

Appendix V – I-WeBS Site Summary Table for OZ401 Dundalk Bay.

"Peck counts for each species in each of the most recent 10 seasons are presented. Please note:

- The mean is based only on available survey data from the most recent 5-season period, i.e. for the period 2016/17 - 2020/21, using I-WeBS core counts.
- Blank columns indicate seasons when no counts were carried out, while blank cells show that a species was absent, where other counts are in the same column.
- Counts that are poor quality are excluded from these tables, with the exception of known underestimates of individual species.
- Where peck counts were recorded outside the midwinter period (Nov, Dec, Jan) these are marked with an asterisk (*). This may indicate that higher numbers occurred during passage periods, or may be due to a lack of counts in the midwinter months.
- The 'Peck Months' column indicates the months when the highest number of peck counts were recorded."
