1. Introduction

1.1 Purpose of the Transport Modelling Report

The Transport Modelling Report (TMR) details the model development, data inputs, model calibration and validation, development of future year models, modelling results and results of appraisal tools for the proposed MetroLink (hereafter, referred to as the 'Project').

The report describes the work that has been undertaken and makes the case for using the transport model as the basis for the appraisal of the Project. It details the way in which the model has been built and provides evidence that it is sufficiently capable of reflecting observed conditions relating to public transport and traffic flows. It also makes clear the basis for any projections produced by the model and provides a clear view of the impact of the Project on the direct vicinity of the proposed Project and its wider surrounding area. This data therefore serves as the modelling input to the assessments undertaken in the Traffic and Transport Assessment (TTAs) and the Environmental Impact Assessment Report (EIAR).

Modelling outputs to inform the Business Case have also been undertaken, including a range of sensitivity test scenarios such as Slow Growth, Alternative Demand, Low Frequency, and Alternative Demand in conjunction with the build-out of the National Development Plan. As such, this report presents the outputs for the Environmental Impact Assessment only, and does not present the outputs utilised for the Business Case.

1.2 Methodology / Structure of the Project Transport Model

As described in the Transport Modelling Plan (TMP, Appendix A9.3), the following chart outlines the assessment methodology including the high-level inputs, the strategic multi-modal modelling assessment, the interaction with local / micro modelling, and the outputs and deliverables. The strategic multi-modal modelling will underpin the assessment and comprise the main assessment of benefits and impacts, feeding into local / micro models where potentially significant impacts are identified and assessed as part of the EIAR/TTAs.

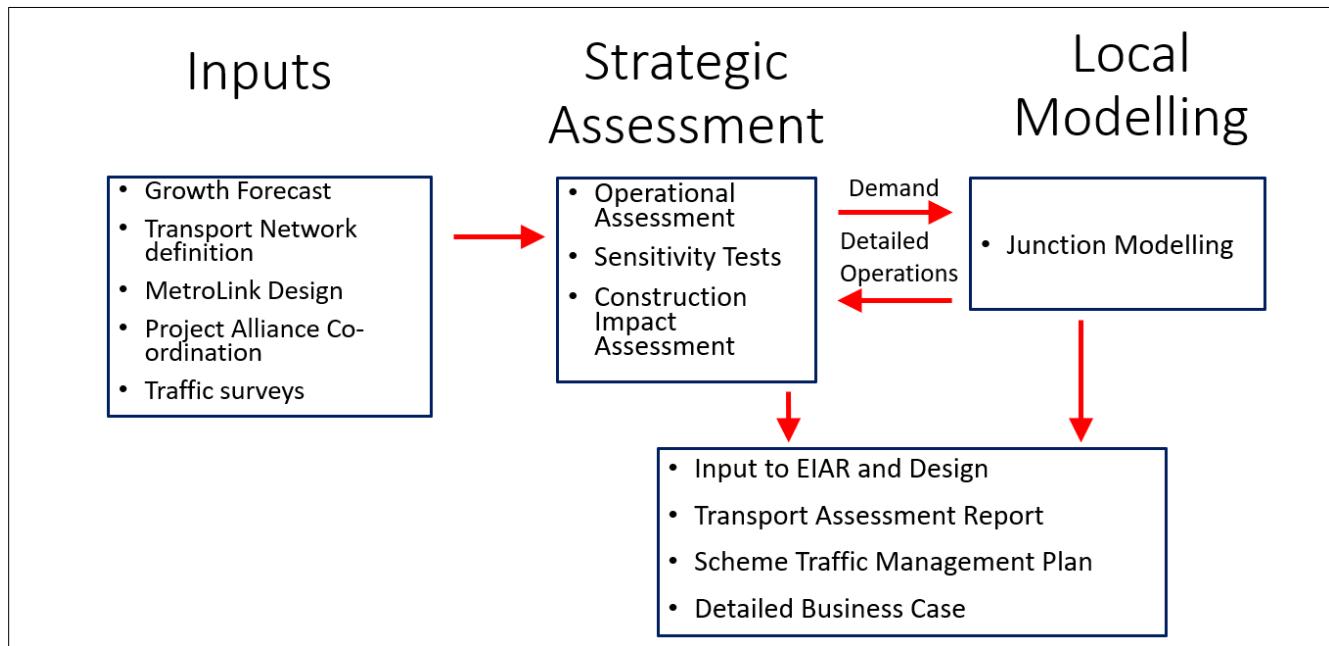

Figure 1.1:Transport Assessment Approach

1.3 NTA East Regional Model

The National Transport Authority (NTA) has developed a Regional Modelling System (RMS) for Ireland that allows for the appraisal of a wide range of potential future transport and land use alternatives.

The RMS comprises the National Demand Forecasting Model (NDFM); five large-scale, detailed, multi-modal regional transport models; and a suite of Appraisal Modules. The five regional models comprising the RMS are focused on the travel to-work areas for Dublin (represented by the East Regional Model (ERM)), for Cork (represented by the South-West Regional Model (SWRM)), for Limerick (represented by the Mid-West Regional Model (MWRM)), for Galway (represented by the West Regional Model (WRM)) and for Waterford (represented by the South-East Regional Model (SERM)). The key attributes of the five regional models include; full geographic coverage of each region, detailed representations of all major surface transport modes including active modes, road and public transport networks and services, and of travel demand for five time periods (AM, 2 Inter-Peaks, PM and Off-Peak). The RMS encompasses behavioural models calibrated to 2016 Household Survey data that predict changes in trip destination and mode choice in response to changing traffic conditions, transport provision and/or policies which influence the cost of travel.

The RMS has been developed to provide the NTA with the means to undertake comparative appraisals of a wide range of potential future transport and land use options, and to provide evidence to assist in the decision-making process.

The RMS captures all day travel demand, thus enabling more accurate modelling of mode choice behaviour and increasingly complex travel patterns, especially in urban areas where traditional nine-to-five working is decreasing. Best practice, innovative approaches were applied to the RMS demand modelling modules including car ownership; parking constraint; demand pricing; and mode and destination choice. The RMS is therefore significantly more responsive to future changes in demographics, economic activity and planning interventions than traditional models.

The strategic model used for the Project Appraisal is the ERM developed by the NTA. The ERM is a multi-modal, network based transport model that includes all main surface modes of travel, including: Full Geographic Coverage of the Eastern Region, a detailed representation of the road network, a detailed representation of the public transport network & services, a detailed representation of all major transport modes including active modes, accurate mode choice modelling of residents, a detailed representation of travel demand of four time periods (AM, Inter-Peak, PM and Off-Peak) and a prediction of changes in trip destination in response to changing traffic conditions, transport provision and/or policy.

This ERM has a base year of 2016 and is calibrated to 2016 Census, 2017 National Household Travel Survey and localised multi-modal surveys.

Further detail and background to the development of the ERM can be found in the NTA's report 'Model Development Report – Eastern Regional Model'.

2. Data Collection

The latest version of ERM was calibrated to a base year of 2016, full details on the data collection used in the development of the model and in the validation and calibration of the model is contained within the NTA's report 'Model Development Report – Eastern Regional Model'.

In May 2018 traffic surveys were undertaken on 108 sites along the proposed Project corridor. Vehicle and pedestrian movement surveys were undertaken for all 108 locations over three separate days and for 24-hour sessions at each. The surveys were undertaken on neutral weekdays, defined as Tuesday, Wednesday or Thursday, and were undertaken out with any school or public holidays. Further details on the locations of the surveys, as well as other data sources, can be found in the Data Collection Report (Appendix A9.6).

3. Forecast Years

3.1 Forecast Years

The following forecast years have been used in the assessment of the Project's Operational Phase.

- Opening Year: 2035.
- Design Year: 2050 (opening year + 15).
- Forecast Year: 2065 (opening year + 30).

Section 4.2 provides further detail on the two scenarios utilised for this assessment- Scenario A and Scenario B.

3.2 Future Growth Rates

In order to ensure that the Project can operate efficiently and deliver benefits into the future, forecasts are required to determine the likely future levels of demand on Dublin's transport system. The TII PAG states that "*Unbiased future demand projections are a critical input in ensuring that capacity for transport infrastructure is neither too large nor too small to meet the future demand. Furthermore, travel demand projections inform the economic and environmental appraisal of transport schemes and therefore play a fundamental role in deciding whether a scheme is to progress*".

The NTA has prepared a set of future planning variables which form a key input into the National Trip End Model (NTEM) and is referred to as the planning sheet reference case.

As part of the process the NTA has determined forecasts for key trip generation and destination variables listed below.

- Population;
- Population by age cohorts;
- Population by school level (Primary, Secondary, Third level);
- Principal Economic Status;
- Employment places at destination;
- Employment places at destination by type (Health, Retail, Food Retail); and
- Education places at destination by level (Primary, Secondary, Third level).

The foundation of this planning sheet is heavily based on published policy documents. The National Planning Framework (NPF) was launched in February 2018, following which the Department of Housing, Planning and Local Government issued an Implementation Roadmap. This document set out the target population figures for each county for 2026 and 2031. In addition, the Department of Housing supplied employment figures for each county up to 2040. There are figures provided for the 'At-Work' population as well as the number of employment places per county.

The NTA have worked with the Regional Assemblies and the Local Authorities to incorporate their housing and growth priorities in the planning sheet. While the planning sheet is controlled at the regional and county level by published policy documents (NPF & RSES), the distribution of growth within counties is discussed and agreed with Local Authorities. Where agreement has not been made the NTA has based the distribution on existing patterns and zoning within the development plans.

These planning sheets are the principal land use scenario for all plans and schemes. Interim year planning sheets for years between 2016 and 2040, are straight line interpolation between 2016 and 2040. For years after 2040, these planning datasheets are created by extending this straight-line interpolation onwards to the forecast year, such as 2050 or 2065.

Figure 3.3 illustrates the increase in population and jobs within the Greater Dublin Area (GDA), and Figure 3.4 illustrates the increase in the population and number of jobs within a 1km (approximately 10-15min walking) catchment distance of stations along the Project alignment, using data from the NTA planning sheets.

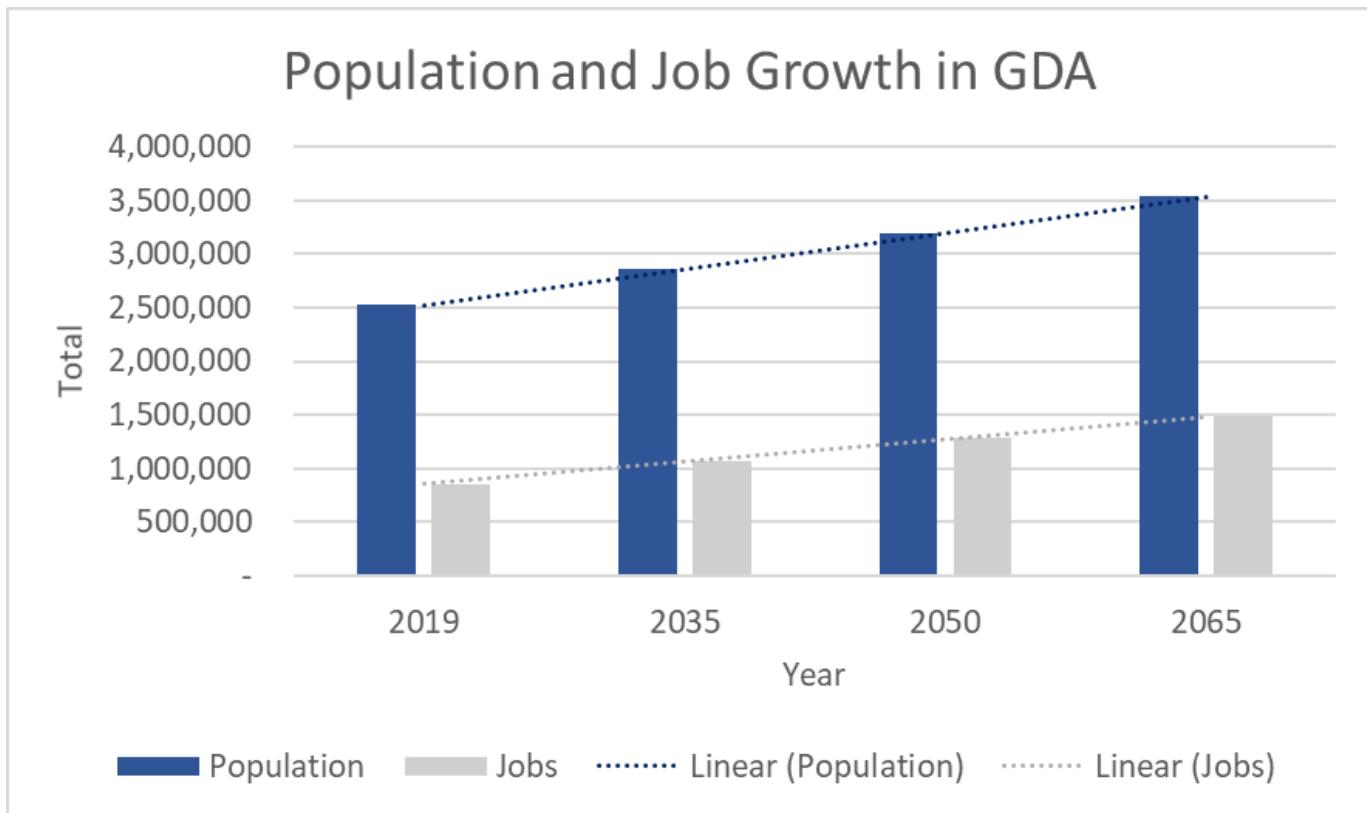

Figure 3.1: Population and Job Growth in Greater Dublin Area 2019 -2065

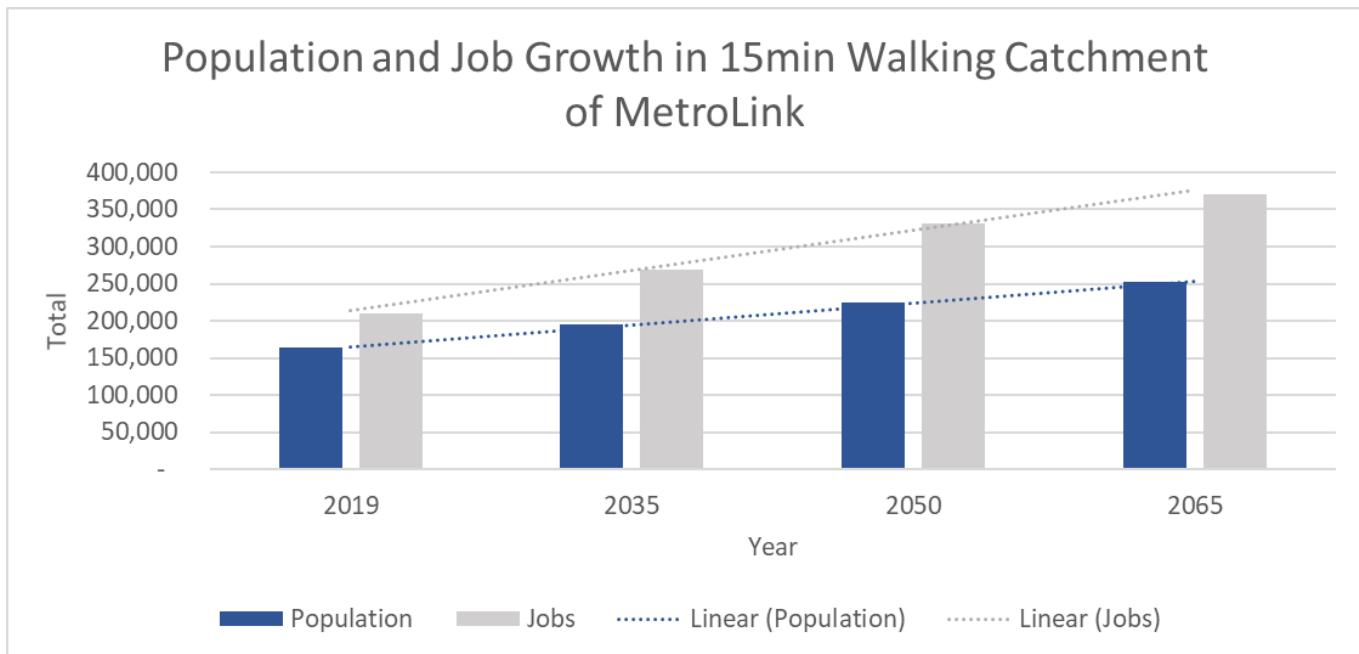

Figure 3.2: Population and Job Growth within 15min Walking Catchment of the Project

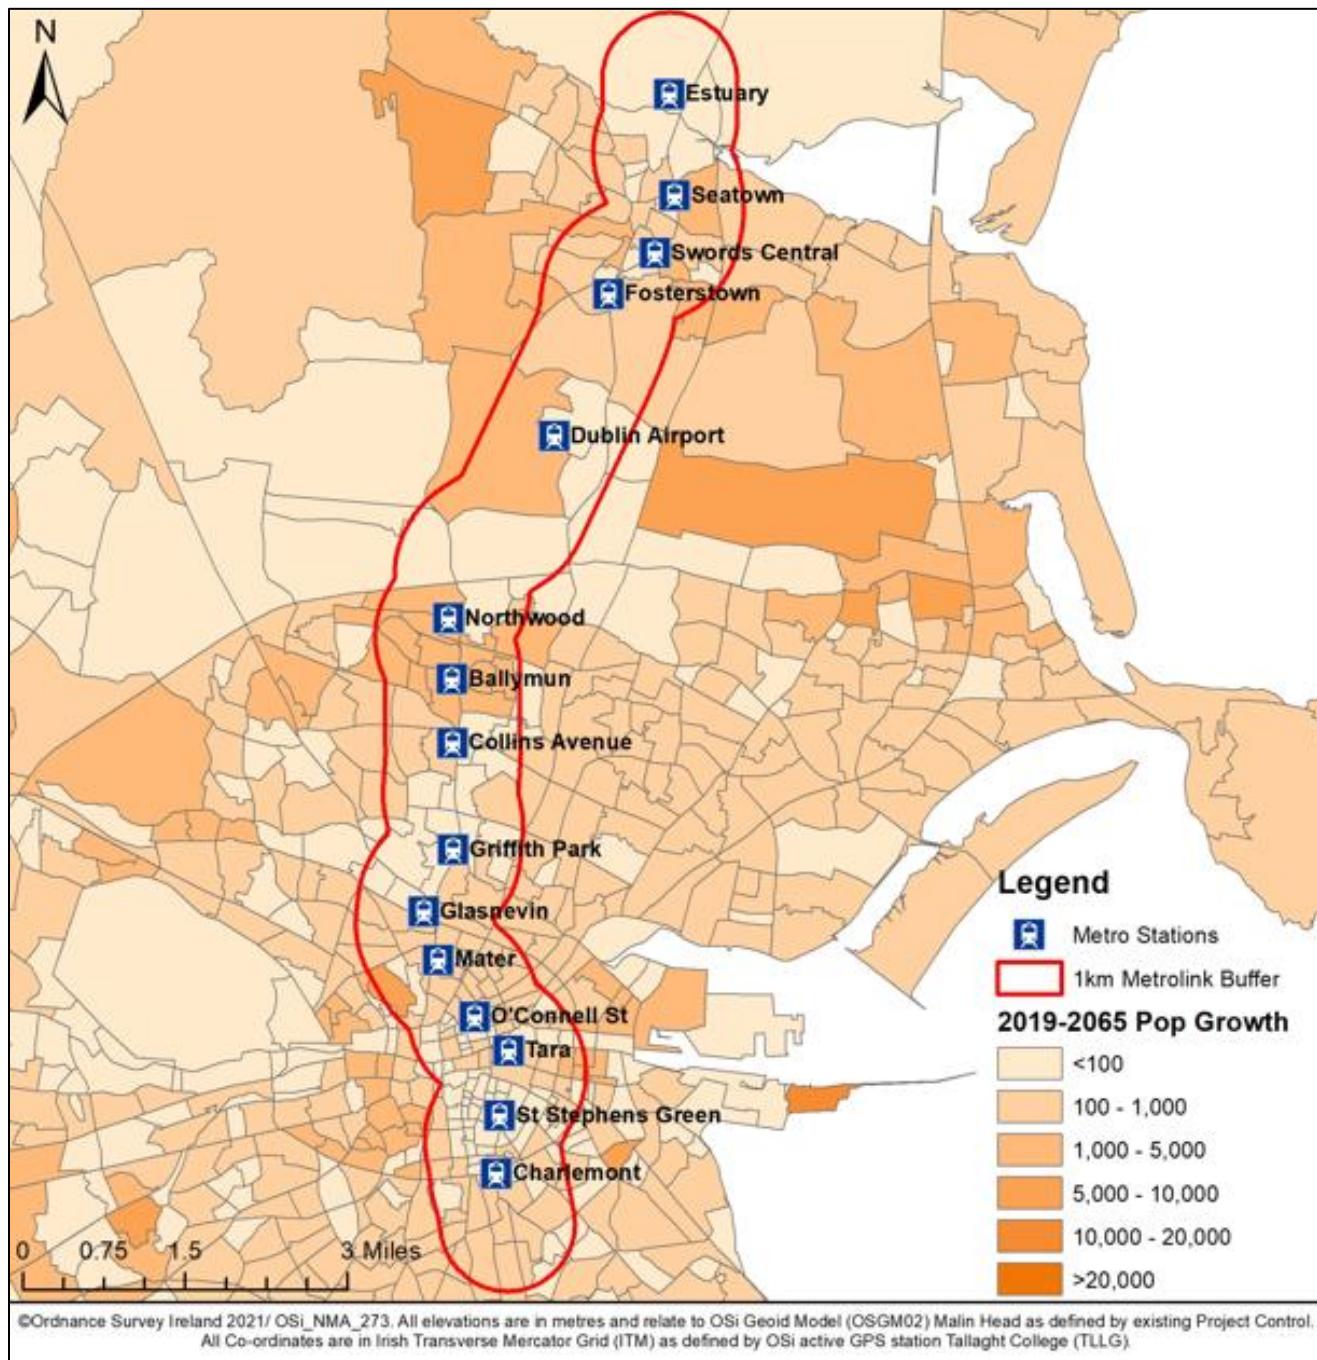

Figure 3.3: Population Growth from 2019 to 2065

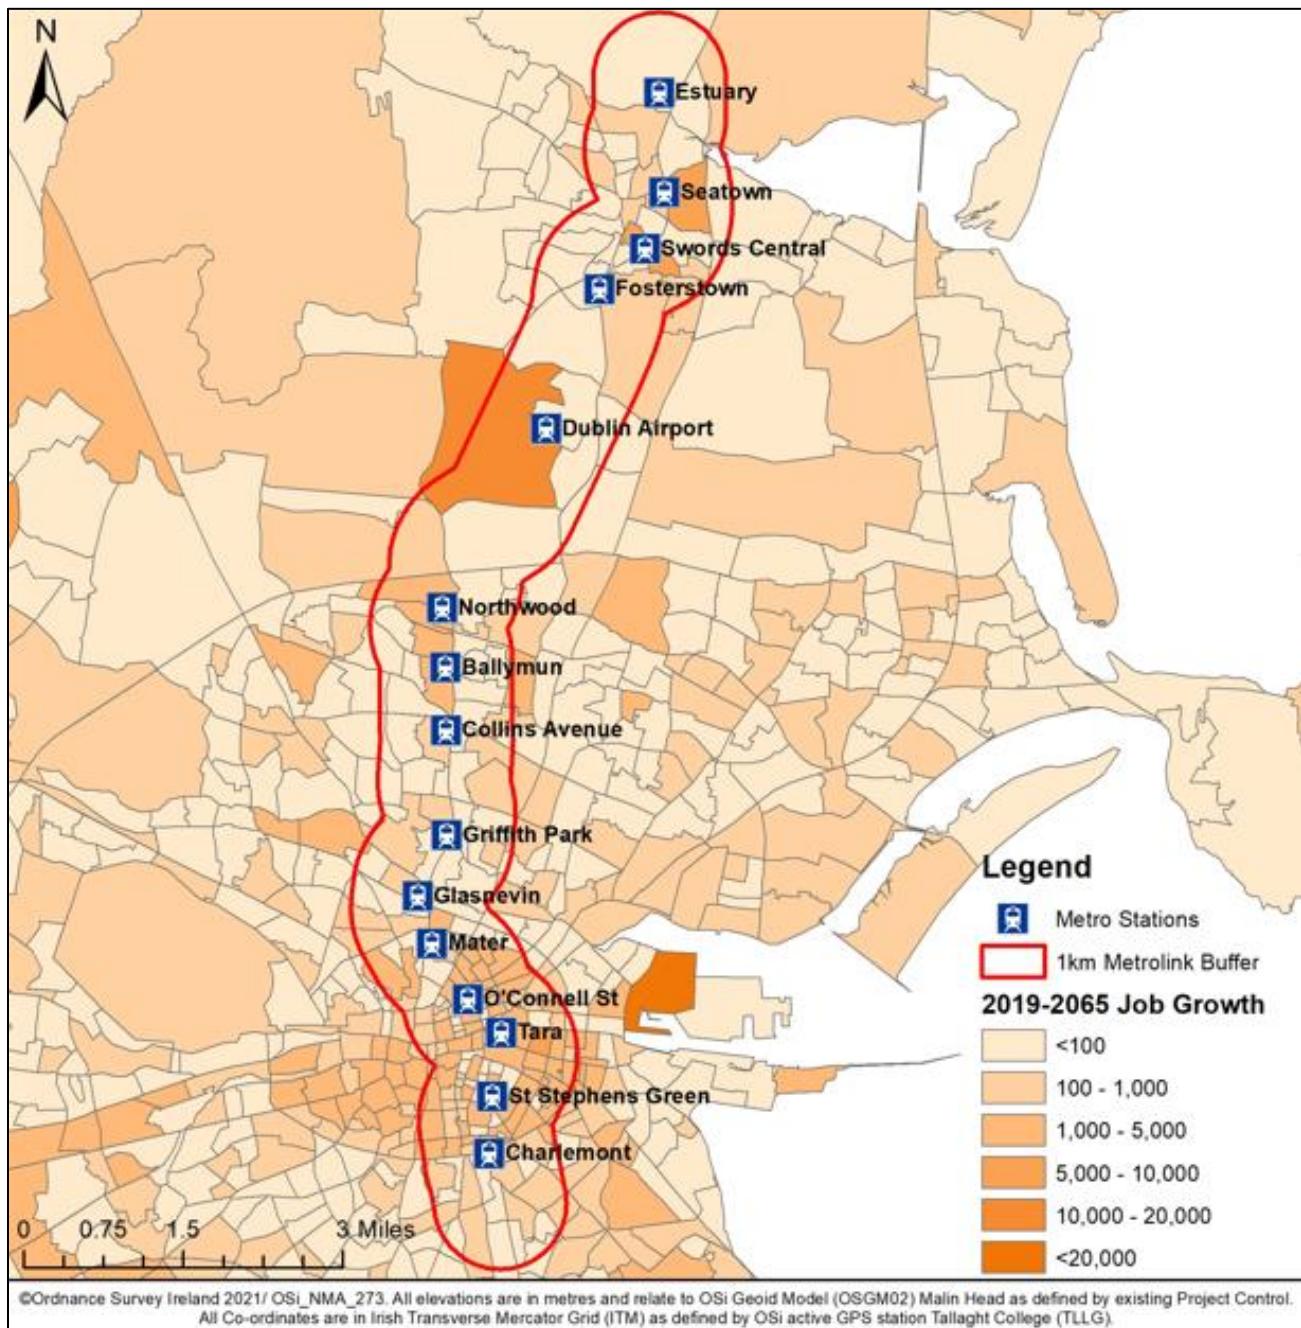

Figure 3.4: Job Growth from 2019 to 2065

3.3 Specific developments

In addition to the forecast growth associated with the typical land use patterns, Dublin Airport is a key growth driver in the corridor and has a different growth associated with flight travel demand. Within the ERM, growth in landside demand is determined for passengers, staff and freight, applied to the Dublin Airport Special Zone. Freight and staff numbers are forecasted on a scaling factor, which are aligned with passenger growth forecasts.

The passenger growth forecasts are based on the central growth forecast from the DTTAS report "Review of Capacity Needs at Ireland's State Airports - August 2018", and the Central Statistics Office (CSO) 2016-2019 Aviation Stats' TAM05. The CSO statistics are used to calculate the growth rate up to 2019 and the growth rate from 2020 to 2050 is determine by interpolation from the 2019 passenger forecast to the 2050 passenger forecast contained within the DTTAS report.

4. Network Development

This section describes the development of the models and scenarios used to assess the Project. This included identifying the area of influence, as well as coding appropriate schemes in the Do Minimum and Do Something scenario networks. 12 model runs have been undertaken, which are detailed in Section 4.5.

4.1 Area of Influence

To determine the main area of influence, two baseline model runs have been carried out; one without the Project, and one with the Project. The public transport and highway outputs from these two runs have been compared to identify the area of influence of the Project, and the results are provided in the 'Area of Influence' Technical Note.

- 2018 Do Nothing - 2018 present day model, without the Project alignment and stations; and
- 2018 Do Something - 2018 present day model with the Project alignment and stations.

The area of influence for the Project can be seen in Figure 4.1. As expected, the main area of influence is in North Dublin directly adjacent to the Project, due to the walking catchment, the proximity of the Project to the counties in the North of Leinster, and the easy access to the proposed park and ride for car users and interchange for passengers on public transport from these areas. The area of influence also extends to the West and South of Dublin along major radial corridors, and the M50 due to opportunities to combine Luas Green Line trips with the Project, and to access the Park and Ride Stations.

The impacts of the Project can and do extend beyond this area of influence, however this area of influence has been used to identify an area where any future network schemes would be included within the future forecast models.

Figure 4.1 Area of Influence for the Project

4.2 Scenario Description

The assessments for the Operational Phase have been carried out using the following scenarios, as presented in Table 4.1:

- Scenario A – Do Committed Minimum
 - ‘Do Minimum’ (2035, 2050, 2065)
 - ‘Do Something (2035, 2050, 2065)
- Scenario B – Likely Future
 - ‘Do National Development Plan (Do NDP)’ (Do Minimum and Do Something 2035)
 - ‘Do Greater Dublin Area Transport Strategy (Do GDA)’ (Do Minimum and Do Something 2050, 2065).

Table 4.1: Modelled Transport Scenarios in Operational Phase

Scenario	Description
Do Minimum-Scenario A	Committed transport schemes in the absence of the Project
Do Something - Scenario A	Scenario with the Project and committed transport schemes only.
Do Minimum-Scenario B	Scenario with planned schemes under the NDP for delivery by 2035 for Opening year (2035) and planned schemes under the Transport Strategy for the GDA for the Design Year (2050) and the Forecast Year (2065), in the absence of the Project
Do Something - Scenario B	Scenario with the Project with planned schemes under the NDP for delivery by 2035 for Opening year (2035) and planned schemes under the Transport Strategy for the GDA for the Design Year (2050) and the Forecast Year (2065)

4.2.1 Do Minimum (Committed) Scenario (Scenario A)

Transport Infrastructure Ireland’s (TII) Project Appraisal Guidelines for National Roads Unit 4.0 – Consideration of Alternatives and Options PE-PAG-02013 (PAG) (TII, 2016) states the following in relation to the Do Minimum: “*The Do Minimum option provides the baseline for the establishing the economic, integration, safety, environmental and accessibility impacts of all options*”. As such, ensuring an appropriate Do Minimum scenario is essential to the robust appraisal of the proposed Project. “*The Do Minimum option should include those transportation facilities and services that are committed within the appraisal period*”. As such, all schemes which are considered to be committed have been included in the Do Minimum Scenario. Committed schemes included in this scenario include, but are not limited to:

- Luas Green Line Capacity Enhancement – Phase 1;
- BusConnects Dublin Area Bus Network Redesign; and,
- BusConnects Fares and Ticketing.

More information on the Do Minimum Scenario is available in the Transport Modelling Plan (Appendix A9.3).

The Project Appraisal Guidelines (PAG) also makes a clear distinction between Committed and Planned Schemes:

"(a) "Planned" improvements that are included in the fiscally constrained long-range plan for which the need, commitment, financing, and public and political support are identified and may be reasonably expected to be implemented; and

(b) "Committed" improvements that have been progressed through planning and are either under construction or are programmed into the capital expenditure budget.

The Do Minimum option should consider "committed" schemes alone as the inclusion of "planned" improvements may lead to a set of scheme options that incorporate projects that may not happen."

4.2.2 Do Minimum (Likely Future) Scenario (Scenario B)

This scenario represents the likely future receiving environment and is based on the delivery of the schemes identified within the National Development Plan for 2035 and based on the implementation of the NTA's GDA Transport Strategy for 2050 and 2065. As such, this model scenario considers the cumulative impacts of interactions between other projects that are most likely to impact on transport movements in the area. Schemes included in this scenario are, but are not limited to:

- Luas Green Line Capacity Enhancement - Phase 2;
- Luas Finglas;
- Luas Lucan;
- BusConnects Core Bus Corridors (planned 16 corridors); and
- DART Expansion.

4.2.3 Do Something Scenario(s)

These scenarios include the provision of the proposed Project, it is simply the Do Minimum scenarios in addition to the operation of the proposed Project. Assumptions for the strategic modelling are detailed in Table 4.2, such as service pattern, headways, fares, capacity (vehicle), crowding curve and waiting curve, or boarding and transfer penalties.

Table 4.2: Modelling Parameters

Assumptions	2035	2050	2065
Service Pattern	Estuary-Charlemont	Estuary-Charlemont	Estuary-Charlemont
Headways	2min	2min	90seconds
Fares	Integrated ticketing (as used for BusConnects).	Same	Same
Capacity (/Vehicle)	125 seat/500 crush	Same	Same
Crowding Curve	As ERM standard crowding curve for Luas	Same	Same
Waiting Curve / Boarding Penalties / Transfer Penalties	As standard RMS/ERM curve & penalties These are: 10min board penalty all modes 15min transfer penalty to/from rail 15min transfer penalty Dublin Bus to Dublin Bus Otherwise, 5min transfer penalty.	Same	Same

The current proposed alignment of the Project is shown in Figure 4.2. The Dardistown station will only service the depot and not all services will stop at the station, accordingly the Dardistown station was coded as a “non-stopping” station within the model runs.

Figure 4.2 Preferred Project Alignment

4.3 Modelled Scenario Summary

12 model runs have been undertaken for the assessment of the Operational Phase for the purposes of the EIAR. The scenarios cover the base year, opening year and forecasted years and a range of different sensitivity tests, as summarised in Table 4.3.

Full model results are contained within the Appendices of this report.

Table 4.3: Modelled Scenarios

Model Year		Run Code	Description
2035	Scenario A	AFQ	2035 Do Minimum (DM)
	Scenario A	AFR	2035 Do Something (DS)
	Scenario B (Enhanced Network Do NDP)	AFK	2035 DoNDP Do Minimum (DM)
	Scenario B (Enhanced Network Do NDP)	AFL	2035 DoNDP Do Something (DS)
2050	Scenario A	AFS	2050 Do Minimum (DM)
	Scenario A	AFT	2050 Do Something (DS)
	Scenario B (Enhanced Network Do GDA)	AFM	2050 DoGDA Do Minimum (DM)
	Scenario B (Enhanced Network Do GDA)	AFN	2050 DoGDA Do Something (DS)
2065	Scenario A	AFU	2065 Do Minimum (DM)

	Scenario B (Enhanced Network Do GDA)	AFO	2065 DoGDA Do Minimum (DM)
	Scenario B (Enhanced Network Do GDA)	AFX	2065 DoGDA Do Something (DS)

5. Model Validation/Calibration

This section provides an overview of the NTA ERM model validation along with the convergence statistics for the modelling undertaken for the Project.

5.1 NTA Model

Details on calibration and validation of the NTA's ERM model is contained with the model development report (Regional Modelling System Model Development Report – East Regional Model (Model Version 3), with reference to section 13 of that report, the following is noted:

"The model was developed, calibrated and validated in line with current transport modelling guidance, primarily from United Kingdom Department for Transport's Transport Analysis Guidance, building on the work undertaken to deliver Version 2 of the RMS in 2016/2017. Each component was developed using the best available data, such as the 2016 Census, National Household Travel Survey, recent traffic and passenger volume data, standard PT timetable data formats such as Google(sic)¹ Transit Feed Specification and GPS-based journey time data."

It further notes the following,

"The ERM was calibrated and validated against the recommended criteria set out in the UK TAG. The level of calibration and validation achieved across each of the model components is of a high standard when considering the model scale and type."

5.2 Model Convergence

ERM incorporates a variable demand model which is run for a fixed number of iterations. Overall and by-mode convergence statistics have been calculated using standard processes which reported convergence measures (GAP) for each of the iterations. The size of GAP values typically increase as forecasts are made over longer periods, so 2050 values are typically larger than those for 2035 results.

Table 5.1 presents a summary of the model convergence from Scenario A model runs, whereas Table 5.2 presents the same for Scenario B model runs. The values obtained for convergence are typical for a model of this size and complexity operating over a medium length forecast period in urban congested conditions. The error range in forecast Project usage arising due to model convergence, at below 4%, is small when compared with the uncertainties of demographic and economic growth over that period. The same would still be the case if the percentage of excess Project trips were added into the convergence percentage error.

¹ GTFS – General Transit Feed Specification.

Table 5.1: Project Model Convergence Summary – Scenario A

Run	Overall GAP					
	AM	LT	SR	PM	OP	Overall
2035 Do Minimum	0.75	1.24	1.31	0.78	1.69	0.99
2035 Do Something	0.81	2.23	0.90	1.07	1.72	1.18
2050 Do Minimum	1.56	2.26	1.33	1.39	1.91	1.61
2050 Do Something	1.78	2.86	1.79	1.79	1.94	2.02
2065 Do Minimum	1.92	2.81	4.55	2.37	1.84	2.71
2065 Do Something	3.20	3.75	3.09	3.83	2.01	3.93

Table 5.2: Project Model Convergence Summary – Scenario B

Run	Overall GAP					
	AM	LT	SR	PM	OP	Overall
2035 NDP Do Minimum	0.95	0.86	0.46	1.33	0.90	0.92
2035 NDP Do Something	0.95	0.79	0.53	1.36	0.89	0.93
2050 GDA Do Minimum	1.91	3.95	2.16	2.11	1.77	2.33
2050 GDA Do Something	2.81	5.47	3.21	3.23	1.81	3.37
2065 GDA Do Minimum	3.20	5.61	2.95	3.86	2.12	3.69
2065 GDA Do Something	2.89	6.29	3.81	2.98	2.05	3.60

6. Modelling Results: Scenario A

6.1 Introduction

The Scenario A runs have been modelled for the years 2035, 2050 and 2065. This section will present details of the following:

- Loading Profiles;
- Overall Network Statistics (Road and Public Transport Networks);
- Boarding and Alighting Numbers;
- Mode Share (including percentage change per zone);
- Public Transport Network Analysis (including Link Flows, Journey Time analysis, Transfers to and from the Project and Passenger Profiles); and,
- Road Network Analysis (including Link Flows and Changes to Road Travel Time).

Model outputs for all time periods can be found in Appendix A.

6.2 Loading Profile

Figure 6.1 and Figure 6.2 show the AM peak period load passengers in each direction for all three forecast years. Figure 6.3 and Figure 6.4 illustrate the PM peak load passengers in each direction. LT and SR results are contained in Appendix A. The loading results for Scenario A are summarised in Table 6.1 below.

Table 6.1: Maximum Loading from Scenario A

Direction	Year	Max Loading	
		AM	PM
Northbound	2035	5,327	8,208
	2050	6,669	10,057
	2065	8,117	12,424
Southbound	2035	10,870	4,312
	2050	12,862	5,475
	2065	15,386	6,965

The loading profile for each year follows a similar trend, increasing in volume each year respectively as a result of the increase in population and jobs in the surrounding area, as noted in Section 3.2. The loading profile has the highest number of journeys heading northbound during the PM peak increasing from 8,208 in 2035 to 12,424 in 2065 compared to the AM increase from 5,327 to 8,117. The highest number of journeys travelling southbound, is during the AM peak as they increase by 42% from 10,870 in 2035 to 15,386 in 2065.

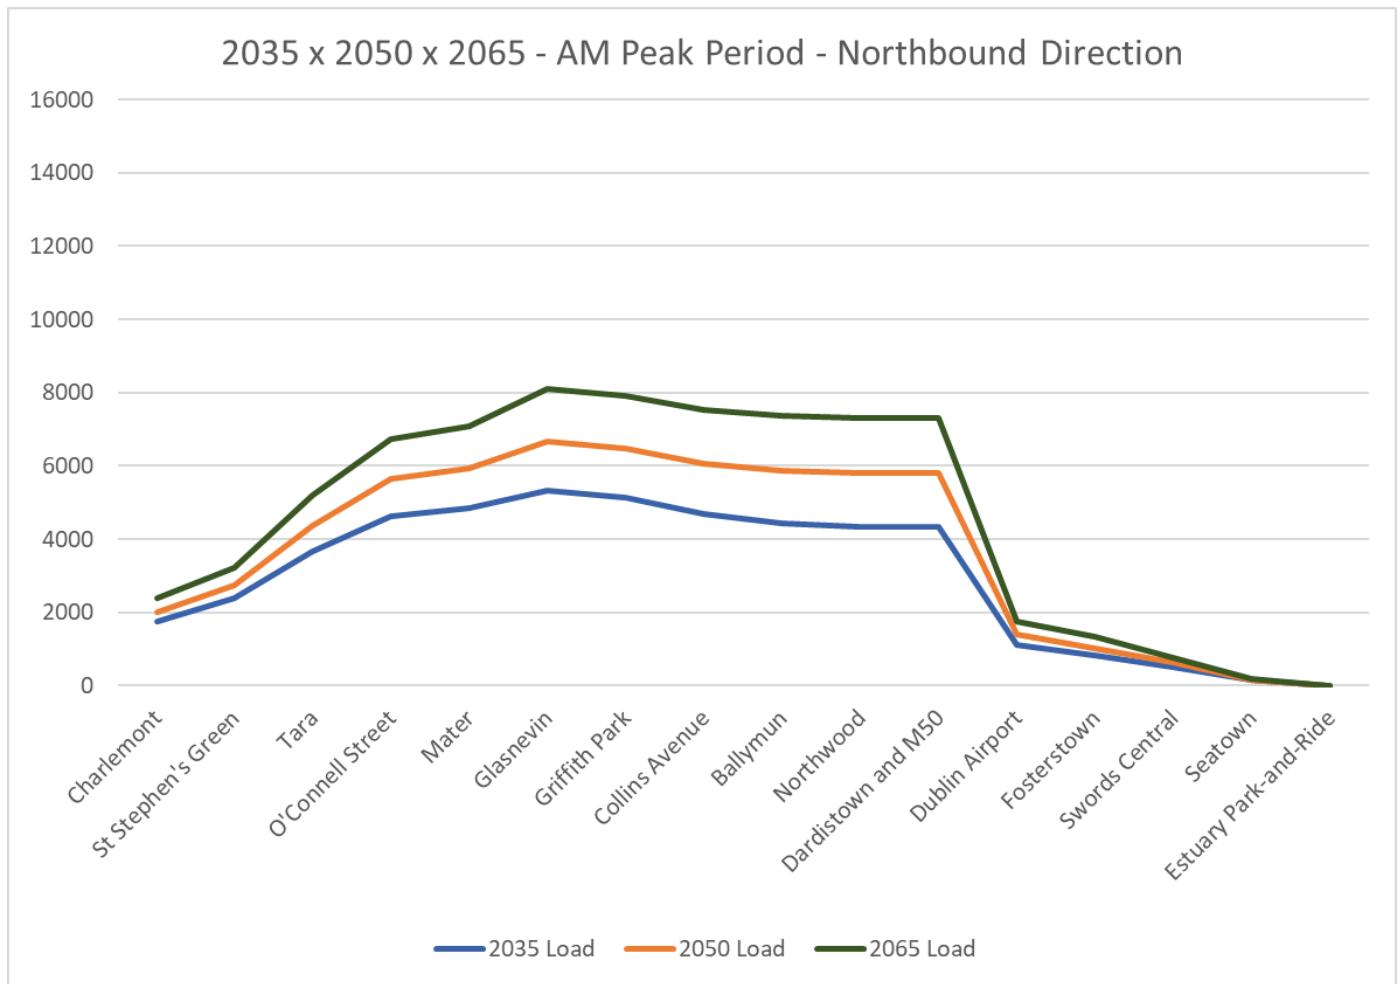

Figure 6.1: Scenario A AM Peak Period - Northbound Forecast Line Flows

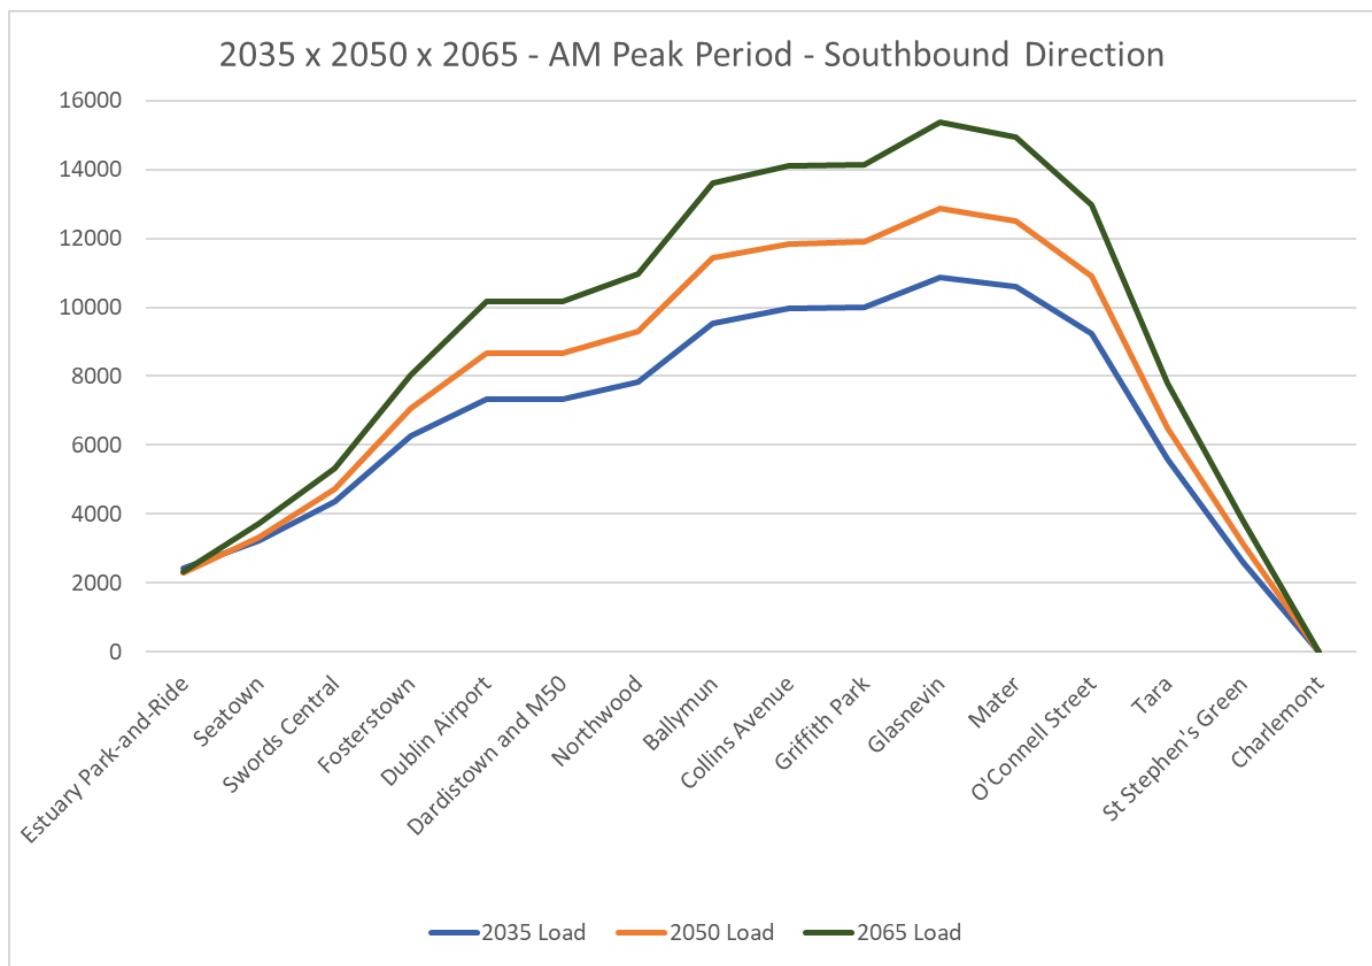

Figure 6.2: Scenario A AM Peak Period – Southbound Forecast Line Flows

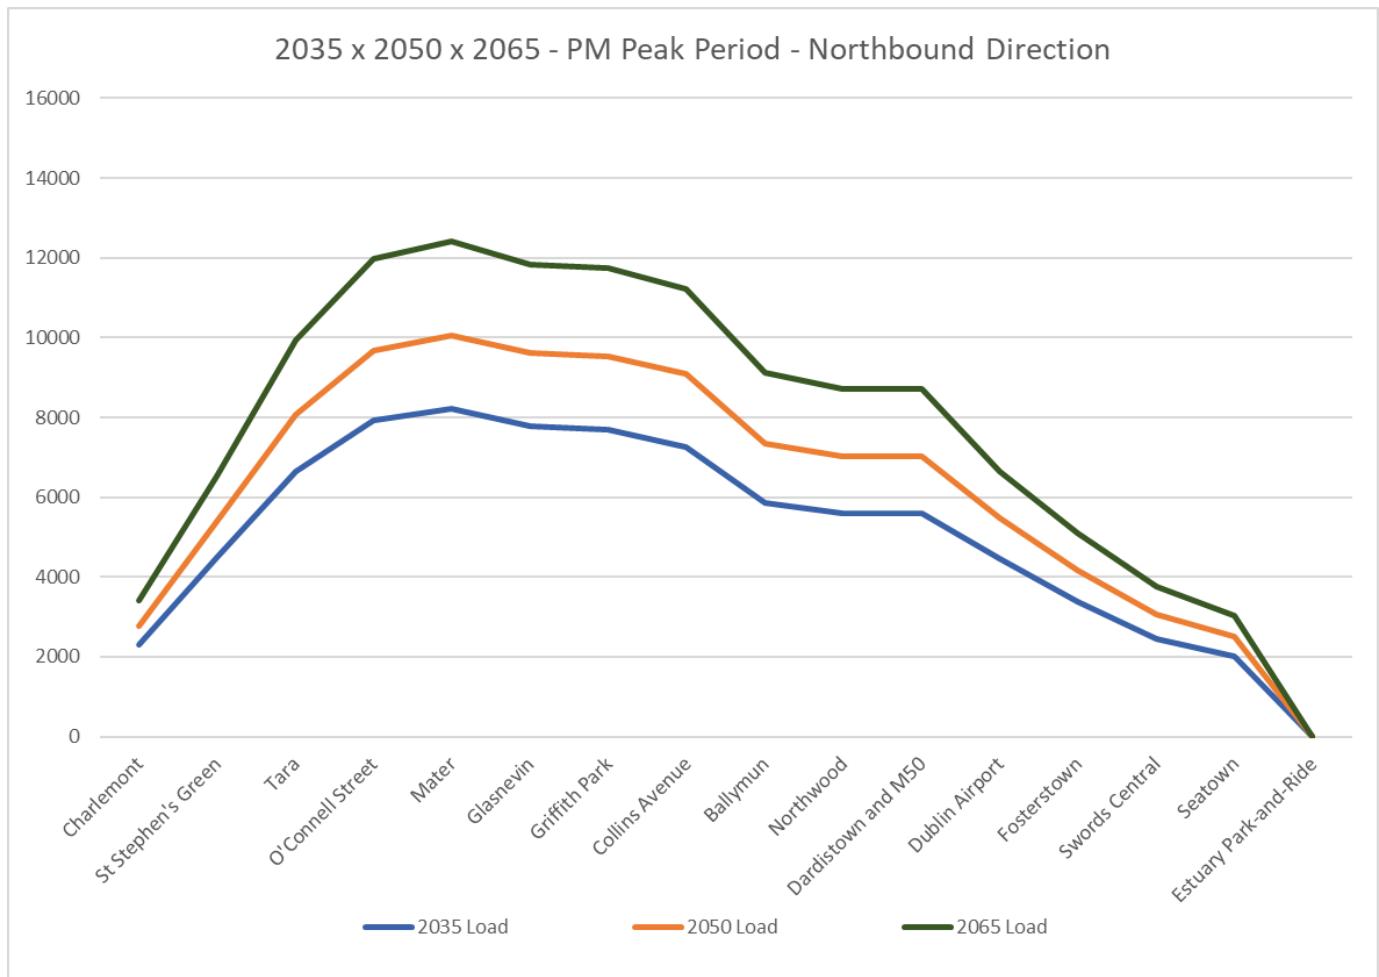

Figure 6.3: Scenario A PM Peak Period Forecast Line Flows

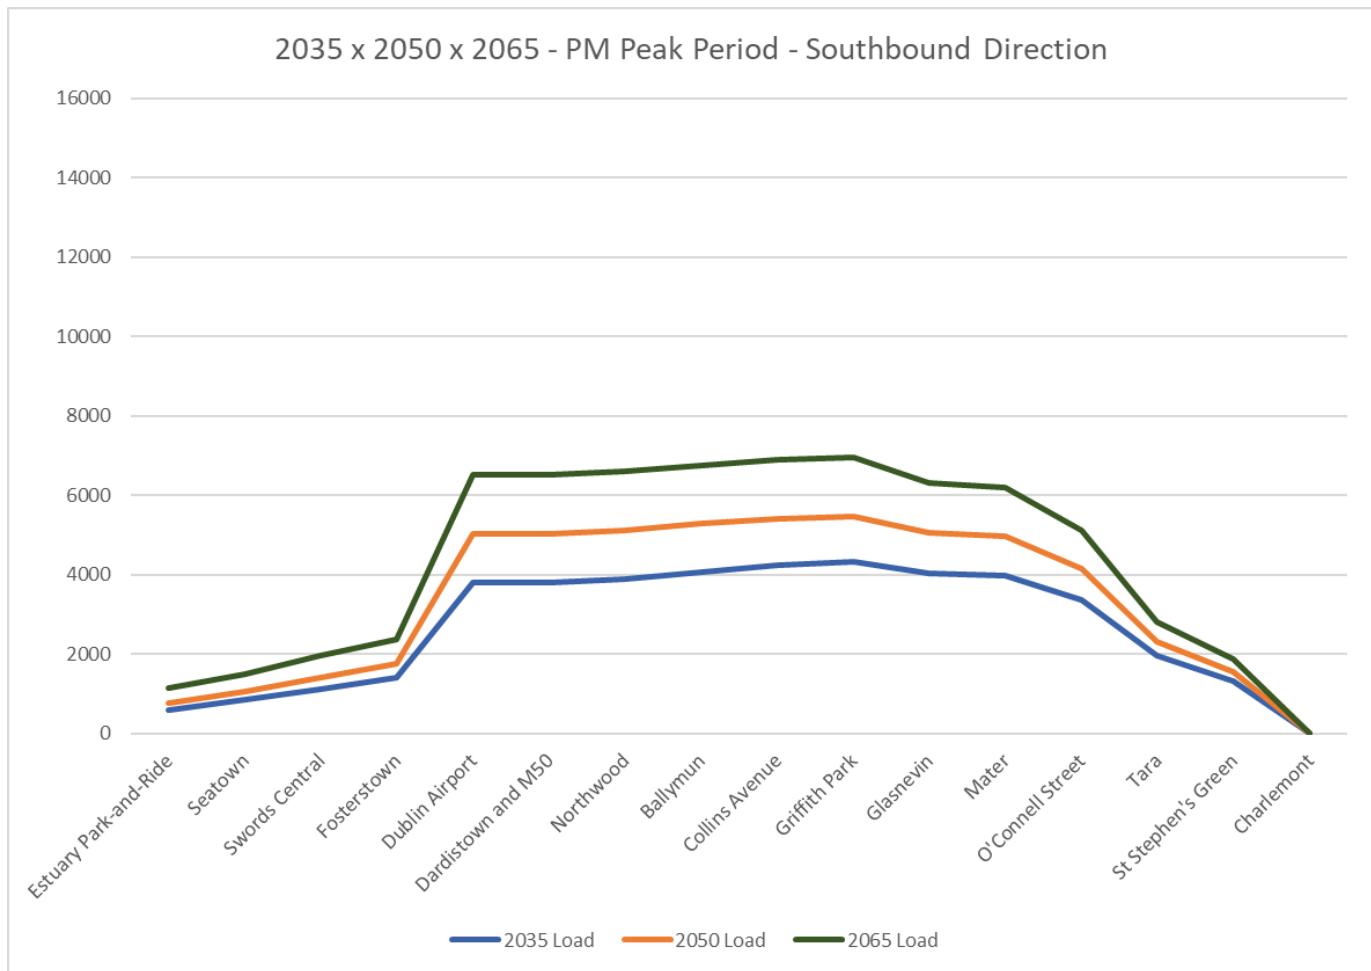

Figure 6.4: Scenario A PM Peak Period Forecast Line Flows

6.3 Boarding and Alighting Numbers

The 12-hour boarding and alighting totals on the Project are shown in Figure 6.5. The boardings and alightings at each station generally increase across the modelled years. Total 12-hour boardings go from 136,923 in 2035 to 175,819 in 2050 (an increase of 28.4% between these years), then to 216,690 in 2065 (an increase of 23.2% between 2050 and 2065).

The busiest stations across all the model periods are, Dublin Airport, Tara Street, Charlemont and O'Connell Street. The Dardistown station is currently only scheduled to operate as a stop for the depot and has been treated as a non-stopping station within the Scenario A runs.

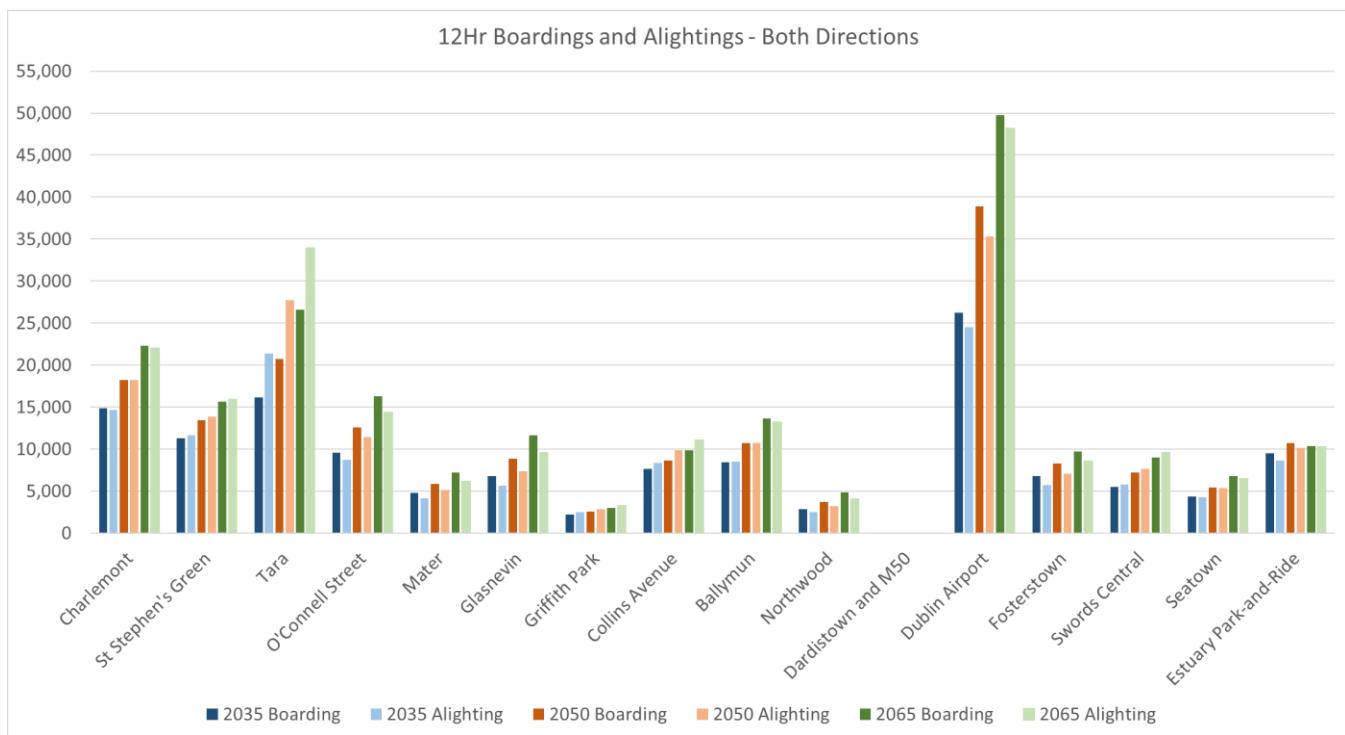

Figure 6.5: Scenario A 12hr Boarding and Alighting

6.4 Overall Network Statistics

A high-level summary of network statistics for the Scenario A comparing the Do Minimum and Do Something scenarios for the AM and PM periods are presented in Table 6.2 and

Table 6.3. A reduction can be seen in the road time travel and distance travelled in the AM and PM periods when comparing the Do Minimum and Do Something scenarios, which can be attributed to the reduction of congestion across areas of the network where people are switching to use the Project and Park and Ride Facility. The average road network speed increases as a result of the Do Something, which can also be related to congestion reduction across the network.

Table 6.2: Scenario A AM Peak Period Summary Network Statistics

Network Statistics	2035		2050		2065	
	Do Minimum	Do Something	Do Minimum	Do Something	Do Minimum	Do Something
Total Road Travel Time (pcu.hrs)	128,560	127,153	154,551	149,291	180,397	171,536
Total Road Distance Travelled (pcu.km)	5,075,029	5,065,917	5,635,554	5,490,816	6,076,605	5,854,831
Average Road Network Speed (kph)	38.6	38.7	37.7	37.8	36.9	37.0

Table 6.3: Scenario A PM Peak Period Summary Network Statistics

Network Statistics	2035		2050		2065	
	Do Minimum	Do Something	Do Minimum	Do Something	Do Minimum	Do Something
Total Road Travel Time (pcu.hrs)	117,623	116,785	137,480	133,181	156,888	150,961
Total Road Distance Travelled (pcu.km)	4,771,729	4,770,283	5,241,733	5,108,662	5,646,909	5,439,956
Average Road Network Speed (kph)	39.5	39.5	38.7	38.8	38.0	38.2

Table 6.4 presents the public network statistics in the Do Minimum and Do Something scenarios in 2035, 2050 and 2065 during the AM 3h period, with Table 6.5 presenting the PM 3h period statistics.

In all scenarios, the total passenger km is higher in the PM period. When comparing the two scenarios during the AM period, there is a reduction of approximately 244,000 passenger km by bus when the Project is in place in 2035. This increases to a reduction of almost 293,000 passenger km in 2050, and a reduction of almost 332,000 passenger km by bus in 2065 when the Project is in place. In total, there is an increase of approximately 145,000 passenger km between the Do Minimum and Do Something scenarios in 2035 AM period. In 2050, the total passenger km travelled increases by approximately 225,000 when comparing the two scenarios. In 2065, the total passenger km travelled over the AM period increases by over 344,000 when the Project is in place, illustrating the positive shift towards public transport use in this scenario.

Table 6.4: Scenario A AM 3h Period Public Transport Network Statistics

Network Statistics	Mode	2035		2050		2065	
		Do Minimum	Do Something	Do Minimum	Do Something	Do Minimum	Do Something
Passenger Km	Bus	1,264,718	1,020,719	1,433,825	1,141,207	1,610,782	1,278,872
	Rail	934,527	929,733	1,166,849	1,205,967	1,419,955	1,516,801
	Luas	375,410	369,076	441,504	441,866	514,062	522,593
	Metro	-	400,062	-	478,492	-	570,809
	Total	2,574,654	2,719,590	3,042,179	3,267,532	3,544,799	3,889,074

When comparing the two scenarios during the PM 3h period, there is a reduction of approximately 196,000 passenger km by bus when the Project is in place in 2035. There is a reduction of almost 227,000 passenger km and 249,000 passenger km in 2050 and 2065 when the Project is in place. In total, there is an increase of approximately 171,000 passenger km between the Do Minimum and Do Something scenarios in 2035 PM peak period. In 2050, the total passenger km travelled increases by approximately 268,000 when comparing the two

scenarios. In 2065, the total passenger km travelled over the PM period increases by almost 441,000 when the Project is in place, illustrating the positive shift towards public transport use in this scenario.

Table 6.5: Scenario A PM 3hr Period Public Transport Network Statistics

Network Statistics	Mode	2035		2050		2065	
		Do Minimum	Do Something	Do Minimum	Do Something	Do Minimum	Do Something

6.5 Mode Share

Mode share comparisons between the Do Minimum and Do Something scenarios have been undertaken to understand the percentage change in modal split between the two scenarios. Similarly, comparisons have also been undertaken to understand the percentage change in modal split from 2035, to 2050 and 2065. Do Minimum and Do Something mode split over 12hrs in Scenario A is shown in Table 6.6.

Table 6.6: Scenario A DM -DS Summary of Mode Split in Scenario A – 12hrs

	2035		2050		2065	
Do Minimum						
	12hr (No. of Trips)	% Mode Split	12hr (No. of Trips)	% Mode Split	12hr (No. of Trips)	% Mode Split
PT	794,921	16.3%	934,217	17.1%	1,080,951	17.8%
Road	2,789,179	57.3%	3,047,259	55.7%	3,287,397	54.1%
Cycle	127,414	2.6%	154,709	2.8%	185,830	3.1%
Walk	1,157,557	23.8%	1,331,561	24.4%	1,519,462	25.0%
Total	4,869,071		5,467,747		6,073,640	
Do Something						
PT (Incl Metro)	836,987	17.1%	988,804	18.0%	1,155,829	18.9%
Road	2,788,703	57.0%	3,029,535	55.2%	3,252,560	53.3%
Cycle	123,403	2.5%	150,012	2.7%	179,738	2.9%
Walk	1,145,113	23.4%	1,321,757	24.1%	1,513,657	24.8%
Total	4,894,206		5,490,107		6,101,784	

In 2035, the mode share of PT (including the Project) increases from 16.3% to 17.1% in the Do Something scenario. In the 2050 scenario, PT (including the Project) increases its mode share by 0.9% between the Do Minimum and Do Something scenarios, whilst Road mode share decreases by 0.5%, indicating a modal shift from private vehicles to public transport when the Project is in place. In 2065, the PT (including the Project) increases its mode share from 17.8% in the Do Minimum scenario, to 18.9% in the Do Something scenario, whereas the Road mode share falls by 0.8%.

6.5.1 Percentage change

Figure 6.6 to Figure 6.8 illustrates the percentage change in road mode share per zone surrounding the alignment, in the AM period.

Throughout the design years, road mode share reduces by up to 5% in a number of zones to the east of the alignment, in areas such as Donabate, and in zones to the south of the M50. At Dublin Airport, the road mode

share decreases by up to 20% in 2065. Similarly, when the Project is in place, the road mode share falls by up to 10% around Swords.

Figure 6.9 to Figure 6.11 illustrates the public transport (including the Project) mode share change along the alignment. The largest increase in mode share can be seen at Estuary station, with an increase of 30%-40% in all years.

With the road mode share reductions seen at Swords and Dublin Airport, there is a corresponding increase in PT (including the Project) mode share. An increase of 5%-20% can be seen in zones in the Swords area, with Dublin Airport seeing an increase of between 10% and 20% in 2065.

Figure 6.12 to Figure 6.17 illustrate the percentage mode share change between the Do Minimum and Do Something scenarios in the PM peak, with Figure 6.12 to Figure 6.14 presenting the change in Road mode share per zone, and Figure 6.15 to Figure 6.17 presenting the change in public transport (including the Project). As with the AM period, Road mode share decreases by up to 30% across all years in the zones at Estuary station as a result of the Park and Ride facility at this station. Similar decreases can be seen in the zones at Dublin Airport, where the largest number of the Project boarding and alighting passengers occur.

As with the AM period, the largest increases in mode share of public transport (including the Project) can be seen at stations along the R132 (in particular, Estuary station) and at Dublin Airport. The Project corridor at Ballymun and Dublin City University also sees increases of between 1% and 10% as a result of the Project.

6.6 Public Transport Network Analysis

6.6.1 Public Transport Link Flows

Figure 6.18 to Figure 6.19 illustrates the change in public transport flows in the AM and PM peaks when the Project is in place in Scenario A. Reductions on the passenger flow on the bus network can be seen along the M50 Port Tunnel towards Dublin Airport, as well as along the R108 Ballymun Road bus corridor, and the R132 Swords Bypass corridor. Increases in flows can be seen on the Luas Red and Green Lines, and the Maynooth and Kildare DART lines, indicating areas of interchange with the proposed Project.

Table 6.7 and Table 6.8 present the changes in rail-based public transport flows as result of the Project, during the AM and PM peak hours in Scenario A. The AM peak hour is defined as 08:00-09:00, and the PM peak hour is defined as 17:00-18:00. Large increases in flows can be seen on the Luas Green, Maynooth and Kildare lines as result of the interchange at Charlemont and Glasnevin station.

Table 6.7: Changes in Public Transport Flows due to the Project – Scenario A AM Peak Hour

Public Transport Line	2035 Do Minimum	Change MetroLink 2035	% Change 2035	2050 Do Minimum	Change MetroLink 2050	% Change 2050	2065 Do Minimum	Change MetroLink 2065	% Change 2065

6.6.2 Journey Time

Journey time comparisons between the Do Minimum and Do Something scenarios has been undertaken to investigate benefits to journey time with the Project in place. The assessment was carried out for zones located across the city as illustrated in Figure 6.20 and detailed within Table 6.9.

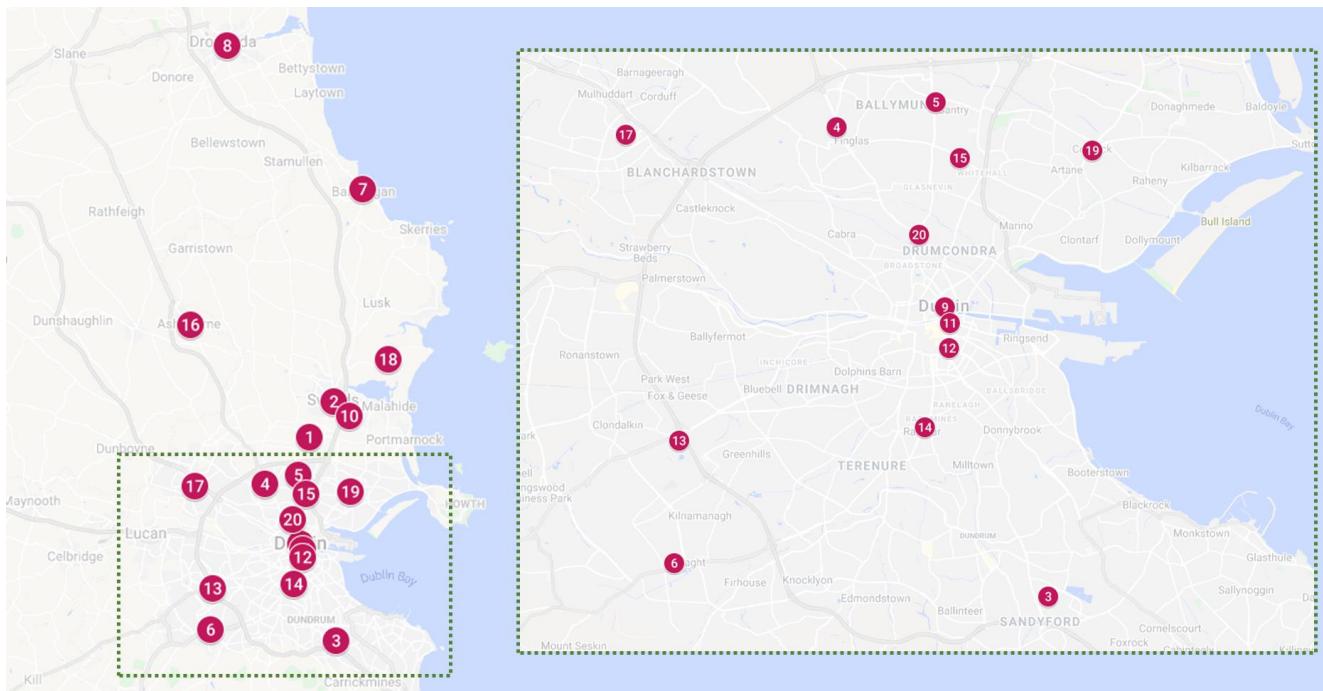

Figure 6.20: Zones assessed for journey time

Table 6.9: Zones assessed for journey time

Nb	Location	Nb	Location	Nb	Location	Nb	Location
1	Dublin Airport	6	Tallaght	11	College Street	16	Ashbourne

The implementation of the Project provides substantial time savings in 2035, 2050 and 2065, from a range of locations in north Dublin, the city centre, and south Dublin. In 2050 AM, the largest journey time savings can be seen in journeys to and from Dublin Airport and Swords Pavilion. The largest journey time saving occurs from Swords Pavilion to Glasnevin, with a saving of approximately 48 minutes in all three years. This is due to the presence of the interchange with the heavy rail network at Glasnevin station, contributing to an overall public transport journey time saving. A saving of approximately 33 minutes can be seen from Dublin Airport to Sandyford at the south of the city in 2050 PM, as a result of the interchange with the Luas Green Line at Charlemont station, and a saving of 30 minutes in 2065, in the PM period.

Overall, in the AM period, journeys to the north (to Swords Pavilion and Swords East) and Dublin Airport see widespread journey time reductions, of up to 32 minutes from Sandyford and Rathgar Road to Swords Pavilion, as a result of the interchange with Luas Green Line. The journey from O'Connell Street to Dublin Airport sees a reduction of up to 24 minutes in 2035 and 2050.

In the PM period, the largest reduction in journey time in 2035 is from Glasnevin to Swords Pavilion, which sees a reduction of approximately 42 minutes in journey time when the Project is in place. This increases to a saving of approximately 43 minutes in 2050 and 2065, respectively. This is due to the interchange with the rail network at Glasnevin station. The Fingal Metro corridor sees consistent journey time savings to and from key locations such as O'Connell Street and St Stephen's Green, with journey time savings of up to 30 minutes and 31 minutes respectively in 2065.

6.6.3 Transfers to and from Other Modes

Table 6.16, Table 6.17, and Table 6.18 show the volume of 12hr transfers to and from the Project in Scenario A, either walking or cycling to/from the surrounding zones, or using other forms of public transport to interchange, in 2035, 2050 and 2065 respectively.

A '**First Boarder**' refers to a passenger who first accesses the public transport network via the Project. Therefore, passengers who transfer from bus/rail/Luas to the Project are not considered 'First Boarders'.

A '**Final Stop**' passenger is someone who exits the public transport network via the Project. Therefore, passengers who transfer to bus/rail/Luas from the Project to continue their journey are not considered to be 'Final Stop' passengers.

In all scenarios, the majority of transfers from 'First Boarders' and 'Final Stop' at Estuary are to/from the Estuary Park and Ride. For all other stations, 'First Boarder' and 'Final Stop' passengers are predominantly in relation to those living within the walking catchments of the stations.

Table 6.16: Transfers to/From Stations – 12hr period in 2035

Station	Transfers To/From MetroLink Stations - 12hr Period				Transfers from MetroLink			
	First Boarders	From Bus	From Rail/DART	From Luas	Final Stop	To Bus	To Rail/DART	To Luas

Transfers To/From MetroLink Stations - 12hr Period								
Station	Transfers to MetroLink				Transfers from MetroLink			
	First Boarders	From Bus	From Rail/DART	From Luas	Final Stop	To Bus	To Rail/DART	To Luas
Estuary Park-and-Ride	7,320	3,057	-	-	7,550	2,723	-	-
Seatown	6,064	745	-	-	6,106	425	-	-
Swords Central	7,913	1,085	-	-	7,411	2,127	-	-
Fosterstown	6,307	3,442	-	-	4,948	3,639	-	-
Dublin Airport	49,043	680	-	-	47,300	854	-	-
Dardistown	-	-	-	-	-	-	-	-
Northwood	4,683	181	-	-	3,839	235	-	-
Ballymun	10,204	3,417	-	-	8,774	4,470	-	-
Collins Avenue	7,043	2,831	-	-	6,795	4,286	-	-
Griffiths Park	2,996	8	-	-	3,259	45	-	-

Station	Transfers To/From MetroLink Stations - 12hr Period				Transfers from MetroLink			
	First Boarders	From Bus	From Rail/DART	From Luas	Final Stop	To Bus	To Rail/DART	To Luas
Glasnevin	2,530	3,310	5,797	-	2,748	1,744	5,071	-
Mater	4,316	2,916	-	-	4,102	2,050	-	-
O'Connell Street	7,507	619	-	8,172	7,053	139	-	7,143
Tara	12,308	9,153	5,084	8	12,631	15,652	5,654	2
St Stephen's Green	10,525	5,130	-	-	11,416	4,520	-	-
Charlemont	8,435	3,854	-	10,008	8,900	4,533	-	8,542

Dublin Airport sees the largest number of transfers to/from zone across all years. After Dublin Airport, stations in the city centre, such as Tara and St Stephen's Green, see significant volumes of transfers to/from zone. Stations such as Collins Avenue and Ballymun, and along the R132, see large numbers of transfers to/from zone due to the surrounding residential catchments of the stations.

Tara sees the largest volume of transfers to/from bus in both scenarios. Estuary and St. Stephen's Green also see large volumes of bus transfers both to and from MetroLink.

Interchange with the heavy rail network is also possible at Glasnevin and Tara stations, however Tara sees a higher volume of transfers to and from this mode.

There is a large volume of transfers to/from Luas at Charlemont and O'Connell Street, as these stations are in close proximity to Luas services (Green Line at Charlemont and both Red and Green lines at O'Connell Street). The transfers to/from Luas at Charlemont is greater than the transfers to/from Luas at O'Connell Street in all three years.

6.7 Road Network Analysis

6.7.1 Link Flows

In comparing the Do Minimum Scenario to the Do Something scenarios in Scenario A, decreases and increases can be seen both in actual and Demand flows on the strategic road network throughout the area of interest. Figure 6.21 displays the AM difference in traffic flows on the highway network with the Project in place, the red shows an increase in flows and the green shows a decrease in flows.

When the proposed Project is in place, there are large reductions in traffic to and from the zones around the alignment to the north of the M50 when comparing the Do Minimum and Do Something scenarios. Notable decreases are seen in traffic flows around Dublin Airport including along the M1 and R132 Swords Bypass.

Increases in traffic flows are seen along the M1 and north Dublin areas as there is an increase of people accessing the Park and Ride facility at Estuary Station.

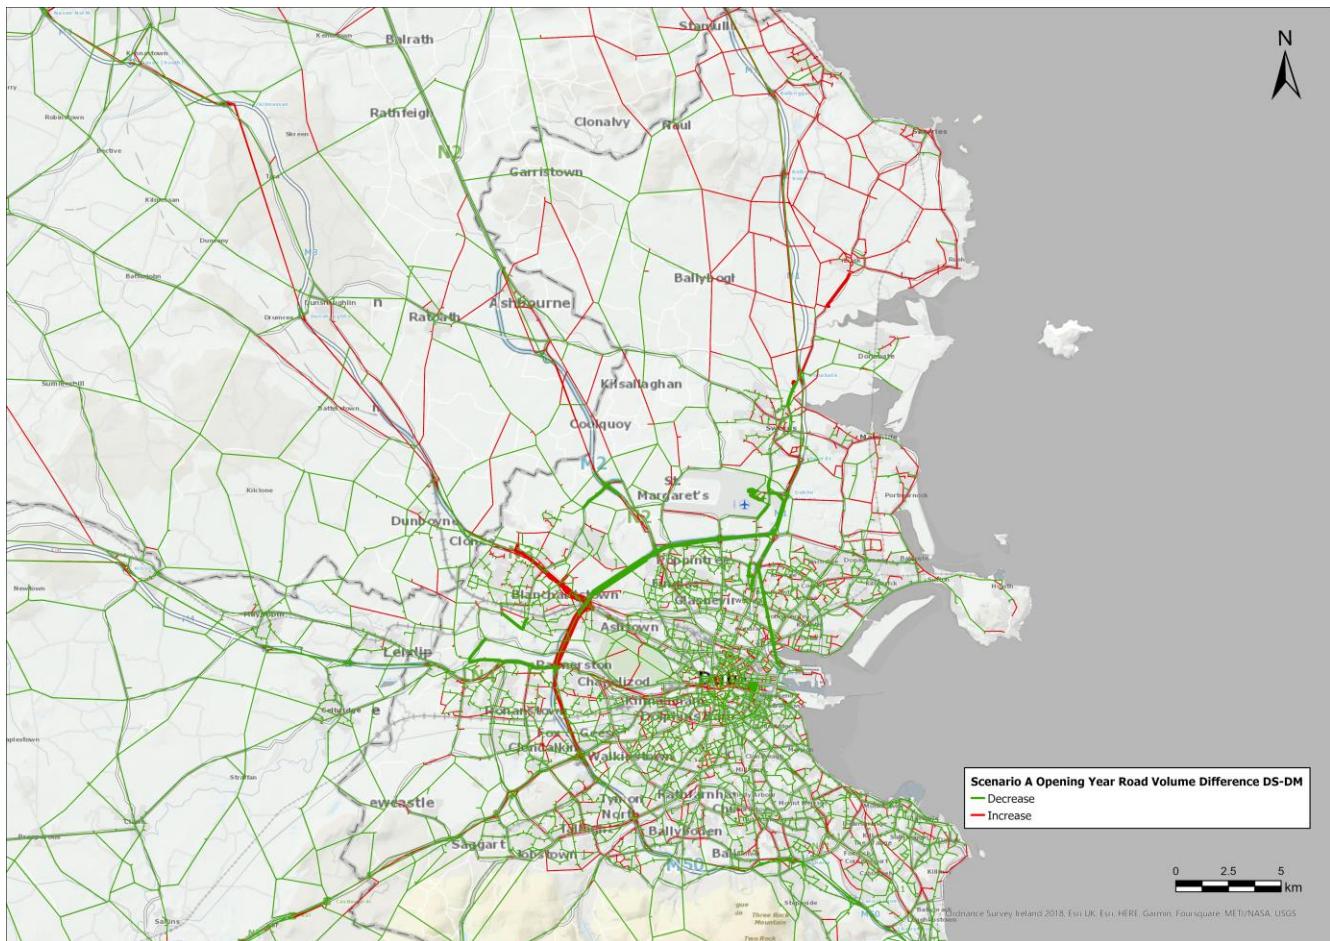

Figure 6.21: Highway Model – Flow Changes Scenario A 2035 AM Peak

Figure 6.22 below shows the AADT traffic flow differences between the Do Something and Do Minimum scenario in 2035, with Figure 6.23 and Figure 6.24 illustrating the same for 2050 and 2065.

There are increases in traffic flow in both directions to the north and south of Swords in all future years. This can be expected due to traffic travelling to the Strategic Park and Ride site at Estuary.

In 2050, reductions in AADT traffic flow can be seen on key national routes such as the M3, M4, M7/M9, M11 and M50. This relates to the transfer of road passengers onto the public transport network, utilising the Maynooth, Kildare and Cork rail lines.

In 2065, reductions in AADT traffic flow can be seen on national routes such as the M1, M3 and M4, as well as throughout the City Centre and Port Tunnel. The largest reduction of up to 5,000 vehicles is on the M1, where it joins the M50, which can be attributed to the presence of the Park and Ride facility.

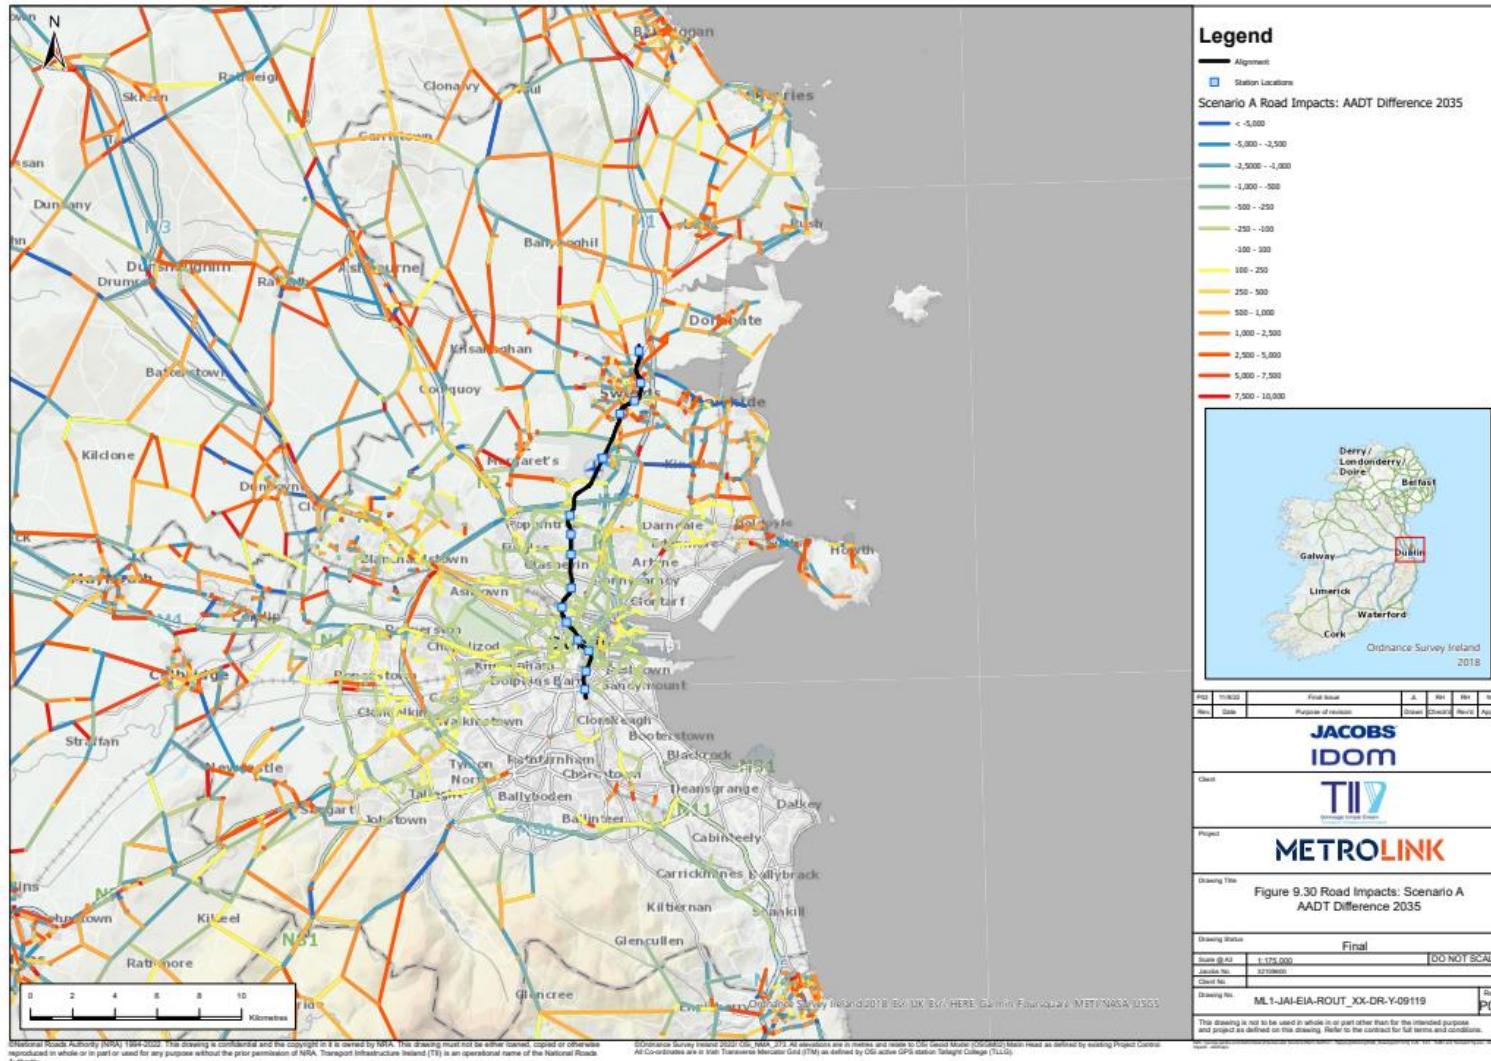

Figure 6.22: Scenario A 2035 DS – DM AADT Traffic Flow

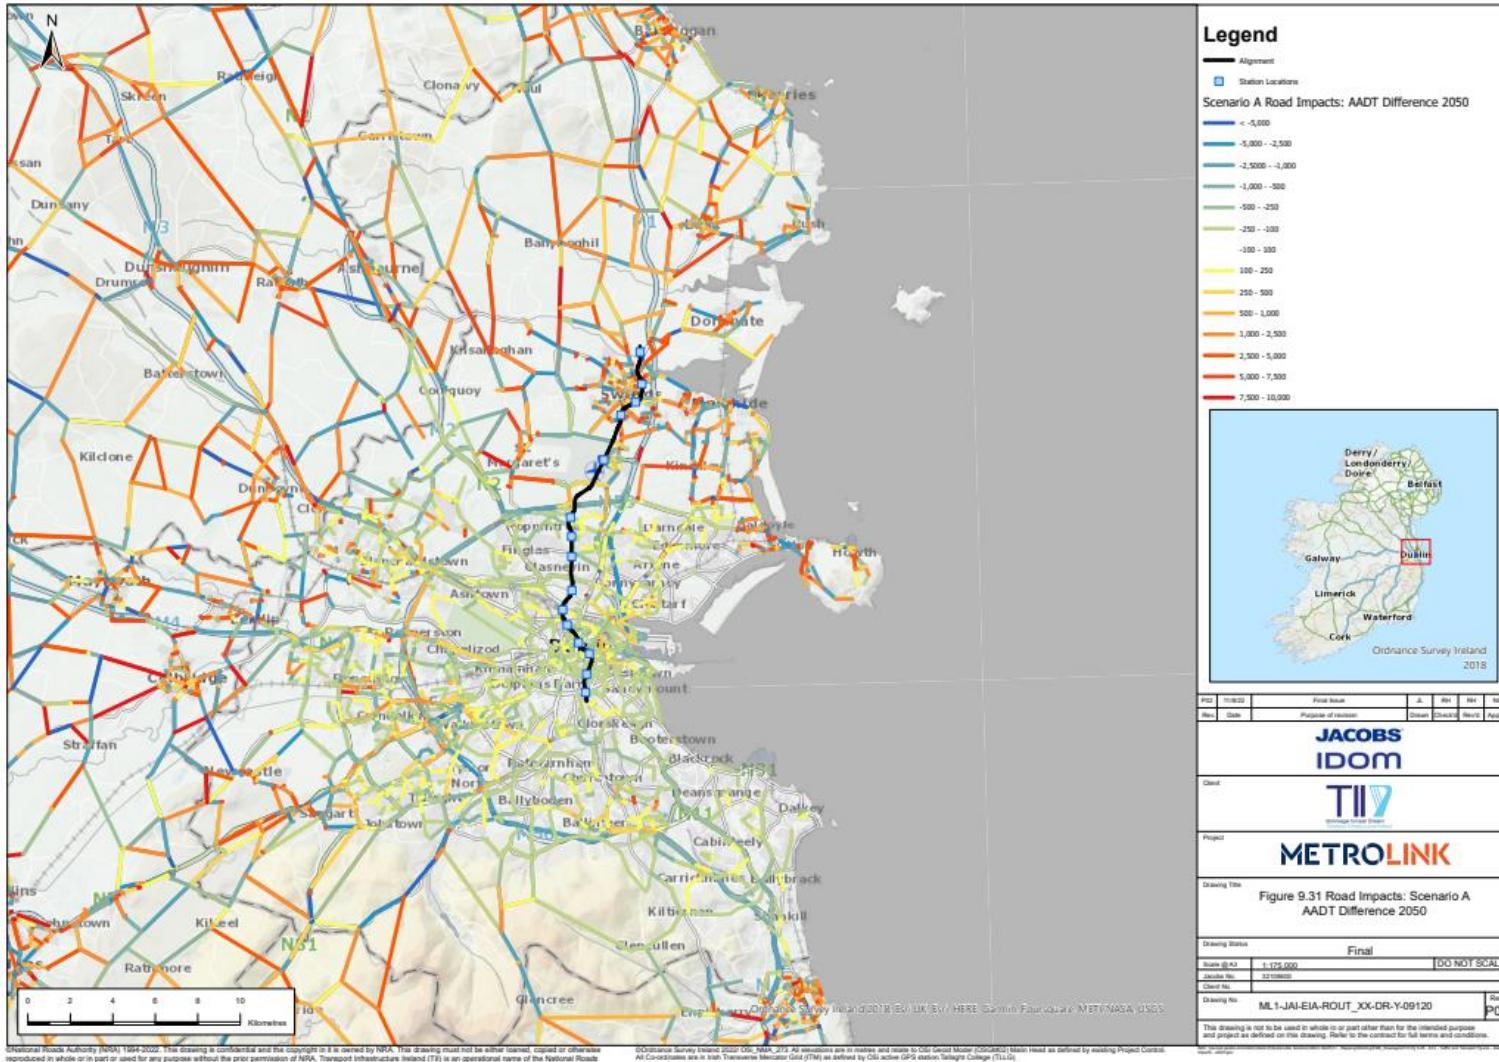

Figure 6.23: Scenario A 2050 DS-DM AADT Traffic Flow

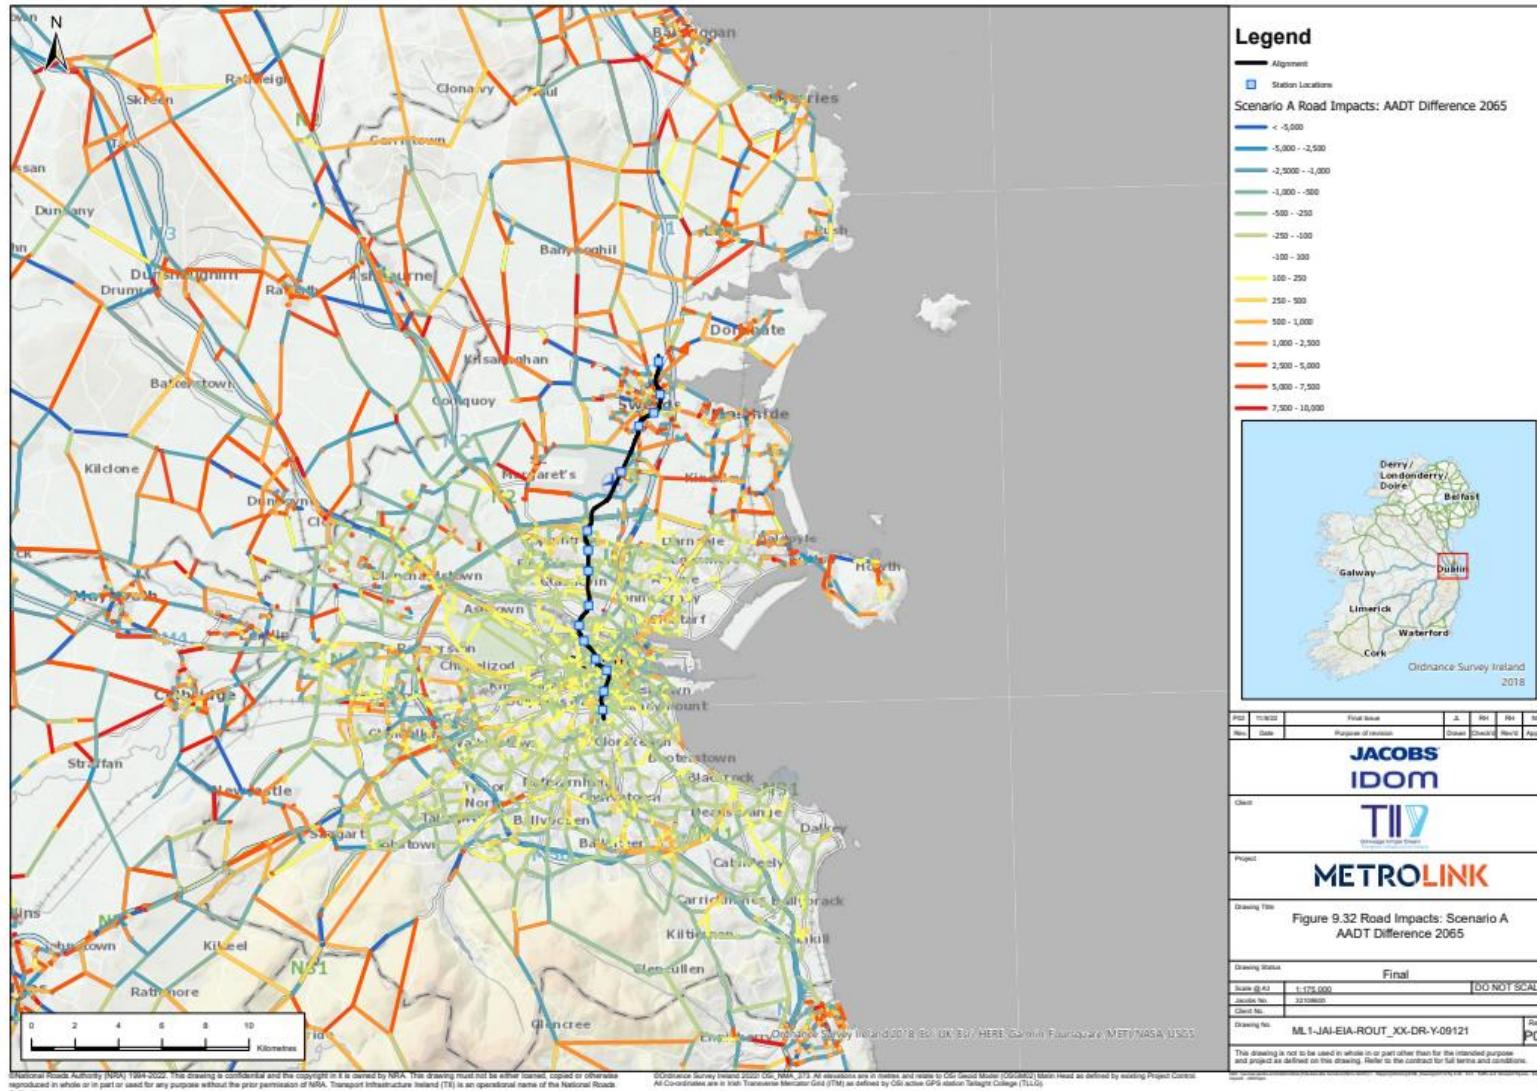

Figure 6.24: Scenario A 2065 DS-DM AADT Traffic Flow

6.7.2 Changes in Road Travel Time

Figure 6.25 to Figure 6.27 shows the changes in road travel time with the Project in place in the AM peak in 2035, 2050 and 2065 in Scenario A.

There are increases in road travel time on links to the North of Estuary Park and Ride in all future years, due to the increase in traffic travelling to and from the Park and Ride Sites in the respective AM peak. There are also road travel time savings between Estuary and Dublin City Centre, due to a reduction in traffic on the road network, as a result of previous highway trips using the MetroLink instead.

The 2035 and 2065 AM peak illustrates a number of impacts to road travel time within Dublin City Centre, however these changes in road travel time are not present in the 2065 scenarios, so may be attributed to variances within the model.

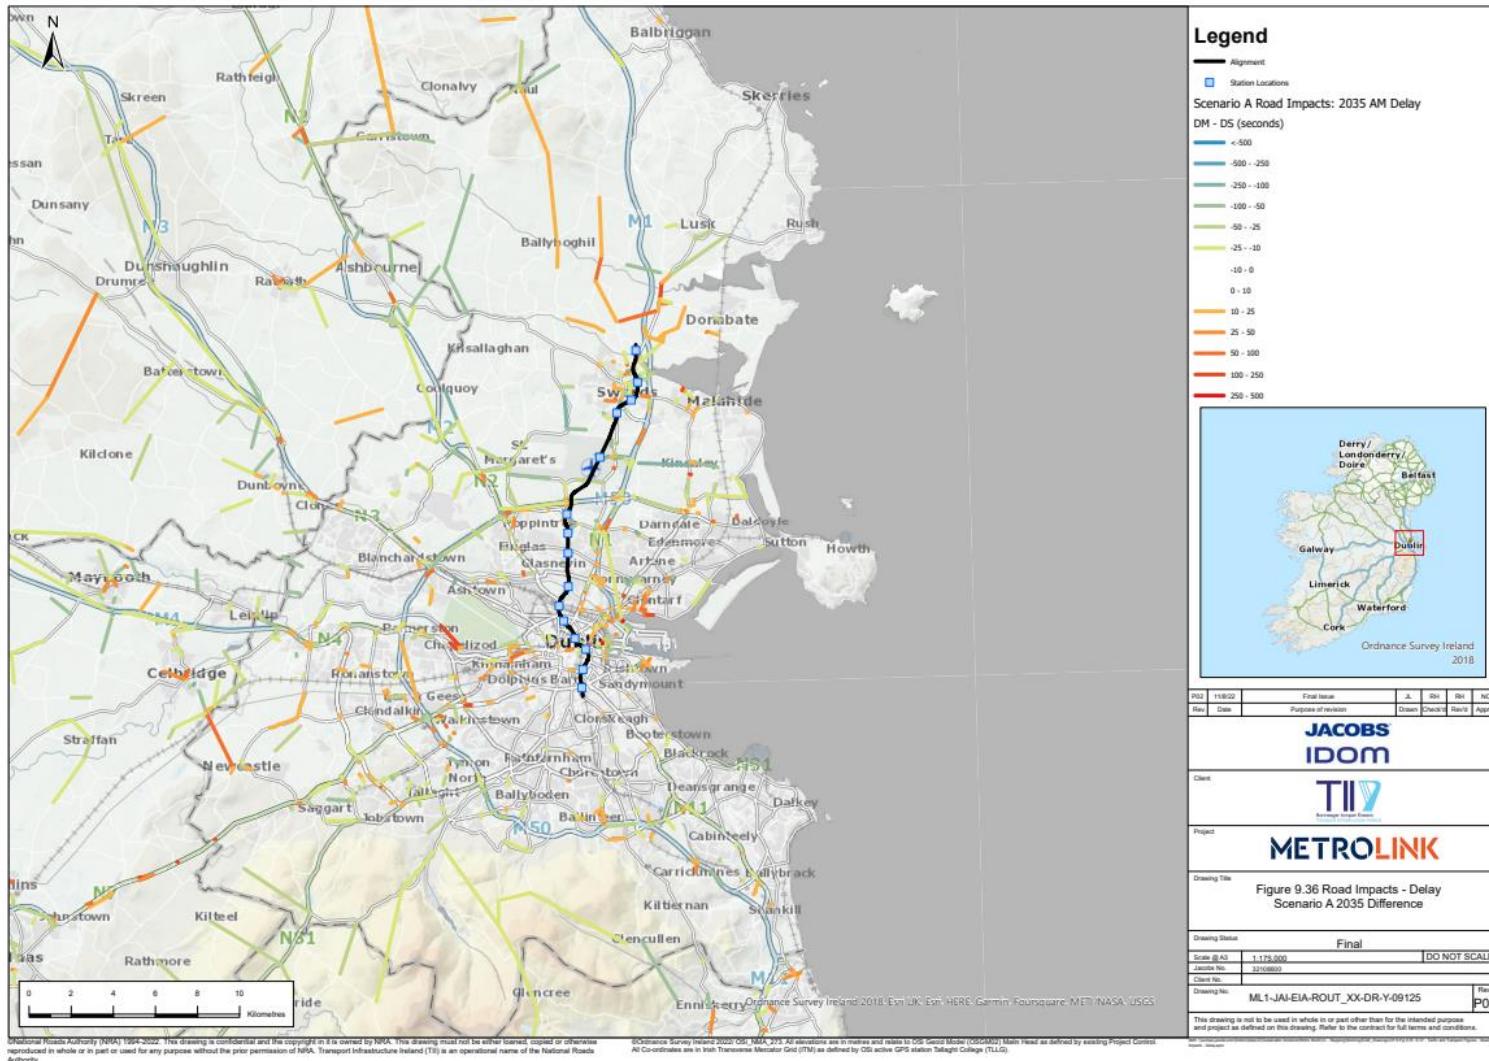

Figure 6.25 - Change in Road Travel Time in Scenario A 2035 AM Peak Period DS

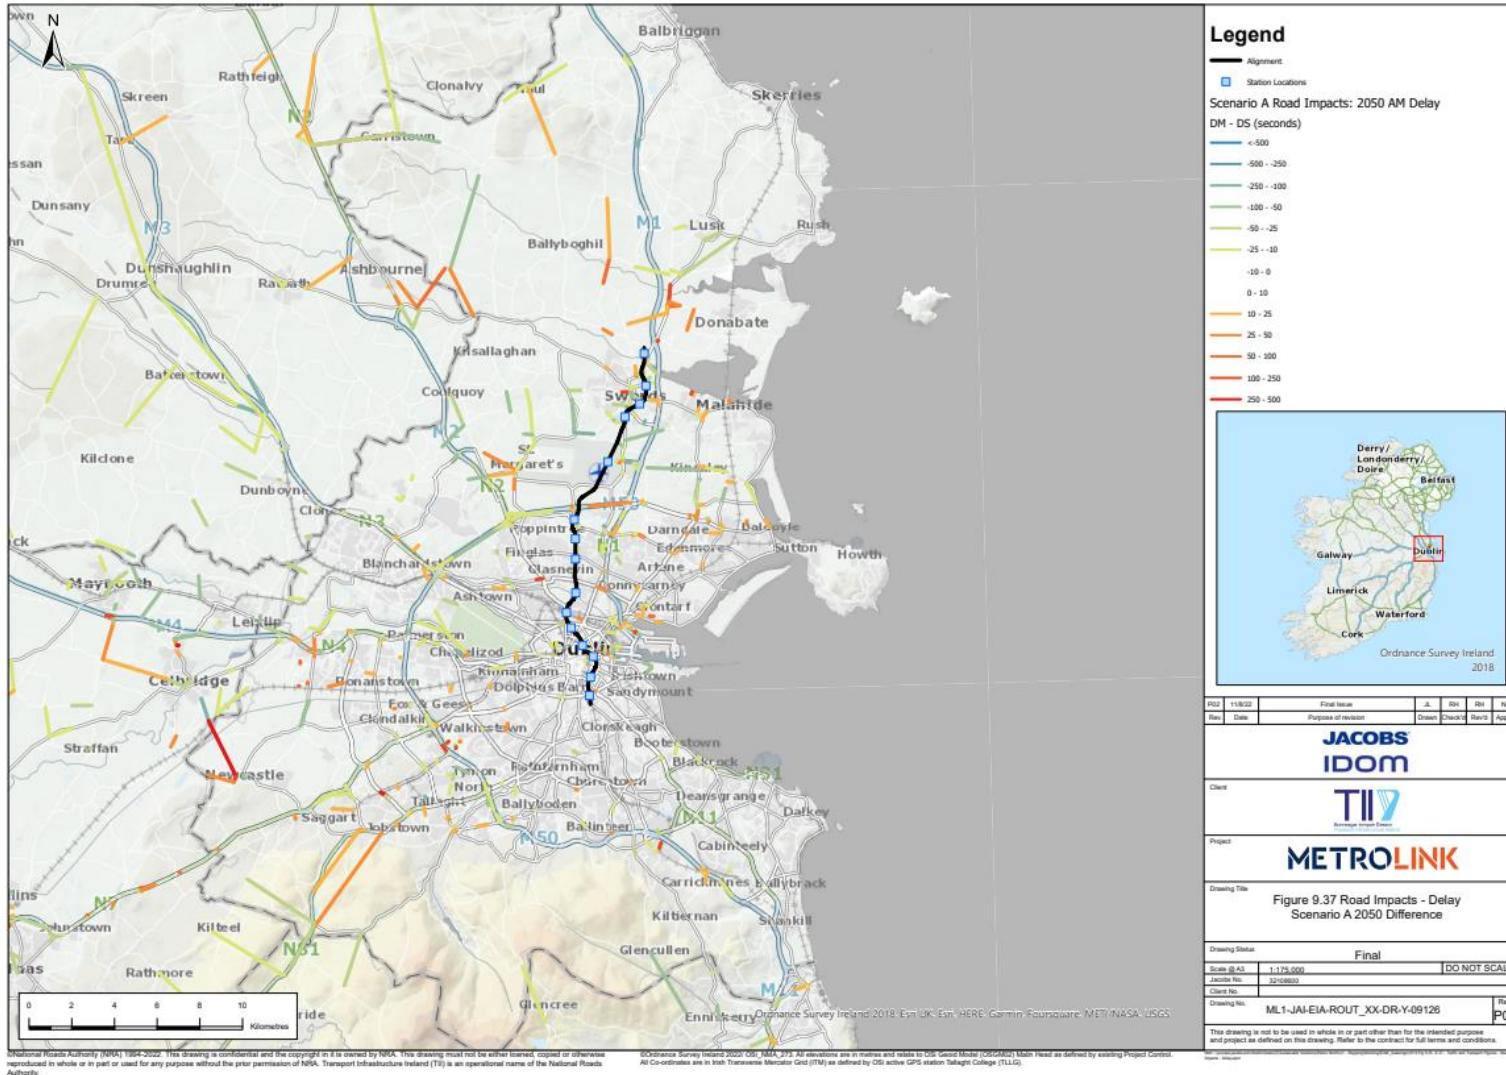

Figure 6.26: Change in Road Travel Time in Scenario A 2050 AM Peak Period DS

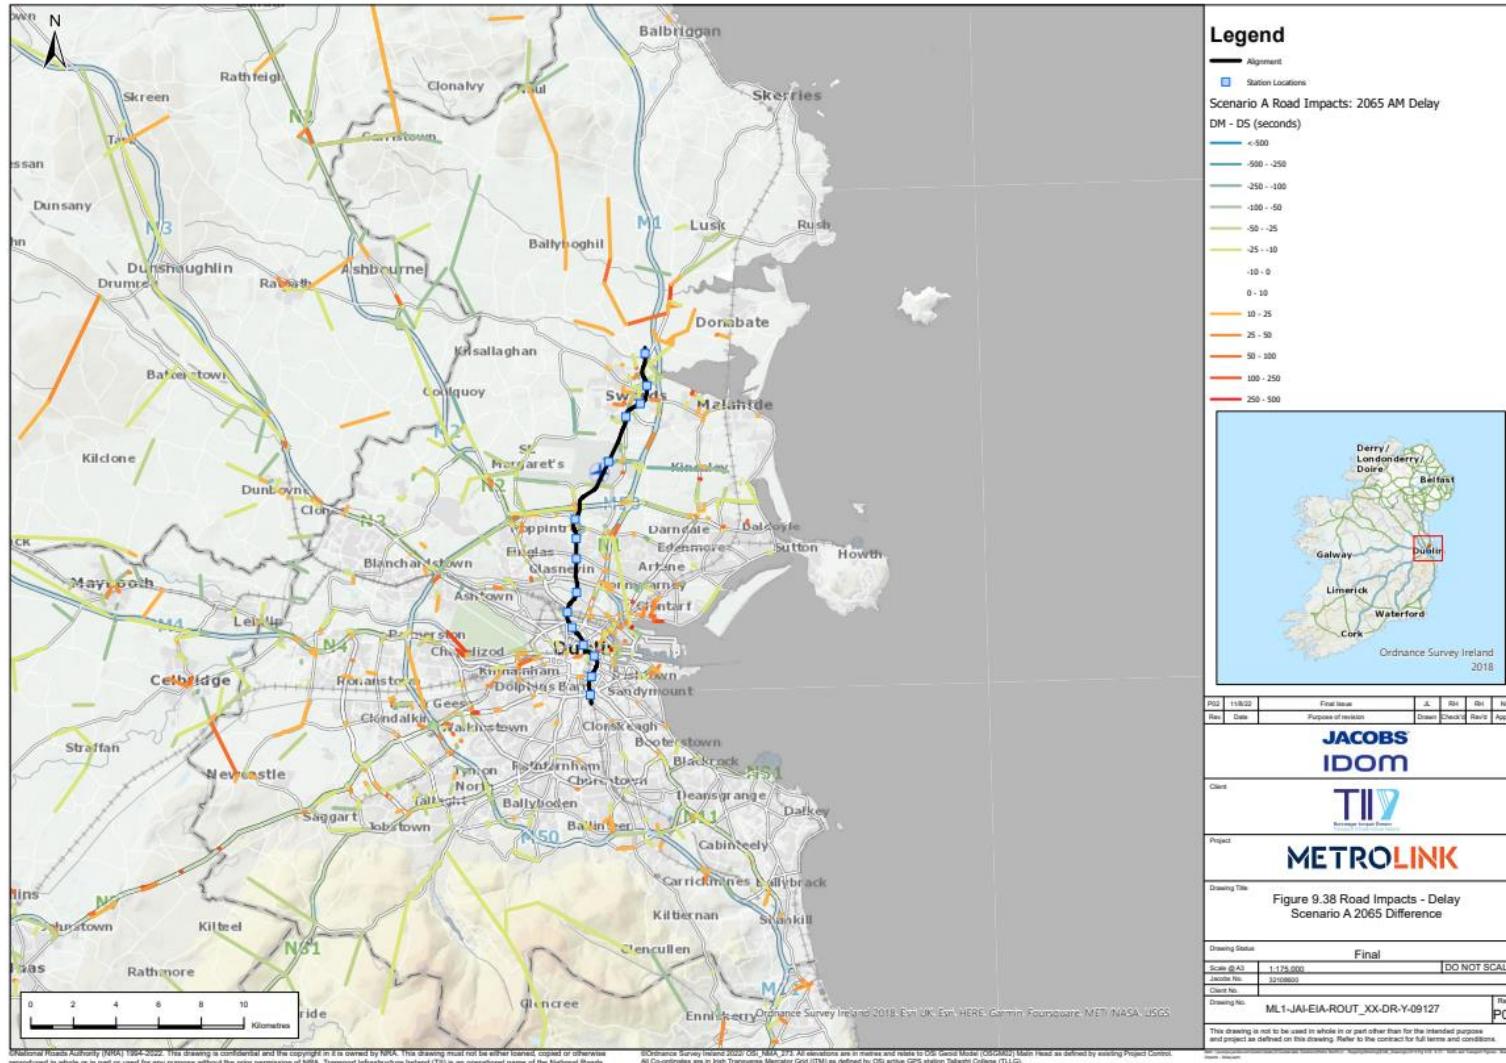

Figure 6.27: Changes in Road Travel Time in Scenario A 2065 AM Peak Period DS

7. Modelling Results: Scenario B

7.1 Introduction

The Scenario B runs have been modelled for the years 2035, 2050 and 2065. This section will present details of the following:

- Loading Profiles;
- Overall Network Statistics (Road and Public Transport Networks);
- Boarding and Alighting Numbers;
- Mode Share (including percentage change per zone);
- Public Transport Network Analysis (including Link Flows, Journey Time analysis, Transfers to and from the Project and Passenger Profiles); and,
- Road Network Analysis (including Link Flows and Road Travel Time Impacts).

Model outputs for all time periods can be found in Appendix A.

7.2 Loading Profile

Figure 7.1 and Figure 7.2 show the AM peak period load passengers in each direction for all three forecast years. Figure 7.3 and Figure 7.4 illustrate the PM peak load passengers in each direction. LT and SR results are contained in Appendix A. The loading results for Scenario B are summarised in Table 7.1 below.

Table 7.1: Maximum Loading for Scenario B

Direction	Year	Max Loading	
		AM	PM
Northbound	2035	5,366	7,526
	2050	6,792	8,724
	2065	7,760	9,616
Southbound	2035	10,046	4,341
	2050	11,251	5,967
	2065	14,022	6,415

The loading profile for each year follows a similar trend, increasing in volume each year respectively as a result of the increase in population and jobs in the surrounding area, as noted in Section 3.2. The loading profile has the highest number of journeys heading northbound during the PM peak increasing from 7,526 in 2035 to 9,616 in 2065 compared to the AM increase from 5,366 to 7,760. The highest number of journeys travelling southbound, is during the AM peak as they increase by 40% from 10,046 in 2035 14,022 in 2065.

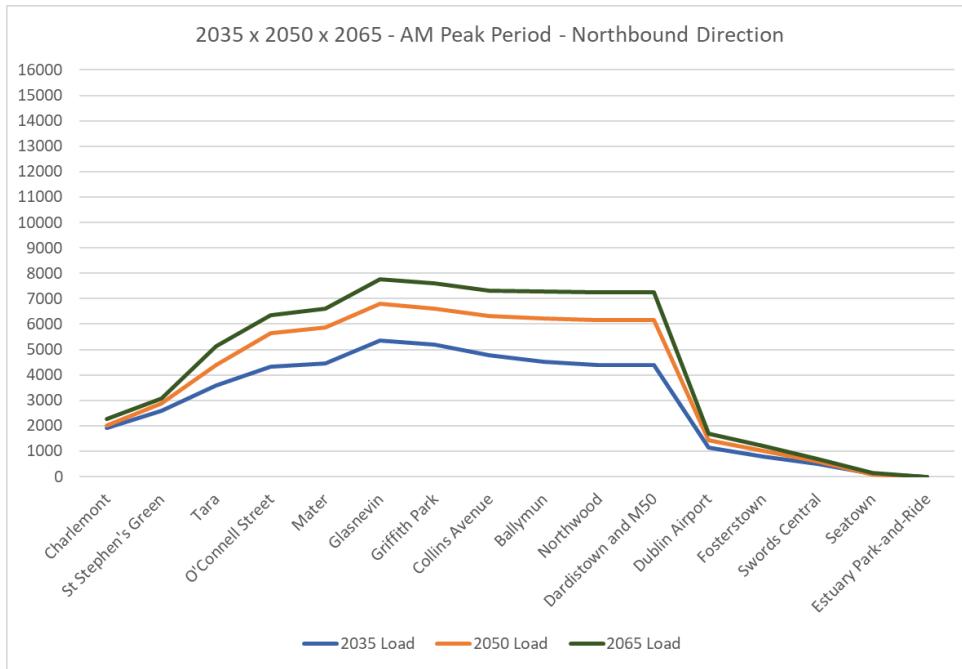

Figure 7.1: Scenario B AM Peak Period - Northbound Forecast Line Flows

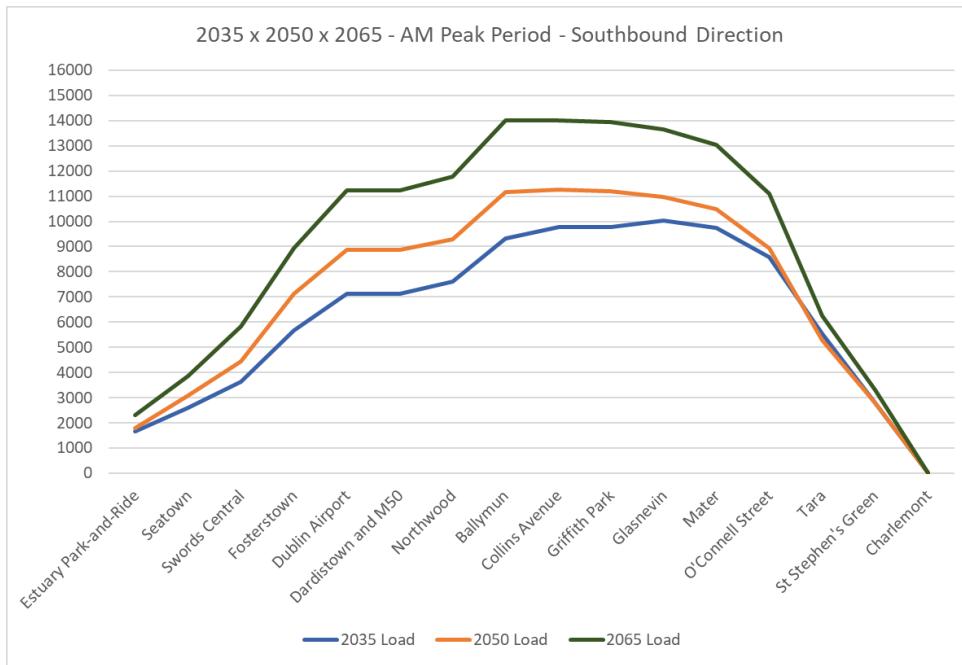

Figure 7.2: Scenario B AM Peak Period – Southbound Forecast Line Flows

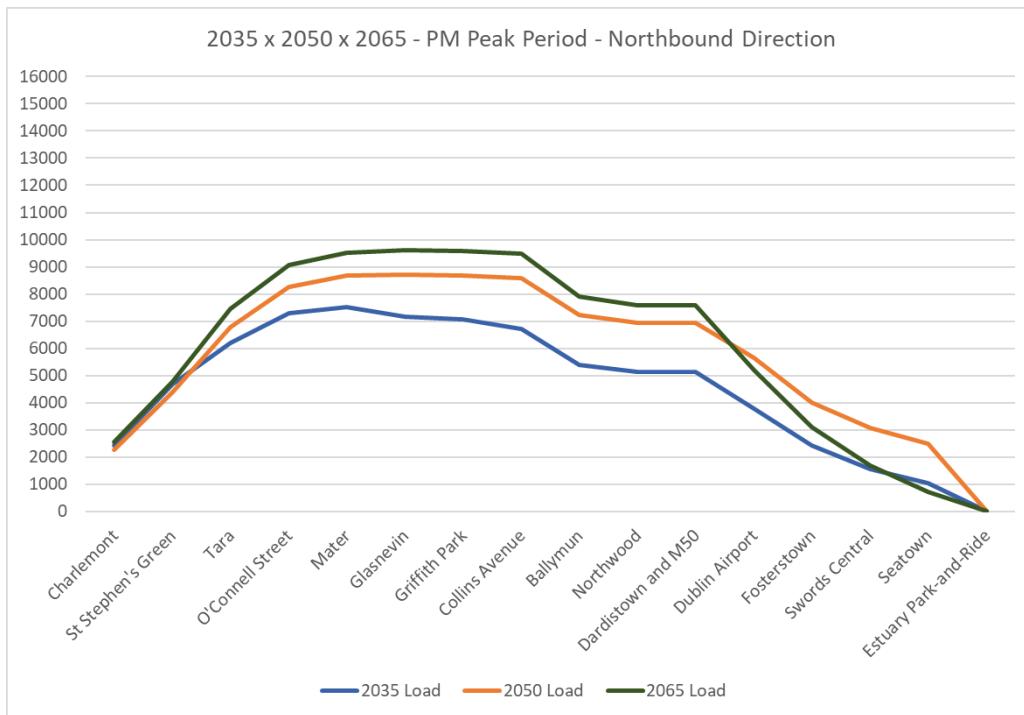

Figure 7.3: Scenario B PM Peak Period Forecast Line Flows

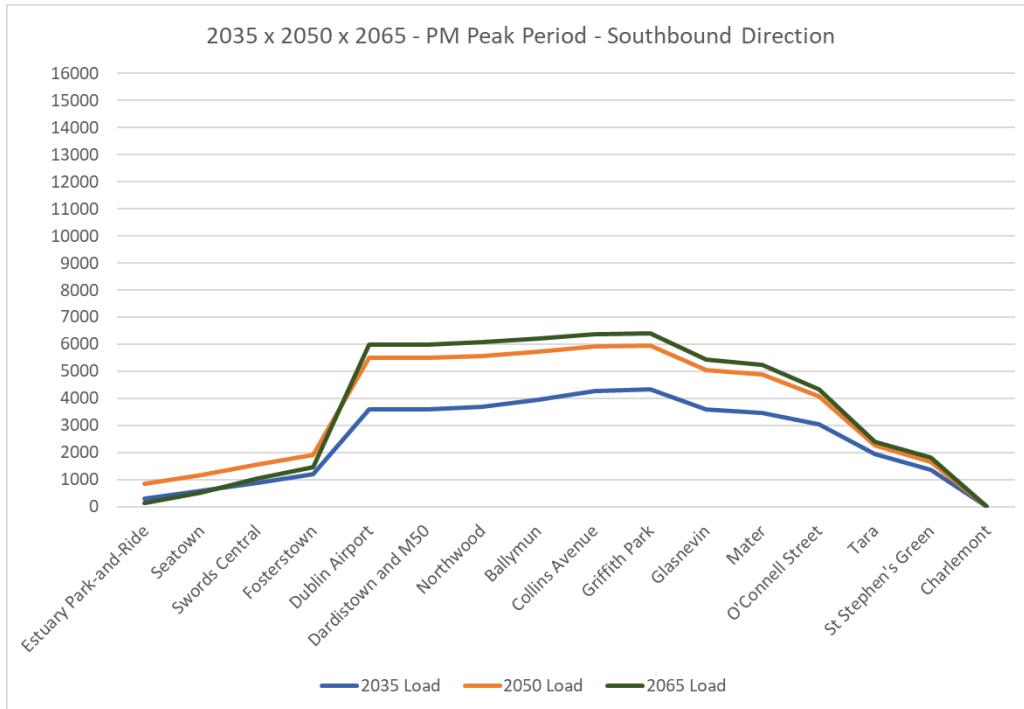

Figure 7.4: Scenario B PM Peak Period Forecast Line Flows

7.3 Boarding and Alighting Numbers

The 12-hour boarding and alighting totals on the Project in Scenario B are shown in Figure 7.5. The boardings and alightings at each station generally increase across the modelled years. Total 12-hour boardings go from 135,388 in 2035 to 169,539 in 2050 (an increase of 25.2% between these years), then to 194,252 in 2065 (an increase of 14.6% between 2050 and 2065).

The busiest stations across all the model periods are, Dublin Airport, Tara Street, Charlemont and St. Stephen's Green. The Dardistown station is currently only scheduled to operate as a stop for the depot and has been treated as a non-stopping station.

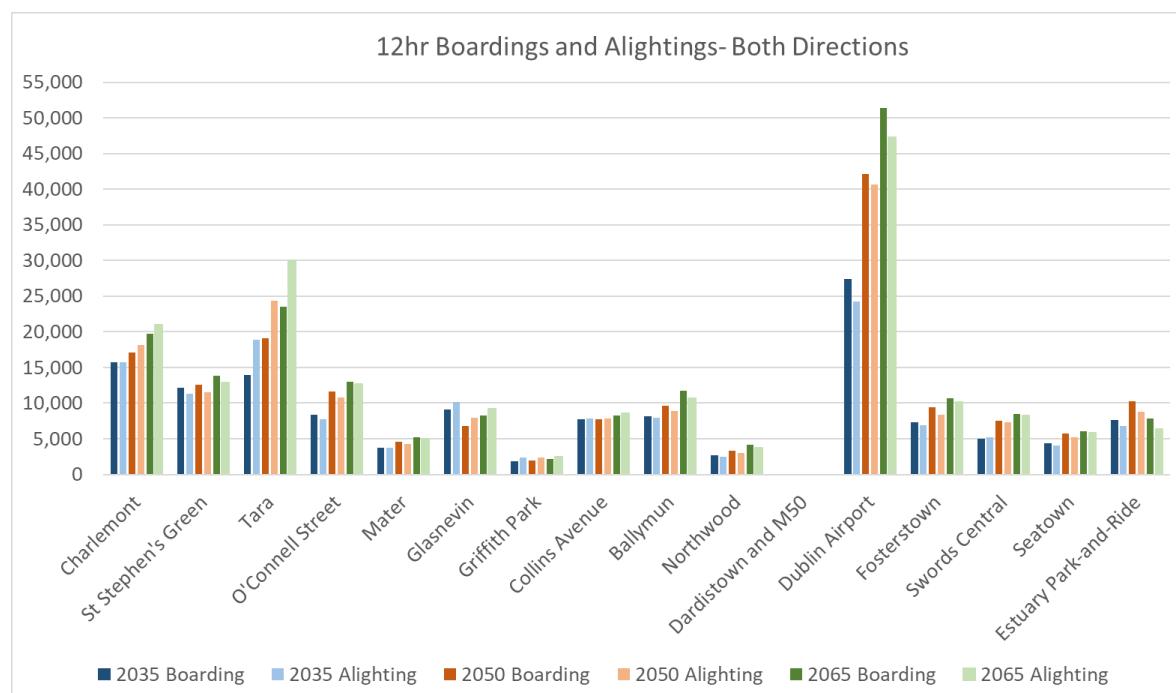

Figure 7.5: Scenario A 12hr Boarding and Alighting

7.4 Overall Network Statistics

A high-level summary of network statistics for the model comparing the Do Minimum and Do Something scenarios for the AM and PM periods in Scenario B are presented in Table 7.2 and Table 7.3.

A reduction can be seen in the road time travel and distance travelled in the AM period when comparing the Do Minimum and Do Something scenarios in 2035, which can be attributed to the reduction of congestion across areas of the network where people are switching to use the Project and Park and Ride facilities. There is a slight increase in the road time travel and distance travelled in the AM period when comparing the Do Minimum and Do Something scenarios in 2050 and 2065.

A reduction can be seen in the road time travel and distance travelled in the PM period when comparing the Do Minimum and Do Something scenarios in 2035 and 2065, which can be attributed to the reduction

of congestion across areas of the network where people are switching to use the Project and Park and Ride facilities. There is a slight increase in the road time travel and distance travelled in the PM period when comparing the Do Minimum and Do Something scenarios in 2050.

The average road network speed remains the same for all years and time periods in exception to the increase in 2050 PM period as a result of the Do Something, which can be related to congestion reduction across the network.

Table 7.2 : Scenario B AM Peak Period Summary Network Statistics

Network Statistics	2035		2050		2065	
	Do Minimum	Do Something	Do Minimum	Do Something	Do Minimum	Do Something
Total Road Travel Time (pcu.hrs)	127,959	127,147	118,519	117,558	141,266	141,591
Total Road Distance Travelled (pcu.km)	5,019,246	5,010,909	5,061,970	5,077,862	5,551,807	5,586,370
Average Road Network Speed (kph)	39.1	39.1	40.5	40.5	39.5	39.5

Table 7.3: Scenario B PM Peak Period Summary Network Statistics

Network Statistics	2035		2050		2065	
	Do Minimum	Do Something	Do Minimum	Do Something	Do Minimum	Do Something
Total Road Travel Time (pcu.hrs)	117,757	117,127	108,713	109,334	127,698	127,175
Total Road Distance Travelled (pcu.km)	4,696,059	4,688,163	4,760,404	4,815,427	5,224,881	5,221,114
Average Road Network Speed (kph)	40.0	40.0	40.5	41.5	40.6	40.6

Table 7.4 presents the public network statistics in the Do Minimum and Do Something scenarios in 2035, 2050 and 2065 during the AM 3h period, with Table 7.5 presenting the PM 3h period statistics.

In all scenarios, the total passenger km is higher in the PM period. When comparing the two scenarios during the AM period, there is a reduction of approximately 220,000 passenger km by bus when the Project is in place in 2035. This reduces to a reduction of almost 219,000 passenger km in 2050, and then increases

to a reduction of over 261,000 passenger km by bus in 2065 when the Project is in place. In total, there is an increase of approximately 137,000 passenger km between the Do Minimum and Do Something scenarios in 2035 AM period. In 2050, the total passenger km travelled increases by approximately 202,000 when comparing the two scenarios. In 2065, the total passenger km travelled over the AM period increases by over 236,000 when the Project is in place, illustrating the positive shift towards public transport use in this scenario.

Table 7.4 : Scenario B AM 3h Period Public Transport Network Statistics

Network Statistics	Mode	2035		2050		2065	
		Do Minimum	Do Something	Do Minimum	Do Something	Do Minimum	Do Something
Passenger Km	Bus	1,107,260	887,141	1,102,110	883,188	1,231,367	970,647
	Rail	1,397,654	1,375,668	1,523,673	1,484,887	1,824,559	1,757,376
	Luas	337,330	332,233	534,625	530,975	611,610	611,522
	Metro	0	384,412	0	463,341	0	564,469
	Total	2,842,245	2,979,454	3,160,408	3,362,391	3,667,535	3,904,014

When comparing the two scenarios during the PM 3h period, there is a reduction of approximately 181,000 passenger km by bus when the Project is in place in 2035. There is a reduction of almost 185,000 passenger km and 224,000 passenger km in 2050 and 2065 when the Project is in place. In total, there is an increase of approximately 137,000 passenger km between the Do Minimum and Do Something scenarios in 2035 PM peak period. In 2050, the total passenger km travelled increases by approximately 240,000 when comparing the two scenarios. In 2065, the total passenger km travelled over the PM period increases by almost 201,000 when the Project is in place, illustrating the positive shift towards public transport use in this scenario.

Table 7.5: Scenario B PM 3hr Period Public Transport Network Statistics

Network Statistics	Mode	2035		2050		2065	
		Do Minimum	Do Something	Do Minimum	Do Something	Do Minimum	Do Something
Passenger Km	Bus	1,114,472	933,622	1,139,407	954,132	1,273,201	1,048,733
	Rail	1,553,788	1,535,623	1,638,592	1,610,140	1,955,416	1,913,607
	Luas	318,303	318,916	516,068	517,080	595,100	598,549
	Metro	0	335,627	0	452,720	0	463,618
	Total	2,986,563	3,123,789	3,294,067	3,534,072	3,823,716	4,024,506

7.5 Mode Share

Mode share comparisons between the Do Minimum and Do Something scenarios have been undertaken to understand the percentage change in modal split between the two scenarios. Similarly, comparisons have also been undertaken to understand the percentage change in modal split from 2035, to 2050 and 2065. Do Minimum and Do Something mode split over 12hrs is shown in Table 7.6.

Table 7.6: Scenario B DM-DS Summary of Mode Split- 12hrs

	2035	2050		2065		
	Do Minimum					
	12hr (No. of Trips)	% Mode Split	12hr (No. of Trips)	% Mode Split	12hr (No. of Trips)	% Mode Split

In 2035, the mode share of PT (including the Project) increases from 17.1% to 17.8% in the Do Something scenario. In the 2050 scenario, PT (including the Project) increases its mode share by 0.8% between the Do Minimum and Do Something scenarios, whilst Road mode share decreases by 0.4%, indicating a modal shift from private vehicles to public transport when the Project is in place. In 2065, the PT (including the Project) increases its mode share from 19.5% in the Do Minimum scenario, to 20.3% in the Do Something scenario, whereas the Road mode share falls by 0.3%.

7.5.1 Percentage Change

Figure 7.6 to Figure 7.8 illustrates the percentage change in road mode share per zone surrounding the Project alignment, in the AM period in Scenario A.

Throughout the design years, road mode share reduces by up to 5% in a number of zones to the east of the alignment, such as in zones to the south of the M50. At Dublin Airport, the road mode share decreases by up to 10% in 2065. Similarly, when Metro Link is in place, the road mode share falls by up to 10% around Swords.

Figure 7.9 to Figure 7.11 illustrates the public transport (including the Project) mode share change along the alignment. The largest increase in mode share can be seen at Estuary station, with an increase of 30%-40% in all years.

With the road mode share reductions seen at Swords and Dublin Airport, there is a corresponding increase in PT (including the Project) mode share. An increase of 5%-20% can be seen in zones in the Swords area and Dublin Airport in 2065.

Figure 7.12 to Figure 7.17 illustrate the percentage mode share change between the Do Minimum and Do Something scenarios in the PM peak, with Figure 7.12 to Figure 7.14 presenting the change in Road mode share per zone, and Figure 7.15 to Figure 7.17 presenting the change in public transport (including the Project). As with the AM period, Road mode share decreases by up to 30% across all years in the zones at Estuary station as a result of the Park and Ride facility at this station. Similar decreases can be seen in the zones at Dublin Airport, where the largest number of the Project boarding and alighting passengers occur.

As with the AM period, the largest increases in mode share of public transport (including the Project) can be seen at stations along the R132 (in particular, Estuary station) and at Dublin Airport. The Project corridor at Ballymun and Dublin City University also sees increases of between 1% and 10% as a result of the Project.

7.6 Public Transport Network Analysis

7.6.1 Public Transport Link Flows

Figure 7.18 to Figure 7.19 illustrates the change in public transport flows in the AM and PM peaks when the Project is in place in Scenario B. Reductions on the passenger flow on the bus network can be seen along the M50 Port Tunnel and in the vicinity of Dublin Airport. Reductions in passenger flow can also be seen on the R108 Ballymun Road bus corridor, and the R132 Swords Bypass corridor. Increases in flows can be seen on the Luas Green Lines, and the Kildare DART line, indicating areas of interchange with the proposed Project.

Table 7.7 and Table 7.8 present the changes in rail-based public transport flows as result of the Project, during the AM and PM peak hours. The AM peak hour is defined as 08:00-09:00, and the PM peak hour is defined as 17:00-18:00. Large increases in flows can be seen on the Luas Green and Luas Red lines as result of the interchange at Charlemont station.

7.6.2 Journey Time

Journey time comparisons between the Do Minimum and Do Something scenarios has been undertaken to investigate benefits to journey time with the Project in place. The assessment was carried out for zones located across the city as illustrated in Figure 7.20 and detailed within Table 7.9.

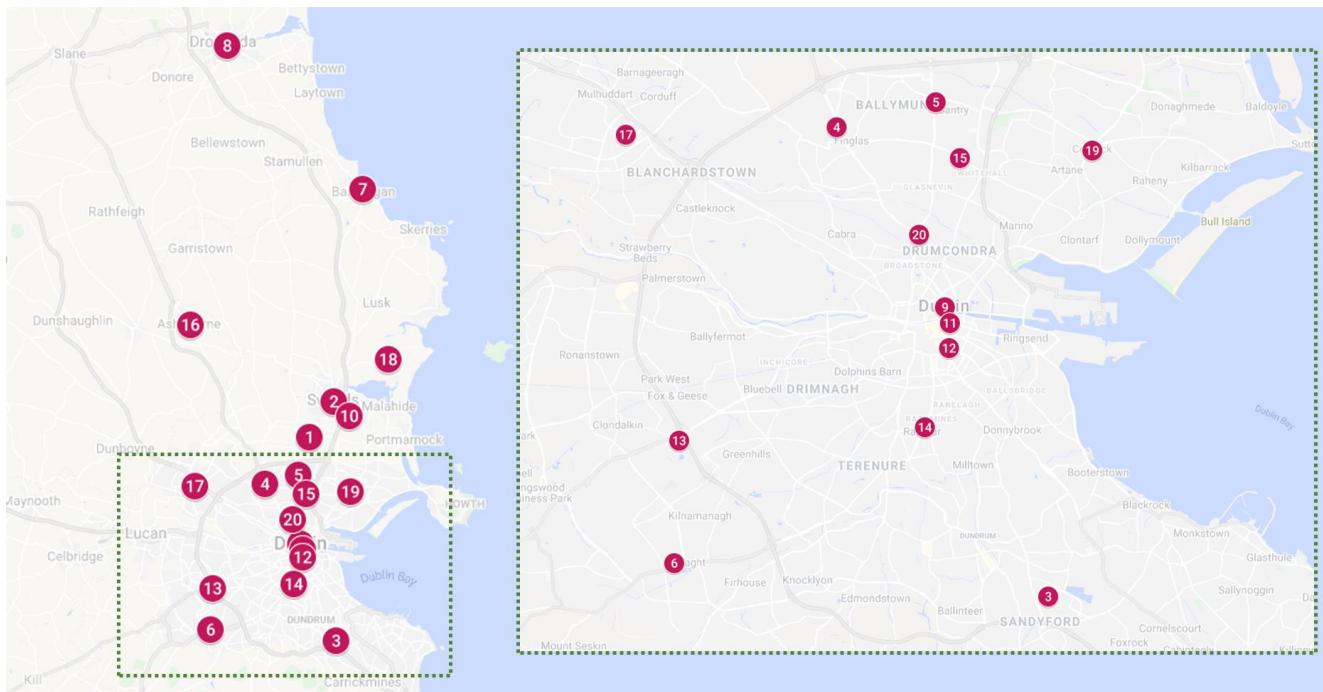

Figure 7.20: Zones assessed for journey time

Table 7.9: Zones assessed for journey time

Nb	Location	Nb	Location	Nb	Location	Nb	Location

The implementation of the Project provides substantial time savings in 2035, 2050 and 2065, from a range of locations in north Dublin, the city centre, and south Dublin. In 2050 AM, the largest journey time savings can be seen in journeys to and from Dublin Airport, Swords East and Swords Pavilion. The largest journey time saving occurs from Swords Pavilion to Glasnevin, with a saving of approximately 35 minutes in all three years. This is due to the presence of the interchange with the heavy rail network at Glasnevin station, contributing to an overall public transport journey time saving. A saving of approximately 33 minutes can be seen from Dublin Airport to Sandyford at the south of the city in 2050 PM, as a result of the Project interchange with the Luas Green Line at Charlemont station, and a saving of 30 minutes in 2065, in the PM period.

Overall, in the AM period, journeys to the north (to Swords Pavilion and Swords East) and Dublin Airport see widespread journey time reductions, of up to 28 minutes from Sandyford and Rathgar Road to Swords Pavilion, as a result of the interchange with Luas Green Line. The journey from O'Connell Street to Dublin Airport sees a reduction of approximately 22 minutes in 2035 and 2050 between these key locations. Improvements can also be seen along the Project corridor, with time savings of up to 22 minutes to and from DCU and Ballymun.

In the PM period, the largest reduction in journey time in 2035 is from Glasnevin to Swords Pavilion, which sees a reduction of approximately 38 minutes in journey time when the Project is in place. This reduces to a saving of approximately 37 minutes in 2050 and 2065, respectively. This is due to the interchange with the rail network at Glasnevin station.

7.6.3 Transfers to and from Other Modes

Table 7.16, Table 7.17 and Table 7.18 show the volume of 12hr transfers to and from the Project in Scenario B, either walking or cycling to/from the surrounding zones, or using other forms of public transport to interchange, in 2035, 2050 and 2065 respectively.

A '**First Boarder**' refers to a passenger who first accesses the public transport network via the Project. Therefore, passengers who transfer from bus/rail/Luas to the Project are not considered 'First Boarders'.

A '**Final Stop**' passenger is someone who exits the public transport network via the Project. Therefore, passengers who transfer to bus/rail/Luas from the Project to continue their journey are not considered to be 'Final Stop' passengers.

In all scenarios, the majority of transfers from 'First Boarders' and 'Final Stop' are to/from the Estuary Park and Ride. For all other stations, 'First Boarder' and 'Final Stop' passengers are predominantly in relation to those living within the walking catchments of the stations.

Table 7.16: Transfers to/From Stations – 12hr period in 2035

Station	Transfers To/From MetroLink Stations - 12hr Period				Transfers from MetroLink

Tara	9,648	7,731	3,075	3,373	10,514	13,984	3,488	2,455
St Stephen's Green	8,271	4,652	931	-	9,056	3,303	560	-

Transfers To/From MetroLink Stations - 12hr Period								
Station	Transfers to MetroLink				Transfers from MetroLink			
	First Boarders	From Bus	From Rail/DART	From Luas	Final Stop	To Bus	To Rail/DART	To Luas
Charlemont	6,656	3,498	-	9,523	7,028	4,400	-	9,591

As in Scenario A, Dublin Airport sees the largest number of transfers to/from zone across all years. After Dublin Airport, stations in the city centre, such as Tara and St Stephen's Green, see significant volumes of transfers to/from zone. Stations such as Collins Avenue and Ballymun, and along the R132, see large numbers of transfers to/from zone due to the surrounding residential catchments of the stations.

Tara sees the largest volume of transfers to/from bus in all three years. St. Stephen's Green and Charlemont also see large volumes of bus transfers both to and from the Project.

Interchange with the heavy rail network is also possible at Glasnevin and Tara stations, however Glasnevin sees a higher volume of transfers to and from this mode.

There is a large volume of transfers to/from Luas at Charlemont and O'Connell Street, as these stations are in close proximity to Luas services (Green Line at Charlemont and both Red and Green lines at O'Connell Street). The transfers to/from Luas at Charlemont are greater than the transfers to/from Luas at O'Connell Street in all three years.

7.7 Road Network Analysis

7.7.1 Link Flows

Figure 7.21 illustrates the change in traffic flows between the Do Minimum and Do Something scenarios in Scenario B 2035 AM peak hour. When the Project is in place, increases in traffic flow can be seen on the M1 north of the Park and Ride Facility, as well as towards Dublin Airport. However, corresponding decreases in traffic can be seen along the R132 corridors south of the Park and Ride Facility, as well as on the M1 south of Dublin Airport. The M50 also sees reductions in traffic flows between the two scenarios, as well as much of Dublin City Centre and national routes to the south such as the N7 and N11.

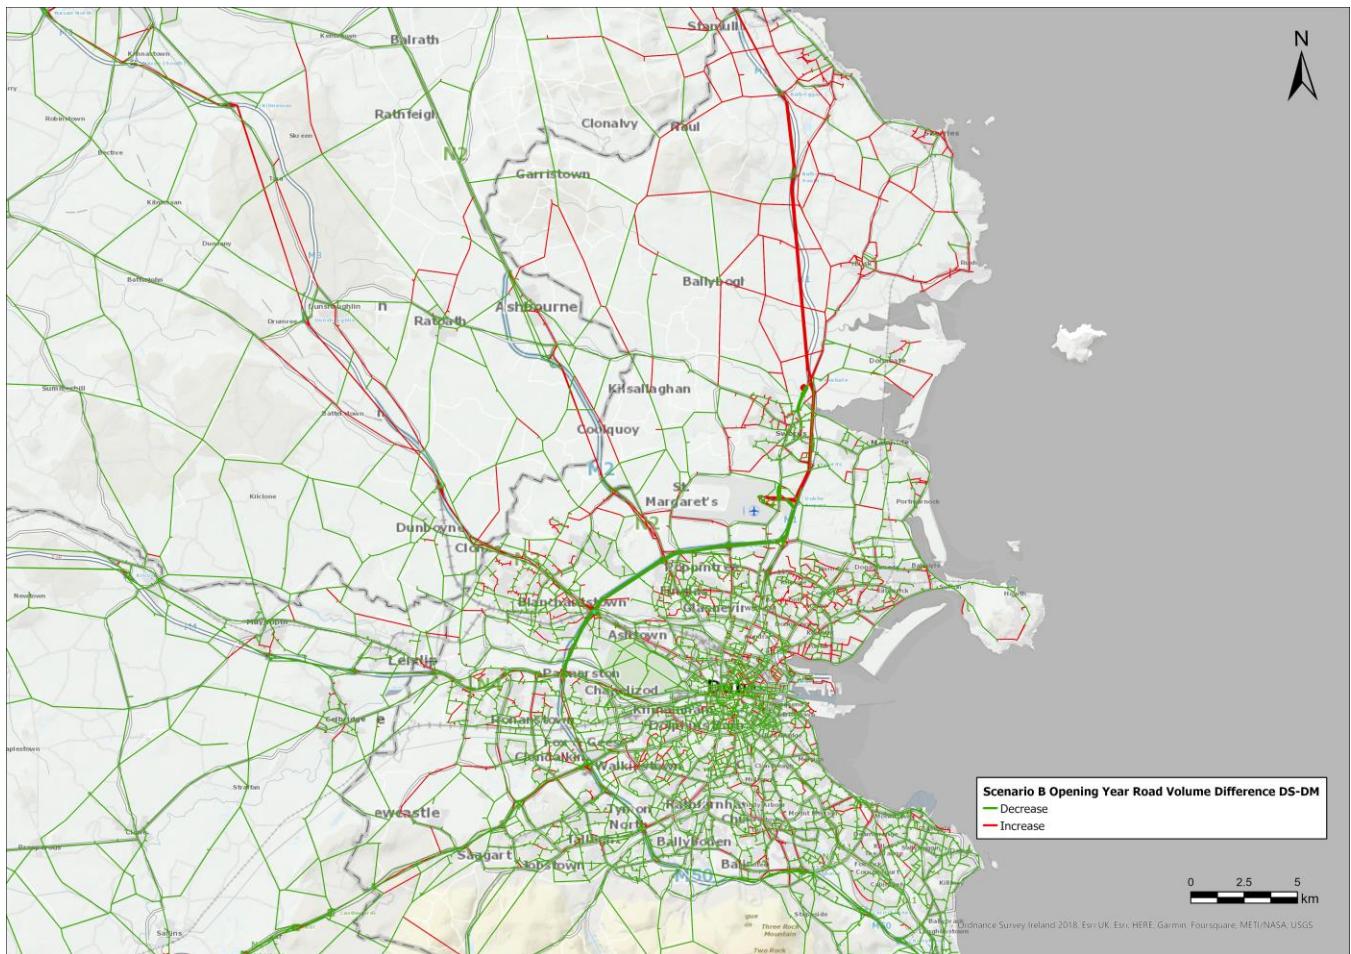

Figure 7.21: Highway Model – Flow Changes Scenario B 2035 AM Peak

Figure 7.22 below shows the AADT traffic flow differences between the Do Something and Do Minimum scenario in Scenario B 2035, with Figure 7.23 and Figure 7.24 illustrating the same for 2050 and 2065.

There are increases in traffic flow in both directions to the north of Estuary and around Swords in 2035 and 2050. This can be expected due to traffic travelling to the Strategic Park and Ride site at Estuary.

In 2050, reductions in AADT traffic flow can be seen on key national routes such as the M2, M3, M4 and M11. This relates to the transfer of road passengers onto the public transport network, utilising the Maynooth, Kildare and Cork rail lines.

In 2065, significant reductions in AADT traffic flow can be seen on national routes such as the M1, M2, M3 and M4, as well as throughout the City Centre and Port Tunnel.

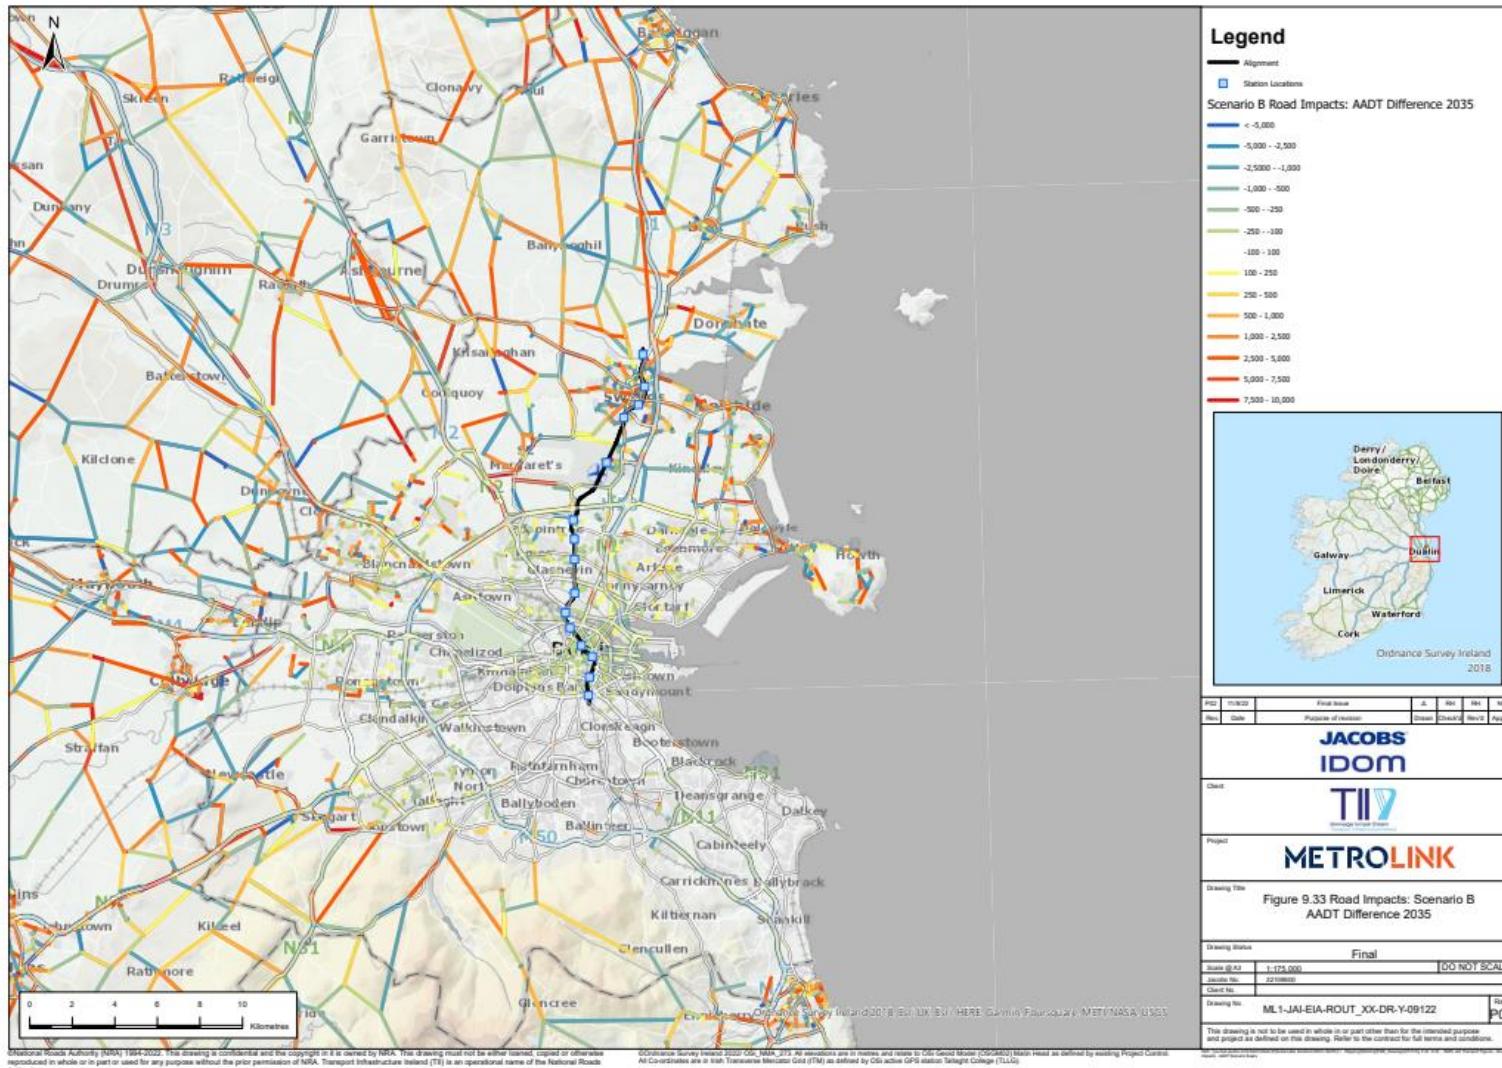

Figure 7.22: Scenario B 2035 DS – DM AADT Traffic Flow

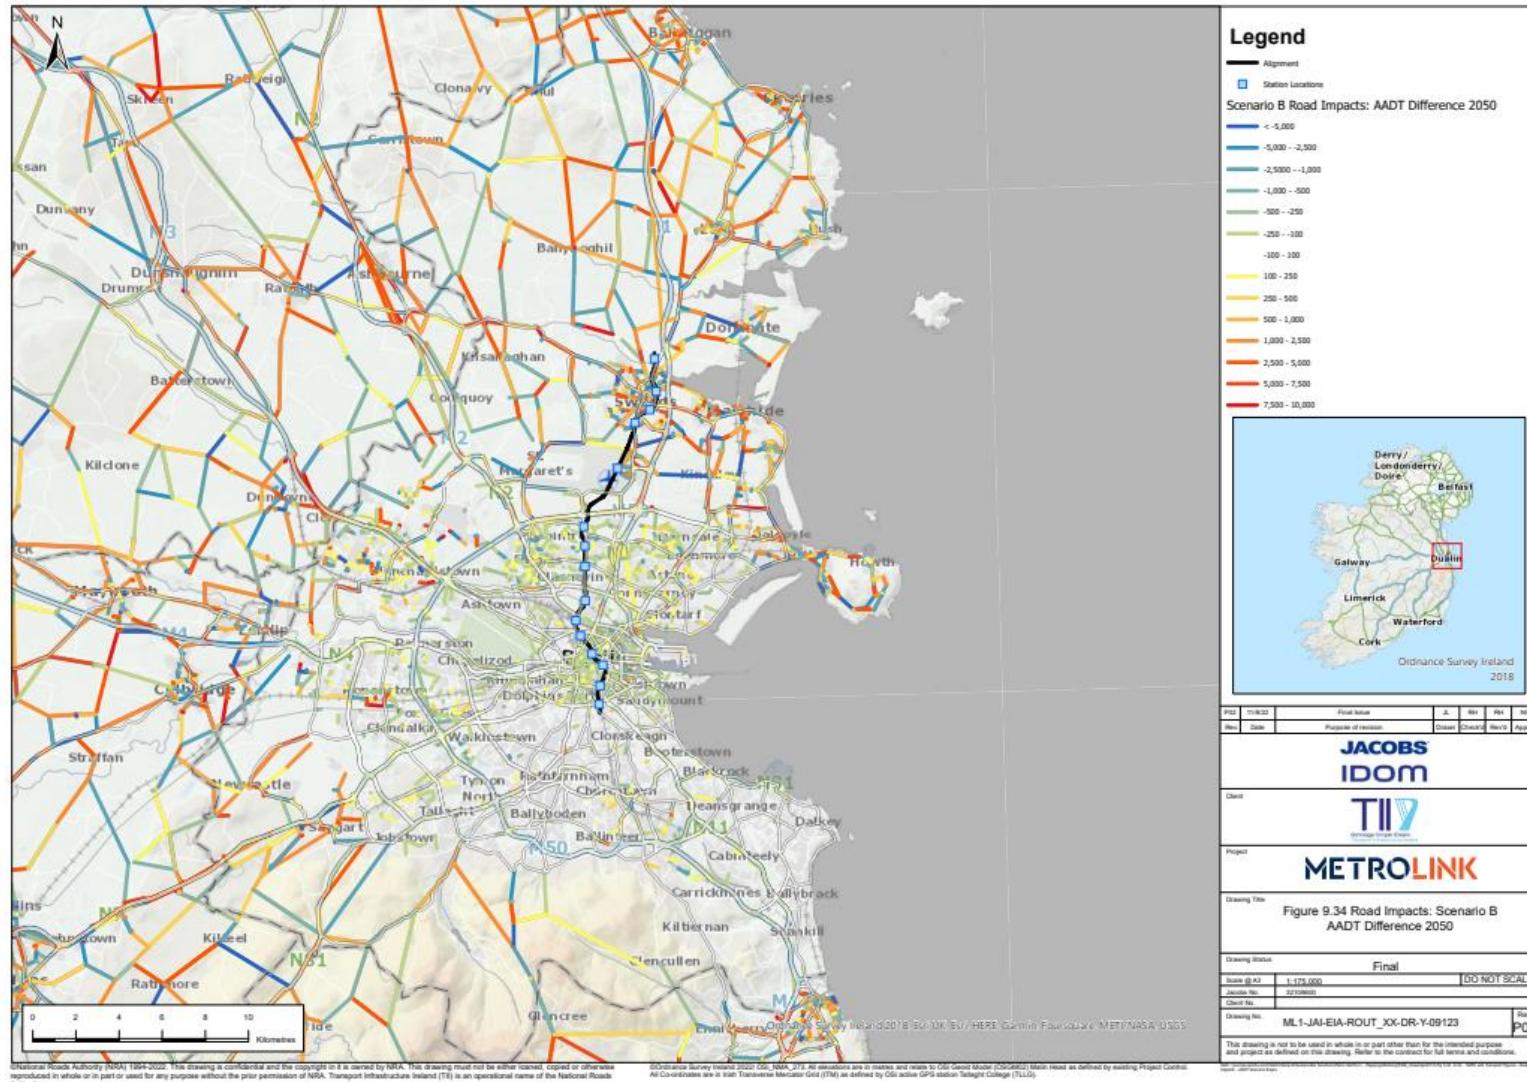

Figure 7.23: Scenario B 2050 DS – DM AADT Traffic Flow

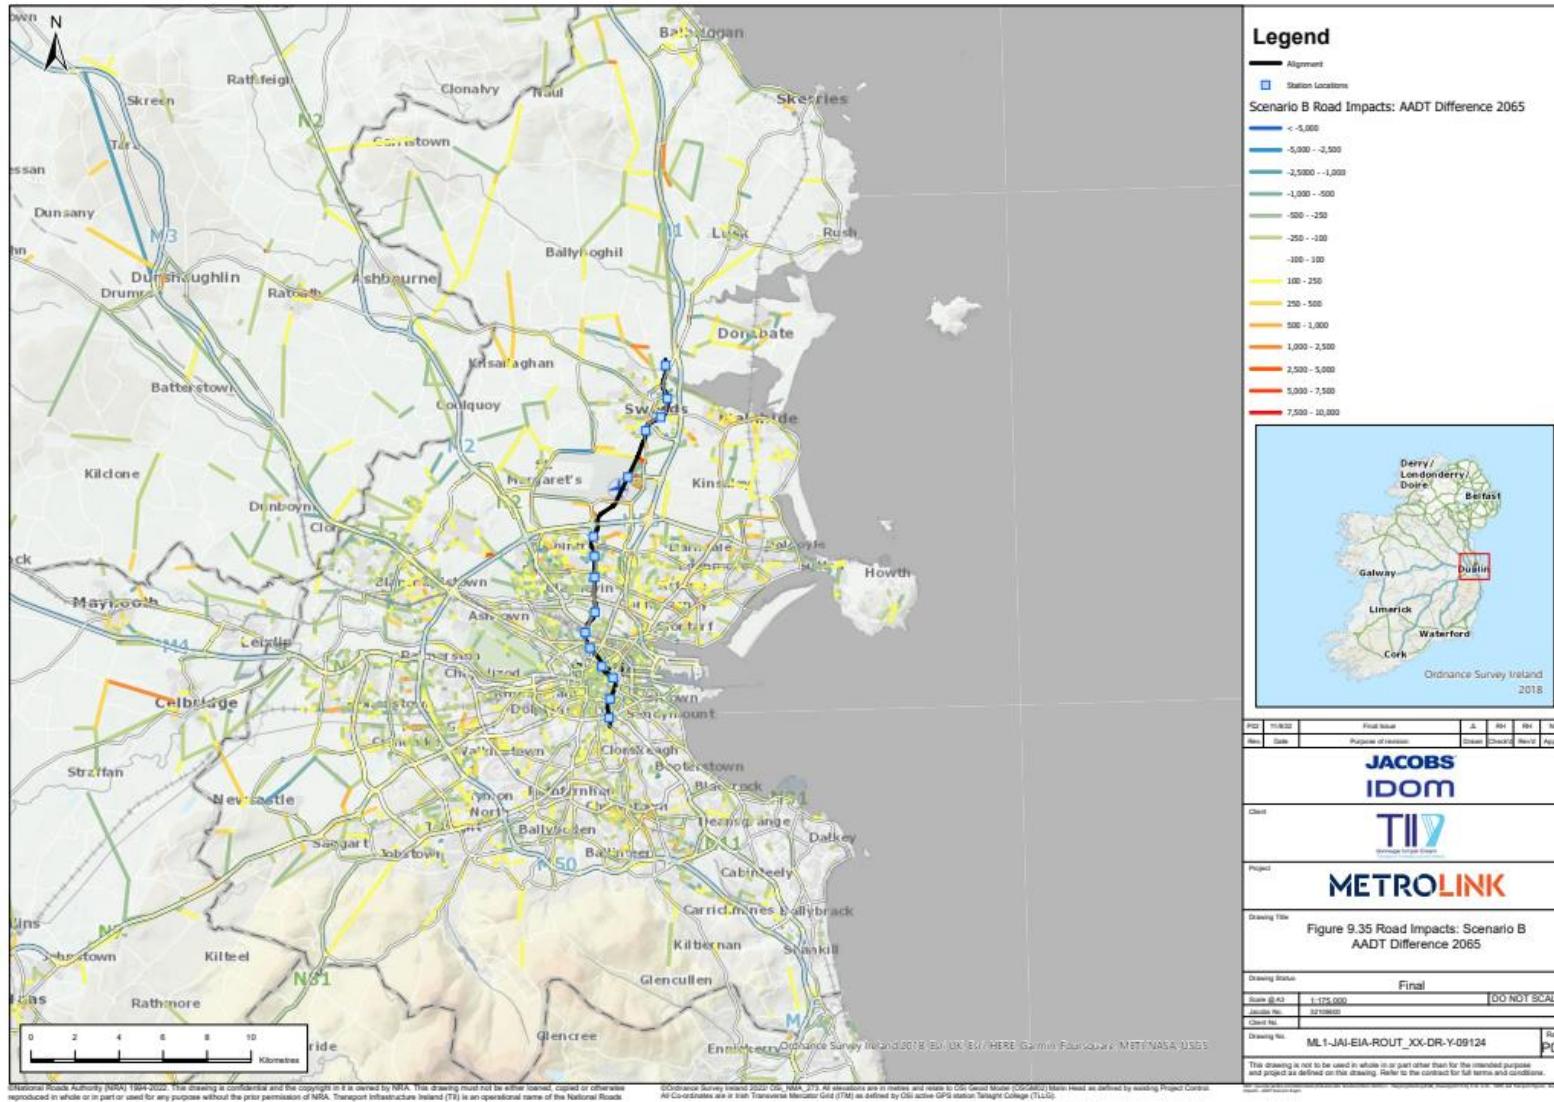

Figure 7.24: Scenario B 2065 DS – DM AADT Traffic Flo

7.7.2 Changes in Road Travel Time

Figure 7.25 to Figure 7.27 shows the changes in road travel time with the Project in place in the AM peak in 2035, 2050 and 2065 in Scenario B.

There are increases in road travel time on links to the North of Estuary Park and Ride in 2050. This could be due to the increase in traffic travelling to and from the Park and Ride Sites in the respective AM peak. There are also road travel time savings of up to 25 seconds along M2, M3, M4 M7 and M11 in all future years, due to a reduction in traffic on the road network, as a result of previous highway trips using the Project instead.

The 2035, 2050 and 2065 AM peak illustrates lower number of impacts to road travel time within Dublin City Centre, in exception to an increase in road travel time of up to 50 seconds along R109 in 2065.

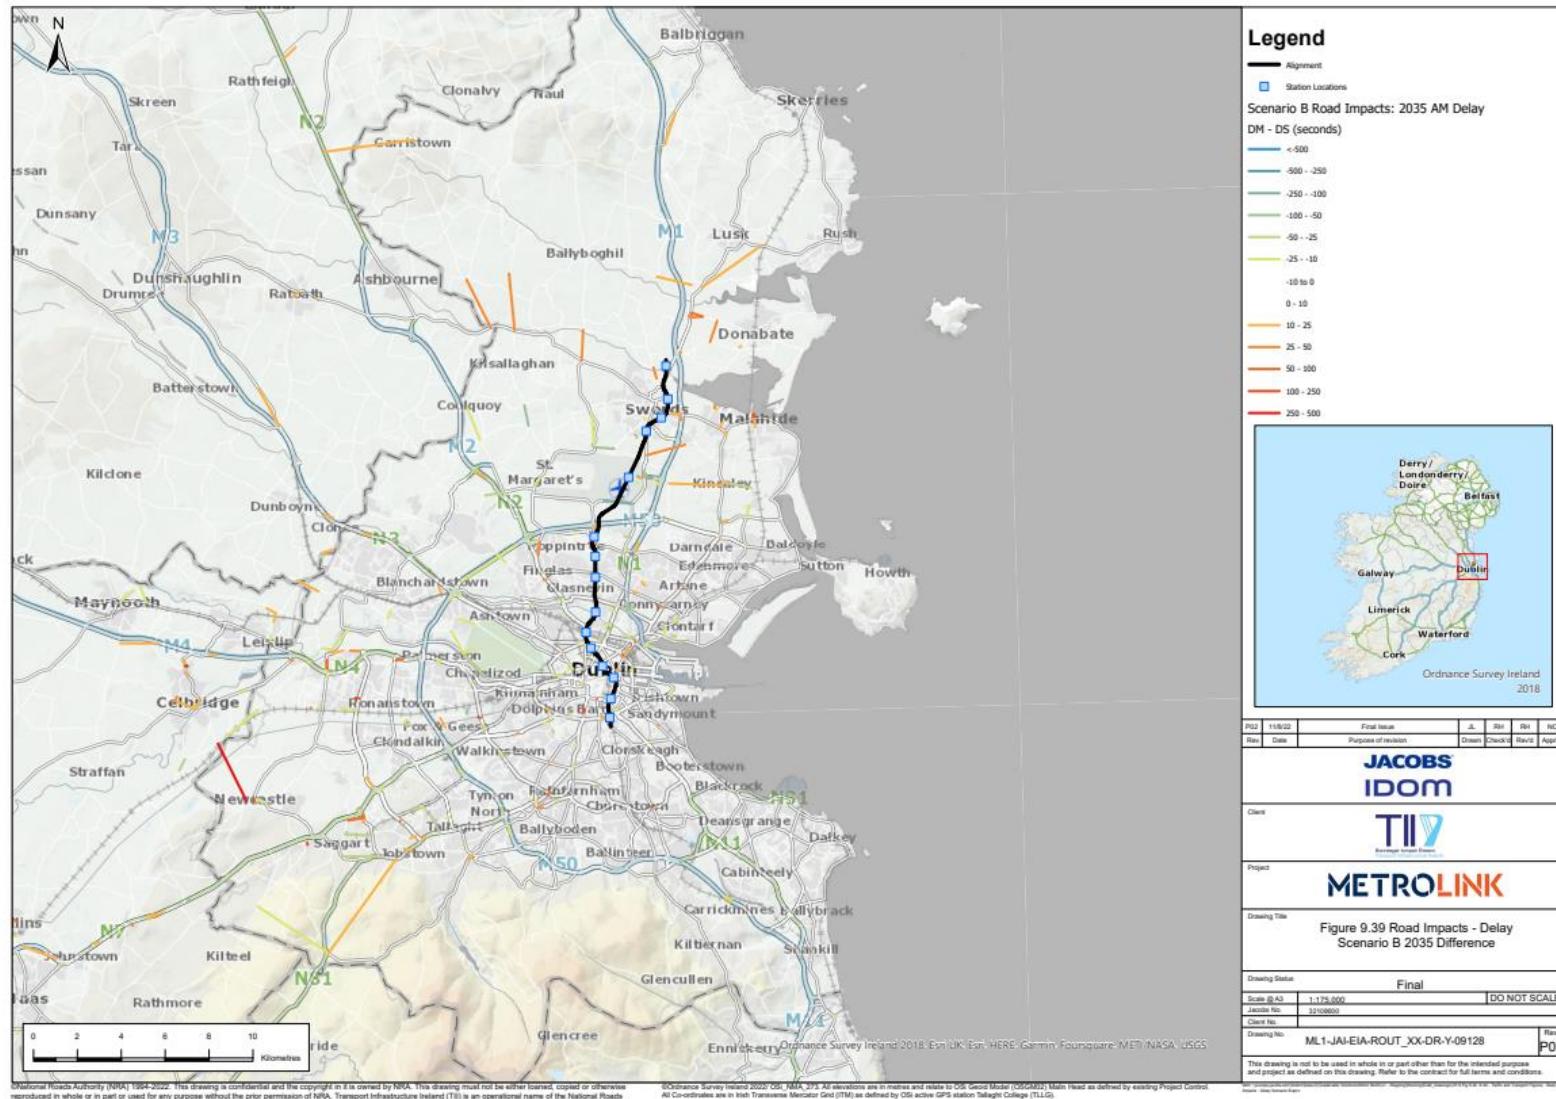

Figure 7.25: Change in Road Travel Time in Scenario B 2035 AM Peak Period DS

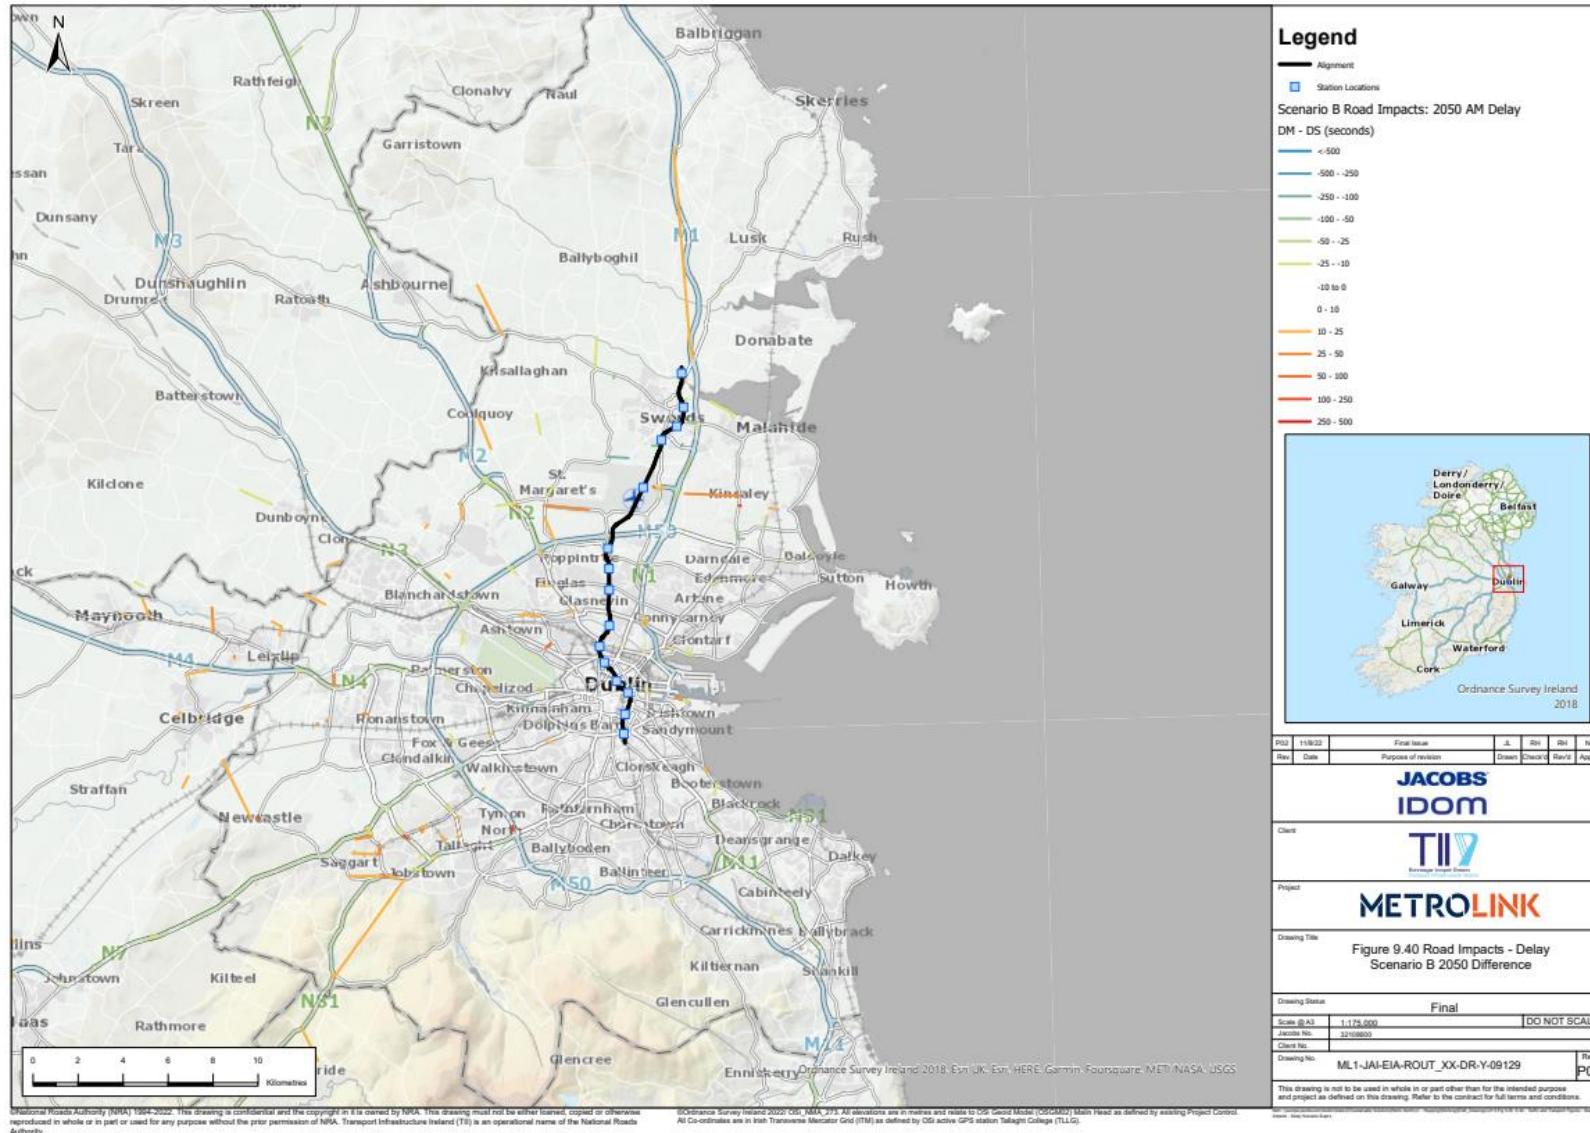

Figure 7.26: Change in Road Travel Time in Scenario B 2050 AM Peak Period DS

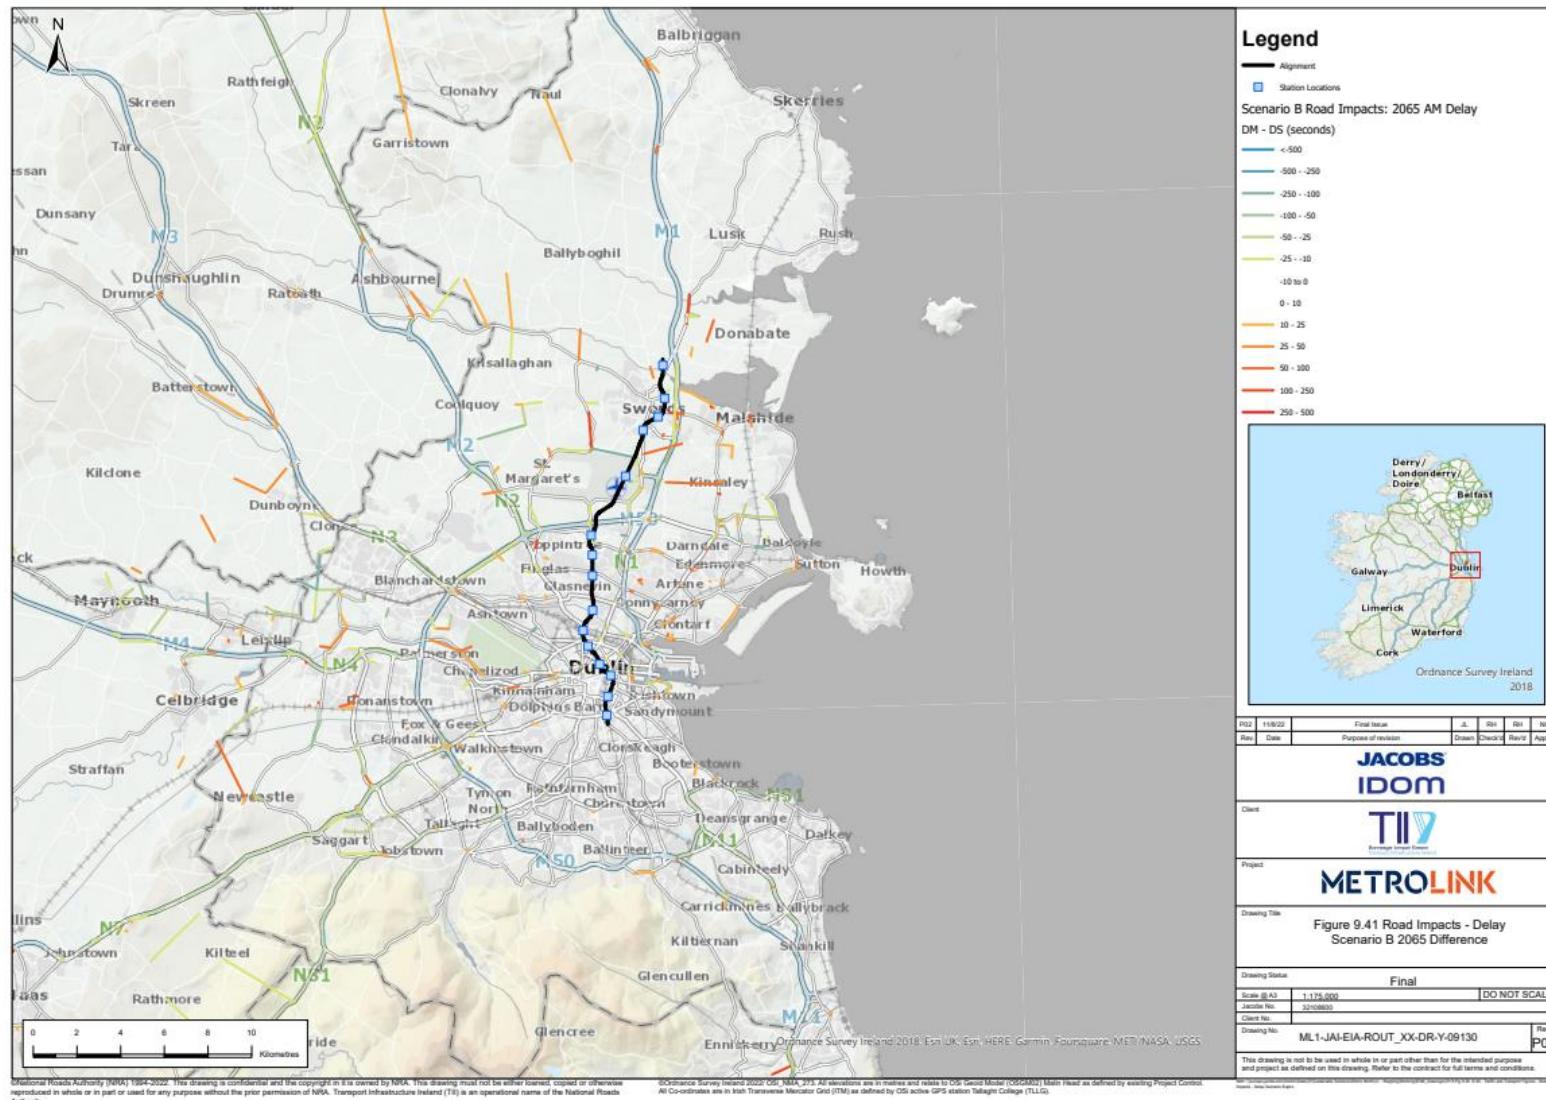

Figure 7.27: Change in Road Travel Time in Scenario B 2065 AM Peak Period D

8. Summary

The NTA's ERM has been utilised to perform a series of 12 runs to inform the appraisal of the Project. The Operational Phase Opening Year is proposed to be 2035, with Design Year 2050 and Forecast Year 2065. The assessment of the Operational Phase has been carried out using the following scenarios:

- Scenario A - Do Committed Minimum:
 - 'Do Minimum' (2035, 2050 and 2065)
 - 'Do Something' (2035, 2050 ad 2065)
- Scenario B – Likely Future:
 - 'Do National Development Plan ('Do NDP', Do Minimum and Do Something 2035)
 - 'Do Greater Dublin Area Transport Strategy ('Do GDA', Do Minimum and Do Something 2050 and 2065).

8.1 ERM Model Validation

The NTA ERM model development report notes that: "*The ERM was calibrated and validated against the recommended criteria set out in the UK TAG. The level of calibration and validation achieved across each of the model components is of a high standard when considering the model scale and type.*"

Whilst the convergence of the modelling undertaken for the Project does not achieve the gap value recommended in the UK TAG, the convergence values are typical for a model of the size and complexity of the Project operating over a medium length forecast period in urban congested conditions.

8.2 Scenario A Summary

The modelling exercise involved analysing various model outputs from each scenario to assess the impact on travel behaviour when the Project is in place. A summary of the results from Scenario A are presented below.

In Scenario A 2035, there will be approximately 137,000 passengers boarding and alighting over the 12hr period, increasing to almost 176,000 in 2050, and to 217,000 in the 2065 scenario.

In all forecast years in Scenario A, the mode share of PT (including the Project) within the Project's area of influence increases between the Do Minimum and Do Something scenarios. The largest percentage point increase can be seen in 2065, where PT (including the Project) mode share increases by 1.15 percentage points from 17.8% in the Do Minimum to 18.94% in the Do Something scenario. A corresponding reduction in Car mode share can also be seen in 2065, reducing by 0.82 percentage points from 54.13% to 53.31% when the Project is in place.

In Scenario A in all forecast years, there is an increase in passenger km on Public Transport between the Do Minimum and Do Something scenarios, reaching a 10% increase in 2065. Similar percentage increases in passenger km on Public Transport can also be seen in the PM period.

The proposed Project provides substantial time savings in 2035, 2050 and 2065, from a range of locations in north Dublin, Dublin City Centre, and south Dublin. The largest journey time saving occurs for journeys to and from Swords Pavilion and Glasnevin, with a saving of approximately 48 minutes in all of the forecast years. A saving of up to approximately 32 minutes can be seen from Dublin Airport to Sandyford at the south of the city, as a result of the Project interchange with the Luas Green Line at Charlemont Station.

Reductions on the passenger flow on the bus network can be seen along the M50 Port Tunnel towards Dublin Airport, as well as along the R108 Ballymun Road bus corridor, and the R132 Swords Bypass corridor. Increases in flows can be seen on the Luas Red and Green Lines, and the Maynooth and Kildare DART lines, indicating areas of interchange with the proposed Project.

In all years, Dublin City Centre locations see large numbers of passengers interchanging between the bus network and the proposed Project for their onward journey, as these locations are hubs for employment so passengers may have origins or final stops in residential areas outside of Dublin City Centre. It is evident at Glasnevin and Tara Stations that a significant volume of passengers will interchange between the DART network and the Project. The location of the Charlemont station also facilitates large volumes of interchange with the Luas Green Line.

The largest reductions in Road travel time can be seen in 2065 Scenario A in both the AM and PM peak periods, with a reduction of 5% in the AM peak period, and a reduction of 4% in the PM peak period. Notable reductions in traffic flow will be seen along key routes south of Dublin Airport, including along the M50, and along most radial routes into Dublin City Centre. National roads such as the N11 and N7, also see reductions in traffic flows when the proposed Project is in place.

8.3 Scenario B Summary

The modelling exercise involved analysing various model outputs from each scenario to assess the impact on travel behaviour when the Project is in place. A summary of the results from Scenario B are presented below.

In Scenario B 2035, there will be approximately 135,400 passengers boarding and alighting over the 12hr period, increasing to 169,500 in 2050, and to 194,200 in the 2065 scenario.

In all forecast years in Scenario B, the mode share of PT (including the Project) within the Project's area of influence increases between the Do Minimum and Do Something scenarios. The largest percentage point increase can be seen in 2050, where PT (including the Project) mode share increases by 0.86 percentage points from 18.69% in the Do Minimum to 19.54% in the Do Something scenario. A corresponding reduction in Car mode share can also be seen in 2050, reducing by 0.4 percentage points from 55.12% to 54.73% when the Project is in place.

In all forecast years in Scenario B, the total passenger km is higher in the PM period. When comparing the Do Minimum and Do Something scenarios in 2065, the total passenger km travelled over the AM period increases by over 236,400 when the proposed Project is in place, which is an increase of 6%.

The largest journey time saving occurs from Swords Pavilion to Glasnevin, with a saving of approximately 28-42 minutes across the three forecast years. Similar journey time savings can also be seen from Swords Pavilion to Blanchardstown, Dublin Airport to Rathgar Road, and between the Ballymun corridor and DCU.

As with Scenario A, in all years in Scenario B, Dublin City Centre locations see large numbers of passengers interchanging between the bus network and the proposed Project for their onward journey. Scenario B sees large volumes of passengers interchanging with the bus network at Ballymun and Collins Avenue Stations. As with Scenario A, there will be large volumes of passengers interchanging with DART at Glasnevin and Tara Street in all forecast years. The location of the Charlemont Station also facilitates large volumes of interchange with the Luas Green Line. Scenario B sees high volumes of interchanging passengers as a result of the implementation of other key public transport infrastructure projects compared to Scenario A.

Scenario B sees no change to Road travel time in 2065 in either the AM or PM peak periods. Notable reductions in traffic flow will be seen along key routes south of Dublin Airport, including along the M50, and along most radial routes into Dublin City Centre. Reductions in traffic flows are also seen when the proposed Project is in place, such as along national routes such as the N7 and N11.
