1.0 INTRODUCTION

1.1 INTRODUCTION

- 1.1.1 MHL Consulting Engineers has been instructed by Cork County GAA Board to prepare a Traffic & Transport Assessment (TTA) in support of a planning application for the proposed residential development on lands at Kilbarry, Cork.
- 1.1.2 The proposed development consists of the construction of a residential development, a creche, and all ancillary site development works, on lands adjacent to Delaney's GAA Club in Kilbarry, Cork. The proposed development provides for 319 no. dwelling houses consisting of 85 no. semi-detached, 118 no. terraced, 53 no. duplex, and 63 no. apartment units.

Access to the proposed development will be via 2 no. entrances, each of which will access the development from the proposed Distribution Road (objective NE-U-08, in the current Local Area Plan). The Distribution Road will link from the Old Whitechurch Road to Upper Dublin Hill and will be partially delivered as part of this application. The Distribution Road will include the installation of grass verges, cycleways and footpaths.

As part of CMATS (Cork Metropolitan Area Transport Strategy) a Northern Distributor Road (NDR) is proposed which will run to the east of the site. The route selection process for this scheme has been advanced and the City Council have confirmed that the routes under consideration will not impact on the site. A drawing has been prepared showing the likely route for the NDR to the east of the site. On its completion the NDR will provide a high frequency orbital bus service in addition to cycle/pedestrian facilities in close proximity to the site. The adjoining IDA lands have been purchased by the Land Development Authority (LDA) as the new Draft Development Plan shows the zoning changing to residential. The development of the site, the subject of this application and the future development of the adjoining site for residential use will ensure a density of development to support this orbital route.

It is anticipated that the Distribution Road through the site will ultimately link to the NDR replacing objective NE-U-08 which will facilitate the future distribution of vehicular traffic from the site.

Ancillary site development works include public realm upgrades, amenity walks and public open spaces.

- 1.1.3 This TTA appraises the manner in which the proposed development will impact the surrounding roads network and considers appropriate access arrangements and the transport choices available to future users of the development site and the manner in which the existing/proposed transport infrastructure surrounding the site will influence that choice. The impact of traffic demand generated by the proposals will be considered and quantified.
- 1.1.4 The scope of this study has been agreed with Cork City Council's Traffic & Transportation Department. Key parameters relating to the traffic modelling carried out including, junctions to be assessed, trip generation, modal shift targets, trip distribution, assessment years and the presentation of results have been agreed with the Council.
- 1.1.5 The key junctions in the area surrounding the proposed development are shown in **Figure 1.1** and are as follows:
- Junction 1: Access Road junction with Old Whitechurch Road.
 - Junction 2. Old Whitechurch Rd./ Old Mallow Rd.
 - Junction 3: Redforge Rd./ Dublin Hill
 - Junction 4: Kilbarry Enterprise Centre Rd./ Upper Dublin Hill
 - Junction 5: Upper Dublin Hill/ Lower Dublin Hill

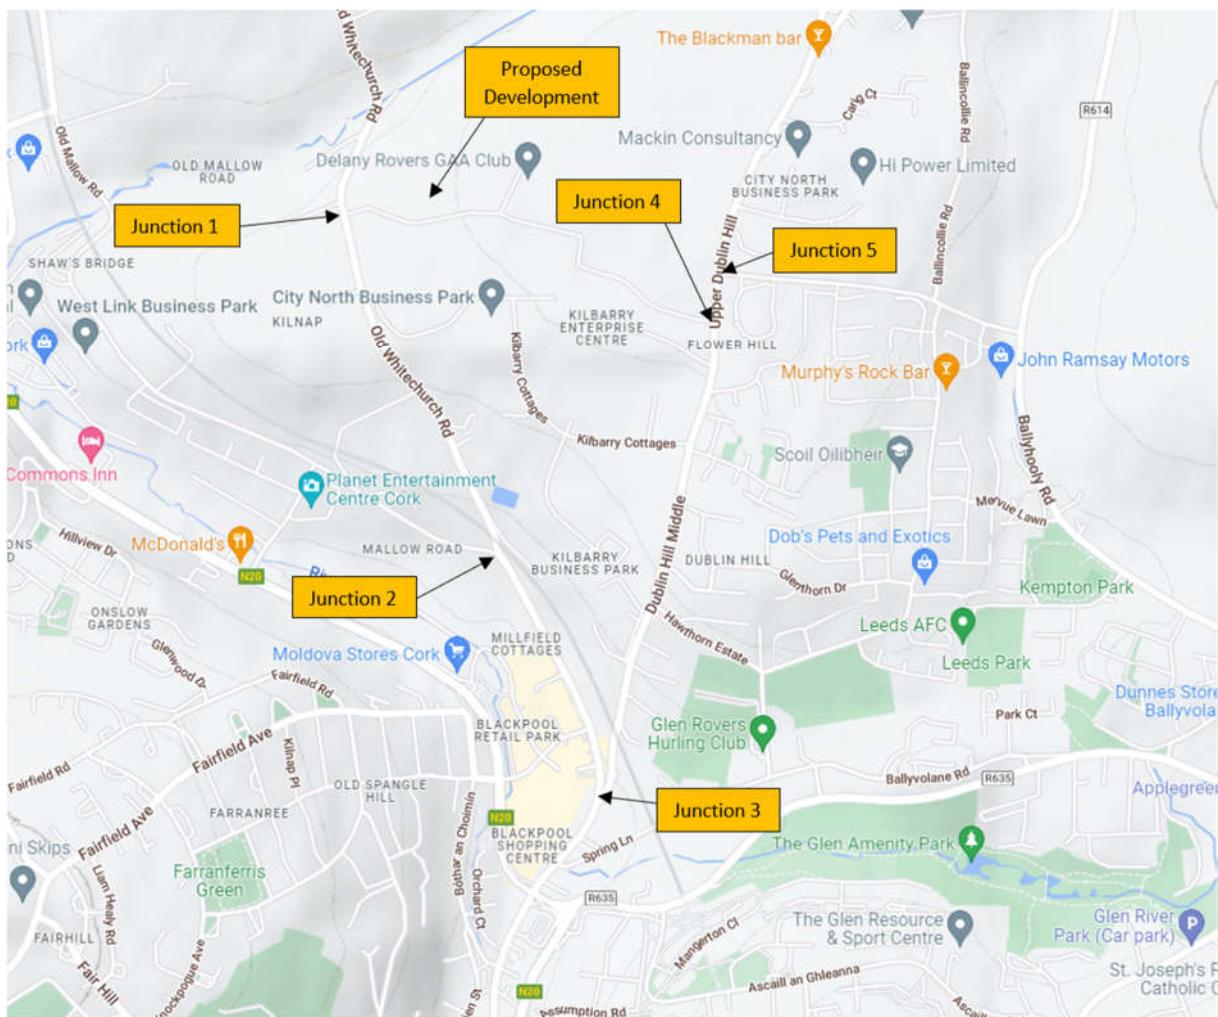

Figure 1.1: Junction Locations

1.2 CONSULTATION

- 1.2.1 The Design Team has engaged with various departments within Cork City Council with a view to consider the respective issues raised as part of the design process of the scheme.
- 1.2.2 These engagements have informed the final layout of the scheme including access arrangements for vehicular, pedestrian and cycle modes of transport.

1.3 DOCUMENT STRUCTURE

- 1.3.1 A TTA is an appropriate form of assessment for the scale of the proposed development and the scope has been agreed with the local authority. The structure of this TTA is in accordance with TII Transport Infrastructure Ireland) Document, Traffic and Transport Assessment Guidelines, 2014.

The aim of this TTA is to identify the characteristics of the application site and surrounding area, examine the likely transport implications, ensure sustainable accessibility is maximised and appropriate infrastructure provided.

The key issues that need to be addressed within this TTA, with reference to the size and location of the development proposal, are as follows:

- Review of the site location, composition and local roads network.

- Analysis of Road Safety data for the most recent five-year period available.
- Accessibility critique reviewing pedestrian, cycle and public transport access to the site, plus any infrastructure currently available to promote travel by sustainable means.
- A review of the relevant planning and transport policy.
- Description of the development proposal.
- Description and justification for the proposed access arrangement, internal layout, parking provision, public transport provision, fire tender/service/delivery access, including all necessary swept-path assessments and visibility splays.
- Forecast multi-modal trip rates and trip generation as agreed with the Local Authority.
- Modal split assumptions used in the trip generation process.
- The use of appropriate and agreed traffic modelling software for the assessment of individual junctions.
- Provide With/Without Development assessment for each of the critical junctions.
- Assess significance of development generated traffic upon the surrounding transport infrastructure and identify any necessary mitigation.

2.0 NON-TECHNICAL SUMMARY

2.1 This TTA has been prepared in support of an application to An Bord Pleanála for permission in respect of the proposed Kilbarry SHD, comprising 319 no. residential units, and a 71-child creche.

2.2 The TTA has demonstrated the following:

- (i) The proposed Kilbarry SHD is in accordance with the traffic and transportation policies and objectives of the Local Area Plan and abides with the delivery of sustainable residential developments.
- (ii) A review of the existing roads network in the vicinity of the site indicates that there are no significant impacts on road safety. At the time of undertaking this report, the RSA Road Collision Statistics were not available in the vicinity of the development.
- (iii) Junction 1: Distributor Road junction with Old Whitechurch Road is shown to operate well within capacity up to and including the design year 2040 with and without development traffic.
- (iv) Junction 2: Old Whitechurch Rd./ Old Mallow Rd. is shown to operate well within capacity up to and including the design year 2040 with and without development traffic.
- (v) Junction 3: Redforge Rd./ Dublin Hill is shown to reach capacity in 2025 during the PM peak with no additional development traffic applied. When development traffic is included, the junction instead reaches capacity in 2024 during the PM Peak and is shown to exceed capacity during the PM Peak in 2025. The analysis results indicate that the junction will exceed capacity both with and without development traffic in the future design years 2030 and 2040.

In an effort to improve junction capacity, an additional model was created for this junction using an increased traffic signal cycle time. The results indicate that this would improve the performance of the junction.

The constructed models of this junction present a very conservative and robust analysis. Future increases in modal shift away from the private car, in line with national targets, have been applied to the development traffic in the 2040 scenario but not to the background traffic.

- (vi) Junction 4: Kilbarry Enterprise Centre Rd./ Upper Dublin Hill is shown to operate well within capacity up to and including the design year 2040 with and without development traffic.
 - (vii) Junction 5: Upper Dublin Hill/ Lower Dublin Hill is shown to operate within capacity up to and including the design year 2040 with and without development traffic.
 - (viii) The proposed site layout is permeable to the roads network and is well connected to existing pedestrian linkages, to public transport offerings, schools, retail and amenity destinations.
 - (ix) The proposed access arrangements are safe and suitable and are in accordance with the Design Manual for Roads & Bridges (DMRB) and the Design Manual for Urban Roads & Streets (DMURS).
 - (x) The site benefits from being in close proximity to regular transport provision within walking distance of the site, which enables journeys throughout Cork City. Future proposed high density orbital bus services, to be available when the Northern Distributor Road is completed and the development of a new train station in Kilbarry will aid future modal shift for residents away from the private car towards more sustainable modes of travel.
- 2.4 A modal shift of 40% (implying an anticipated increase in public transport usage or active travel in the immediate area of 21%) for future year models is deemed to be reasonable. This modal shift increase of 21% has been applied to the proposed development traffic for design year 2040 only, by which time it is anticipated that the Northern Distributor Road, and the train service via the proposed Blackpool/Kilbarry train station, will be in operation. This same modal shift increase of 21% has not been applied to the background traffic of the modelled junctions, ensuring that a conservative (worst-case) analysis has been carried out.

3.0 EXISTING CONDITIONS

3.1 INTRODUCTION

- 3.1.1 This section describes the base data used to develop the junction models, the critical links and junctions as agreed with the Local Authority, committed transport proposals to the area and other surrounding proposed development.

3.2 BASELINE TRAFFIC CONDITIONS

- 3.2.1 A variety of different data sources have been used, including:
- 12-hour classified turning counts (3 sites, refer **Figure 3.1** below);
 - Background OS Mapping and aerial photography;
 - On-site junction measurements including saturation flows, link speeds, queue length measurements, pedestrian movements at signalled crossings and geometric data for each of the modelled junctions;
- 3.2.2 A total of 3 no. turning count surveys were undertaken as part of the study on Tuesday 5th April 2022, as outlined in the following figure; these surveys were carried out simultaneously using video cameras at each of the junctions for a 12-hour period.
- 3.2.3 On-site measurements including lane widths, junction turning radii, lane lengths and saturation flows were undertaken by MHL and were incorporated in the constructed models.

Figure 3.2.1: Traffic Count Survey Locations

3.2.4 The following figures present the recorded 12-hour traffic profile, number of vehicles per turning movement, and percentage of classified vehicles for each of the surveyed sites carried out on Tuesday 5th of April 2022:

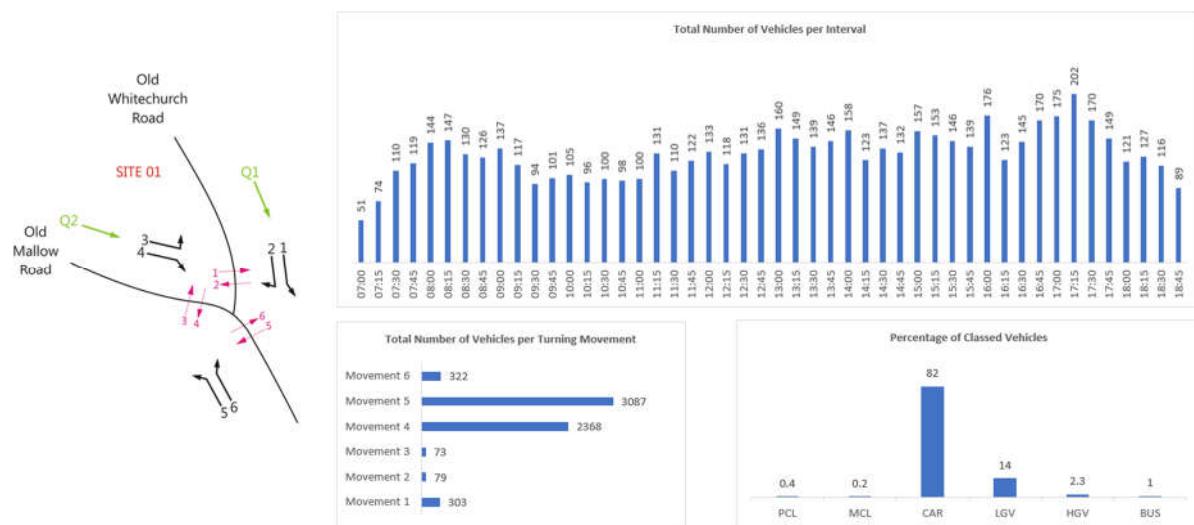

Figure 3.2.2: Site 1: Old Whitechurch Rd./Old Mallow Rd. junction

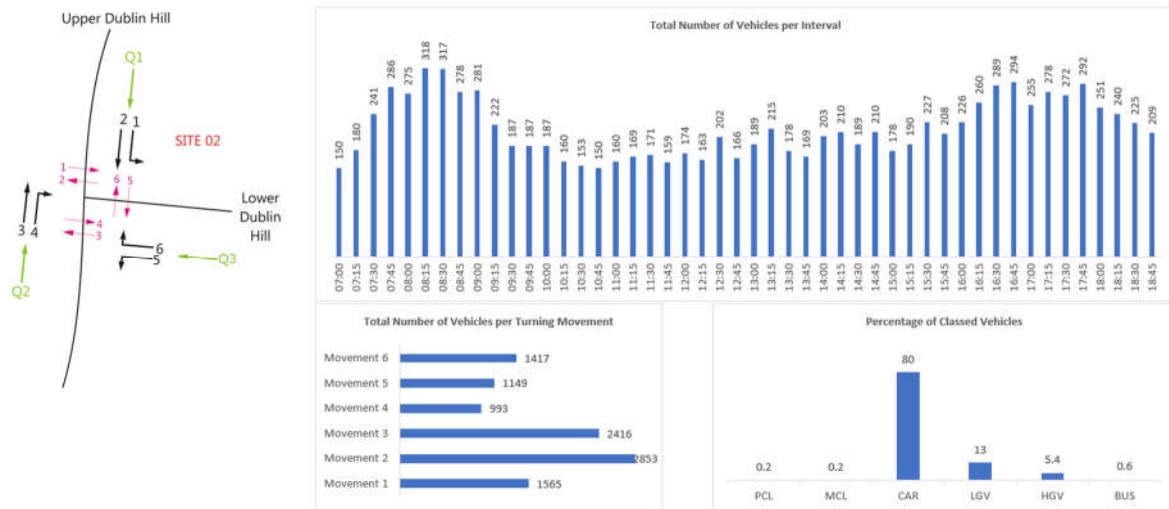

Figure 3.2.3: Site 2: Upper Dublin Hill / Lower Dublin Hill junction

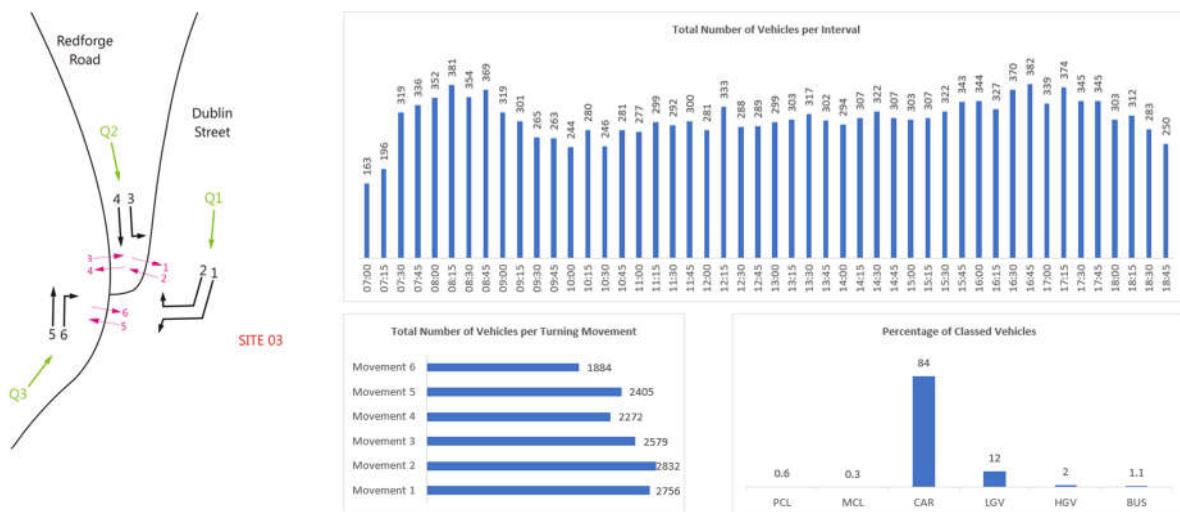

Figure 3.2.4: Site 3: Redforge Rd. / Dublin St. junction

3.2.5 The data presented in the above figures shows the peak hour traffic periods for both morning and evening respectively at each junction as follows:

- Site 1: 08:00 – 09:00 and 16:45 – 17:45
- Site 2: 07:45 – 08:45 and 16:30 – 17:30
- Site 3: 08:00 – 09:00 and 16:30 – 17:30

For the purpose of the modelling analysis, each of the above peak hour traffic periods are included in order to obtain the worst-case traffic build-up results. This ensures a robust analysis of the road network is conducted. The models have been calibrated to represent recorded flows.

3.2.6 The percentage of classified vehicles was used within the generated traffic models to accurately reflect existing conditions.

3.3 SITE LOCATION AND COMPOSITION

- 3.3.1 The application site is located on the lands to the west of Delaney's GAA Club, with access onto Old Whitechurch Road and to Upper Dublin Hill by means of a right of way over the main access road serving Delaney's GAA Club. The location of the access road is within the 50kph speed limit zone on both main roads. The site is bounded by the Delaney's GAA club to the east and Old Whitechurch Rd. to the west.

Figure 3.3.1: Existing Site Boundary

3.4 LOCAL ROADS NETWORK

The following junctions were identified as the key junctions in the area surrounding the proposed development.

3.4.1 Junction 1: Access Road junction with Old Whitechurch Road

This priority junction serves as a vehicular access between the Rathpeacon/ Whitechurch area of Cork and the greater Cork City urban area. The measured two-way AADT (Annual Average Daily Traffic) at the junction is 620.

Image 3.4.1: Image of existing Access Road junction with Old Whitechurch Road

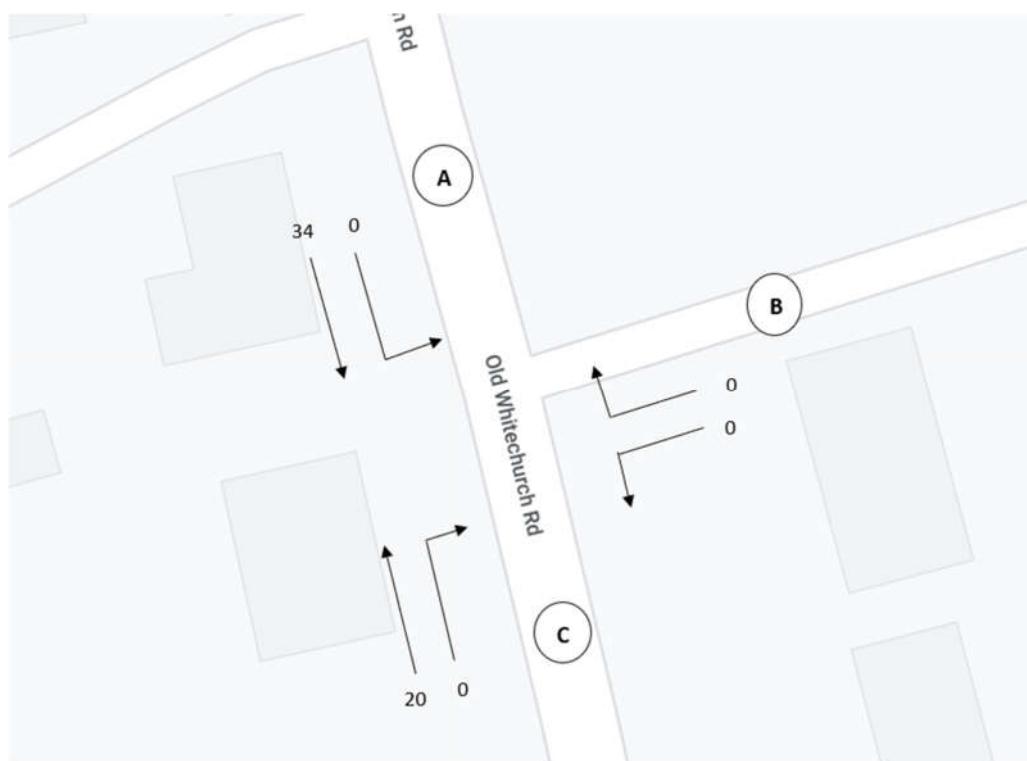

Figure 3.4.1: Access Road junction – AM Peak Hour Flows

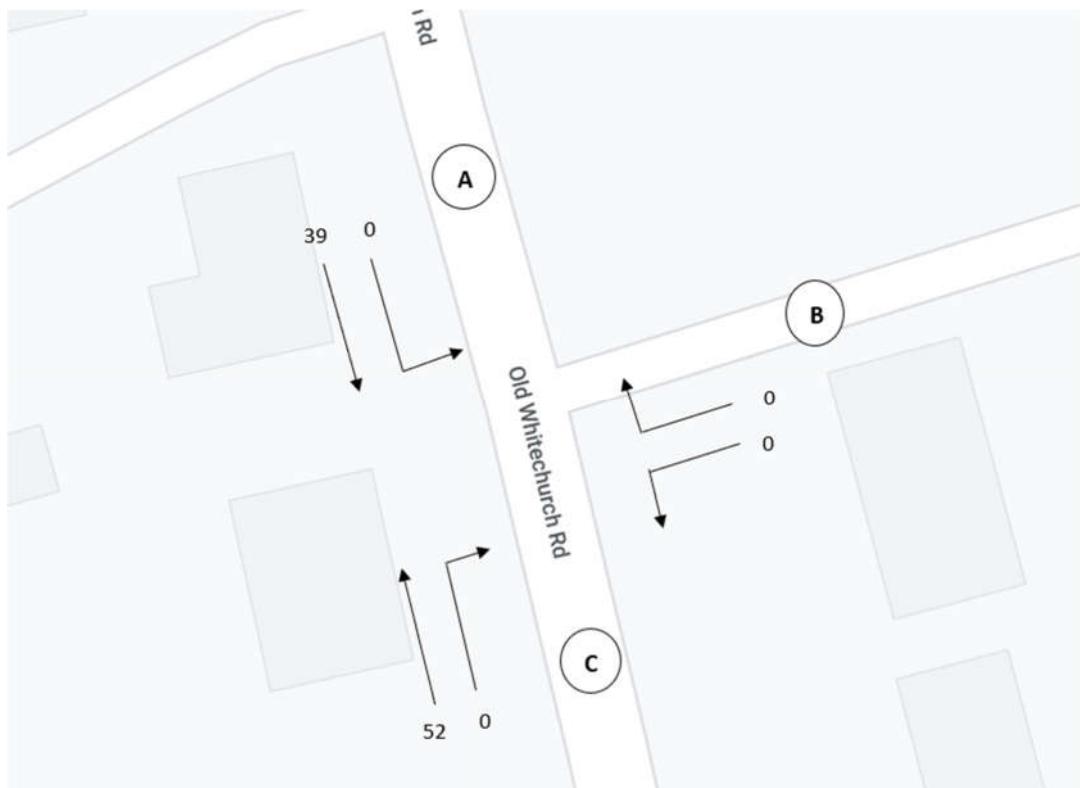

Figure 3.4.2: Access Road junction – PM Peak Hour Flows

3.4.2 Junction 2: Old Whitechurch Rd./ Old Mallow Rd.

This Signalised Junction serves as a primary access towards the Blackpool Shopping Centre and into Cork City via the N20. The measured two-way AADT (Annual Average Daily Traffic) at the junction is 6145.

Image 3.4.2: Image of Junction 2: Old Whitechurch Rd./Old Mallow Rd.

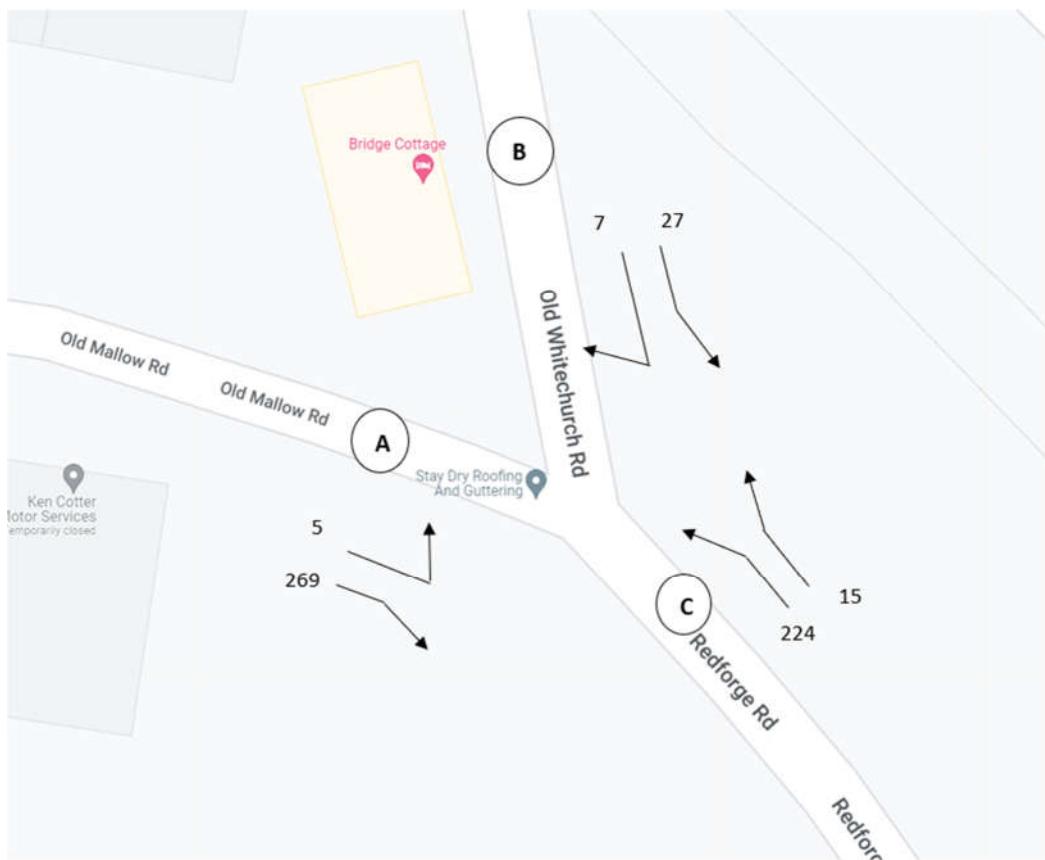

Figure 3.4.3: Old Whitechurch Rd./ Old Mallow Rd. – AM Peak Hour Flows

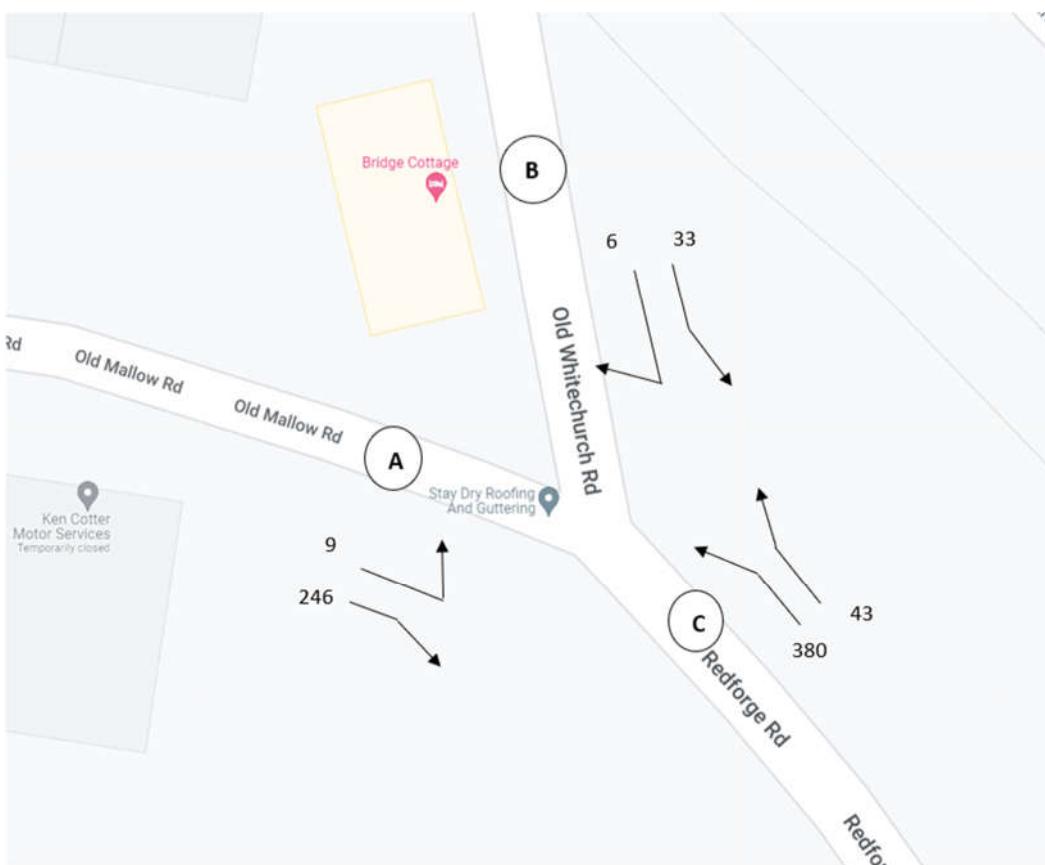

Figure 3.4.4: Old Whitechurch Rd./ Old Mallow Rd. - PM Peak Hour Flows

3.4.3 Junction 3: Redforge Rd./ Dublin Hill

This signalised junction forms a link between the Dublin Hill/ White's Cross area to the Blackpool shopping and Cork City. Traffic heading to Cork City travels either south along Dublin St. towards Watercourse Rd. or travels north along Redforge Rd. towards the Brother Delaney Rd. junction. The measured two-way AADT (Annual Average Daily Traffic) at the junction is 16,360.

Image 3.4.3: Redforge Rd./ Dublin Hill Junction

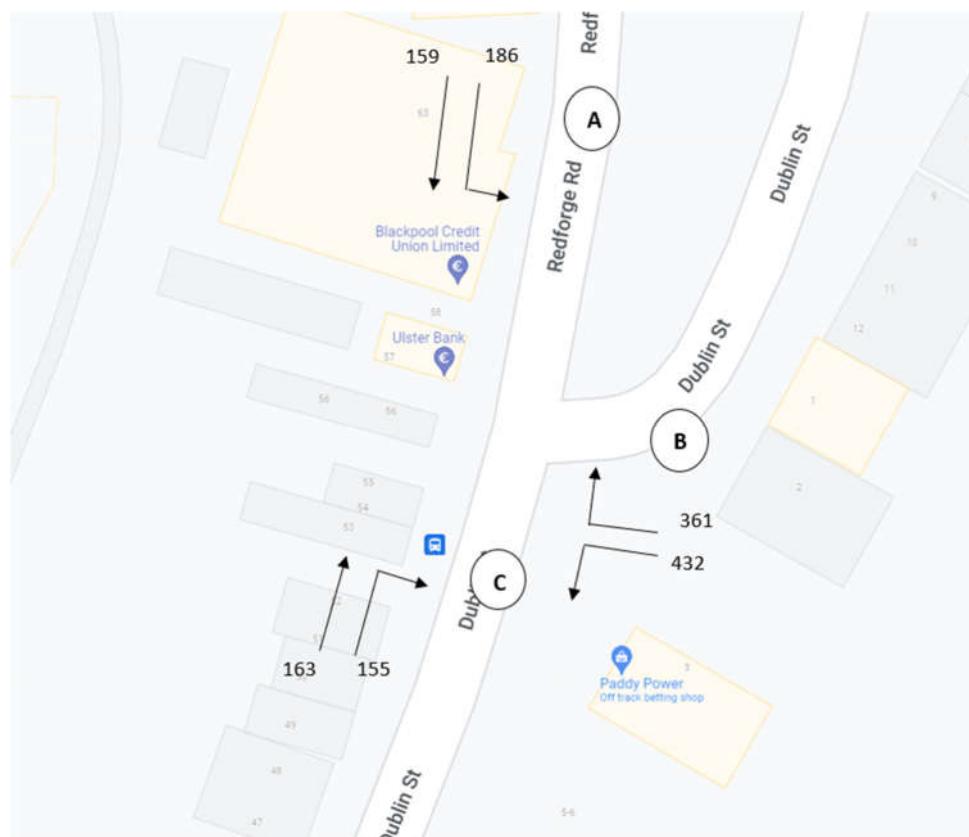

Figure 3.4.5: Redforge Rd./ Dublin Hill Junction. – AM Peak Hour Flows

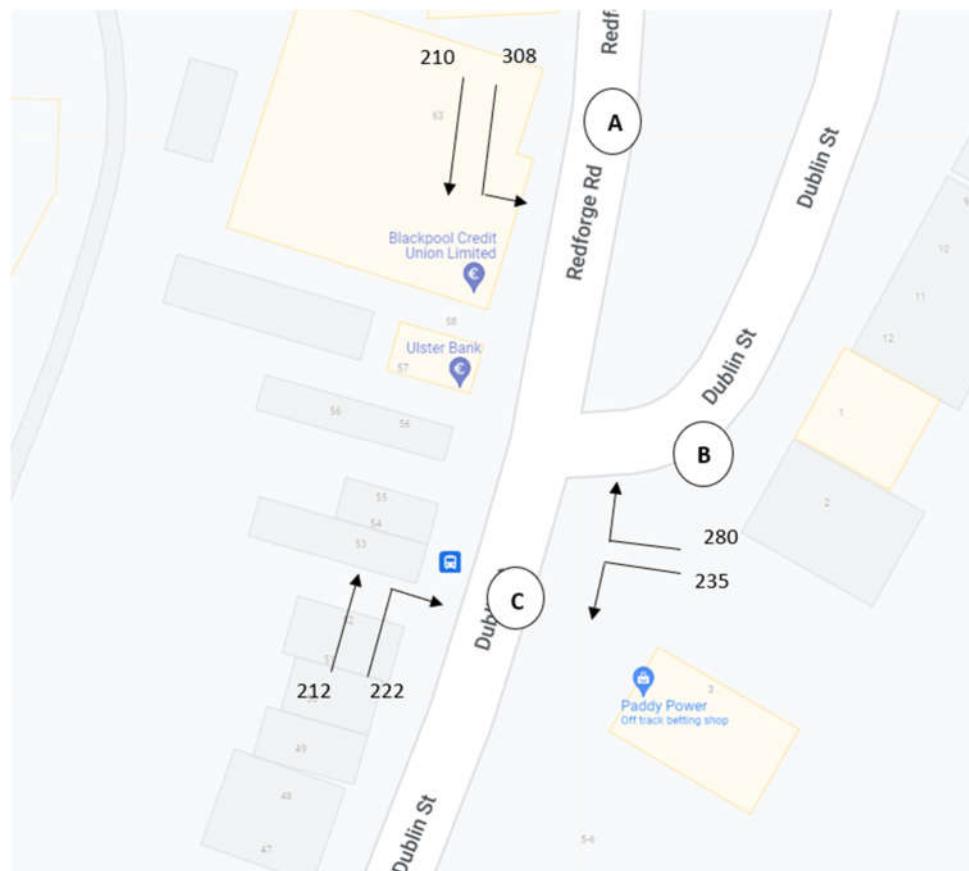

Figure 3.4.6: Redforge Rd./ Dublin Hill – PM Peak Hour Flows

3.4.4 Junction 4: Kilbarry Enterprise Centre Rd./ Upper Dublin Hill

This priority junction provides access to the Kilbarry Enterprise Centre and Delaneys GAA pitch from Upper Dublin Hill. The measured two-way AADT (Annual Average Daily Traffic) at the junction is 10,655.

Image 3.4.4: Kilbarry Enterprise Centre Rd./ Upper Dublin Hill Junction

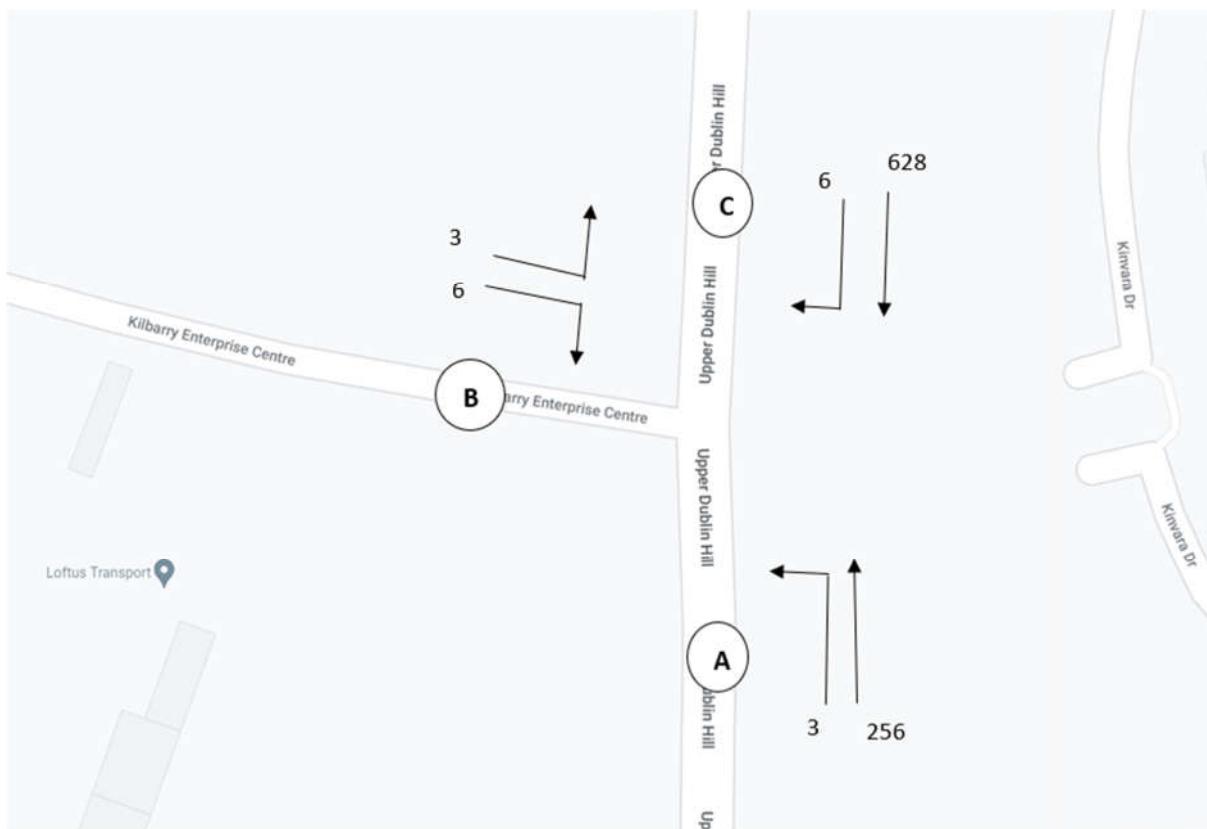

Figure 3.4.5: Kilbarry Enterprise Centre Rd./ Upper Dublin Hill Junction – AM Peak Hour Flows

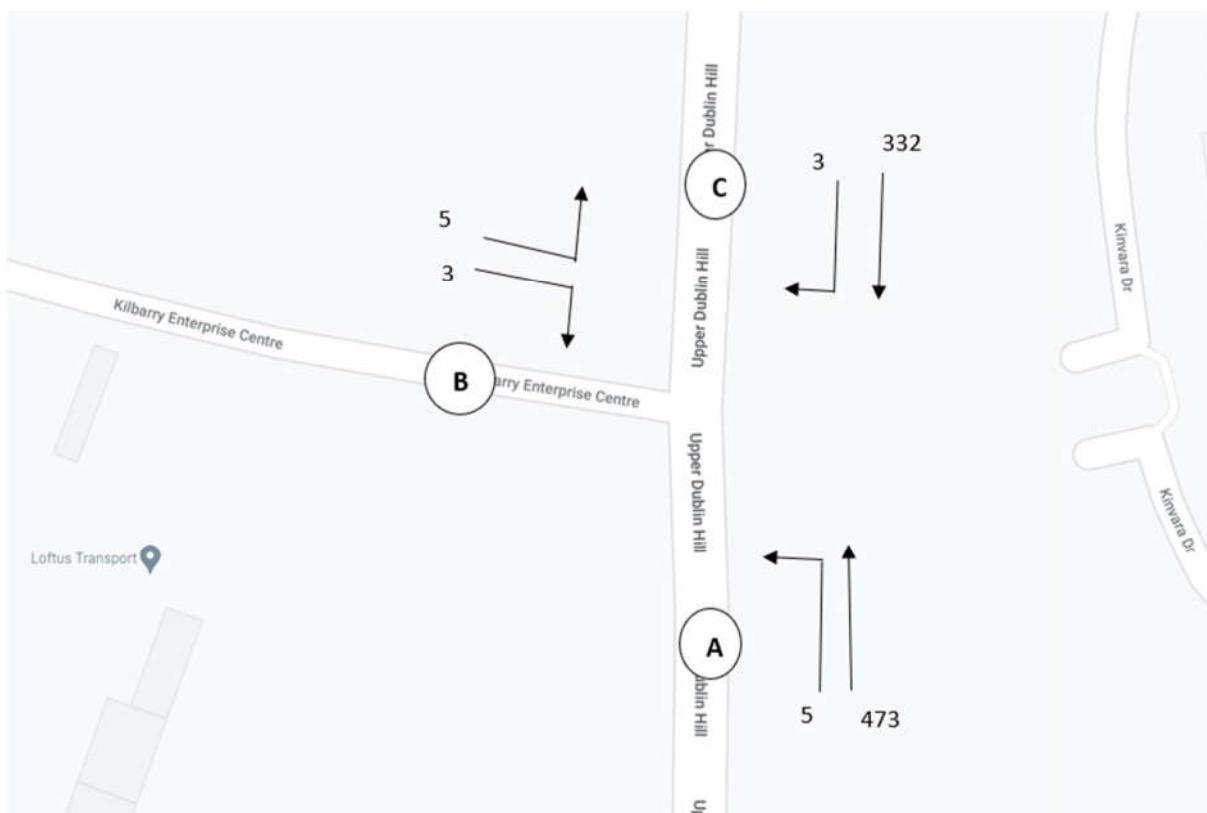

Figure 3.4.6: Kilbarry Enterprise Centre Rd./ Upper Dublin Hill Junction – PM Peak Hour Flows

3.4.5 Junction 5: Upper Dublin Hill/ Lower Dublin Hill

This priority junction forms a major link into the Blackpool shopping centre and onwards to Cork City. The measured two-way AADT (Annual Average Daily Traffic) at the junction is 14125.

Image 3.4.5: Upper Dublin Hill/ Lower Dublin Hill Junction

Figure 3.4.5: Upper Dublin Hill/ Lower Dublin Hill – AM Peak Hour Flows

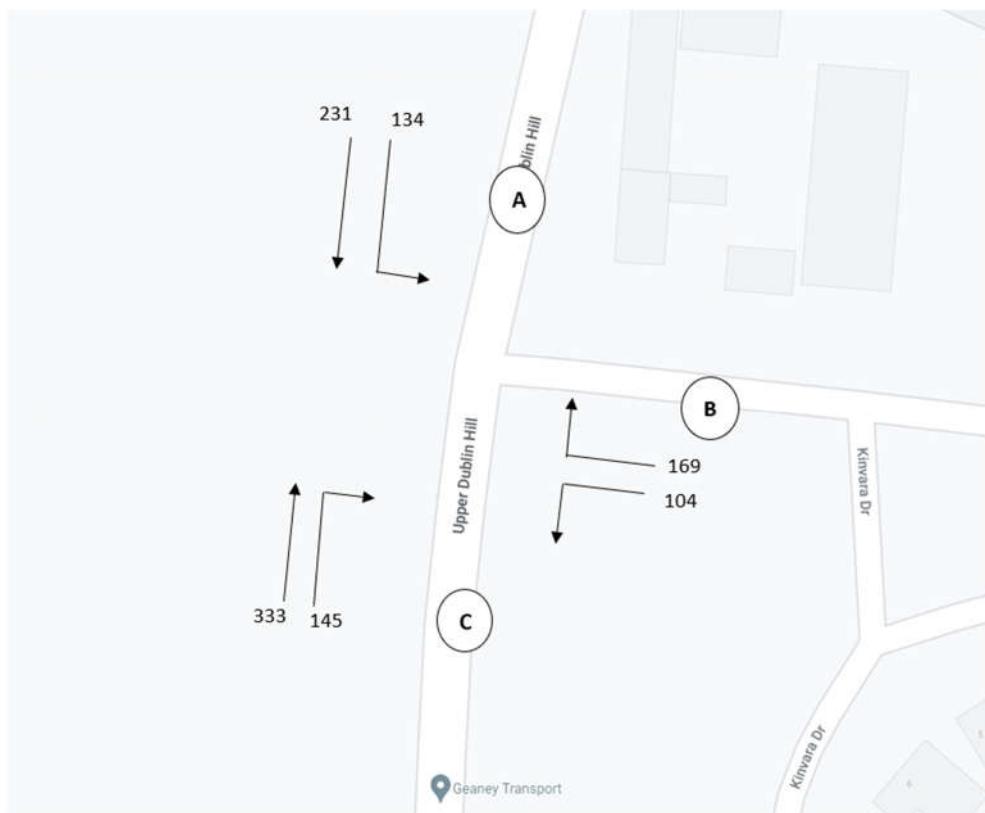

Figure 3.4.6: Upper Dublin Hill/ Lower Dublin Hill – PM Peak Hour Flows

3.5 COMMITTED TRANSPORT PROPOSALS

- 3.5.1 The publication of the CMATS (Cork Metropolitan Area Transport Study) document proposes major upgrades to public transport provision to serve the City Public Transport Network. These measures will contribute to an expected increase in modal shift towards sustainable travel resulting in a reduction in traffic generation from residential developments. Figure 3.5.1 outlines the 9 measures proposed to achieve this aim.

As part of this assessment, allowance was made for a modal shift of 40% (current sustainable travel usage in the area as per 2016 census was 19%) for development traffic only, in the Design Year 2040. This represents a 21% increase in modal shift over current levels and has been applied to 'new development traffic' only. The use of an increased modal shift for development traffic is justified based on the expected increase in public transport options available in the vicinity of the development brought on by BusConnects and the proposed infrastructure improvements per CMATS.

The resulting reduction in traffic generation from the site has not been applied to background traffic flows, refer to Chapter 6.0 of this report for further details.

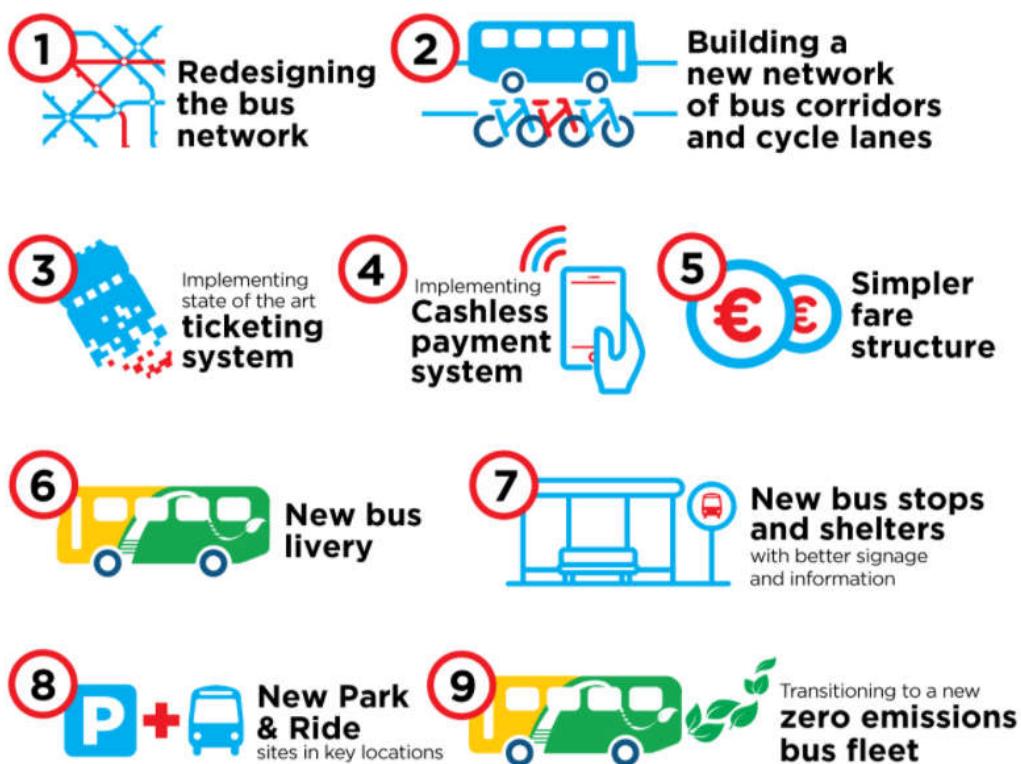

Figure 3.5.1: BusConnects Cork – Measures proposed to increase public transport usage.

- 3.5.2 The route for the proposed Northern Distributor Road is included within CMATS and extends in very close proximity to the development site. The proposed route included in CMATS is indicative only but serves as a good indicator of the route to be taken. Figure 3.5.2 highlights a potential route for the Northern Distributor Road around the development lands and Delaney's GAA grounds. This route was presented as part of the tripartite submission and it was confirmed by Cork City Council Infrastructure Department that it broadly represents the emerging preferred route soon to be published. None of the routes assessed pass through the GAA grounds or the development site.

Figure 3.5.2: Northern Distributor Road – indicative route option

The proposed Northern Distributor Road is anticipated for completion in 2031 and will provide a direct route for local traffic to avoid the major traffic centres of Blackpool and the City Centre when wishing to travel to the N22 west or the N8 east.

- 3.5.3 The proposed Blackpool/Kilbarry train station, included in CMATS as part of the proposed suburban rail network, will offer an attractive alternative mode of travel for residents. The proposed station, as shown in CMATS, is located approximately 20-minutes' walk from the site.

Figure 3.5.3: Taken from CMATS – Proposed Suburban Rail

The train station will have a significant impact on the commuter habits of the Blackpool/Kilbarry area by offering a frequent, reliable, and comfortable travel option into Cork City. According to CMATS, the proposed frequency of trains between the Blackpool/Kilbarry station and Kent Station will be 5 minutes.

4.0 PROPOSED DEVELOPMENT

4.1 INTRODUCTION

- 4.1.1 The proposed Kilbarry Residential Development consisting of residential housing and a creche abides with the zoning in the local area plan of ZO1 Sustainable Residential Developments.
- 4.1.2 The proposed development will consist of a strategic housing development of 319no. residential dwellings comprising of 85no. semi-detached units (comprising of 17no. 4-bed units and 68no. 3-bed units), 118no. terraced units (comprising of 8no. 4-bed units, 60no. 3-bed units and 50no. 2-bed units), 53no. duplex units (comprising of 26no. 1-bed units, 25no. 2-bed units and 2no. 3-bed units) and 63no. apartments (in 3no. part 4 storey and part 5-storey blocks and comprising 15no. 1-bed units and 48no. 2-bed units). The development also includes the provision of a crèche facility (519sqm) and a riverside amenity park to the north and northeast of the site.

phase 1. The Traffic Impact Assessment includes the design year 2023 (phase 1 complete), the design year 2024 (phase 2 complete), the proposed opening year of 2025, the opening year +5 (2030), and the opening year +15 (2040).

4.3 CONSTRUCTION STAGE TRAFFIC IMPACT

- 4.3.1 The construction stage of the proposed development will be phased as described above in section 4.2.1.

It is envisaged that working hours will be from 07:00 to 18:00, Monday to Friday (08:00 to 14:00 Saturday) for construction personnel through each phase of the development. Generally, construction workers will travel to site before the measured peak hour of 08:00 – 09:00, to be on site for an 07:00 start-time. A very limited number of construction employees are likely to travel to the site during peak hours.

It is anticipated that heavy goods vehicles, HGV's, will be restricted to movements on the local road network during the off-peak periods. It is estimated that truck movements and general deliveries would arrive/leave at a steady rate during the course of the day.

In general, the impact of construction traffic will be temporary in nature and less significant than the final development operational stage.

- 4.3.4 The construction stage elements of the Traffic Management Plan submitted with this application, including identified haulage routes, will be implemented.

The surrounding road network is suitable to accommodate the construction traffic associated with the proposed development. The Traffic Management Plan includes a range of mitigating measures to:

- ensure the safety of the workforce on the site
- ensure the safety of those accessing the site
- ensure the safety of the public on the surrounding roads
- minimise construction traffic generation
- minimise disruption on the surrounding road network

5.0 TRIP GENERATION

- 5.1.1 Trip generation from the proposed development was garnered via the TRICS database. MHL is a licence holder for the TRICS database and employ it for traffic studies. TRICS is a well-established UK and Irish national database which holds in excess of 2,100 site locations and 7,000 survey counts with over 98 separate land use sub-categories. The TRICS program was utilised for the land-use sub-category associated with the development proposal. The "Guidelines for Traffic and Transportation Assessments" state that for residential use the busiest hours are between 08:00-09:00 and 17:00-18:00. Traffic counts conducted on the 5th May 2021 by Tracsis were utilised to establish the actual AM & PM Peak traffic hours for the local road network for the purposes of this assessment.
- 5.1.2 Sites from Greater Dublin Area, Tipperary, Waterford, Carlow, Louth, Wicklow, Wexford, Cavan, Donegal, Monaghan, Antrim, and Tyrone were included from the TRICS database to determine the trip rates as shown in **Table 5.1** and **Table 5.2** below.

Total Rates:			1.458			1.605			3.063

Table 5.2 Trip Generation Per Apartment (TRICS)

- 5.1.3 In the following chapter reference is made to the current (2016) Modal Shift by means of travel to work, school or college and is based on 2016 Census Data. The site is located in the Electoral Division of 'St. Marys', ref. **Table 6.1**, with 2016-year figures implying 19% of persons in the area use sustainable means of travel.
- 5.1.4 Trip Generation from the proposed 71 pupil creche was derived using the TRICS database. The following table presents the peak hour trip rates for a standalone creche.
- In this instance, it is assumed that the creche will serve both the proposed scheme and the wider area. It is anticipated that the creche will add to traffic entering and exiting the development during the morning/evening peak hours over and above 'pass-by' traffic (traffic already accounted for on the network).

Table 5.3 Trip Generation Per Pupil – Creche (TRICS)

6.0 MODAL SPLIT

- 6.1.1 This section describes the current level of modal shift (the use of sustainable modes of travel) based on available data and compares these to national targets.
- 6.1.2 The 2016 Census online SAP data was used to assess current modal shift patterns in the St. Marys Area which encompasses the site. 19% of people in this area said they were commuting on foot, bike or using public transport.

Population aged 5 years and over by means of travel to work, school or college			
Means of Travel	Population aged 5 years and over by means of travel to work (Number)	Population aged 5 years and over by means of travel to school or college (Number)	Population aged 5 years and over by means of travel to work, school or college (total) (Number)
On Foot	95	322	417
Bicycle	27	5	32
Bus, minibus or coach	83	162	245
Train, DART or LUAS	2	0	2
Motorcycle or scooter	11	3	14
Car Driver	1,414	96	1,510
Car passenger	151	996	1,147
Van	156	4	160
Other (incl. lorry)	16	0	16
Work mainly at or from home	65	0	65
Not stated	67	73	140
Total	2,087	1,661	3,748

**Table 6.1: 2016 Modal Shift by means of travel to work, school or college.
(Electoral Division of St. Marys)**

6.1.3 Future national targets in the range of 40% are being pursued by all Local Authorities and the Kilbarry area is part of future public transport upgrade proposals. Given the location of the proposed development and based on the increased density of development, a limited increase in sustainable transport is expected. A change in the local demographic to a younger population (lower car ownership) will also facilitate this change.

6.1.4 A modal split of 40% (implying an anticipated increase in public transport or active travel in the immediate area of 21%) for the Opening Year +15 (2040) scenario is deemed to be reasonable.

This modal shift of 21% will not be applied to the other modelled scenarios as it is unlikely that the proposed surrounding infrastructure, as depicted in CMATS, would be completed by the respective scenario years (e.g., the proposed Northern Distributor Road). Additionally, to ensure a robust analysis of the wider road network, the modal shift will not be applied to background network traffic.

7.0 TRAFFIC GENERATION / FORECASTING

- 7.1.1 This section describes the traffic generation from the development as outlined in Section 5 and accounts for future modal shift targets as described in Section 6.
- 7.1.2 Based on the above trip generation rates the following tables present the residential development traffic for the different phases. This traffic has been added to existing background flows and distributed through the network to model each of the identified junctions. The results are presented in Section 9 of this report.

Phase 1 only		AM PEAK		PM PEAK	
		Arrivals	Departures	Arrivals	Departures
New Residential Houses Trip Generation - based on TRICs database					
109	Peak Trips Trip Rates Per Unit	0.192	0.555	0.487	0.294

Table 7.3 Proposed Development Traffic in 2025

- 7.1.3 As the proposed development site currently generates no traffic, no reduction has been applied to account for pass-by trips, transfer trips or combined trips from the residential element of the scheme.
- 7.1.4 It is assumed that a portion of the Creche demand will be derived from the proposed development, however, in order to carry out a robust assessment of the roads network it is assumed that 80% of traffic that would be generated by a standalone creche will be attracted to the proposed development.
- 7.1.5 In addition to development traffic, recorded background traffic was factored using TII (Transport Infrastructure Ireland) Project Appraisal Guidelines (PE-PAG-02017) for use in future year scenarios. The following table presents the factors used on recorded vehicle counts based on Link Based Growth Rates (Central Growth) for the Cork Metropolitan Area.

	Cars/LGV	HGV	Combined
Count %	97%	3%	100%
2022 to 2023	1.017	1.029	1.017
2022 to 2024	1.034	1.060	1.035
2022 to 2025	1.052	1.091	1.053
2022 to 2030	1.143	1.261	1.147
2022 to 2040	1.237	1.420	1.243

TII Project Appraisal Guidelines for National Roads Unit 5.3
Travel Demand Projections (PE-PAG-0217-02)

Table 7.4 Background Traffic Growth Rates Per Annum

8.0 TRIP ATTRACTION AND DISTRIBUTION

- 8.1.1 This section describes the methodology used in the distribution of development specific traffic onto the modelled network. **Figure 3.1** outlines the location of each of the junctions where turning count movements were recorded over a 12-hour timeframe. This ‘snapshot’ of existing traffic movements provides a basis for determining desire lines which was used to assign development traffic at each of the modelled junctions.
- 8.1.2 The following figures illustrate the distribution of the proposed development traffic across the existing road network for each of the following scenarios:
- 2023 AM/PM - Phase 1 only (Old Whitechurch Rd. access in operation only)
 - 2024 AM/PM - Phases 1 & 2 (Old Whitechurch Rd. access in operation only)
 - 2025 AM/PM - Phases 1, 2, & 3 (full development traffic with Old Whitechurch Rd. access in operation only)
 - 2030 AM/PM - Dev +5 years (access onto Upper Dublin Hill via existing Delaney’s GAA access in operation, no change to modal shift applied)
 - 2040 AM/PM With/Without Dev +15 years (with entrance onto Upper Dublin Hill via existing Delaney’s GAA access in operation, modal shift to 40% applied)

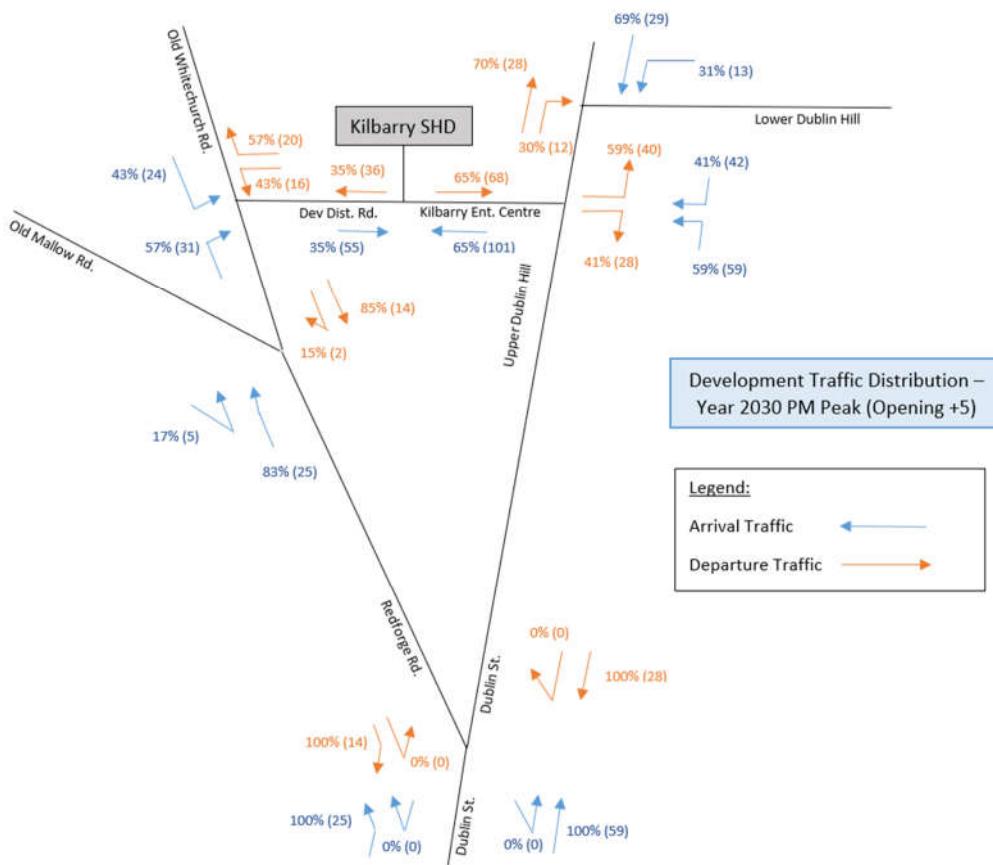

Figure 8.8: Development Traffic Distribution - Year 2030 PM Peak

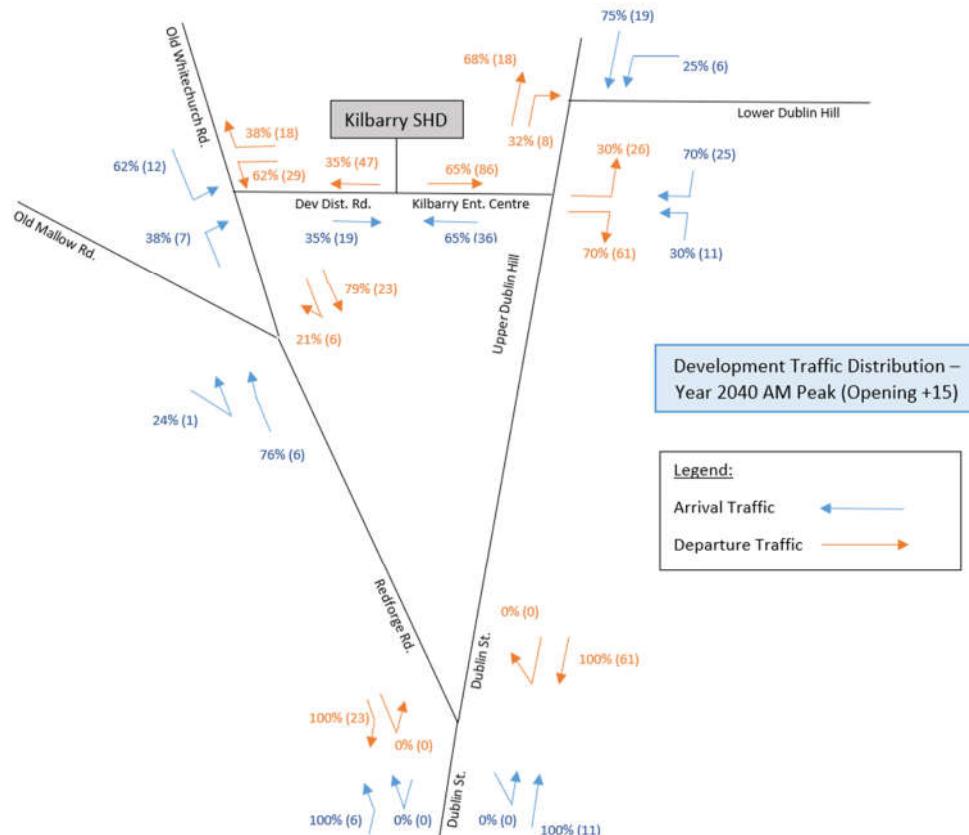

Figure 8.9: Development Traffic Distribution - Year 2040 AM Peak

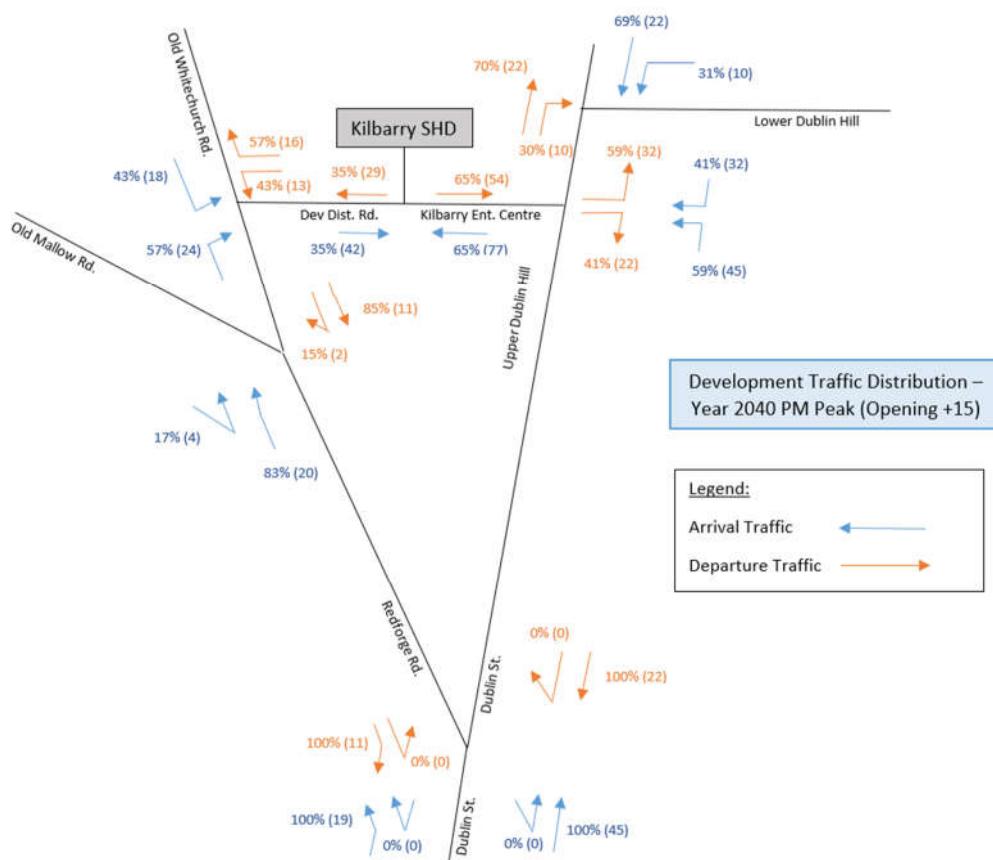

Figure 8.10: Development Traffic Distribution - Year 2040 PM Peak

8.1.3 The distribution of development traffic was used to create traffic flow matrices for each Junction when the development is in operation. Traffic flow matrices were developed for each of the following scenarios:

- 2023 AM/PM With/Without Phase 1
- 2024 Am/PM With/Without Phases 1 & 2
- 2025 Am/PM With/Without Phases 1, 2, & 3 (full development)
- 2030 AM/PM With/Without Dev +5 years
- 2040 AM/PM With/Without Dev +15 years

Table 8.55 Junction 5: 2040 With Development AM/PM Peak Hour Traffic Movements

9.0 NETWORK MODELLING RESULTS

9.1 INTRODUCTION

- 9.1.1 This section presents the results of the traffic modelling of the five identified junctions presented both with/without development in place for both morning and evening peaks, for each phase of the development as it becomes occupied. The current year (2022) results are based on traffic surveys completed on 5th April 2022 and are representative of how each junction currently operates during peak periods. The complete results sheets of the generated models are provided as an appendix (Appendix A).
- 9.1.2 Of the five identified junctions, the junctions identified as 1,4, and 5, are priority T-junctions with the remaining two, identified as junctions 2 and 3, being signalised. Traffic Signal controlled junctions are analysed using LinSig Version 3.3 and priority-controlled junctions are analysed using Junctions 9 Software (PICADY).
- 9.1.3 The Junctions 9: PICADY modelling software produces an RFC % (Ratio of Flow to Capacity), a Delay figure measured in seconds and a LOS (Level of Service) which are used to compare the effects the development will have on the junction being modelled. An RFC of 85% on a roundabout junction implies that the junction has reached capacity but is still operational with delay incurred. The following table describes the different LOS and the implications for the junction being assessed.

Level of Service A	Free-Flow
Level of Service B	Reasonably Free-Flow (no delay incurred)
Level of Service C	Stable Operation (busy but operational with acceptable delay incurred)
Level of Service D	Borderline Unstable (Junctions reaching capacity – but still operational-delay incurred)
Level of Service E	Extremely Unstable (Junctions at capacity or over, any incident will cause a grid-lock situation- significant delay incurred)
Level of Service F	Breakdown (Junctions over capacity, unacceptable delay traffic at a standstill)

Table 9.1 Level of Service

- 9.1.4 The LinSig modelling software produces a PRC % (Practical Reserve Capacity) and a Delay figure which are used to compare the effects the development will have on the junction being modelled. A PRC of 10% implies that the junction has reached capacity but is still operational with delay incurred. The delay figure produced (pcuHr) is a measure of the overall delay incurred on all arms of the junction and is based on the Demand Flow per arm multiplied by the Average Delay per PCU.

9.2 Junction 1: Access Road junction with Old Whitechurch Road

- 9.2.1 The Junctions 9: PICADY results for the junction both with/without development are presented in **Table 9.2** below.
- 9.2.2 The results indicate that the junction currently operates within capacity for both AM & PM peak at a Level of Service A – Free Flow. For the purposes of modelling the “Without Development” future year scenarios, it is assumed that no traffic will travel via the existing minor road which would serve as the development access road when the development is occupied.

Table 9.2: Junction 1 – PICADY Results

- 9.2.3 Future year results, with the development traffic included, show an increasing RFC% (Ratio of Glow to Capacity) as the different phases are introduced. A maximum AM and PM RFC% result, of 36% and 24% respectively, is shown in 2025 when all three phases of the development are added. The RFC% can be seen to decrease in the future year scenarios 2030 and 2040 as traffic is siphoned away from this junction and onto the Kilbarry Enterprise Centre Rd./ Upper Dublin Hill (Junction 4). The junction operates with a Level of Service A – Free Flow for all modelled scenarios.

9.3 Junction 2: Old Whitechurch Rd./ Old Mallow Rd.

- 9.3.1 The LinSig results for Junction 2 with and without development traffic are presented in **Table 9.3** below.
- 9.3.2 The results indicate that the junction will operate within capacity during both AM & PM peak for all future years both with and without development traffic.

Junction 2: Old Whitechurch Rd./ Old Mallow Rd.		No Development			With Development		
		Cycle Time (s)	PRC (%)	Delay (pcu/hr)	Cycle Time (s)	PRC (%)	Delay (pcu/hr)

Table 9.3: Junction 2 – LinSig Results

9.4 Junction 3: Redforge Rd./ Dublin Hill

- 9.4.1 The LinSig results for Junction 3 both with and without development traffic are presented in **Table 9.4** below.
- 9.4.2 The results indicate that the junction will reach capacity in 2025 during the PM peak with no additional development traffic applied. When development traffic is included, the junction instead reaches capacity in 2024 during the PM Peak and is shown to exceed capacity during the PM Peak in 2025. The junction can be seen to continue degrading and exceeds capacity both with and without development traffic for the design years 2030 and 2040.

Table 9.4 Junction 3: LinSig results

9.5 Junction 4: Kilbarry Enterprise Centre Rd./ Upper Dublin Hill

- 9.5.1 The PICADY results for Junction 4 both with and without development traffic are presented in **Table 9.5** below.

- 9.5.2 The results indicate that the junction currently operates within capacity for both AM & PM peak at a Level of Service A – Free Flow.
- 9.5.3 Future year results, with and without the development traffic included, show a gradual increase in RFC% (Ratio of Glow to Capacity) up to design year 2040. Design years 2030 & 2040 include a portion of the development traffic accessing Upper Dublin Hill via the Kilbarry Enterprise Centre Rd. link. It is not anticipated that the connection between the Development Distributor Road and the Kilbarry Enterprise Centre Rd. will be open for the modelled scenario year 2025. In accordance, a maximum AM and PM RFC% result, of 34% and 20% respectively, is shown in 2030. The reduction in the RFC% in 2040 is the result of anticipated modal shift to more sustainable modes of travel upon the completion of the Northern Distributor Road and improved available public travel facilities prior to 2040. The junction is shown to operate with a Level of Service A – Free Flow for all modelled scenarios.

Table 9.5 Junction 4: PICADY results**9.6 Junction 5: Upper Dublin Hill/ Lower Dublin Hill**

- 9.6.1 The PICADY results for Junction 5 both with and without development traffic are presented in **Table 9.6** below.

9.6.2 The results indicate that the junction currently operates within capacity for both AM & PM peak at a Level of Service A – Free Flow.

9.6.3 Future year results, with and without the development traffic included, show a gradual increase in RFC% (Ratio of Glow to Capacity) up to design year 2040. The junction is shown to operate, both with and without development traffic, with a Level of Service B – Reasonably Free Flow (no delay incurred) in design year 2030, and a Level of Service C - Stable Operation (busy but operational with acceptable delay incurred) in design year 2040.

Table 9.6 Junction 5: PICADY results

9.7 TRAFFIC MODELLING CONCLUSIONS

9.7.1 The traffic modelling results show that, with and without development traffic, the junctions 1, 2, 4, and 5 operate within capacity up to and including the design year 2040.

9.7.2 Analysis of Junction 3: Redforge Rd./ Dublin Hill shows that the junction will reach capacity in 2025 without the introduction of the proposed development traffic. With development traffic included, the junction reaches capacity in 2024.

A LinSig traffic model of the junction was constructed both with/without development traffic which shows what impact an extended cycle time would have on the junction capacity. Table 9.7 shows the results of this change.

Junction 3: Redforge Rd./ Dublin St.		No Development			With Development		
		Cycle Time (s)	PRC (%)	Delay (pcu/hr)	Cycle Time (s)	PRC (%)	Delay (pcu/hr)
2022	AM	110	51.7	13.75	110	N/A	N/A
	PM	110	25.6	14.83	110	N/A	N/A
2023	AM	110	48.1	14.04	110	40.9	14.98

2040	AM	110	14.4	20.74	110	11.0	22.97
	PM	110	-7.1	38.30	110	-13.7	59.85

Table 9.7 Junction 3: LinSig results with Cycle Time of 110 seconds

The increase in cycle time from 90 seconds to 110 seconds is shown to improve the capacity of the junction when compared to the previous results.

The results in both tables 9.4 & 9.7 represent a very conservative and robust analysis of the junction. In reality, an increased modal shift in the area away from the private car and the completion of the Northern Distributor Road, give a strong reason to believe that a reduction in traffic volumes throughout the local road network is likely. For the purposes of producing a robust analysis, it was deemed appropriate to include the full traffic volumes in the analysis while understanding that the true future scenario would be much improved.

The combination of an increased cycle time, the continued modal shift towards national targets, and regional traffic utilising the future Northern Distributor Road will result in an increase in available capacity at the Redforge Rd./Dublin Hill junction in future year scenarios.

10.0 CUMULATIVE IMPACT

- 10.1.1 As outlined in **Section 7.0** of this report, industry standard growth rates have been applied to background traffic for future year assessments (to account for further development within the area). These growth rates make allowance for modal shift targets as set by national policy but do not take account of site-specific measures that may be implemented to mitigate against traffic generation from a particular development. In this instance the development of strategic transport corridors in-line with CMATS and Bus Connects. An increase in modal shift from the recorded 19% level to 40% has been applied to development traffic in design year 2040. It was deemed inappropriate to apply this increase to prior year scenarios. The 40% figure falls short of the national target of 45% implying that the analysis presented is robust.
- 10.1.2 Per the Cork Metropolitan Area Transport Strategy (CMATS), future road infrastructural projects such as the Northern Distributor Road and the Outer Ring Road will have a fundamental effect on traffic in this area. In addition, CMATS proposes the development of the Kilbarry Train Station which will provide a direct link to the city centre and to further afield. At present there is no direct path for local traffic to bypass the Blackpool retail area if wishing to access the N20. This results in high traffic volumes in the area, especially during the PM Peak. With the delivery of these road schemes, traffic volumes in the area can be expected to fall dramatically.

11.0 ROAD SAFETY

11.1.1 Existing Road Network Safety

Old Whitechurch Road to the west of the development site operates at a 50kph speed limit and comprises a wide 6.0m carriageway with a footpath along its western edge. Traffic calming measures in the form of a speed bump are present to the south of the exiting access road to the development site. There are no cycle lane facilities along of road.

Figure 11.1: Existing Speed Bump present on Old Whitechurch Road in close proximity to site access

To the east of the development site, a future connection is proposed to the existing Kilbarry Enterprise Centre Road. This road which serves as the access road to the Delaney's GAA ground, comprises a 6.0m wide carriageway with a footpath along its northern edge for its full length. The width of the existing footpath is exceedingly narrow over long stretches. Pedestrians attempting to cross Upper Dublin Hill and join the wider footpath network do not presently have access to a formalised pedestrian crossing with appropriate dropped kerbing.

11.1.2 Road Collision Database

At the time of undertaking this Traffic and Transport Assessment, the RSA Road Collision Statistics were not available in the vicinity of the development.

11.1.3 Proposed Road Safety Mitigation Measures

The proposed development will include a number of measures that are deemed necessary to improve road safety in the area. Internally within the scheme, raised junctions, colour contrasted surfaces, and minimal junction radii will create a low-speed regime where pedestrians will have the priority.

External to the site, public realm improvement works to include new footpath and the provision of pedestrian crossings at both the Old Whitechurch Road and Upper Dublin Hill junctions are proposed. The full extent of works proposed are detailed in the submitted planning drawings.

12.0 ENVIRONMENTAL IMPACT

- 12.1 The proposed development has been designed in accordance with the principles of DMURS (Design Manual for Urban Roads and Streets) with all internal roads having a gradient of not greater than 5% and good pedestrian connectivity throughout.
- 12.2 Proposed infrastructure improvements to the wider road network will put the development site in close proximity to public transport facilities. These infrastructure improvements include the proposed Northern Distributor Road which is preliminarily planned for completion in 2031 (per CMATS). The result of these infrastructure improvements should result in the scheme moving closer to the target modal split as set out by Government (45%).
- 12.3 The construction stage of the scheme proposes to re-use / relocate excavation material within the site where possible. This will result in a significant reduction in construction traffic generated to and from the site. There is a requirement for the exportation of excavated material over and above what can be re-used on-site. The exportation of materials will be carried out in accordance with the developed Construction Environmental Management Plan (CEMP) so as to minimise the impact the construction phase of the development will have on the existing roads network.

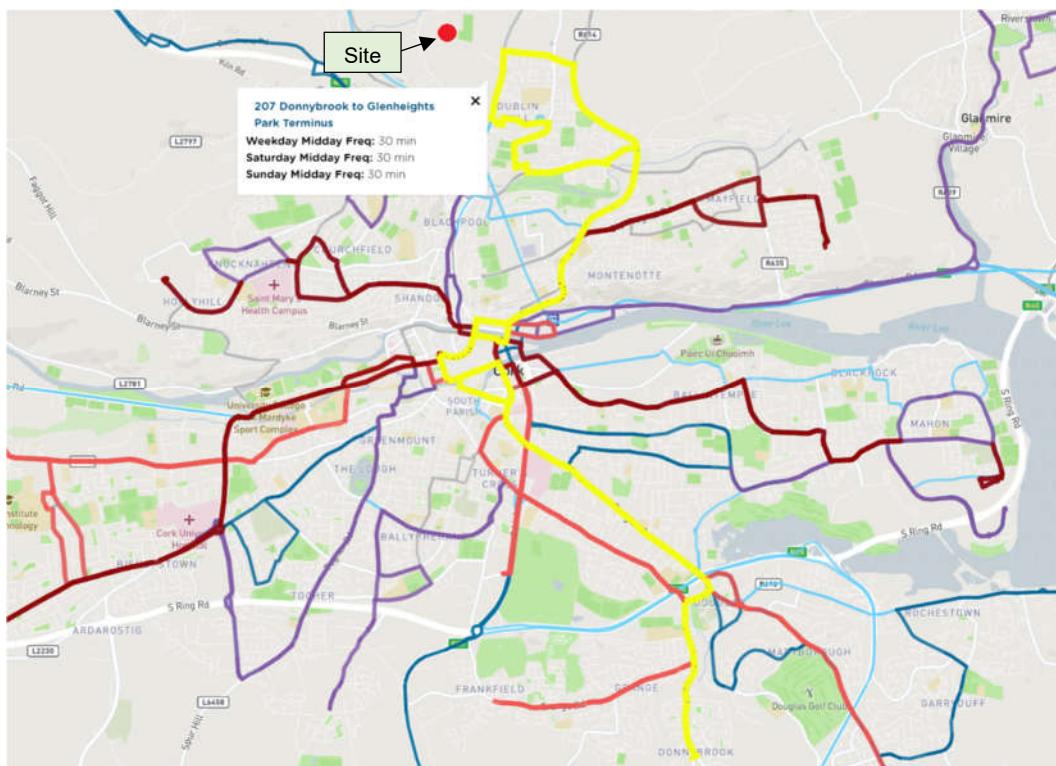

13.0 INTERNAL LAYOUT & PARKING PROVISION

- 13.1 **Figure 4.1.2** presents the proposed layout which includes the provision of on street and own curtilage parking, shared cycle/footpaths, pedestrian/cycle permeability throughout the site on designated off-road routes, and raised shared surfaces serving as speed control measures.
- 13.2 A total of 534 no. car parking spaces and 12 no. motorbike spaces are proposed for the proposed development, which are allocated on the basis of housing type and likely demands of future residents. The proposed parking provision is in accordance with the Development Plan minimum standard of 2 spaces per house and 1 space per apartment.
- 13.3 The development includes 124 no. bicycle parking spaces, provided as internal bike storage areas in each of the 3 apartments Blocks E, F and G, covered bike storage for the 4 duplex blocks, and additional bike storage at the crèche.

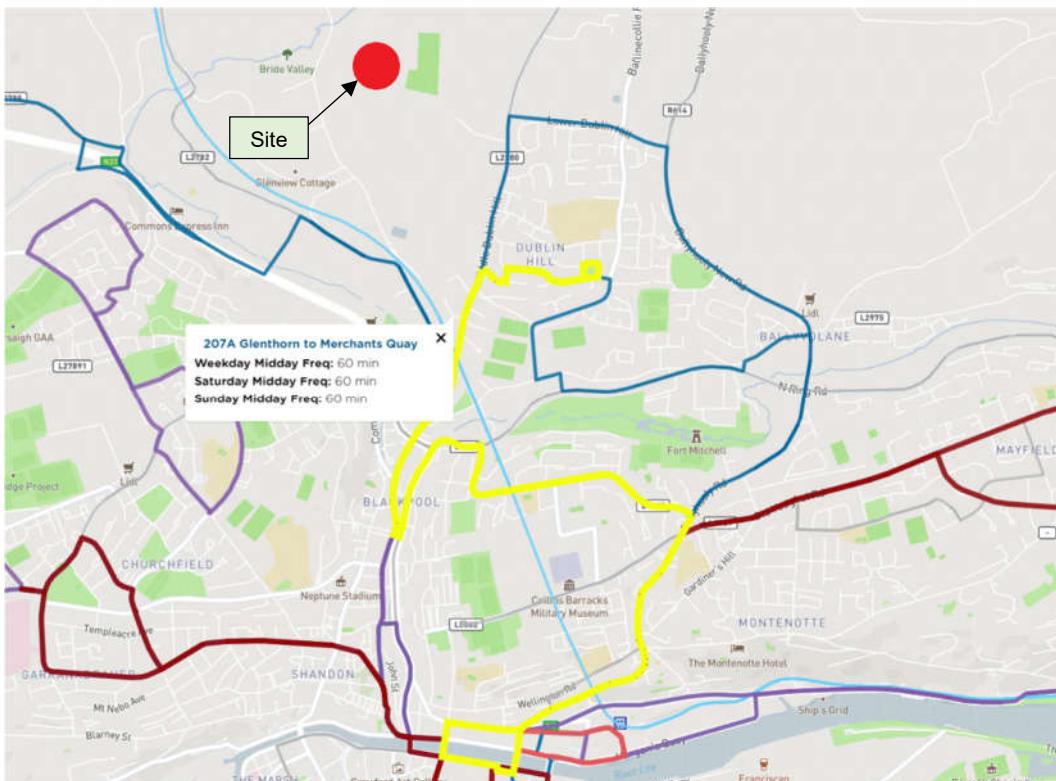

14.0 PUBLIC TRANSPORT

- 14.1 The proposed scheme is in close proximity to a number of high frequency bus services. The following figures are taken from the BusConnects online network map and indicate the bus services presently available via bus stops located within 15-min walking distance of the development lands.

The 207 Donnybrook to Glenheights bus route which operates 7 days a week running a 30min service, serves Donnybrook, Douglas, Ballyvolane, and Cork City Centre.

**Figure 14.1: 207 Service – Donnybrook to Glenheights**

The 207A Glenthorn to Merchants Quay bus route operates 7 days a week running a 60min service travelling via Blackpool and Glen Ave.'

**Figure 14.2: 207A Service – Glenthorn to Merchants Quay**

The 215-bus service runs a 30min service and serves Blarney, Cork City Centre and Mahon Point. This service runs 7 days a week.

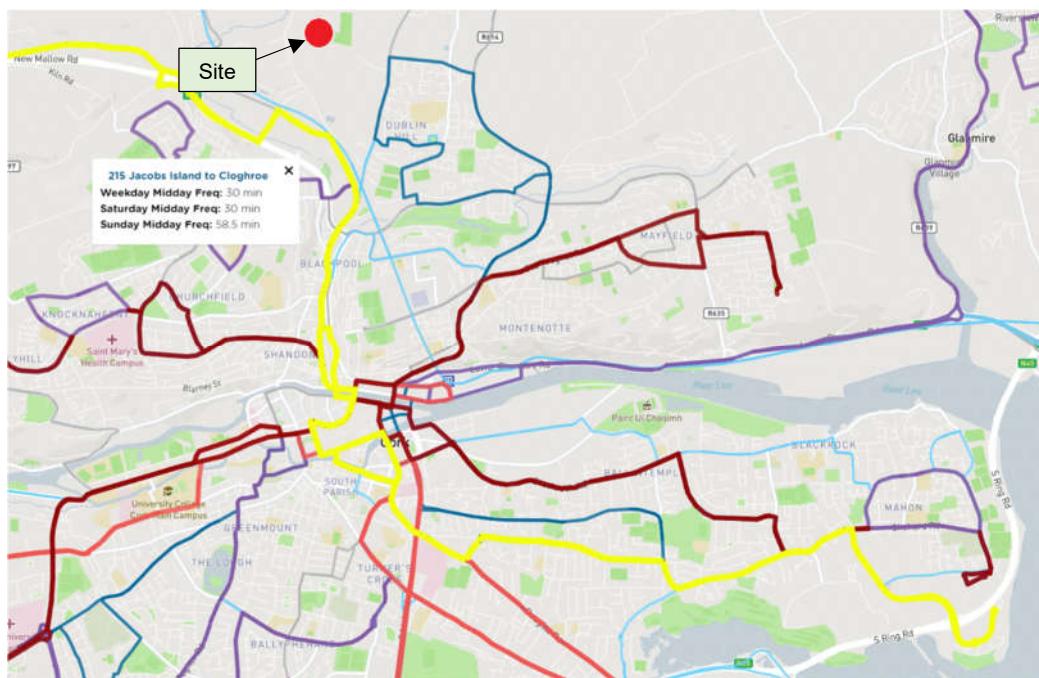

Figure 14.3: 215 Service – Jacobs Island to Cloghroe

Within 25-min walk from the development, the 203 Manor Farm to Fairhill bus route operates a 20min service Monday to Saturday and a 30min service on Sundays.

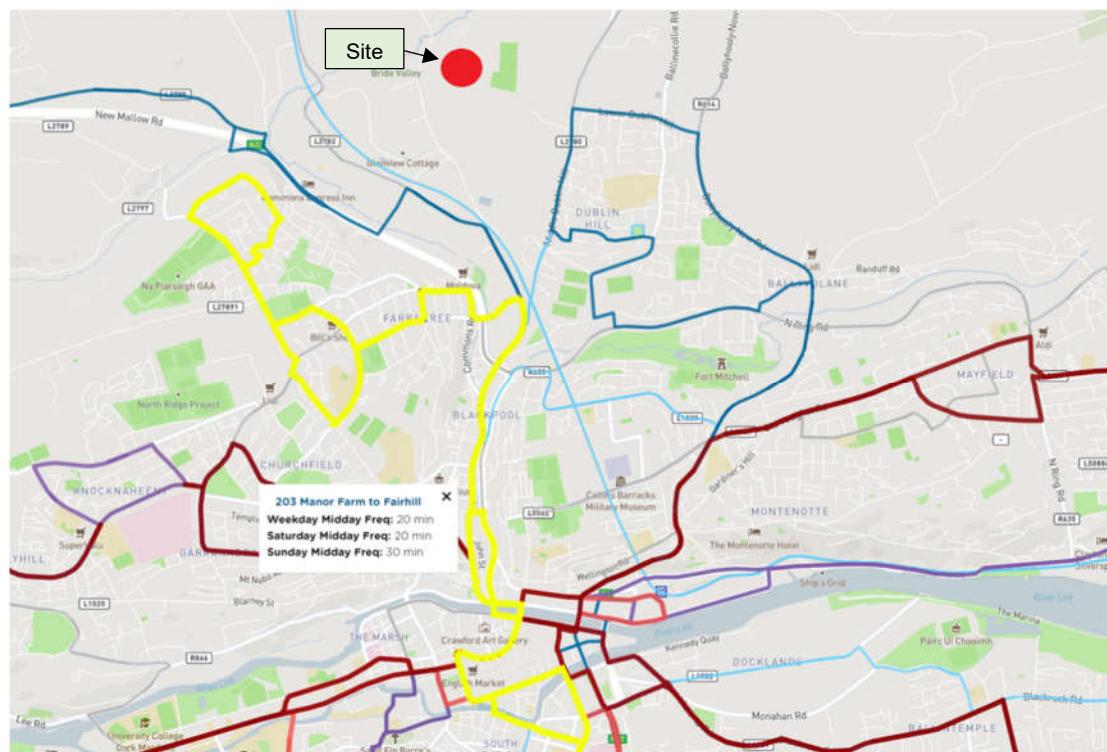

Figure 14.4: 203 Service – Manor Farm to Fairhill

- 14.2 The following image, taken from the BusConnects website, highlights (in grey) the 60-min travel time from the development site utilising the existing BusConnects network.

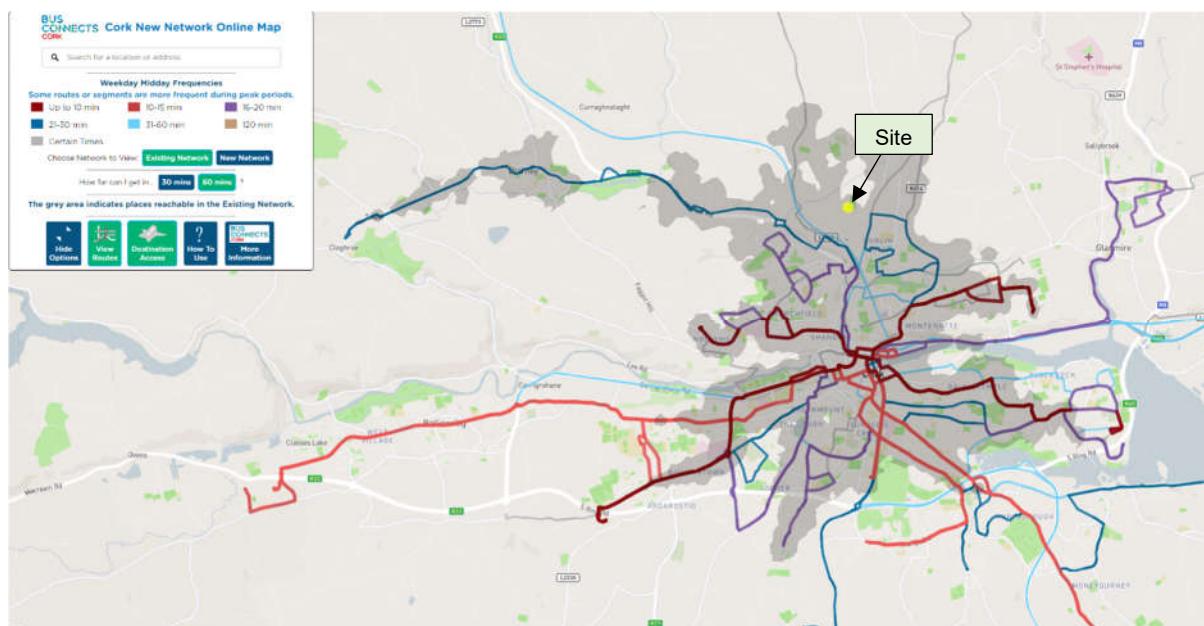

Figure 14.5: BusConnects existing network – 60 mins travel area

- 14.3 The following isochrone map shows the areas currently accessible by public transport based on time of travel from the site.

Note: The distances include transfers to different services so are indicative only (delay may be experienced during transfer)

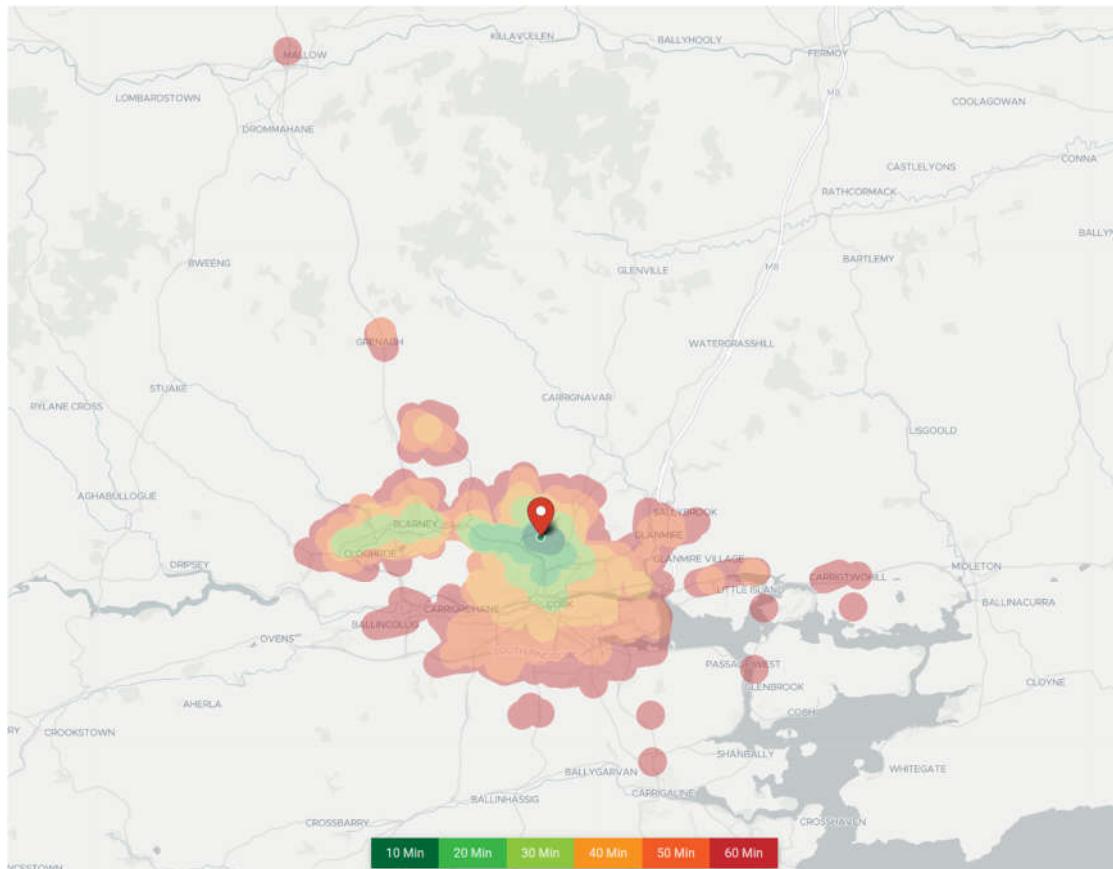

Figure 14.6: Time of travel by Public Transport Options

It is evident from **Figure 14.6** that current public transport provision in the area allows travel to a wide area within 60 mins, with many of the main employment centres being within the 30 mins range.

A commute time by public transport in excess of 45 mins results in a change in behavioural preference away from public transport. It can be concluded that the proposed development site by its location will encourage the use of public transport in-line with national policy.

- 14.4 The aforementioned travel times will significantly improve as a result of CMATS which will introduce high frequency orbital bus services upon completion of the Northern Distributor Road. Access to these bus services will be in close proximity to the proposed development.
- 14.5 As noted previously in Section 3.5, the Cork Metropolitan Area Transport Strategy 2040 (CMATS) proposes significant improvements to the public transport facilities over and above what is currently available. With the provision of these facilities and other incentives as part of national policy, it is anticipated that a greater shift to public transport will occur during the operational phase of this scheme. CMATS has provided more certainty for the delivery of these enhancements

15.0 ACCESSIBILITY AND INTEGRATION

- 15.1 A desktop assessment of the existing permeability for cyclists and pedestrians from the site was carried out. Presented in the following isochrone maps are the range of distances, for both pedestrians and cyclists, based on travel time. Pedestrians have the benefit of footpaths, but cyclists are required to use the existing regional roads and share with other vehicles.

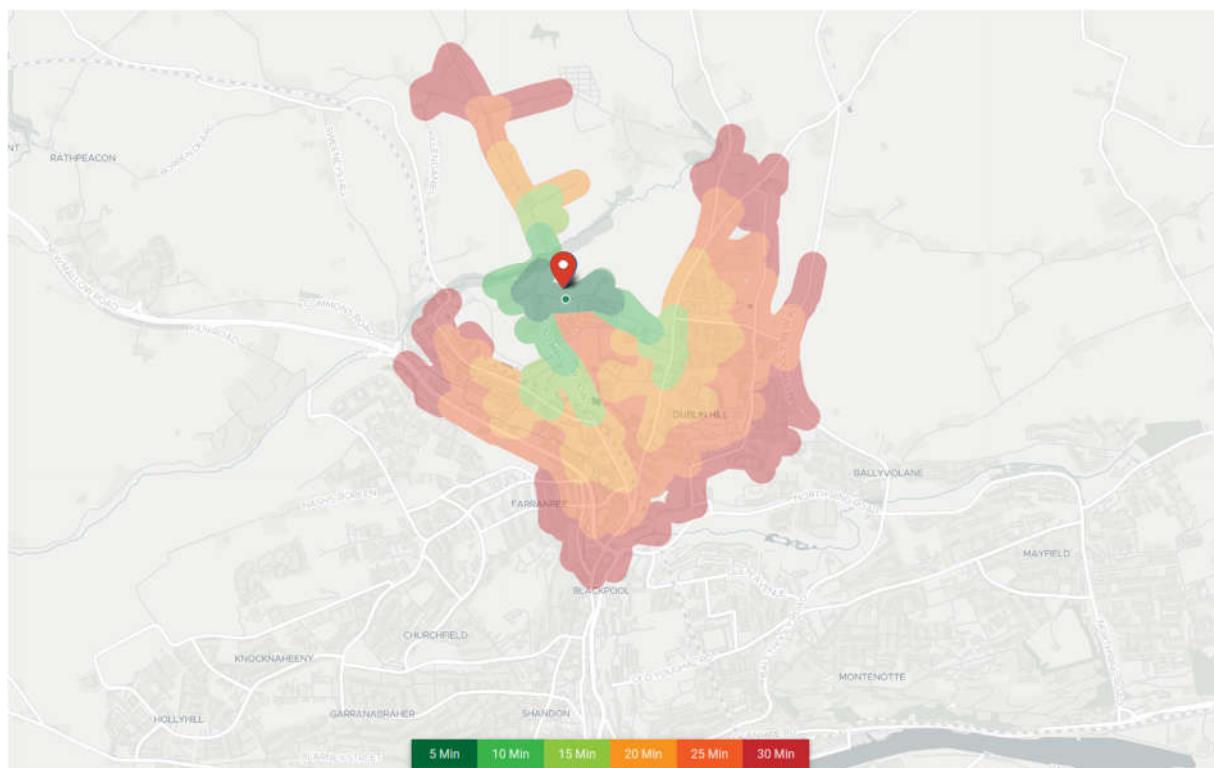

Figure 15.1: Proposed Development: Walking distance to local area

- 15.2 Within 5 mins walk time from the site:
 - Delany's GAA

Within 20 mins walk time from the site:

- St. Aidan's Community College
- Aldi Blackpool
- Woodies Blackpool
- SouthDoc Blackpool
- Planet Entertainment Centre

- Planet Health Club

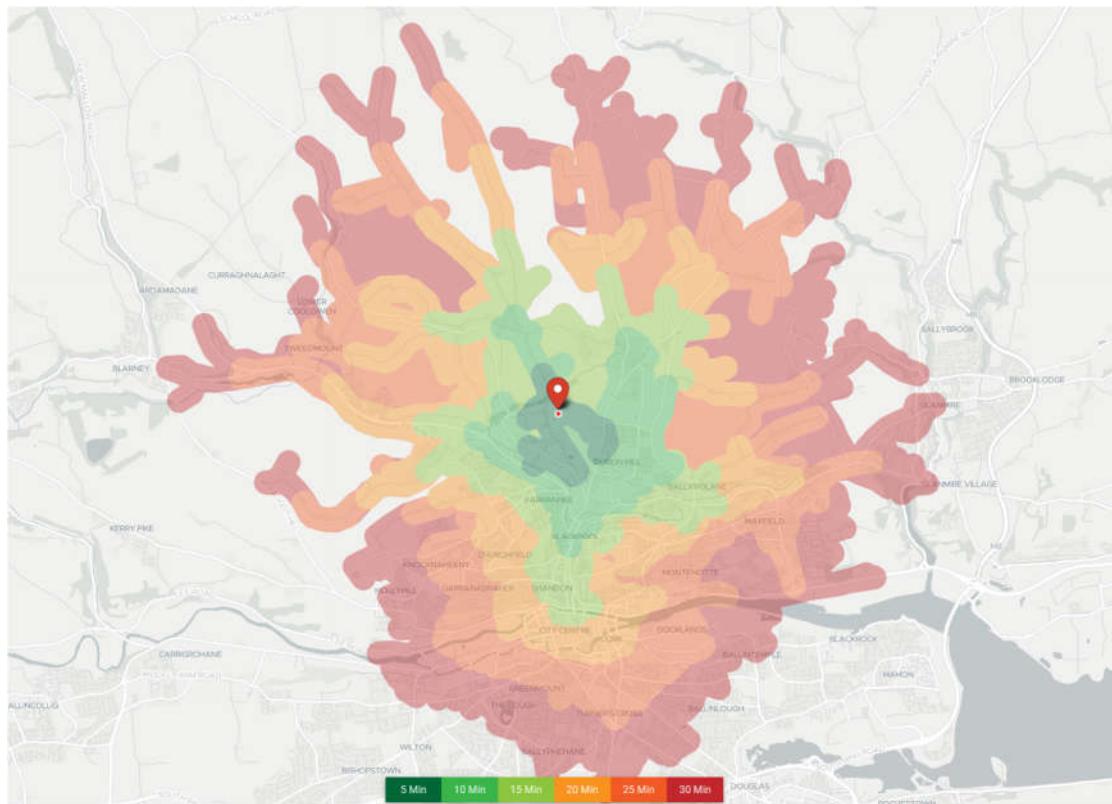

Figure 15.2: Proposed Development: Cycle distance to local area

- 15.3 The cycle range is presented in similar terms and relates to the average distance travelled in a specific time (16-19 kmh). Cork City Centre falls within the 20 min category based on unrestricted flow through junctions.

Note: The travel speed used is on the low side, an experienced cyclist would have a 26-30kph average speed, however the speed used is more reflective of the topography in and around the site lands.

16.0 ACCESS FOR PEOPLE WITH DISABILITIES

- 16.1 The internal layout of the development is designed to accommodate all road users and will adhere to national guidelines regarding people with disabilities. Proposed works to the public realm in the vicinity of the site will benefit all road users encouraging walking and cycling as well as the use of public transport. All pedestrian crossings as well as footpath/cycle lane crossings will include the appropriate tactile paving in accordance with the design guidelines for use of tactile paving.

17.0 MOBILITY MANAGEMENT PLAN (SUSTAINABLE ACCESS STRATEGY)

- 17.1 A separate complete Mobility Management Plan for the proposed development has been included as part of this planning application package.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

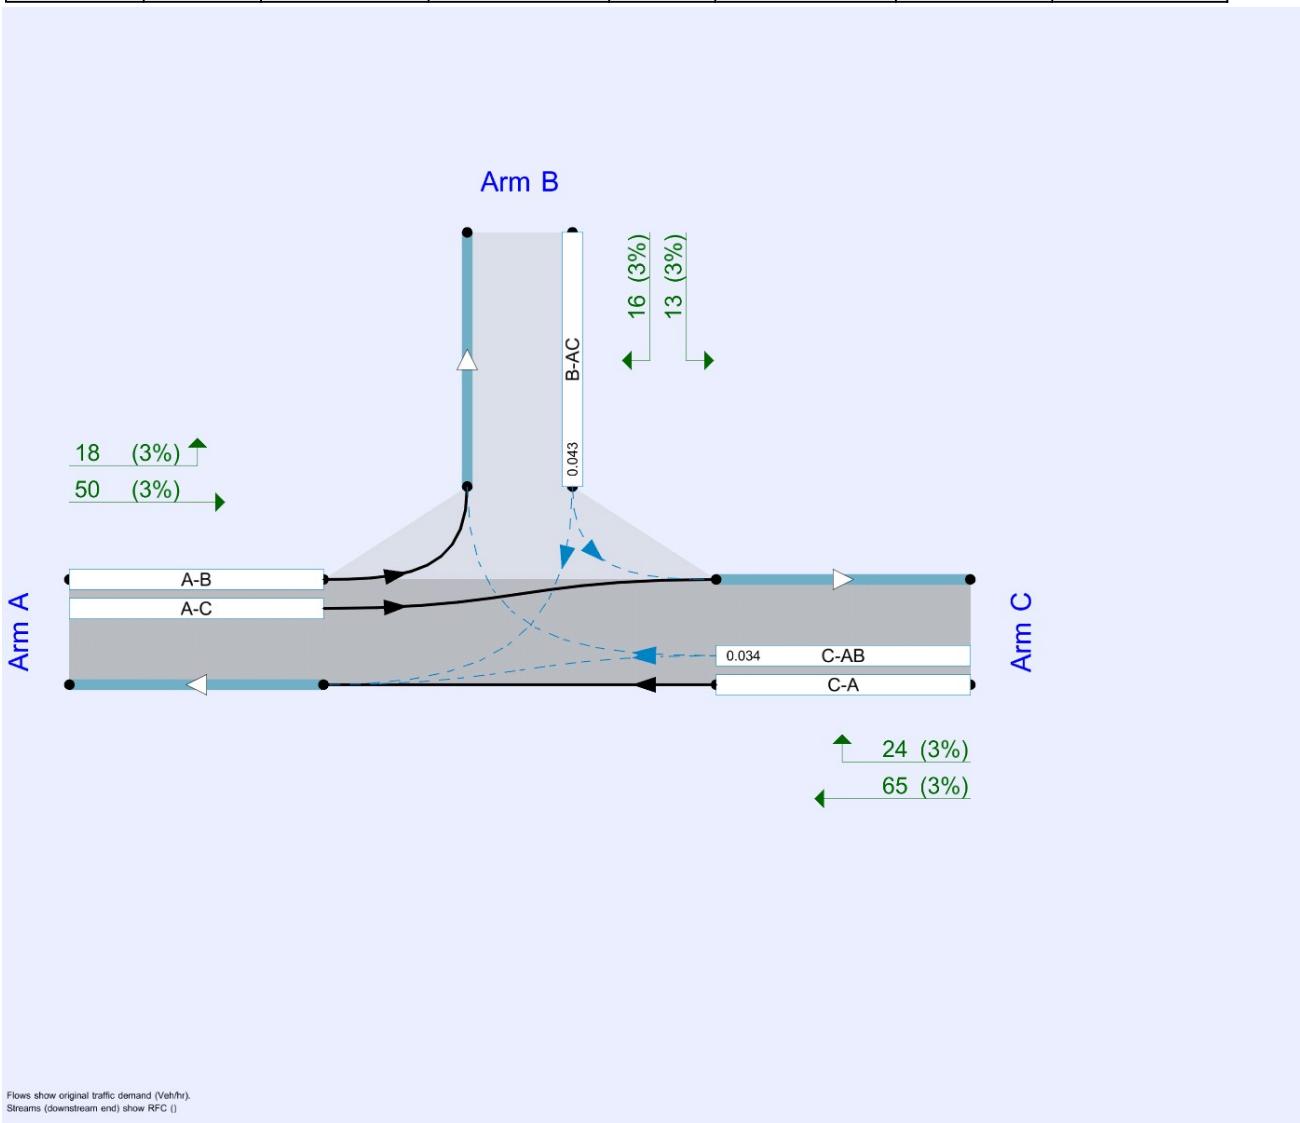

File summary

File Description

Analysis Set Details

ID	Network flow scaling factor (%)
A1	100.000

2022, AM

Data Errors and Warnings

No errors or warnings

Junction Network

Junctions

Junction	Name	Junction type	Major road direction	Use circulating lanes	Junction Delay (s)	Junction LOS
1	T-Junction Existing Access Road	T-Junction	Two-way		0.00	A

Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	900	

Arms

Arms

Arm	Name	Description	Arm type
A	Old Whitechurch Road (N)		Major
B	Existing Access Road		Minor
C	Old Whitechurch Road (S)		Major

Major Arm Geometry

Arm	Width of carriageway (m)	Has kerbed central reserve	Has right turn bay	Visibility for right turn (m)	Blocks?	Blocking queue (PCU)
C	6.00			0.0	✓	0.00

Geometries for Arm C are measured opposite Arm B. Geometries for Arm A (if relevant) are measured opposite Arm D.

Minor Arm Geometry

Arm	Minor arm type	Lane width (m)	Visibility to left (m)	Visibility to right (m)
B	One lane	2.50	70	35

Slope / Intercept / Capacity

Priority Intersection Slopes and Intercepts

Stream	Intercept (Veh/hr)	Slope for A-B	Slope for A-C	Slope for C-A	Slope for C-B
B-A	492	0.090	0.226	0.142	0.323
B-C	614	0.094	0.238	-	-
C-B	574	0.222	0.222	-	-

The slopes and intercepts shown above do NOT include any corrections or adjustments.

Streams may be combined, in which case capacity will be adjusted.

Values are shown for the first time segment only; they may differ for subsequent time segments.

Traffic Demand

Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

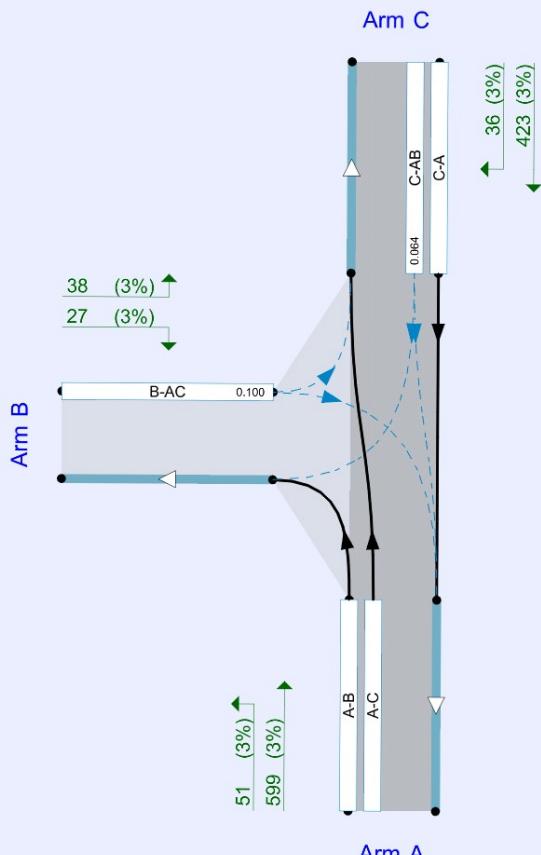

File summary

Description	

Units

Distance units	Speed units	Traffic units input	Traffic units results	Flow units	Average delay units	Total delay units	Rate of delay units
m	kph	Veh	Veh	perHour	s	-Min	perMin

Flows show original traffic demand (Veh/hr).
Streams (downstream end) show RFC ()

The junction diagram reflects the last run of Junctions.

Analysis Options

Calculate Queue Percentiles	Calculate residual capacity	Residual capacity criteria type	RFC Threshold	Average Delay threshold (s)	Queue threshold (PCU)
	✓	Delay	0.85	36.00	20.00

Data Errors and Warnings

No errors or warnings

Junction Network

Junctions

Junction	Name	Junction type	Major road direction	Use circulating lanes	Junction Delay (s)	Junction LOS
4	Kilbarry Enterprise Centre/ Upper Dublin Hill	T-Junction	Two-way		0.15	A

Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	136	Stream C-AB

Arms

Arms

Arm	Name	Description	Arm type
A	Upper Dublin Hill (S)		Major
B	Kilbarry Enterprise Centre		Minor
C	Upper Dublin Hill (S)		Major

Major Arm Geometry

Arm	Width of carriageway (m)	Has kerbed central reserve	Has right turn bay	Visibility for right turn (m)	Blocks?	Blocking queue (PCU)
C	9.00			121.0	✓	0.00

Geometries for Arm C are measured opposite Arm B. Geometries for Arm A (if relevant) are measured opposite Arm D.

Minor Arm Geometry

Arm	Minor arm type	Lane width (m)	Visibility to left (m)	Visibility to right (m)
B	One lane	3.50	100	90

Slope / Intercept / Capacity

Priority Intersection Slopes and Intercepts

Stream	Intercept (Veh/hr)	Slope for A-B	Slope for A-C	Slope for C-A	Slope for C-B
B-A	583	0.092	0.234	0.147	0.334
B-C	715	0.095	0.241	-	-
C-B	644	0.217	0.217	-	-

The slopes and intercepts shown above do NOT include any corrections or adjustments.

Streams may be combined, in which case capacity will be adjusted.

Values are shown for the first time segment only; they may differ for subsequent time segments.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

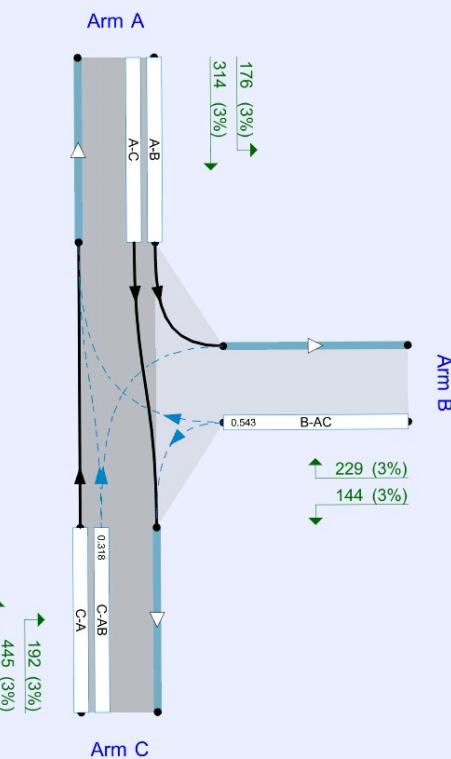

File summary

Description	

Units

Distance units	Speed units	Traffic units input	Traffic units results	Flow units	Average delay units	Total delay units	Rate of delay units
m	kph	Veh	Veh	perHour	s	-Min	perMin

Flows show original traffic demand (Veh/hr).
Streams (downstream end) show RFC ()

The junction diagram reflects the last run of Junctions.

Analysis Options

Calculate Queue Percentiles	Calculate residual capacity	Residual capacity criteria type	RFC Threshold	Average Delay threshold (s)	Queue threshold (PCU)
	✓	Delay	0.85	36.00	20.00

Data Errors and Warnings

No errors or warnings

Junction Network

Junctions

Junction	Name	Junction type	Major road direction	Use circulating lanes	Junction Delay (s)	Junction LOS
5	Upper Dublin Hill/ Lower Dublin Hill	T-Junction	Two-way		5.85	A

Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	12	Stream B-AC

Arms

Arms

Arm	Name	Description	Arm type
A	Upper Dublin Hill (N)		Major
B	Lower Dublin Hill		Minor
C	Upper Dublin Hill (S)		Major

Major Arm Geometry

Arm	Width of carriageway (m)	Has kerbed central reserve	Has right turn bay	Visibility for right turn (m)	Blocks?	Blocking queue (PCU)
C	9.00			155.0	✓	0.00

Geometries for Arm C are measured opposite Arm B. Geometries for Arm A (if relevant) are measured opposite Arm D.

Minor Arm Geometry

Arm	Minor arm type	Lane width (m)	Visibility to left (m)	Visibility to right (m)
B	One lane	4.00	110	150

Slope / Intercept / Capacity

Priority Intersection Slopes and Intercepts

Stream	Intercept (Veh/hr)	Slope for A-B	Slope for A-C	Slope for C-A	Slope for C-B
B-A	649	0.103	0.260	0.163	0.371
B-C	790	0.105	0.266	-	-
C-B	664	0.224	0.224	-	-

The slopes and intercepts shown above do NOT include any corrections or adjustments.

Streams may be combined, in which case capacity will be adjusted.

Values are shown for the first time segment only; they may differ for subsequent time segments.

Traffic Demand

APPENDIX C: TRICS

TRIP RATE CALCULATION SELECTION PARAMETERS:

Land Use : 03 - RESIDENTIAL
 Category : A - HOUSES PRIVATELY OWNED

TOTAL VEHICLESSelected regions and areas:

13 MUNSTER		
TI	TIPPERARY	1 days
WA	WATERFORD	1 days
14 LEINSTER		
CC	CARLOW	1 days
LU	LOUTH	1 days
WC	WICKLOW	2 days
WX	WEXFORD	1 days
15 GREATER DUBLIN		
DL	DUBLIN	1 days
16 ULSTER (REPUBLIC OF IRELAND)		
CV	CAVAN	2 days
DN	DONEGAL	6 days
MG	MONAGHAN	2 days
17 ULSTER (NORTHERN IRELAND)		
AN	ANTRIM	1 days
TY	TYRONE	1 days

This section displays the number of survey days per TRICS® sub-region in the selected set

Primary Filtering selection:

This data displays the chosen trip rate parameter and its selected range. Only sites that fall within the parameter range are included in the trip rate calculation.

Parameter: No of Dwellings
 Actual Range: 6 to 280 (units:)
 Range Selected by User: 4 to 437 (units:)

Parking Spaces Range: All Surveys Included

Parking Spaces per Dwelling Range: All Surveys Included

Bedrooms per Dwelling Range: All Surveys Included

Percentage of dwellings privately owned: All Surveys Included

Public Transport Provision:

Selection by: Include all surveys

Date Range: 01/01/14 to 12/10/21

This data displays the range of survey dates selected. Only surveys that were conducted within this date range are included in the trip rate calculation.

Selected survey days:

Monday	5 days
Tuesday	4 days
Wednesday	7 days
Thursday	3 days
Friday	1 days

This data displays the number of selected surveys by day of the week.

Selected survey types:

Manual count	20 days
Directional ATC Count	0 days

This data displays the number of manual classified surveys and the number of unclassified ATC surveys, the total adding up to the overall number of surveys in the selected set. Manual surveys are undertaken using staff, whilst ATC surveys are undertaking using machines.

Selected Locations:

Edge of Town Centre	3
Suburban Area (PPS6 Out of Centre)	4
Edge of Town	12
Neighbourhood Centre (PPS6 Local Centre)	1

This data displays the number of surveys per main location category within the selected set. The main location categories consist of Free Standing, Edge of Town, Suburban Area, Neighbourhood Centre, Edge of Town Centre, Town Centre and Not Known.

Selected Location Sub Categories:

Industrial Zone	1
Residential Zone	13
Out of Town	1
No Sub Category	5

This data displays the number of surveys per location sub-category within the selected set. The location sub-categories consist of Commercial Zone, Industrial Zone, Development Zone, Residential Zone, Retail Zone, Built-Up Zone, Village, Out of Town, High Street and No Sub Category.

Secondary Filtering selection:

Use Class:

C3	20 days
----	---------

This data displays the number of surveys per Use Class classification within the selected set. The Use Classes Order 2005 has been used for this purpose, which can be found within the Library module of TRICS®.

Population within 500m Range:

All Surveys Included

Population within 1 mile:

1,000 or Less	1 days
1,001 to 5,000	5 days
5,001 to 10,000	8 days
10,001 to 15,000	5 days
15,001 to 20,000	1 days

This data displays the number of selected surveys within stated 1-mile radii of population.

Population within 5 miles:

5,000 or Less	1 days
5,001 to 25,000	11 days
25,001 to 50,000	4 days
50,001 to 75,000	4 days

This data displays the number of selected surveys within stated 5-mile radii of population.

Car ownership within 5 miles:

0.6 to 1.0	5 days
1.1 to 1.5	10 days
1.6 to 2.0	5 days

This data displays the number of selected surveys within stated ranges of average cars owned per residential dwelling, within a radius of 5-miles of selected survey sites.

Travel Plan:

No	20 days
----	---------

This data displays the number of surveys within the selected set that were undertaken at sites with Travel Plans in place, and the number of surveys that were undertaken at sites without Travel Plans.

PTAL Rating:

No PTAL Present	20 days
-----------------	---------

This data displays the number of selected surveys with PTAL Ratings.

Covid-19 Restrictions	Yes	At least one survey within the selected data set was undertaken at a time of Covid-19 restrictions
-----------------------	-----	--

			<i>Survey Type: MANUAL</i>

This section provides a list of all survey sites and days in the selected set. For each individual survey site, it displays a unique site reference code and site address, the selected trip rate calculation parameter and its value, the day of the week and date of each survey, and whether the survey was a manual classified count or an ATC count.

TRIP RATE for Land Use 03 - RESIDENTIAL/A - HOUSES PRIVATELY OWNED

18:00 - 19:00	20	75	0.373	20	75	0.292	20	75	0.665
Total Rates:		3.246			3.398				6.644

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP*FACT. Trip rates are then rounded to 3 decimal places.

The survey data, graphs and all associated supporting information, contained within the TRICS Database are published by TRICS Consortium Limited ("the Company") and the Company claims copyright and database rights in this published work. The Company authorises those who possess a current TRICS licence to access the TRICS Database and copy the data contained within the TRICS Database for the licence holders' use only. Parameter summary

Trip rate parameter range selected:	6 - 280 (units:)
Survey date date range:	01/01/14 - 12/10/21
Number of weekdays (Monday-Friday):	20
Number of Saturdays:	0
Number of Sundays:	0
Surveys automatically removed from selection:	0
Surveys manually removed from selection:	0

This section displays a quick summary of some of the data filtering selections made by the TRICS® user. The trip rate calculation parameter range of all selected surveys is displayed first, followed by the range of minimum and maximum survey dates selected by the user. Then, the total number of selected weekdays and weekend days in the selected set of surveys are shown. Finally, the number of survey days that have been manually removed from the selected set outside of the standard filtering procedure are displayed.

Calculation Reference: AUDIT-761701-220613-0637

TRIP RATE CALCULATION SELECTION PARAMETERS:

Land Use : 03 - RESIDENTIAL
Category : C - FLATS PRIVATELY OWNED

TOTAL VEHICLES

Selected regions and areas:

12 CONNAUGHT		
MA MAYO		1 days
13 MUNSTER		
WA WATERFORD		1 days
14 LEINSTER		
LU LOUTH		1 days
15 GREATER DUBLIN		
DL DUBLIN		1 days
17 ULSTER (NORTHERN IRELAND)		
AN ANTRIM		1 days

This section displays the number of survey days per TRICS® sub-region in the selected set

Primary Filtering selection:

This data displays the chosen trip rate parameter and its selected range. Only sites that fall within the parameter range are included in the trip rate calculation.

Parameter: No of Dwellings
Actual Range: 20 to 51 (units:)
Range Selected by User: 18 to 372 (units:)

Parking Spaces Range: All Surveys Included

Parking Spaces per Dwelling Range: All Surveys Included

Bedrooms per Dwelling Range: All Surveys Included

Percentage of dwellings privately owned: All Surveys Included

Public Transport Provision:

Selection by: Include all surveys

Date Range: 01/01/14 to 22/09/21

This data displays the range of survey dates selected. Only surveys that were conducted within this date range are included in the trip rate calculation.

Selected survey days:

Tuesday	2 days
Wednesday	2 days
Friday	1 days

This data displays the number of selected surveys by day of the week.

Selected survey types:

Manual count	5 days
Directional ATC Count	0 days

This data displays the number of manual classified surveys and the number of unclassified ATC surveys, the total adding up to the overall number of surveys in the selected set. Manual surveys are undertaken using staff, whilst ATC surveys are undertaking using machines.

Selected Locations:

Edge of Town Centre	1
Suburban Area (PPS6 Out of Centre)	2
Edge of Town	1
Neighbourhood Centre (PPS6 Local Centre)	1

This data displays the number of surveys per main location category within the selected set. The main location categories consist of Free Standing, Edge of Town, Suburban Area, Neighbourhood Centre, Edge of Town Centre, Town Centre and Not Known.

Selected Location Sub Categories:

Residential Zone	4
No Sub Category	1

This data displays the number of surveys per location sub-category within the selected set. The location sub-categories consist of Commercial Zone, Industrial Zone, Development Zone, Residential Zone, Retail Zone, Built-Up Zone, Village, Out of Town, High Street and No Sub Category.

Secondary Filtering selection:

Use Class:

C3	5 days
----	--------

This data displays the number of surveys per Use Class classification within the selected set. The Use Classes Order 2005 has been used for this purpose, which can be found within the Library module of TRICS®.

Population within 500m Range:

All Surveys Included

Population within 1 mile:

1,001 to 5,000	1 days
5,001 to 10,000	2 days
20,001 to 25,000	1 days
25,001 to 50,000	1 days

This data displays the number of selected surveys within stated 1-mile radii of population.

Population within 5 miles:

5,001 to 25,000	1 days
50,001 to 75,000	2 days
125,001 to 250,000	1 days
250,001 to 500,000	1 days

This data displays the number of selected surveys within stated 5-mile radii of population.

Car ownership within 5 miles:

0.6 to 1.0	1 days
1.1 to 1.5	4 days

This data displays the number of selected surveys within stated ranges of average cars owned per residential dwelling, within a radius of 5-miles of selected survey sites.

Travel Plan:

No	5 days
----	--------

This data displays the number of surveys within the selected set that were undertaken at sites with Travel Plans in place, and the number of surveys that were undertaken at sites without Travel Plans.

PTAL Rating:

No PTAL Present	5 days
-----------------	--------

This data displays the number of selected surveys with PTAL Ratings.

Covid-19 Restrictions	Yes	At least one survey within the selected data set was undertaken at a time of Covid-19 restrictions
-----------------------	-----	--

			Survey Type: MANUAL

This section provides a list of all survey sites and days in the selected set. For each individual survey site, it displays a unique site reference code and site address, the selected trip rate calculation parameter and its value, the day of the week and date of each survey, and whether the survey was a manual classified count or an ATC count.

TRIP RATE for Land Use 03 - RESIDENTIAL/C - FLATS PRIVATELY OWNED

Total Rates:		1.458			1.605			3.063	

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP*FACT. Trip rates are then rounded to 3 decimal places.

The survey data, graphs and all associated supporting information, contained within the TRICS Database are published by TRICS Consortium Limited ("the Company") and the Company claims copyright and database rights in this published work. The Company authorises those who possess a current TRICS licence to access the TRICS Database and copy the data contained within the TRICS Database for the licence holders' use only. Parameter summary

Trip rate parameter range selected:	20 - 51 (units:)
Survey date date range:	01/01/14 - 22/09/21
Number of weekdays (Monday-Friday):	5
Number of Saturdays:	0
Number of Sundays:	0
Surveys automatically removed from selection:	0
Surveys manually removed from selection:	0

This section displays a quick summary of some of the data filtering selections made by the TRICS® user. The trip rate calculation parameter range of all selected surveys is displayed first, followed by the range of minimum and maximum survey dates selected by the user. Then, the total number of selected weekdays and weekend days in the selected set of surveys are shown. Finally, the number of survey days that have been manually removed from the selected set outside of the standard filtering procedure are displayed.

TRIP RATE CALCULATION SELECTION PARAMETERS:

Land Use : 04 - EDUCATION

Category : D - NURSERY

TOTAL VEHICLES

Selected regions and areas:

12 CONNAUGHT

RO ROSCOMMON 2 days

16 ULSTER (REPUBLIC OF IRELAND)

MG MONAGHAN 1 days

This section displays the number of survey days per TRICS® sub-region in the selected set

Primary Filtering selection:

This data displays the chosen trip rate parameter and its selected range. Only sites that fall within the parameter range are included in the trip rate calculation.

Parameter: Number of pupils

Actual Range: 55 to 106 (units:)

Range Selected by User: 18 to 106 (units:)

Parking Spaces Range: All Surveys Included

Public Transport Provision:

Selection by: Include all surveys

Date Range: 01/01/14 to 12/10/21

This data displays the range of survey dates selected. Only surveys that were conducted within this date range are included in the trip rate calculation.

Selected survey days:

Tuesday 2 days

Friday 1 days

This data displays the number of selected surveys by day of the week.

Selected survey types:

Manual count 3 days

Directional ATC Count 0 days

This data displays the number of manual classified surveys and the number of unclassified ATC surveys, the total adding up to the overall number of surveys in the selected set. Manual surveys are undertaken using staff, whilst ATC surveys are undertaking using machines.

Selected Locations:

Edge of Town Centre 2

Edge of Town 1

This data displays the number of surveys per main location category within the selected set. The main location categories consist of Free Standing, Edge of Town, Suburban Area, Neighbourhood Centre, Edge of Town Centre, Town Centre and Not Known.

Selected Location Sub Categories:

Residential Zone 3

This data displays the number of surveys per location sub-category within the selected set. The location sub-categories consist of Commercial Zone, Industrial Zone, Development Zone, Residential Zone, Retail Zone, Built-Up Zone, Village, Out of Town, High Street and No Sub Category.

Secondary Filtering selection:

Use Class:

E(f) 3 days

This data displays the number of surveys per Use Class classification within the selected set. The Use Classes Order 2005 has been used for this purpose, which can be found within the Library module of TRICS®.

Population within 500m Range:

All Surveys Included

Secondary Filtering selection (Cont.):

Population within 1 mile:

1,001 to 5,000	1 days
5,001 to 10,000	2 days

This data displays the number of selected surveys within stated 1-mile radii of population.

Population within 5 miles:

5,001 to 25,000	2 days
50,001 to 75,000	1 days

This data displays the number of selected surveys within stated 5-mile radii of population.

Car ownership within 5 miles:

1.1 to 1.5	3 days
------------	--------

This data displays the number of selected surveys within stated ranges of average cars owned per residential dwelling, within a radius of 5-miles of selected survey sites.

Travel Plan:

No	3 days
----	--------

This data displays the number of surveys within the selected set that were undertaken at sites with Travel Plans in place, and the number of surveys that were undertaken at sites without Travel Plans.

PTAL Rating:

No PTAL Present	3 days
-----------------	--------

This data displays the number of selected surveys with PTAL Ratings.

Covid-19 Restrictions	Yes	At least one survey within the selected data set was undertaken at a time of Covid-19 restrictions
-----------------------	-----	--
