elevated levels of output during initial start-up phases or times of peak energy demand. This may lead to brief yet significant emissions of pollutants, particularly when diesel fuel is utilised. These emissions contain fine particles and nitrogen oxides that can penetrate deep into the lungs, which may affect lung development and increase the risk of respiratory conditions such as asthma. Overall, this raises serious concerns about the health and wellbeing of children and whether these risks have been fully considered.

Exposure During Daily Activities and School Times

As a parent in the area, I am concerned that children living nearby or attending local schools will be exposed to higher levels of air pollution when the plant is operating at peak times, particularly when they are outdoors during school drop-off, break times, and after-school activities. During physical activity, children breathe more rapidly, increasing their intake of pollutants and making them more vulnerable to harmful effects. What is especially worrying is the potential for repeated exposure during key stages of development, which could have lasting impacts on their health and wellbeing. Overall, this raises serious concerns as to whether these risks have been fully considered.

Cumulative Impact on Child's Development

As a parent in the area, I am concerned about the impact of fine particulate matter over time. These pollutants can travel long distances and accumulate, meaning children may be exposed not only during peak pollution events but also through ongoing low-level exposure. The cumulative effect of this is particularly worrying, as repeated exposure during key stages of growth and development could have lasting impacts on lung development and overall health. From a community perspective, this raises serious concerns about the long-term safety of this development for children, and it is not clear that these cumulative impacts have been fully considered.

Need for Precaution Due to Uncertainty

There is significant concern regarding the insufficient assessment of long-term health impacts on children, particularly with respect to repeated exposure associated with intermittent plant operation and diesel utilisation. Since children are especially susceptible to air pollution, uncertainty surrounding these effects warrants scrutiny. It is inadequate to presume minimal risk without substantial, transparent evidence. Given these circumstances, it is recommended that a precautionary approach be adopted to prioritise the health and wellbeing of children and to ensure that all potential risks are thoroughly evaluated and mitigated.

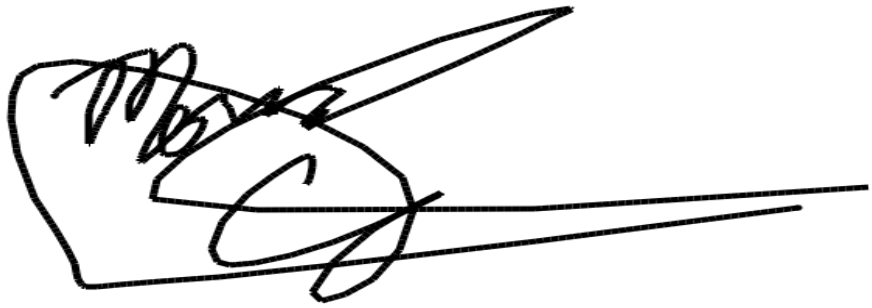
Operational Uncertainty and Lack of Enforceable Limits

There are concerns that the Environmental Impact Assessment relies on assumed operational scenarios rather than fully assessing worst-case conditions. As the plant will operate in response to electricity demand, there is uncertainty regarding how frequently or intensively it may run, including periods when diesel will be used, potentially resulting in higher emissions than those modelled. Without a thorough evaluation of the worst-case scenario, it is not possible to confidently rule out the possibility of major environmental impacts.

Conclusion

Due to the concerns mentioned—such as uncertainty about how often operations will occur, overall environmental impacts, and risks related to diesel use—this project is not viewed as proper or sustainable development. There has also been insufficient consideration of the possibility that the actual impacts could be greater than those evaluated. Therefore, we respectfully ask that approval for this application be refused.

Yours Sincerely,



Name: Moira Mahony
