**Re: Objection to the Proposed Tirawley Wind Farm Strategic Infrastructure Development
Objection Submission to An Coimisiún Pleanála**

Re: Planning permission for the construction of Tirawley Windfarm consisting of 16 no. wind turbines, a permanent 110kV substation, 110kV underground cable and grid connection, and ancillary development in the townlands of Ballymurphy, Ballynaleck, Barnhill Lower & Upper, Barroe, Billoos, Carn, Carrickanass, Carrowmore, Castlelacken Demesne, and other townlands in County Mayo.

Case Number: PAX16.324258

Dear Sir/Madam,

I have lived in Lackenhill for 38 years with my family. This is our family farm and five generations of our family have lived here over 100 years in peace and tranquility. I cannot understand how any company has the right to inflict this development on us, being surrounded by 8 turbines and a quarry which will be blasting rock all day together with vehicular traffic moving peat. Our home will be worthless and unbearable to live in, as will our way of life. The damage to our bog at Lissadrone where we have turbary rights will be irreversible.

We are writing as a family located much too close to the proposed Tirawley Wind Farm project, submitted by Constant Energy Limited, to formally lodge our objection to this Strategic Infrastructure Development application. This development poses significant and irreversible risks to our health, tranquility, the local environment, biodiversity and our neighbours. In particular the proposal threatens critical habitats for protected species such as the Hen Harrier, involves substantial habitat removal including over 4 km of hedgerow, and raises serious concerns regarding visual impact, traffic disruption, and inadequate community consultation.

These issues, coupled with shortcomings in the Environmental Impact Assessment Report, justify a refusal of permission for this project.

Having reviewed the applicants document, we wish to raise the following concerns:

1. Quarry and movement of peat and vehicular traffic

The quarry within the proposed development site is located just 150 metres from my home and I understand it has been listed as disused with Mayo County Council; and is to be treated as abandoned for the purposes of the planning application. There is no mention in the document of peat being moved to or from the quarry, nor any risk analysis carried out for such movement. Regarding rock breaking to make the quarry usable for loads of peat, the document does not specify any plans or activities involving rock breaking at the quarry. Where are the plans for movement of peat as indicated in the planning document?

The peat (unspecified amount) in my estimate to be thousands of tonnes will pass by my sitting room window which is 7m from the road, on its way to the disused quarry to be dumped 160m away. Over the past 20 years we have spent €70,000 on remedial works to combat what I now know is pyrite. The construction traffic on the road coupled with heavy machinery in the quarry will destroy all this work.

The planning document does not specify the exact amount or number of tonnes of peat to be moved to the quarry. It mentions an existing (disused) quarry within the proposed development site and that some forestry felling and site development works including soil excavation will take place, but no quantitative data about peat moved to the quarry is provided. How can I base my objection on hypothetical data?

As for a peat slippage risk assessment, a Peat Slide Risk Assessment (PSRA) has been conducted for the overall wind farm site, particularly influencing turbine siting to avoid steep slopes and areas prone to peat slippage. However, why is there no specific mention of a peat slide risk analysis carried out specifically on the quarry itself which is located on an elevated hill?

2. Impact on water that supplies our home

We are residents of Lacken and my household relies on a private well and spring-fed groundwater source for all drinking water, cooking and domestic use. Consequently, we

have serious concerns regarding the potential impact of the proposed Tirawley Wind Farm development on both the quality and quantity of my water supply.

The proposed development involves extensive excavation works, turbine foundations, access roads, drainage infrastructure, forestry felling and associated construction activities across an area that is highly dependent on shallow groundwater systems. The Environmental Impact Assessment Report (EIAR) acknowledges that groundwater within the area commonly emerges as springs (Section 9.5.1.9), yet it does not appear to adequately assess the dependence of local households on these groundwater sources for their daily drinking water supplies.

Many homes in the area are supplied by shallow groundwater springs which are collected and piped directly to individual dwellings. These springs represent the only semi-reliable source of potable water available to many residents. A significant number of these sources originate at elevations similar to those proposed for turbine foundations and associated infrastructure. As a result, they may be highly susceptible to changes in groundwater levels, groundwater flow paths and hydrogeological conditions arising from large-scale excavation, blasting, piling and construction activities.

These springs are already known to experience reduced flows or complete drying during prolonged periods of drought. Any alteration of groundwater pathways, interception of groundwater flows or disruption of subsurface hydrological systems could further reduce water availability and place existing domestic water supplies at risk. Such impacts would have significant consequences for residents who have no practical alternative water source.

Particularly concerning is the fact that parts of the development area are underlain by karstified geological formations. Karst aquifers are recognised as highly sensitive hydrogeological environments due to the rapid movement of groundwater through fissures, fractures and solution channels. Small changes in groundwater flow regimes can have disproportionate impacts on springs and water supplies located considerable distances away from the source of disturbance. Given the importance of these groundwater-fed springs to local communities, An Coimisiún Pleanála must be satisfied beyond reasonable scientific doubt that the development will not adversely affect either the quantity or quality of these water supplies.

Furthermore, the Geological Survey Ireland groundwater vulnerability mapping identifies the wind farm area as being within a High Groundwater Vulnerability zone. This classification indicates that groundwater in the area is particularly susceptible to contamination, with pollutants capable of entering the groundwater system rapidly and subsequently discharging to springs, wells and surface waters.

The EIAR appears to focus primarily on potential impacts to surface waters and ecological receptors. However, insufficient consideration has been given to the risks posed to private drinking water supplies. Potential contamination pathways may arise from fuel spills, concrete washout, sediment-laden runoff, forestry operations, chemical use, construction activities and the mobilisation of naturally occurring iron-rich ("red water") groundwater during excavation and piling works. Any mixing of deeper groundwater with the clean shallow groundwater currently supplying domestic wells and springs could have serious implications for water quality.

The potential consequences of groundwater contamination extend beyond environmental impacts and directly affect public health. Residents who rely on private

water supplies have no alternative source available should contamination occur. Once groundwater systems are damaged or polluted, remediation may be difficult, costly or impossible.

In light of the acknowledged hydrogeological sensitivity of the area, the widespread reliance of local residents on spring-fed water supplies, the presence of highly vulnerable groundwater and the apparent absence of a detailed assessment of impacts on private drinking water sources, I submit that the EIAR has failed to adequately assess a critical aspect of the receiving environment. Accordingly, An Coimisiún Pleanála should require a comprehensive hydrogeological assessment of all private wells, springs and domestic water supplies that may be affected by the proposed development before any determination is made.

Until it can be conclusively demonstrated that the development will not adversely affect existing private drinking water supplies, the precautionary principle should apply and permission should be refused.

3. Megalithic tombs

MA007-057---- : Megalithic tomb - court tomb : **LECARROWNTemple**

Description: See linked document with details from Ruaidhrí de Valera and Seán Ó Nualláin, Survey of the Megalithic Tombs of Ireland. Volume II. County Mayo. (Dublin: Stationery Office, 1964) Date of upload: 30 December 2011

MA007-058---- : Megalithic tomb - court tomb : **LECARROWNTemple**

Description: See linked document with details from Ruaidhrí de Valera and Seán Ó Nualláin, Survey of the Megalithic Tombs of Ireland. Volume II. County Mayo. (Dublin: Stationery Office, 1964) Date of upload: 30 December 2011

The above megalithic tombs are on the farm next to our home, given the close proximity of them to the road, how can they be protected as lorries thunder past drawing hundreds of loads of peat? We have them fenced off as part of protecting our heritage in the ACRES scheme. They have never been touched or disturbed so what effect with rock breaking and enormous vehicular traffic inflict on our priceless tombs?

Can ACP ensure their protection in light of this development?

4. Noise & Shadow Flicker – H11

Our home is identified as a “receptor” H11 in the EIAR. We would like it noted that we have an issue with the term “receptor” as it appears to detach the development from the fact that it is being proposed for an area that is home to so many people. The area is not a barren site, it's our home and our community.

Our home is located approximately:

- **624 metres from turbine AT16 stated in Table 15.1**
- **740 metres from turbine AT14**
- **920 metres from turbine AT10**
- **935 metres from turbine AT15**

- **AT09, AT12, AT13 and AT11 are located just over 1 km from my home**

We are concerned that the EIAR assessment does not adequately address the real-world residential impact of having two large-scale turbines located within approximately one kilometre of my home.

Noise Impact Concerns

The proposed turbine AT16 is located only approximately **624 metres from our home (H11)**. We consider this separation distance insufficient to protect residential amenity, particularly given the scale of modern turbines and the quiet rural environment in which my home is located.

The assessment relies heavily on predicted modelling. We request that An Coimisiún Pleanála carefully examine whether the modelling fully represents the actual conditions experienced at H11, including:

- night-time noise impacts when background noise levels are naturally low;
- periods with specific wind direction where turbines **AT09, AT10, AT11, AT12, AT13, AT14, AT15 and AT16** may all contribute simultaneously;
- amplitude modulation (“blade swish” or changing character of turbine noise);
- low-frequency noise impacts;
- the cumulative noise contribution from multiple turbines.

A predicted compliance with a numerical noise limit does not necessarily mean that there will be no significant loss of residential amenity. A change from the existing quiet rural soundscape to continuous operational turbine noise has the potential to materially affect my enjoyment of my home, garden and surrounding property.

We request that a more precautionary assessment be applied to H11 given its proximity to AT16 and the combined influence of eight turbines.

Shadow Flicker

The EIAR identifies our home, H11, as being approximately 624 metres from turbine A. Table 15.3 of Chapter 15 predicts that H11 will experience:

- 101 hours 23 minutes worst-case shadow flicker per year
- 17 hours 06 minutes expected shadow flicker per year
- 41 minutes maximum expected shadow flicker per day

This exceeds the 2006 Wind Energy Development Guidelines recommendation of no more than 30 minutes per day by 11 minutes.

The proposed turbines AT14, AT10 and AT15 are all within 1km from my home and are located directly west of my home. My living, kitchen and dining room windows face west with a setting sun in the evening the shadow flicker will be intolerable.

We consider this significant because the applicant’s own modelling confirms that our home is one of the receptors where the guideline threshold is exceeded. The issue is not a theoretical concern — the impact has already been identified within the EIAR.

While the EIAR refers to mitigation measures in **Section 15.2.9.3**, including turbine control measures/shadow flicker control systems, we do not consider reliance on future mitigation alone to be sufficient justification for permitting a development that is predicted to create an exceedance of shadow flicker at my home.

The mitigation proposal effectively acknowledges that turbines have the potential to cause unacceptable shadow flicker impacts unless active intervention occurs. This raises concerns regarding:

- long-term reliability of control systems;
- monitoring and enforcement arrangements;
- responsibility if mitigation fails;
- whether shutdown will occur automatically or only after complaints;
- how compliance at H11 will be independently verified throughout the lifetime of the wind farm.

We further note that the Draft Revised Wind Energy Development Guidelines (2019) recognise that modern turbine technology can prevent shadow flicker and move towards a zero shadow flicker approach at sensitive receptors.

Given that H11 is already predicted to exceed the 2006 daily guideline, we submit that the appropriate standard should be prevention rather than management.

5. Residential and Property Impact

The proposed wind turbines are located uncomfortably close to existing homes. Despite the stated 540m buffer, the visual impact, noise pollution, and potential shadow flicker effects will significantly disrupt our residential amenity and quality of life. There is also a genuine concern about the likely devaluation of property prices due to proximity to large-scale industrial turbines.

(Reference: Appendix 1.6 Community Engagement Report, Pages 7-13)

6. Site Suitability and Landscape Impact

This proposal is unique from other wind farms in that their site entrances are off a local road. As the proposal is meandering through the centre of our community with turbines scattered out wherever the developer could place them using the outdated guidelines. There will be approximately 14 - 16 site entrances off 10 of our minor roads and lane ways. The chaos this will cause to our local traffic going about their daily lives to Church, School, Community Centre and shops is unimaginable.

The fact that all of the above Church, School, both Primary and Secondary School, Community Centre and Sensory Garden and all our local amenities are listed as private dwellings in the proposal. This seems to be a deliberate lie that Carrowmore Lacken is not a community at all.

Carrowmore Lacken is a thriving rural community, how long this will last is in your hands?

We are concerned that the applicant does not appreciate that the Lacken area is not a “site” between Killala and Ballycastle. This term to me is an insult and demeans our community with over 600 people living in the area. The applicant does not give any consideration to the community for which it is proposing such a development. The complete industrialisation of our beautiful, historic area simply does not fit. The lack of consideration is evident by the total inadequate attempt at community engagement by holding one information day 30km away from Lacken that was for a completely different site layout and as far as we are aware did not even include details of the BESS and Substation. The exclusion of this significant detail for the information day in our opinion constitutes that there was NO community engagement. The developer never came to our door to give information on the proposed development and we support the Lacken Ballycastle Community Landscape Protection Group in their submission relating to this and all other points.

Mayo County Council has described the location as scattered and not suitable for a development of this scale. The area includes sensitive landscapes, visible from the Wild Atlantic Way and other designated scenic routes, which would be adversely affected by this wind farm. The visual intrusion on the unique coastal and rural landscape is unacceptable and contrary to the policies outlined in the Mayo County Development Plan regarding landscape protection and visual amenities.

(Reference: Mayo County Council submission, EIAR Chapter 17 - Traffic and Transport, Pages 9-10; Planning Statement, Pages 69-71)

7. Environmental and Ecological Concerns

The site includes sensitive habitats such as blanket bogs and areas with ecological significance under the Habitats Directive. The large volumes of peat to be extracted and the disturbance to these habitats could have long-term detrimental effects on biodiversity and peatland restoration efforts. Once the lands involved in this development have been destroyed, they are gone forever, no man-made biodiversity habitat can replace what is such a natural habitat.

(Reference: Appendix 1.6 Community Engagement Report, Pages 13-14; Planning Statement, Pages 69-71)

8. Impact on Hen Harrier Habitat

We are particularly concerned about the impact of the proposed development on the hen harrier, an Annex I protected species under the EU Birds Directive and one whose Irish population has declined significantly in recent years. The EIAR acknowledges that hen harriers are present within the study area and that the site provides suitable autumn and winter foraging habitat. The site contains a combination of blanket bog, scrub, wet grassland, semi-improved grassland and hedgerow networks, all of which are important habitats for foraging and roosting hen harriers.

Of particular concern is that a winter hen harrier roost was recorded within the study area, yet no comprehensive winter roost survey appears to have been undertaken across the wind farm site itself. The applicant's roost surveys focused primarily on areas

outside the development footprint, despite evidence that hen harriers utilise habitats within the proposed development area. In the absence of a robust assessment of winter roosting activity, it is difficult to conclude that the impacts on this protected species have been fully assessed.

The development will result in the permanent loss and fragmentation of habitats used by hen harriers, including substantial hedgerow removal, loss of blanket bog habitat, forestry felling and the construction of extensive site roads and infrastructure. While mitigation is proposed, there remains uncertainty as to whether replacement habitats can adequately replicate the ecological value of the habitats being lost, particularly in the short to medium term.

We are also concerned about the cumulative effects of habitat loss, construction disturbance and operational displacement. Research has shown that hen harriers may avoid otherwise suitable habitat in the vicinity of operational turbines, resulting in a reduction in available foraging area. The application does not appear to adequately assess or mitigate this displacement effect.

Given the conservation status of the species, the acknowledged presence of suitable habitat and recorded winter roosting activity within the study area, we do not believe sufficient scientific certainty has been provided to demonstrate that the proposed development will not adversely affect the hen harrier population using this landscape. The precautionary principle should therefore apply.

9. Traffic and Infrastructure Impact

The construction phase will bring significant disruption to the local road network due to the delivery of abnormal loads and turbine components. The existing roads will require widening and modifications that will impact local traffic flow and road safety. The scale of this impact has not been adequately mitigated in the proposal. We do not believe that proper surveys have been carried out on historic structures such as the Palmerstown Bridge. The roads around the area are narrow, this level of construction traffic and ongoing maintenance traffic after construction will have a disastrous effect on the road infrastructure in the area.

(Reference: EIAR Chapter 17 - Traffic and Transport, Pages 6-10; Appendix 1.6 Community Engagement Report, Pages 11-12)

10. Community and Socio-Economic Issues

While I acknowledge some regional economic benefits, the socio-economic impact on sustainable family farms and local amenities is concerning. The proposal does not sufficiently address the community's needs or provide clear, direct benefits to local residents. The proposed community benefit package remains vague and unconvincing. I do not believe that this development would constitute proper planning given the numerous residential applications that have been refused over the years for the area.

11. Tourism cumulative impact

I am concerned about the cumulative impact the Tirawley wind farm will have on tourism in not only the Lacken Area but also in Ballycastle. Recently the Glenora wind farm has been approved by An Coimisiún Pleanála for 22 turbines. The coast road from Lacken to

Ballycastle is an extremely important part of the Wild Atlantic Way and is an extremely important economic asset to the area. The cumulative effect of Tirawley, Glenora, Keerglen and potentially Clydagh will have on tourism in the area cannot be ignored. The communities involved have worked extremely hard over the years to promote the areas, and the recently launched Failte Ireland and Mayo County Council tourism plan for the area is a significant boost for the area. This cumulative wind energy development that is planned for the north west coast of Mayo is eroding the future that our communities can have. The Lacken Ballycastle coastline is impressively historic with the Céide fields complex and down Patrick head, the future that residents could have will become negligible if ACP do not consider fully the cumulative impact of all projects in the area. I do not believe that the applicant has fully considered all the cumulative effects.

The proposed development represents a direct threat to the tourism economy upon which many businesses and community initiatives depend.

The North Mayo coast is recognised nationally and internationally for its unspoilt scenery, archaeological significance and unique visitor experience. The area forms an important part of the Wild Atlantic Way and contains some of the most significant heritage and landscape resources in Ireland.

Tourism within the area is not dependent upon industrial development but rather upon the preservation of the natural landscape, coastal scenery, tranquility and cultural heritage that attract visitors from across Ireland and abroad.

Visitors come to experience:

- The Céide Fields cultural landscape.
- Downpatrick Head.
- The Wild Atlantic Way.
- The North Mayo coastal scenery.
- The Western Way and local walking routes.
- Local heritage sites and monuments - The Lacken Gazebo.
- The area's dark skies and natural tranquillity.
- Historic locations associated with General Humbert's 1798 landing and campaign.

The introduction of sixteen turbines reaching approximately 135 metres in height, together with aviation lighting, a large BESS facility and a major substation, would industrialise a landscape that is currently marketed and valued precisely because it remains largely undeveloped.

The Environmental Impact Assessment acknowledges significant visual impacts from numerous viewpoints. These impacts will not be experienced solely by residents but also by visitors using scenic roads, walking routes and tourism facilities throughout the area.

The Protected Western Way National Waymarked Trail passes through the wider landscape and visitors using this route will experience the turbines at close range. The quality of this walking experience will be significantly diminished.

The cumulative effect of existing, permitted and proposed wind energy developments throughout North Mayo must also be considered. The gradual industrialisation of the Mayo landscape threatens the long-term viability of tourism across the wider region.

The Lacken Gazebo is a Folly, one of the most unusual protected structures in Ireland which can be viewed from Sligo, Leitrim, Donegal and all over Mayo. It is formed from a double arch of rough stones. It is situated on the summit of Lacken Hill to the rear of Castle Lacken: seat of the Palmer family from the sixteenth century. This was constructed during the latter part of the eighteenth century by either Sir Roger or Sir John Palmer. This structure is located 300m from the nearest turbine AT16, how can this historical monument be protected in light of the planned development?

12. Cumulative Impact and Strategic Considerations

The project overlaps with areas where other developments are planned or existing, increasing cumulative environmental, visual, and infrastructural pressures. The applicant does not acknowledge that Glenora in Ballycastle has received approval from ACP or that the Keerglen wind farm received approval from Mayo County Council and is on appeal with ACP. The scale and height of modern turbines, as noted by Mayo County Council, raise questions about the suitability of this site compared to previous assessments.

(Reference: Mayo County Council submission, EIAR Chapter 17, Pages 9-10)

I wish to state that I was never approached by the developer in my community about this development. None of my neighbours were approached either, there was no community engagement or information leaflets. The only information was an advert stating a "Wind Farm development within the barony of Tirawley incorporating the townlands of Lacken and Ballycastle". It could not be more vague in detail, no townlands listed? Was this an attempt by the developer to conceal the true locations? It was very bad form the way we have all been treated. The only people who will gain are those putting turbines on their land and were told to keep quiet and not tell their neighbours.

I wish to adopt and support the detailed submission made by the Lacken Ballycastle Community Landscape Protection Group in relation to the proposed Tirawley Wind Farm development (PAX16.324258). In particular, I endorse the concerns raised regarding cumulative wind farm development across North Mayo, impacts on the Céide Fields cultural landscape, effects on tourism and recreation, biodiversity impacts, inadequacies in community consultation, and the assessment of the Battery Energy Storage System. While I do not repeat those detailed arguments in full, I request that they be considered as forming part of this submission.

In conclusion, we respectfully submit that the proposed Tirawley Wind Farm project is not appropriate for this location due to the significant negative impacts on residential amenity, local landscape, ecology, infrastructure, and the community. We urge An Coimisiún Pleanála to

refuse permission for this development in the interests of proper planning and sustainable development.

Thank you for considering our submission.

Yours faithfully

Matthew Jackson
