WORK AND REPORT LIMITATIONS

IMPORTANT: This section should be read before reliance is placed on any of the opinions, advice, calculations, interpretations, conclusions or recommendations in the following report.

1. Although every effort has been made to ensure the accuracy of the material contained in this document, complete accuracy cannot be guaranteed. Neither the Minerex Environmental Limited nor the author(s) accept any responsibility whatsoever for loss or damage occasioned or claimed to have been occasioned, in part or in full, as a consequence of any person acting, or refraining from acting, as a result of a matter contained in this publication.

2. Minerex Environmental Limited (MEL) has prepared this document for the sole use of its client in accordance with the work authorised.

3. No warranty, expressed or implied, is made as to the professional advice included in this report or any other services provided by MEL. However, MEL does carry Professional Indemnity (PI) Insurance.

4. All or part of this document may not be reproduced or be relied upon by any other party without prior and express written permission from MEL.

5. Estimates and subsequent interpretations contained in this report are derived from reviewing and assessing available information on the site conditions, the likely environmental responses and the experience of the company. Sometimes important information such as particle size distribution (PSD) / grading analyses, pumping test results or permeability results are not available, incomplete, unrepresentative or irrelevant, and an opinion is required to be given by the author in order to derive a value, amount or quantity to assist the project in moving forward for permit / licensing purposes.

6. MEL has prepared this report in line with best current practice and with all reasonable professional judgement, skill, care and diligence in consideration of the limits imposed by materials, equipment and methodologies used, and the time constraints and resources devoted to it as agreed with the client.

7. The interpretative basis of the conclusions contained in this report should be taken into account in any future use of this report. If the scope of the works includes drilling, pitting, sampling, or interpretation of such information, the client's attention is drawn to the fact that special risks occur whenever hydrogeological and related disciplines are applied to identify subsurface conditions.

8. The environmental, geological, geotechnical, geochemical, hydrological and hydrogeological conditions etc. that MEL interprets to exist between sampling points may differ from those that actually exist. Trial pitting and drilling, for example, exposes the subsoils over typically <1% of a site and in sites with long histories with several owners and business practices, interpretations and interpolations can be very different to the actual site conditions. Even a comprehensive sampling and testing programme, implemented in accordance with a professional Standard of Care considering Industry Standard Guidance, may fail to detect certain physical conditions, geology, geochemistry and hydrochemistry etc only discovered later on during bulk excavations for example.

9. Also, the passage of time, natural occurrences, and activities within and in the adjacent sites to the site, may substantially alter the discovered conditions at any time after the Site Investigations and interpretations are carried out by MEL.

10. Changes in the legislation, industry standards and guidance may cause opinion, advice, conclusions and recommendations set out in MEL reports to become out of date, inappropriate or incorrect. Once a report has been issued to a Client, MEL will have no obligation to advise the Client of any such changes, or their repercussions.

11. While MEL endeavours to take reasonable effort to assess data in hand at the time of writing and give the best advice possible, MEL will accept no responsibility for how the information within this report is interpreted and used. Where elements of this report are based upon information provided by others, it is assumed that all the relevant information has been supplied to MEL in full and is reliable, accurate and representative. It should always be assumed that MEL has not independently verified any information provided by others. MEL, its agents, directors, owners, employees, and contractors therefore will not be held responsible for any loss (reputation, financial, technical or otherwise) occurring from the use of this report, however caused.

1. Introduction

1.1 Background

Minerex Environmental Ltd (MEL) has been commissioned by Jennings O'Donovan & Partners (JOD, the Client) on behalf of FuturEnergy Ireland and SSE (the Developer/s) to assess the geological site characteristics in relation to the planning application for Gortyrahilly Windfarm (GWF, the development), Co. Cork.

1.2 Purpose

Site Investigation for the purposes of assessing ground conditions at EIA design phase of a proposed wind farm development, Gortyrahilly Wind Farm, Co. Cork. Assessing ground conditions in terms of peat and slope stability risk, subsoil and geological characterisation and classification.

1.3 Scope of Works – Tender

The scope of works was initially specified by the Developer at tender phase. The scope of works for ground investigations at tender included the following works;

- Peat probing (50 m grid), 50 ha
- Trial pits, 35 no.
- Shear vane tests, 25 no.
- Number of groundwater monitoring wells, 5 no.
- SI report with detailed findings, records and interpretation

Provisional works included;

- Gouge auger samples
- Boreholes up to 15 m, 5 no.
- Ground penetrating radar surveys (5 days)

In consultation with the Client and Developer the scope of works was adapted to the site based on observations made by desk study and initial site walk overs and assessments. The actual completed scope of works is detailed in **Section 2**.

This work has been carried out in unison with the EIAR for the proposed development. Therefore, this report will be appended to **EIAR Chapter 8 - Soils & Geology** as part of the planning application for the proposed development. The EIAR tender scope includes for a stand alone Peat Stability Report as well as stand alone Site Investigation report, however the two will be merged in this Site Investigation report. This is done with a view streamlining the site geological assessment.

Further to the above, the geological or environmental setting of the site will be described in detail in **EIAR Chapter 8 – Soil & Geology** with appended maps and graphics for reference. This report will refer and summarise the EIAR chapter/s to avoid duplication of information or graphics. This report will also reference **EIAR Chapter 9 – Hydrology & Hydrogeology** in relation to groundwater.

1.4 Statement of Authority

Minerex Environmental Ltd. (MEL) is an independent, Irish owned consultancy providing environmental services in the hydrogeological and environmental disciplines. The company was established in 1994 and continues to thrive, providing consultancy to clients in both the public & private sectors. More information can be found at www.minerex.ie. The principal members of the MEL EIA team involved in this assessment include the following persons;

- Cecil Shine – B.Sc. (Geology), M.Sc (Water & Soil), PGeo, EurGeol – Technical Director and Project Director – Experince; >25 years.
- Sven Klinkenbergh – B.Sc (Environmental Science), P.G.Dip (Environmental Protection) – Associate, Project Manager and EIA Lead Author – Experience; 10 years
- Jen Caleno – B.Sc (Geology), M.Sc (Geoscience) – Project Technician – Experience; 5 years
- Dr. Chris Fennel – B.A.Mod (Environmental Science) Ph.D (Civil Structural and Environmental Engineering) – Project Technician – Experience; 3 years.

2. Site Investigation Works & Methods

2.1 Scope of Works – Completed

The completed scope of works included;

- Peat depth probing, 378 no. sampling locations.
- Trial pits, 37 no.
- Sub-soil sampling and Particle Size Distribution analysis, 4 no.
- Shear vane tests, 10 no.
- Drilling – Rotary Core, 3 no.
- Drill core sample analysisz. Point Load (PL) and Unconfined Compression Test (UCS).

2.2 Peat & Slope Stability Risk Assessment Methodology

2.2.1 Peat depth probing & topography assessments

Peat depth probing and gouge coring surveys were undertaken at the site including at each proposed potential turbine location, and at proposed locations for other infrastructure including an Energy Storage Unit where access permitted.

Depth probing was conducted using a fibreglass depth probe and at each survey point the depth of peat, local incline (incline within a c. 5-10 m radius of the survey point) and grid reference (Irish Grid) were recorded. Notes on observations were also recorded including time of taking photographs, presence of drains etc.

2.2.2 Peat gouge coring & qualitative assessments

Gouge coring of peat was carried out to a limited extent (peat depth generally shallow). Peat quality assessment were made at existing cuttings and during trial pitting.

2.2.3 Piezometer installation & groundwater assessments

Not applicable. Peat depth at the site observed to be shallow generally at the site.

2.2.4 Topography & substrate topology

Using available topographical data provided for the site and peat thickness / depth data obtained during MEL surveys, the topology (characteristics of a surface) of the substrate underlying the peat on site was assessed and cross sections generated to evaluate variance from the surface topology.

2.2.5 Peat stability numerical assessment

This stability assessment has been undertaken using a relatively simple infinite slope stability approach (Boylan, N, and Long, M, 2012) (derived from Bromhead's formula (Scottish Gov., 2017)), as follows;

$$FoS = \frac{cu}{yz \sin\alpha \cos\alpha}$$

For the purpose of this assessment, the above formula will be referred to as the *FoS Formula*.

Qualifying peat stability at all peat survey points was done using the following parameters;

Table 1: Formula Parameters & Symbols

Symbol	Description	Unit
FoS	Factor of Safety	FoS
c_u	Effective cohesion or Undrained Shear Strength	kPa
y	Bulk Unit Weight of Peat	kN/m3
z	Depth to failure plain	m
α	Slope Angle	Degrees

The Factor of Safety (FoS) result will range from 0 to infinity, however the following ranges are prescribed ratings as follows;

Table 2: Factor of Safety (FoS) Classifications (Scottish Gov., 2017)

Description	FoS Value Range	Classification
Stable	>1.3	Acceptable
Marginally Stable	1.0 > < 1.3	Acceptable
Unstable	<1.0	Unacceptable

As per the guidance listed in Section 2 of this report, FoS values of 1.0 or greater are considered acceptable in terms of peat stability (Scottish Gov., 2017).

The assessment has been completed on the basis of 2 no. scenarios, which are as follows;

1. Scenario A – Peat stability in terms of the receiving environment as is, that is using the depth of peat observed and recorded during site surveys.
2. Scenario B – Peat stability in terms of the in situ peat with 1m fill (presumed peat) placed on top, that is using the depth of peat observed and recorded during site surveys plus 1 metre fill (depth + 1.0m). This is the assessment worst case scenario and this will be used to assess stability at proposed infrastructure locations.

Undrained shear strength (effective cohesion) (c_u) has been derived by means of assessing moisture content results, that is; there is a correlation between peat moisture content and shear strength (effective cohesion). Shear vane testing has been carried out on the site however, shear vane test, or in situ barrel shear tests are not considered representative of shear strength characteristics of the peat being assessed in terms of stability assessment given numerous flaws with the test itself, namely; the shear vane test evaluates the shear strength where by the force is exerted in a vertical and cylindrical plane, which is not indicative of forces at play with respect slope stability or mass movement; and fibres and roots within the peat will effect the test itself, potentially exaggerating, or giving misleading data. The following graph presents conceptual shear strength values for peat (Boylan N, Jennings P & Long M., 2008).

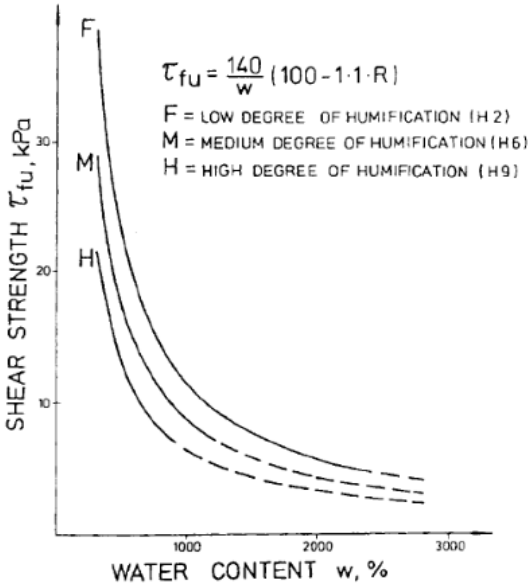

Figure 1: Correlation Between Moisture Content and Shear Strength of Peat (N. Boylan, P. Jennings & M. Long, 2008)

The following table presents the typical minimum, average and maximum moisture content which been used to determine indicative shear strength values for the Site.

Table 3: Peat Moisture Content Range & Indicative Shear Strength

Category	Moisture Content (%)	Indicative Shear Strength (kPa)
Minimum	200	>20
Average	750	10-20
Maximum	1500	<10

For the purpose of assessing peat stability for the Site a conservative undrained shear strength (effective cohesion) value will be used in numerical assessments; i.e. 3.5 kPa.

In situ bulk density (kg/m^3), or bulk unit weight (kN/m^3) of peat (y) is typically within the range of 900-1100 kg/m^3 (Munro R, 2004), or 8.8-10.8kN/m^3. For the purpose of assessing peat stability for the Site a conservative bulk unit weight value will be used in numerical assessments i.e. 11kN/m^3.

The depth to failure plane (z) is presumed to be thickness or depth of peat at any given sampling point being assessed, however it should be noted that the failure plane can potentially be within peat (peat on peat movement), or the substrate i.e. weathered rock or underlying soils.

Slope angle (α) is presumed to be topographical incline measured on site / evaluated using high resolution elevation data at any given sampling point being assessed, however it should be noted that the slope angle (α) relates to the failure plane angle, which is presumed to be the peat and substrate interface, and which is presumed to be parallel to the surface when using FoS Formula (Infinite Slope Formula). In reality the underlying substrate is unlikely to be parallel to the surface topology.

It should be noted that FoS Formula does not account for forces related to the toe and head of an area or mass of soil with the potential for mass movement, that is; in reality the Infinite Slope formula will likely exaggerate stability conditions negatively.

The following table lists parameter values, including inferred conservative parameter values used in numerical assessments.

Table 4: Formula Parameters, Symbols & Inferred Conservative Values

Symbol	Description	Value	Unit
c_u	Effective cohesion	3.5	kPa
y	Bulk Unit Weight of Peat	11	kN/m3
z	Depth to failure plain	Depth of Peat	m
α	Slope Angle	Surface Topography	Degrees

2.2.6 Risk Matrices & Ranking

In assessing the risk in relation to peat stability on site it is important to rate the risk in terms of the hazard, the likelihood and the consequences if any such issue should arise. Therefore, the slope stability risk assessment considers the following parameters, which are assessed by means of a series of risk matrices (Scottish Gov., 2017).

Table 5: Parameters Included In Risk Matrices and Assessed

Category	Description
Landslide History	Considers the likelihood of landslide events occurring based on the history of the site, including the current site use.
Factor of Safety	As described above, includes the following; • Peat depth • Peat quality / condition • Moisture content • Incline (surface topography) • Shear strength • Bulk unit weight of peat
Substrate Topology	Identifying and qualifying variance in substrate topology and qualifying variance from theory underlining the stability formula used i.e. Infinite Slope (Parallel and no foot and head forces)
Significance of Receptor	Qualifying potential receptors in terms of significance.
Distance to Receptor	Qualifying localised proposed development areas in terms of distance to nearest receptor.

Considering the above parameters, the stability assessment follows the following steps;

1. FoS_{RAW} - Assess the site in terms of soil stability using the FoS Formula and calculate a Factor of Safety (FoS) using the *raw* data. This step is considered as preparation of the data obtained for the site i.e. translating the data to a value related to stability, and is not considered the final output of the stability assessment.
2. $FoS_{ADJUSTED}$ - Assess the FoS_{RAW} values in terms of suitability of the application of FoS Formula by considering the history of landslides in relation to the proposed site, and the topology of the substrate compared to the surface topology of the site. This is done by means of a risk matrix which qualifies the point, and also applies a coefficient for the next risk assessment step.
3. Risk Ranking RR_{SF} - The $FoS_{ADJUSTED}$ data is assessed in terms of significance of associated receptor. This is done by means of a risk matrix which qualifies the point, and also applies a coefficient for the next risk assessment step.
4. Risk Ranking RR_D – The RR_{SF} data is assessed in terms of distance to associated receptor. This is done by means of a risk matrix which qualifies the point.

Results and conclusions made by means of the above risk assessment are viewed as two tiered, that is;

1. The likelihood of a stability issue or landslide while considering the significance of the receptor (RR_{SF}).
2. The consequence of a stability issue or landslide while considering the distance to the receptor (RR_{D}).

For example; (1) The risk of a stability issues or landslide occurring at location X and impacting on receptor Y is negligible. (2) Considering the short distance from location X to receptor Y, in the unlikely event that an issue did arise the risk of adverse impacts effecting receptor Y is moderate.

Risk Matrices are presented in **Appendix I**.

2.2.7 Interpretation of Results.

Results of the numerical stability risk assessment are modelled / mapped and interrogated in the context of site topography, site conditions, the proposed development and receptor sensitivity and susceptibility. Interpretation of results in the context of the development, activity and any potential consequences is an important step of the slope stability risk assessment. It is important to consider groups of data sets and site specific dynamics at a particular location (for example; at a proposed turbine location) and to qualitatively risk assess stability in the context of all observed site characteristics, including; topography, substrate topology, geology, hydrogeology, and hydrology, etc. For example; data might indicate a single point of unacceptable FoS / stability, however this needs to be considered in context of neighbouring data and actual site conditions, such as the presence of deep peat within a localised basin confined by shallow bedrock at the surface at neighbouring points, that is; deep, "unstable" peat (by numerical model) observed to be confined by shallow bedrock does not equate to an elevated risk of a catastrophic landslide event occurring, but does equate to potential localised stability issues arising if excavating at that particular location with deep peat.

In turn, any potential stability hazard must be considered in risk assessments in terms of potential consequences to receptors, and not simply likelihood of a stability issues arising. For example; in an area with low risk in terms of stability or Factor of Safety (FoS), but immediately and directly upgradient of a sensitive receptor such as a surface water body, in the unlikely event (low risk = acceptable FoS) that a significant stability issue should arise, due to the proximity to the receiving receptor the consequences of such an event have the potential to be significant.

The following table presents the interpretation of stability risk assessment data in the context of stability, or factor of safety (FoS) (Adjusted, Scenario B) at each significant development infrastructure unit.

2.3 Subsoil & Slope Stability Risk Assessment Methodology

2.3.1 Subsoil stability numerical assessment

This stability assessment has been undertaken in a similar manner to the peat stability assessment. However, due to the limited data available (compared to number of peat depth probing locations) qualifying stability in subsoils at the Site will infer data obtained at nearest neighbour trial pit locations.

Subsoils observed on site generally are classified as follows;

- Clayey, silty, sandy, GRAVEL (or TILL) with coobles and boulders.

The undrained shear strength observed in till subsoils at the Site ranged from 15 to 180kPa (**Appendix B**). This data is not considered highly reliable due to numerous site specific factors including particle size distribution of subsoils, particularly with high gravel / cobble content in this instance.

The undrained shear strength for inorganic silty sandy soils is typically in the range of 50 to 75kPa but is highly variable depending on the particular particle sizes and their character comprising the soil. It should be noted saturation / pore water pressure can also dramatically impact and reduce shear strength, or cohesion values in soils.

For the purpose of assessing subsoil stability for the Site a conservative undrained shear strength (effective cohesion) value will be used in numerical assessments; i.e. 40 kPa.

In situ bulk density (kg/m^3), or bulk unit weight (kN/m^3) of soils/subsoils (y), namely silty sandy subsoils, is typically within the range of 2500 to 2700 kg/m^3, or 24.5 to 26.5 kN/m^3. For the purpose of assessing subsoil stability for the Site a conservative bulk unit weight value will be used in numerical assessments i.e. 27 .0 kN/m^3.

The depth to failure plane (z) is presumed to be thickness or depth of subsoils at any given sampling point being assessed. However, subsoil depths will be inferred in areas of the site with limited data. It should be noted that the failure plane can potentially be within subsoils (subsoil on subsoil movement), or the substrate i.e. weathered bedrock. In relation to the Site specifically, it is important to note the presence of iron pan. Iron pan is a layer of oxidised iron within the subsoil. The iron pan layer is relatively impermeable which can impede or significantly alter groundwater movement in the subsoils. Under the right circumstances the iron pan layer can therefore can become a slip or failure plane. In such instances the failure plane has the potential to parallel to the overlying topography.

Slope angle (α) is presumed to be topographical incline measured on site / evaluated using high resolution elevation data at any given sampling point being assessed, however it should be noted that the slope angle (α) relates to the failure plane angle, which is presumed to be the peat and substrate interface, and which is presumed to be parallel to the surface when using FoS Formula (Infinite Slope Formula). In reality the underlying substrate (bedrock) is unlikely to be parallel to the surface topology. However, considering the presence of iron pan in subsoils at the site it is important to consider the potential for parallel failure planes when assessing stability at the site.

It should be noted that FoS Formula does not account for forces related to the toe and head of an area or mass of soil with the potential for mass movement, that is; in reality the Infinite Slope formula will likely exaggerate stability conditions negatively.

The following table lists parameter values, including inferred conservative parameter values used in numerical assessments.

Table 6: Formula Parameters, Symbols & Inferred Conservative Values

Symbol	Description	Value	Unit
c_u	Effective cohesion	40	kPa
y	Bulk Unit Weight of Peat	27.0	kN/m3
z	Depth to failure plain	Depth of subsoil to bedrock	m
α	Slope Angle	Surface Topography	Degrees

2.3.2 Risk Matrices & Ranking

In assessing the risk in relation to subsoil stability on site it is important to rate the risk in terms of the hazard, the likelihood and the consequences if any such issue should arise. Therefore, the slope stability risk assessment considers the following parameters, which are assessed by means of a series of risk matrices (Scottish Gov., 2017).

Table 7: Parameters Included In Risk Matrices and Assessed

Category	Description
Landslide History	Considers the likelihood of landslide events occurring based on the history of the site, including the current site use.
Factor of Safety	As described above, includes the following;

Category	Description
	• Subsoil depth (to failure plain) • Subsoil composition (PSD) • Moisture content • Incline (surface topography) • Shear strength • Bulk unit weight of subsoil
Substrate Topology	Identifying and qualifying variance in substrate topology and qualifying variance from theory underlining the stability formula used i.e. Infinite Slope (Parallel and no foot and head forces) **For the purposes of considering worst case conditions (the potential for iron pan and parallel failure plains), substrate topology is considered parallel.**
Significance of Receptor	Qualifying potential receptors in terms of significance.
Distance to Receptor	Qualifying localised proposed development areas in terms of distance to nearest receptor.

Considering the above parameters, the stability assessment follows the following steps;

5. FoS_{RAW} - Assess the site in terms of soil stability using the FoS Formula and calculate a Factor of Safety (FoS) using the *raw* data. This step is considered as preparation of the data obtained for the site i.e. translating the data to a value related to stability, and is not considered the final output of the stability assessment.
6. $FoS_{ADJUSTED}$ - Assess the FoS_{RAW} values in terms of suitability of the application of FoS Formula by considering the history of landslides in relation to the proposed site, and the topology of the substrate compared to the surface topology of the site. This is done by means of a risk matrix which qualifies the point, and also applies a coefficient for the next risk assessment step.
7. Risk Ranking RR_{SF} - The $FoS_{ADJUSTED}$ data is assessed in terms of significance of associated receptor. This is done by means of a risk matrix which qualifies the point, and also applies a coefficient for the next risk assessment step.
8. Risk Ranking RR_D – The RR_{SF} data is assessed in terms of distance to associated receptor. This is done by means of a risk matrix which qualifies the point.

Results and conclusions made by means of the above risk assessment are viewed as two tiered, that is;

3. The likelihood of a stability issue or landslide while considering the significance of the receptor (RR_{SF}).
4. The consequence of a stability issue or landslide while considering the distance to the receptor (RR_D).

For example; (1) The risk of a stability issues or landslide occurring at location X and impacting on receptor Y is negligible. (2) Considering the short distance from location X to receptor Y, in the unlikely event that an issue did arise the risk of adverse impacts effecting receptor Y is moderate.

Risk Matrices are presented in **Appendix I**.

3. Baseline Conditions

3.1 Site Description & History

There is one recorded landslide events in close proximity to the Site (GSI, Accessed 2021).

There were no indications of stability issues or mass movement observed on the Site during site surveys.

Deep (c. 5m in places) drainage channels eroded into underlying tills are observed in the west / north west area of the site.

The Site is mapped as having areas ranging from Low Risk to High Risk in terms of Landslide Stability, that is; full spectrum of slope stability risk categories (GSI, ND). Larger areas of High Risk landslide susceptibility are associated with relatively expansive steep slopes.

Refer to EIAR baseline section for further information (**Chapter 8: Soils and Geology**).

3.2 Site Geology

Consultation with Geological Survey Ireland Spatial Resources (GSI) indicates that the bedrock at 1:1,000,000 scale the Site is underlain by;

- Bird Hill Formation (BH) - Purple siltstone & fine sandstone. Purple-red, fine-grained sandstone and subordinate lightly calcretised purple siltstone. The sandstone is weakly parallel-laminated and contains small-scale cross-lamination. The sandstones are thinly interbedded with siltstones.
- Caha Mountain Formation (CM) - Purple & green sandstone & siltstone. The sandstone bodies show low angle cross stratification and usually have erosive bases, cutting into underlying fine grained material.
- Gortanimill Formation (GM) - Sandstone and siltstone. Medium- to fine-grained green sandstone with some red siltstone.

The region contains a multitude of complex geological features however, there are no mapped faults or other significant features underlying the area of the Site.

Rocky outcrops are common within the Site Boundary.

Refer to EIAR baseline section for further information (**Chapter 8: Soils and Geology**).

3.3 Site Soils & Subsoils

Consultation with available maps (GSI) indicate that the soil type across the entire area of the Site, and the general area in the region is Blanket Peat and Loamy Drift (Peaty Soil) with several significant areas mapped as being Bedrock at Surface.

Peat depths observed on the Site are generally shallow with the exception of isolated pockets of deeper peat, however depths at most sampling points are within the range of 0.0-0.5 m and areas with deeper, particularly extremely deep peat have been avoided in terms of the Development footprint. Peat depths are mapped and presented in **Appendix A**.

Peat quality assessment (by gouge coring / trial pitting / observations at cut locations) indicate relatively moderate to high Von Post values (generally H5 to H8) across the Site.

Refer to EIAR baseline section for further information (**Chapter 8: Soils and Geology**).

3.4 Topography & Substrate Topology

The topography at and in the immediate area surrounding the Site is highly variable with multiple peaks, ridges with variable elevations and inclines. At lower elevations the topography is relatively flat or comprising of low magnitude inclines, however at mid and high elevation relative to the Site, steep high magnitude inclines are common place.

Site observations indicate that the substrate topology varies significantly to surface topology. Highest rates of variance are associated with areas which include deeper peat, that is; areas of deeper peat are contained with "pockets" delineated by areas or ridges of shallow bedrock. Areas with generally shallower peat have less variance from the substrate however such areas are indicatively low risk in terms of stability given the peat is shallow.

3.5 Hydrology & Climate

Several mapped rivers run through and directly adjacent to the Site. Extensive constructed drainage channels associated with forestry, agriculture and peat cutting activities exist at the site.

Refer to EIAR baseline section for further information (**Chapter 9: Hydrology and Hydrogeology**).

3.6 Receptors

Receptors associated with the Development footprint are generally limited to non-critical infrastructure and water bodies.

Receptors associated with the proposed development, that is; streams, rivers, lakes and groundwater, are considered highly sensitive receptors considering;

- High or good WFD status and objective to protect same.
- Moderate WFD status and objective to restore same to at least good status by 2021.
- The numerous downgradient designations (sensitive protected areas) associated with each of the two associated catchments and the sensitive habitats and species associated with same.
- Designation of some downgradient surface water bodies and all groundwater bodies as sources of drinking water.

Ultimately, all surface water and groundwater associated with the Site is considered sensitive and must be protected.

There is one location whereby the receptor is identified as dwellings and agricultural buildings (north of T12). The receptor/s in this instance are considered highly sensitive and c. 200m downgradient of the Development footprint with mapped High risk landslide susceptibility between the footprint and the receptor.

Risk to receptors must consider both the hazard, and likelihood of adversely impacting on any given sensitive receptor, and therefore parameters such as; distance from potential source of hazard to receptor, pathway directness and/or connectivity, and assimilative capacity of the receiving water body should also be considered.

Distance of proposed turbine and hard stand areas have been assessed in terms of distance to associates receptors (surface water features), the results for which are presented in **Appendix I.**

Refer to EIAR baseline section for further information (**Chapter 9: Hydrology and Hydrogeology**).

4. Site Investigation Data & Results

4.1 Peat Depth Data

Approximately 380 no. peat depth probe locations were assessed at the Site.

Georeferenced and categorized peat depth locations are presented in **Appendix A**.

Peat depth data is presented in **Appendix B**.

Number of probe locations by Depth Category are presented in **Table 8**;

Table 8: Peat Depth Probe Points per Depth Category

Peat Depth Category	No.
A – Rock (0.00-0.01 m)	84
B – Very Shallow (0.01-0.5 m)	226
C – Shallow (0.5-2.0 m)	54
D – Moderately Deep (2.0-3.5m)	12
E – Deep (3.5-5.0 m)	0
F – Very Deep (>5.0 m)	0

4.2 Trial Pit Data

A total of 37 no. Trial Pits were completed, logged and sampled at the Site.

Trial Pit and Borehole locations are presented in **Appendix C**.

Trial Pit Logs are presented in **Appendix D**. Trial Pit and Site Investigation Photos are presented in **Appendix E**.

A total of 4 no subsoil samples were obtained from the Site and tested for particle size distribution (PSD).

Subsoil laboratory certificates are presented in **Appendix G**.

Particle Size Distribution (PSD) Soil Description results for subsoils (BS 1377 : Part 2 : 1990 : Clause 9) at the site are presented in **Table 9**. Note; cobble size particles observed on trial pit log sheets.

Table 9: Reported Subsoil Description (PSD)

Sample ID	Cobbles (%)	Gravel (%)	Sand (%)	Silt & Clay (%)	Description
TP08-A1 (SS1)	0.0	85.0	10.0	5.0	Silty/clayey sandy GRAVEL
TP13-A1 (SS1)	0.0	70.0	16.0	14.0	Silty/clayey sandy GRAVEL
TP24-A1 (SS1)	0.0	58.0	22.0	19.0	Silty/clayey, very sandy GRAVEL
TP30-A1 (SS1)	0.0	55.0	21.0	24.0	Very silty/clayey, very sandy GRAVEL

Iron pan was observed in several trial pits as listed in **Appendix H**, and presented in **Appendix C, Appendix D** and **Appendix E**.

4.3 Borehole Data

A total of 3 no. rotary core boreholes were completed, logged, and sampled at the Site.

Borehole logs are presented in **Appendix F**.

Drill logs indicate that;

- Bedrock underlying the site is described as SILTSTONE (BH01, BH02, BH03)
- Bedrock is relatively unweathered at each drilling location at the Site.
- Driller notes water strike at BH01G at 4m bGL likley perched groundwater on top of unweathered bedrock. .

Siltstone is mainly comprised of silt-sized particles. Silt-sized particles range between 0.002 and 0.063 millimeters in diameter (BS 5930). They are intermediate in size between coarse clay on the small side and fine sand on the large side.

Bedrock cores obtained were tested for Unconfined Compressive Strength (UCS), and Point Load Strength (PL).

Rock core testing laboratory certificates are presented in **Appendix G**.

Unconfined Compressive Strength (UCS) results presented in **Table 10** indicate bedrock underlying the site is considered weak.

Table 10: Bedrock Core Laboratory Strength Testing Results

Parameter	(Unit)	BH01	BH02	BH03
UCS Results	*Kn*	56.7	71.5	30.6
UCS Results	*MPa*	12.57	15.77	6.77
Rock Strength (UCS MPa)	*BS EN ISO 14689*	Weak	Weak	Weak

4.4 Peat Stability Risk Assessment Results

Review of peat stability assessment result data and maps as presented in **Appendix I** indicate that the factor of safety is generally acceptable and very low to low stability risk across the site with the exception of minor isolated areas or pockets of deeper peat.

Summary of risk at the site under varying conditions and scenarios is presented in in the following tables.

Table 11: Factor of Safety (Adjusted) at Peat Probe Locations

	Acceptable	Marginally Stable	Unstable
FoS (Adj.) Scenario A	370	2	5
FoS (Adj.) Scenario B	328	34	15

Table 12: Risk Ranking (Distance) at Peat Probe Locations

	Very Low	Low	Moderate	High
RR (Dist.) Scenario A	264	94	19	0
RR (Dist.) Scenario B	236	101	37	3

Areas of elevated stability risk, even at a localised scale, are considered geo-hazards requiring mitigation. Geo-hazards are presented in **Appendix H**.

4.5 Peat Stability Risk Assessment Interpretation

The following table presents the interpretation of stability risk assessment data in the context of stability, or factor of safety (FoS) (Adjusted, Scenario B) at each significant development infrastructure unit.

Table 13: Peat Stability Risk Assessment – Factor of Safety (Adjusted)(Scenario B) at Main Infrastructure Units

Turbine No. / Unit	FoS_{ADJ} (Factor of Safety adjusted according considering site specific conditions)	Geo-Hazard / Comment (Important to consider when carrying out detailed design and pre construction planning)
T1	Data indicates peat stability is acceptable, with the exception of minor isolated* pockets of deeper peat (marginally acceptable / unstable at localised scale). *Confined by shallow bedrock / bedrock outcrops. Surface topography varies greatly from substrate topology.	Steep incline, deep till deposits, iron pan and high risk landslide susceptibility downgradient (N / NW) of the proposed turbine location. Potential for deeper peat in isolated pockets / troughs. Potential for localised stability issues.
T2	Data indicates peat stability is acceptable.	Steep incline, deep till deposits, iron pan and high risk landslide susceptibility downgradient (N / NW) of the proposed turbine location. Potential for deeper peat in isolated pockets / troughs. Potential for localised stability issues.
T3	Data indicates peat stability is acceptable.	Potential for localised stability issues.
T4	Data indicates peat stability is acceptable, with the exception of isolated pockets of deeper peat (marginally acceptable / unstable at localised scale).	Potential for deeper peat in isolated pockets / troughs. Potential for localised stability issues.
T5	Data indicates peat stability is acceptable.	Potential for localised stability issues.
T6	Data indicates peat stability is acceptable, with the exception of isolated pockets of deeper peat (marginally acceptable at localised scale).	Potential for deeper peat in isolated pockets / troughs. Potential for localised stability issues.
T7	Data indicates peat stability is acceptable, with the exception of isolated pockets of deeper peat (marginally acceptable at localised scale).	Potential for localised stability issues.
T8	Data indicates peat stability is acceptable.	Potential for localised stability issues.
T9	Data indicates peat stability is acceptable.	Potential for localised stability issues.
T10	Data indicates peat stability is acceptable.	Potential for localised stability issues.
T11	Data indicates peat stability is acceptable, with the exception of isolated pockets of deeper peat (marginally acceptable at localised scale).	Potential for deeper peat in isolated pockets / troughs. Potential for localised stability issues.
T12	Data indicates peat stability is acceptable, with the exception of isolated pockets of deeper peat (marginally acceptable / unstable at localised scale).	Steep incline, and high risk landslide susceptibility downgradient (N / NW) of the proposed turbine location. Potential for deeper peat in isolated

Turbine No. / Unit	FoS_{ADJ} (Factor of Safety adjusted according considering site specific conditions)	Geo-Hazard / Comment (Important to consider when carrying out detailed design and pre construction planning)
		pockets / troughs. Potential for localised stability issues.
T13	Data indicates peat stability is acceptable, with the exception of isolated pockets of deeper peat (marginally acceptable / unstable at localised scale).	Potential for deeper peat in isolated pockets / troughs. Potential for localised stability issues.
T14	Data at this location is inferred based on neighbouring peat data and on site observations. Land is reconstituted agricultural land to the south, and blanket peat to the north of the of the associated river. Data indicates peat stability is acceptable.	Potential for localised stability issues. Proximity to surface water receptor.
Substation	Data indicates peat stability is acceptable.	Potential for localised stability issues.
Met Mast	Data indicates peat stability is acceptable, with the exception of isolated pockets of deeper peat (marginally acceptable / unstable at localised scale).	Steep incline, deep till deposits, iron pan and high risk landslide susceptibility downgradient (N / NW) of the proposed turbine location. Potential for localised stability issues.
Borrow Pit A	Borrow Pit Location A (Between T2 and T3) = Data indicates peat stability is acceptable.	Potential for localised stability issues.
Borrow Pit B	Borrow Pit Location B (Between T6 and T11) = Data indicates peat stability is acceptable, with the exception of isolated pockets of deeper peat (marginally acceptable at localised scale).	Potential for deeper peat in isolated pockets / troughs. Potential for localised stability issues.

The following table presents the interpretation of stability risk assessment data in the context of stability, or factor of safety (FoS) (Adjusted, Scenario B) at each significant development infrastructure unit.

Table 14: Peat Stability Risk Assessment – Factor of Safety (Adjusted)(Scenario B) at Main Infrastructure Units

Turbine No. / Unit	RR_D (Ranked Risk considering Distance to Sensitive Receptors)	Receptor / Comment
T1	Very Low with isolated pockets associated with localised elevated stability risk.	Drainage / Surface Water
T2	Very Low with isolated pockets associated with localised elevated stability risk.	Drainage / Surface Water
T3	Very Low	Drainage / Surface Water
T4	Very Low - with isolated pockets associated with localised elevated stability risk.	Drainage / Surface Water
T5	Very Low - with isolated pockets associated with localised elevated stability risk.	Drainage / Surface Water
T6	Low - with isolated pockets associated with localised elevated stability risk.	Drainage / Surface Water
T7	Low	Drainage / Surface Water
T8	Very Low	Drainage / Surface Water
T9	Very Low	Drainage / Surface Water
T10	Very Low - with isolated pockets associated with localised elevated stability risk.	Drainage / Surface Water
T11	Low - with isolated pockets associated with localised elevated stability risk.	Drainage / Surface Water
T12	Moderate to High. Elevated risk driven by sensitivity of and proximity to receptor.	**Dwelling / farm yard c. 200m downgradient. Drainage / Surface Water**
T13	Very Low to Low at the hardstand area, to Moderate, with minor area High downgradient - with isolated pockets associated with localised elevated stability risk. Elevated risk driven by proximity to receptor.	Drainage / Surface Water
T14	Very Low to High. Data at this location is inferred based on neighbouring peat data and on site observations. To the north / west of the associated river data indicates Low to High stability risk. To the south / east of the associated river data indicates relatively lower risk.	Drainage / Surface Water – 0m.
Substation	Very Low to Moderate	Drainage / Surface Water
Met Mast	Low to Moderate - with isolated pockets associated with localised elevated stability risk.	Drainage / Surface Water
Borrow Pit A	Similar to T3	Drainage / Surface Water
Borrow Pit B	Similar to T6 and T11	Drainage channels through area.

4.6 Subsoil Stability Risk Assessment Results

Review of subsoil stability assessment result data and maps as presented in **Appendix I** indicate that the factor of safety is generally acceptable and very low to low stability risk across the site (areas assessed / trial pit locations*) with the exception of minor isolated areas of steeper inclines and deeper till deposits (inferred*).

Summary of risk at the site under varying conditions and scenarios is presented in the following tables.

Table 15: Factor of Safety (Adjusted) at Trial Pit Locations

	Acceptable	Marginally Stable	Unstable
FoS (Adj.) Scenario A	37	0	0
FoS (Adj.) Scenario B	37	0	0

Table 16: Risk Ranking (Distance) at Trial Pit Locations

	Very Low	Low	Moderate	High
RR (Dist.) Scenario A	28	9	0	0
RR (Dist.) Scenario B	28	9	0	0

Based on the inferred conservative values applied to the above stability risk assessment, the factor of safety is highly dependent on cohesive strength, which in turn is highly dependent on hydrogeological characteristics including pore water pressure. **Figure 2** presents potential varying Factors of Safety for subsoils at the Site depending on varying cohesive strength and depths to failure plane.

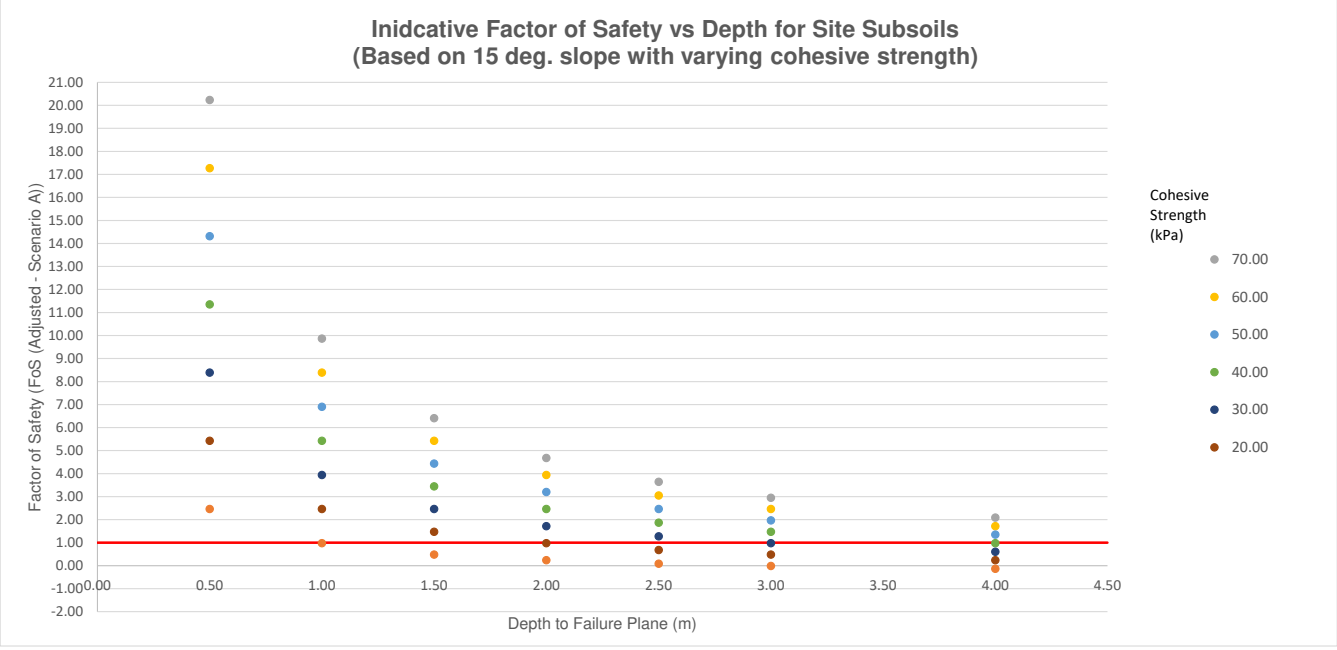

Figure 2: Correlation Between Factor of Safety, Cohesive Strength and Depth of Subsoils

Observations made during site walk overs include deep deposits of till in the north wester area of the site. Iron pan was also observed in trial pits in those areas. The area is also extensively modified in term of constructed drainage for agricultural purposes.

Areas with potentially deep till deposits, steep incline (c. >15 degrees), potential for iron pan, and enhanced opportunity for recharge to groundwater are considered to have elevated Moderate to High risk in terms of subsoil soil stability.

Areas of elevated stability risk, even at a localised scale, are considered geo-hazards requiring mitigation. Geo-hazards are presented in **Appendix H**.

4.7 Peat Stability Risk Assessment Interpretation

The following table presents the interpretation of stability risk assessment data in the context of stability, or factor of safety (FoS) (Adjusted, Scenario B) at each significant development infrastructure unit.

Table 17: Subsoil Stability Risk Assessment – Risk Ranking (Distance)(Scenario B) at Main Infrastructure Units

Turbine No. / Unit	RR_D (Ranked Risk considering Distance to Sensitive Receptors)	Geo-Hazard / Comment
T1	Low (Inferred)	Close proximity to geohazard. Steep incline, deep till deposits, iron pan and high risk landslide susceptibility downgradient (N / NW) of the proposed turbine location. Potential for deeper peat in isolated pockets / troughs. Potential for localised stability issues.
T2	Low	Close proximity to geohazard. Steep incline, deep till deposits, iron pan and high risk landslide susceptibility downgradient (N / NW) of the proposed turbine location. Potential for deeper peat in isolated pockets / troughs. Potential for localised stability issues.
T3	Very Low	Potential for localised stability issues.
T4	Low (Inferred)	Potential for deeper peat in isolated pockets / troughs. Potential for localised stability issues.
T5	Low (Inferred)	Potential for localised stability issues.
T6	Low (Inferred)	Potential for deeper peat in isolated pockets / troughs. Potential for localised stability issues.
T7	Very Low	Potential for localised stability issues.
T8	Very Low	Potential for localised stability issues.
T9	Very Low	Potential for localised stability issues.
T10	Very Low	Potential for localised stability issues.
T11	Low to Moderate	Close proximity to receptor; SW. Potential for deeper peat in isolated pockets / troughs. Potential for localised stability issues.
T12	Low to Moderate	Close proximity to highly sensitive receptor; dwelling / farm. Close proximity to geohazard. Steep incline, and high risk landslide susceptibility downgradient (N / NW) of the proposed turbine location. Potential for deeper peat in isolated pockets / troughs. Potential for localised stability issues.
T13	Low to Moderate	Close proximity to receptor; SW. Potential for deeper peat in isolated pockets / troughs. Potential for localised stability issues.
T14	Low to Moderate	Potential for localised stability issues.

Turbine No. / Unit	RR_D (Ranked Risk considering Distance to Sensitive Receptors)	Geo-Hazard / Comment
	Data at this location is inferred based on neighbouring peat data and on site observations.	
Substation	Very Low (Inferred)	Bedrock outcrop. Potential for localised stability issues.
Met Mast	Low	Close proximity to geohazard. Steep incline, deep till deposits, iron pan and high risk landslide susceptibility downgradient (N / NW) of the proposed turbine location. Potential for localised stability issues.
Borrow Pit A	Very Low	Potential for localised stability issues.
Borrow Pit B	Low (Inferred)	Potential for deeper peat in isolated pockets / troughs. Potential for localised stability issues.

5. Conclusions

Peat Stability

Peat depth across the site is generally shallow with the exception of isolated pockets of deeper peat delineated by shallow subsoils and/or bedrock at or near the surface. There was no deep or very deep peat observed at the site.

The Factor of Safety (Adjusted) (Scenario B i.e. 1m surcharge) at peat probe locations is generally Acceptable with the exception of marginally stable / unstable point locations associated with deeper peat and/or steeper inclines.

The Risk Ranking (Distance) Scenario B i.e. 1m surcharge) at peat probe locations is generally Very Low to Low with the exception of Moderate or High risk point locations associated with deeper peat and/or steeper inclines and/or close proximity to sensitive receptors.

Subsoil Stability

Subsoils underlying the site are characterized generally as clayey sandy GRAVEL or TILL.

The Factor of Safety (Adjusted) (Scenario B i.e. 1m surcharge) at trial pit locations is generally Acceptable with no exception of marginally stable / unstable point locations.

The Risk Ranking (Distance) Scenario B i.e. 1m surcharge) at trial pit locations is generally Very Low to Low with no exceptions of Moderate or High risk point locations.

Elevated risk is identified (inferred) in areas possessing deeper tills and steep inclines, particularly in areas with potential for iron pan and hydrogeological impacts.

Rock Strength

Bedrock is relatively unweathered.

Bedrock strength at the Site is reported as Weak.

Geo-Hazards

A register of Geo-Hazards is mapped and presented in **Appendix H**.

6. Caveats & Recommendations

The risk of landslides occurring on the proposed site under worst case scenario conditions (Conservative values and Scenario B (+1m)) has been determined to be generally **very low to low** however, the following points should be noted;

- The low risk classification is largely driven by shallow peat depths at sampling points associated with proposed infrastructure locations, and by the undulating nature of the substrate topology, however the potential for deeper areas of peat suggests that soil stability at a highly localized scale may give rise to some difficulty e.g. collapse of side walls in excavations, and subsidence over time under newly installed floating hardstands (on peat), etc. Such potential issues give rise to the need for vigilance during and after the construction phase of the proposed development and it is recommended that all works are supervised and moniroed by a competent person (Geotechnical Engineer) through out the construction phase, and that the site is monitored at a reasonable frequency during the operational phase of the proposed development. The frequency of monitoring during the operational phase will be conducted at a high frequency (e.g. weekly) during the initial months, and will reduce (e.g. monthly) gradually over the following year minimum, or until site conditions are observed to be stable.

- The purpose of this report is to assess the proposed infrastructure units associated with the proposed development. The proposed site contains some existing infrastructure including roads and cosntructed drainage. Furrhermore the site area, relataive to the development footrpint is large. The assessment/s reported here are limited to sampling point locations which have been executed to assess the proposed locations of new infrastructure units. The proposed site is mapped as having areas classified as high risk in terms of landslide susceptibility however, although stability would likely be an issue in these areas, the footprint of the existing and proposed development does not include these higher risk areas.

- It is recommeended that the development layout avoids areas classifiied as having high stability risk per this report or the GSI Landslide Susceptibility model. Furthermore, any potential impacts to hydrogeological conditions at high risk areas should be avoided. Through EIA, constraint identifcation and design process, the development footrpint avoids areas of unacceptable risk, however this will include all aspects of the development including; vehicle movements, personell movements, temporray storage, etc. In other words, the dveelopment (includng construction activities) will be limited to the development footprint as far as practical, and otherwise will avoid areas of elevated risk. Furthermore, high risk or high susceptability areas are asscoated with steep inclines, for example: excavated material including broken rock, or boulder, if managed poorly has the potential to role down a steep inlince to a highly sensitive receptor (a dwelling / farm yard in the case of T13). Managament of of excavation araisings or any bulk material or equipment will consider proximity to these areas or geo-constraints, and developer's or sub-contractors method statement and risk assessments will incorporate this into operational and health and safety mitigation measures.

- Considering the variability of subsoil depths, bedrock depths and low rock strength, and in line with infrastructure manufacturer specification, further Site Investigation tailored to specifying turbine and infrastructure foundation design on a case by case basis might be required, particularly in areas adjacent to mapped high risk landslide susceptbility areas (GSI). This will be done in conjunction with or in adherance with turbine manufacturers and their specifications for particular infratructure units.

Trial Pit & Borehole Locations
Site Overview

Legend

Development Layout

Site Investigation

- GWF Borehole Locations

3188-A1 Soil - SI Trial Pit Data

- Yes, Iron Pan Present
- No, Iron Pan Not Present

WF

Ancillary

- Proposed Turbine Locations
- Proposed Borrow Pits
- Site_Entrances
- Proposed On-Site Substation
- Proposed Temporary Construction Compound
- Proposed Met Mast
- 603679 GWF Redline Boundary
- Site Infrastructure

UGC

- Under Ground Cable (UGC)

Hydrology

- WFD_RiverWaterbodies

Site Drainage

Site Drainage

- Mapped River Corrected
- Significant Drain
- Minor Drain

Project: Gortyrahilly Wind Farm

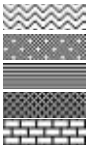
GENERAL LEGEND, ABBREVIATIONS AND INSTALLATION DETAILS

BEDROCK

Metamorphic bedrock
Igneous bedrock
Mudstone / Shale bedrock
Siltstone / Sandstone bedrock
Limestone bedrock



COLOUR

Brown (Light, medium, dark)
Grey (Light, medium, dark)
Mustard
Beige (tan)
Olive
Mottled
Orange

GRAIN SIZE (Soil)

Clay (% of)	C(20)
Silt (% of)	St(20)
Sand (% of)	Sd(20)
Gravel (% of)	G(20)
Sand (Fine to Medium)	Sd_{F-M}
Gravel (Fine to Coarse Subangular to angular)	$G_{F-C\ SA-A}$

MONITORING POINT COMPLETIONS

TS/C1/PH1	Terminal Site/Couple no./Phreatic no.
PR/C2/P2	Peat Repository/Couple no./Piezometer no.
H7	Von Post humification scale
	Push-on cap
	Screen
	Casing
	Porous tip
	Drive cone
P1 PH1	Piezometer no. and Phreatic tube no.
	Bentonite pellets
	Cement-Bentonite grout
	Gravel pack, nominal 2-5mm in diameter
	Damp, wet and water strike respectively
1/2/03	Static water table (with date measured and hours since installation)

PLAN SKETCHES

PWS1	Hand dug trial pits / Shallow pit excavations (JCB)
TP1	Percussion Window Sampler (PWS) boreholes
100 BG	FID/PID in ppm Hydrocarbons with BG = background
99.791	Reduced levels - maOD Malin
	Oil pipeline
	Storage tanks (Overground and underground)

OVERBURDEN

(Description uses BS 5930 and GSI guidelines)

BOULDER(S) (>200mm)

COBBLES (60 to 200mm)

GRAVEL (Homogeneous larger sized particles from 2 to 60 mm)

SAND (General, if without grain size description) Particle sizes: 2 to 0.06mm. Three sub-categories distinguishable to the eye)

Coarse **SAND** (2-0.6mm)

Medium **SAND** (0.6-0.2mm)

Fine **SAND** (0.2-0.06mm)

SILT (0.06 - 0.002mm)

CLAYS (<0.002mm)

CONCRETE

TARMACADAM

CRUSHED STONE or AGGREGATE

LANDFILL (eg plastic, glass, wood, domestic waste, concrete etc.)

FILL OR BACKFILLED GROUND (unspecified)

COLLAPSED FORMATION (with possible voids) or **DRILL CHIPPINGS / MATERIAL RETURNED BY AIR FLUSH DRILLING**

LOSS (Blank - white)

TOP SOIL

PEAT (General) (with descriptions such as colour, plant remains evident, distinct H_2S smell etc) (H (Von Post) value associated commonly)

MONITORING POINT DESIGN FOR PEAT SUBSOILS

Push-on, female cap

The cap is loosely fitted to allow easy removal. The piezometer is labelled using indellible ink inside and outside the cap. A small hole is drilled in the side to enable air movement in and out of the piezometer.

Casing up-stand

The upstand is the height of the casing above ground level in meters. The height depends on local groundwater and surface water circumstances. The piezometer number is scrapped onto the side of the casing near the cap as with time the writing on the cap wears off. Upstands vary from 0.3 to 1.0m in height. The convention is allow a higher upstand for those piezometers positioned at a higher level.

Casing

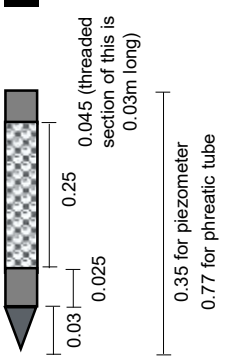
The casing is black or dark grey coloured, flush-threaded, uPVC. The OD is 26.80mm and the ID is 18.40. The casing is flush-threaded to the piezometer tip.

Tube or Piezometer tip

This section is installed opposite the required formation. There are two sections to the piezometer tip. The inner tube section is 18.40mm ID, white in colour and involves extruded microporous polyethylene. The outer comprises grey or black coloured uPVC with 10 x 0.013m diameter holes per 0.10m of piezometer tip. Therefore the surface area exposed to the formation (peat) is small. The piezometer tube tip is flush-threaded, either male or female, to the piezometer casing. Threaded part is 0.03m long. The phreatic tube tip is longer than the piezometer tube tip to allow for greater water level fluctuations.

Drive cone

This is grey coloured, solid, uPVC, pushed or screwed into the tube or piezometer tip. No glue has been used. If the ground is soft, a push-in button cap may be used instead of a drive cone.



NOTES:-

The phreatic tubes are pushed by hand into the peat. The piezometers are pushed or driven into the peat and mineral soil after a narrow diameter hole has been formed using overburden drilling (Cobra or Percussion Window Sampler) / coring equipment (Gouge corer). The tubes and piezometers have three main functions: water table measurements, water sampling, permeability measurements.

DESCRIPTIONS

**	Drillers Description
Friable	Easily crumbled

SAMPLES

U( )	Undisturbed 102mm diameter sample, ( ) denotes number of blows to drive sampler
U( )F, U( )P	F- not recovered, P-partially recovered
U38	Undisturbed 38mm diameter sample
P(F), (P)	Piston sample - disturbed
B	Bulk sample - disturbed
D	Jar Sample - disturbed
W	Water Sample
CBR	California Bearing Ratio mould sample
ES	Chemical Sample for Contamination Analysis
SPTLS	Standard Penetration Test S lump sample from split sampler

CORE RECOVERY AND ROCK QUALITY

TCR	Total Core Recovery (% of Core Run)
SCR	Solid Core Recovery (length of core having at least one full diameter as % of core run)
RQD	Rock Quality Designation (length of solid core greater than 100mm as % of core run)

Where there is insufficient space for the TCR, SCR and RQD, the results may be found in the remarks column

If	Fracture Spacing in mm (Minimum/Average/Maximum) NI - non intact, NR - no recovery
AZCL	Assumed Zone of Core Loss
NI	Non intact

GROUNDWATER

▽	Groundwater strike
▼	Groundwater level after standing period
Date/Water	Date of shift (day/month)/Depth to water at end of previous shift shown above the date and depth to water at beginning of shift given below the date

INSITU TESTING

S	Standard Penetration Test - split barrel sampler
C	Standard Penetration Test - solid 60^o cone
SW	Self Weight Penetration
Ivp, HVp (R)	In Situ Vane Test, Hand Vane Test (R) demonstrates remoulded strength
K(F), (C), (R), (P)	Permeability Test
HP	Hand Penetrometer Test

MEASURED PROPERTIES

N	Standard Penetration Test - blows required to drive 300mm after seating drive
x/y	Denotes x blows for y mm within the Standard Penetration Test
x*/y	Denotes x blows for y mm within the seating drive
c_u	Undrained Shear Strength (kN/m^2)
CBR	California Bearing Ratio

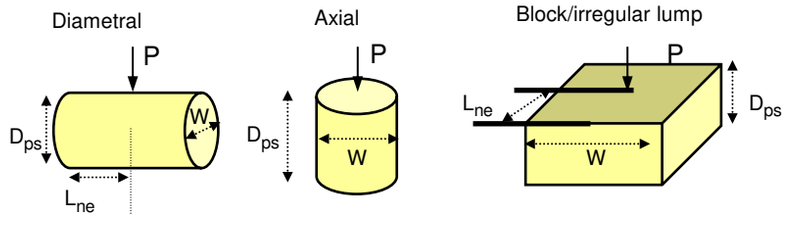
Test Type
D - Diametral, A - Axial, I - Irregular Lump, B - Block
Direction
L - parallel to planes of weakness
P - perpendicular to planes of weakness
U - unknown or random
Dimensions
Dps - Distance between platens (platen separation)
Dps' - at failure (see ISRM note 6)
Lne - Length from platens to nearest free end
W - Width of shortest dimension perpendicular to load, P



Test performed in accordance with ISRM Suggested Methods : 2007, unless noted otherwise
Detailed legend for test and dimensions, based on ISRM, is shown above.
Size factor, F = $(De/50)^{0.45}$ for all tests.

Location of highly sensitive receptor (dwelling / farm yard) c. 200 m distance downgradient from T12

Western / North Western area of site referred to re. elevated stability risk in deeper tills.
Areas possess steep incline, potential for deep tills, hydrological/hydrogeological modification, deeply eroded drainage channels, high landslide sysceptibility (GSI), potential for iron pan.

Elevated stability risk due to geo-hazards - pockets deep peat, steep inclince etc, and proximity to sensitive receptors (yard / dwelling).

Elevated stability risk due to potential for pockets of deeper peat, and proximity to sensitive receptors (surface water)
