PAH	Polycyclic Aromatic Hydrocarbon
PCB	Polychlorinated Biphenyl
PFAS	Perfluoralkyl and polyfluoralkyl substances
PFOS	Perfluorooctonate sulfonate
PPE	Personal Protective Equipment
RPE	Respiratory Protective Equipment
S4UL	Suitable for Use Level
SOM	Soil Organic Matter
SURGE	Dublin Soil Urban Geochemistry Project
SVOC	Semi-volatile Organic Compound
TBM	Tunnel Boring Machine
TII	Transport Infrastructure Ireland
TPH	Total Petroleum Hydrocarbon
VOC	Volatile Organic Compound
WAC	Waste Acceptance Criteria
WEL	Workplace Exposure Limit
WHO	World Health Organisation
WFD	Water Framework Directive

Executive Summary

Introduction

The available desk study information and ground investigation data relating to land contamination for the Dublin Metrolink project (the proposed Project) has been reviewed and interpreted to provide an assessment of the potential risks and constraints associated with land contamination. This report is intended to supplement the Ground Investigation Report (GIR) and Geotechnical Design Report (GDR) and to inform the Environmental Impact Assessment Report (EIAR).

Metrolink is the next phase of Dublin's integrated light rail network, which begins to the north of Swords, runs southward over the Broad Meadow River and alongside the R132 trunk road, beneath Dublin Airport and will terminate to the south of Dublin City at Charlemont. The proposed Project includes over-ground sections, retained cut and bored tunnels, and has been divided into four geographical areas (AZ1 to AZ4) for the purposes of the EIAR and this report.

The scope of this report includes:

- Review of available desk study information, including studies undertaken for the Old Metro North scheme and more recent published information relating to ground conditions and regulatory data.
- Review of ground investigation (GI) data from investigations from the Old Metro North scheme and GI and monitoring undertaken between 2019 and 2021 for the Metrolink project (GI Phases 1, 2, 3, 4 and 5), including GI logs and extraction of relevant geochemical data.
- Identification of potential contamination sources relevant to the proposed Project, review of relevant pathways and receptors and development of a preliminary Conceptual Site Model (CSM).
- Generic quantitative risk assessment (GQRA) based on the available geochemical soil and water data to aid in identification of potential contaminated land risks and enable an update to the CSM.
- Identification of information gaps and potentially significant contaminated land risks which may present a constraint to the proposed Project.

A Works Area has been defined for the proposed Project based on the footprint/ boundary of construction and any areas required for temporary access, site compounds, working platforms and other enabling activities. The Study Area is based on a 250m buffer from this Works Area.

Potential Contamination Sources

The desk study review indicated a number of potential contamination sources within the Study Area, the majority of which have been assessed as posing a low risk to the proposed Project. The primary potential contamination sources of relevance to the proposed Project identified from the available information are as follows:

- Car dismantlers yard and fuel station south of Swords, near Fostertown Station.
- Former infilled quarry in the location of the proposed Dublin Airport Station, and the historical use of Dublin Airport for aviation.
- Former infilled gravel pits and sewage works in the vicinity of Seatown.

- General urban made ground from the historical development of Dublin City in many proposed station locations, particularly in AZ4.
- Former burial site / infilled ground at the proposed Griffith Park Station location.
- Historic use of land around the proposed Charlemont Station and the Glasnevin interchange as railway land and use of an area on the opposite side of the Royal Canal to Glasnevin as a creosote yard.
- Leakages from oil filled cables, particularly near Tara and Mater Stations.
- Current / former hospitals at the proposed Mater and Tara station locations.

A conceptual site model (CSM) has been developed to inform the assessment of risk associated with land contamination for both the construction and operational phases of the proposed Project. The CSM has been reviewed against the results of the information review including a generic quantitative risk assessment of the available geochemical and monitoring data. The ground conditions and potential risks are summarised by AZ as follows.

AZ1 – Northern

Made ground mainly encountered in a layer up to 1.2m thick (predominantly reworked natural ground and road make up with occasional anthropogenic inclusions) associated with the existing road network and urban use of the land, with a maximum of 4.6mbgl encountered in the Swords area. The made ground overlies glacial deposits (mainly cohesive with occasional granular layers) between 2m and 30m thick, overlying limestone and interbedded shale of the Malahide Formation. Potential influence of fertiliser use was identified around the proposed Estuary Station along with TPH in one location which could represent an isolated spill event. Elevated concentrations of metals in the soil and groundwater may represent natural background concentrations.

AZ2 – Airport

The majority of the proposed Project comprises tunnel with portals at the northern and southern ends and a proposed station at Dublin Airport. Made ground up to 2.6mbgl was identified at Dublin Airport corresponding to a former quarry, now infilled. The made ground overlies Waulsortian Limestone in this location and comprises tarmac, concrete, sandy gravel or gravelly clay with rebar and red brick; possible domestic waste / putrescible material was identified in one location. Metallic (mainly lead and arsenic), and organic (TPH, PAH) were identified in the made ground and groundwater at elevated concentrations as well as asbestos in one location.

AZ3 – Dardistown to Northwood

Much of AZ3 comprises greenfield / agricultural land with notable made ground up to 2.5m thick comprising sandy gravelly clay or sandy gravel with brick, plastic metal or pottery mainly confined to the northern and southern extents, associated with the road network and potential unmapped historic activities around Dardistown. The made ground overlies glacial till deposits (sandy gravelly clay with cobbles and granular horizons) 16 to 20m thick over bedrock (Tober Colleen Formation towards the north, Lucan Formation towards the south). Some elevated hydrocarbon concentrations were identified around Dardistown with no obvious source, agricultural influence may have resulted in the ammonia and chloride present in the groundwater.

AZ4- Northwood to Charlemont

Made ground was recorded in the majority of exploratory hole locations in AZ4, typically up to around 3m thick, and up to a maximum depth of 7mbgl at the proposed Charlemont Station. The majority of made ground is attributable to historical urban development rather than specific potentially contaminative land uses. The made ground typically comprised sandy gravelly clay with brick, concrete, ash and plastic, notable observances of

contamination included hydrocarbon / bitumen odours at the proposed Collins Avenue, Tara and O'Connell Street stations. Elevated concentrations of metallic and organic contaminants were identified in several locations as well as asbestos fibres.

Preliminary Materials and Waste Assessment

The project will result in generation of an estimated 3,025,588m3 of excavated material, of which only 99,931m3 is expected to be reused within the project primarily due to space constraints (refer to Table 7.1).

Table E0.1: Summary of Excavated Material Quantities

Material Type	Volume (m^3)	%
Made Ground	153,458	5.1%
Superficial Deposits	1,742,258	57.6%
Mixed	155,302	5.1%
Rock	974,570	32.2%
Total	**3,025,588**	

Table E1.2 provides a preliminary waste classification of excavated material assuming all the material is sent to landfill (i.e. no mitigation is applied).

Table E0.2: Preliminary Waste Classification (Assuming All Excavated Material is Waste)

Waste Classification	Volume (m^3)	%
Hazardous	94,775	3.1%
Non-hazardous	221,121	7.3%
Increased Inert	104,554	3.5%
Inert	2,605,138	86.1%
Total	**3,025,588**	
Backfill Required	99,931	
Total Surplus	2,925,657	

Regarding mitigation of the materials management risk the preferred scenario for managing the excavated material is use as restoration material off site via an application under Article 27 of the European Communities (Waste Directive) Regulations 2011 (S.I. No. 126 of 2011), as amended (Waste Directive Regulations (2011)) (referred to as Article 27) progressed by Arup. If this application is unsuccessful a secondary approach is to send material to Soil Recovery Facilities (SRFs). The approach is summarised as follows:

- Primary mitigation: The Article 27 application is successful and between 71.6% (worst case) and 89.7% (best case) of the excavated material is removed from site as a by-product, the remainder being removed from site as waste.

- Secondary mitigation: The Article 27 application is unsuccessful; the next best option is to send excavated compliant material to Soil Recovery Facilities (SRFs).

Under the primary mitigation scenario between 71.6% and 89.6% of the material is likely to be Article 27 compliant with the remainder potentially requiring off-site disposal, as summarised in Table E1.3.

Table E0.3: Summary of Quantities for Primary Mitigation

Material Type	Preliminary Waste Classification	A27 Worst Case		A27 Best Case	
		Volume (m^3)	%	Volume (m^3)	%
Article 27 non-compliant					
	Hazardous	94,775	3.1%	94,775	3.1%
	Non-hazardous	155,481	5.1%	155,481	5.1%
	Increased Inert	49,093	1.6%	49,093	1.6%
	Inert	560,157	18.5%	10,968	0.4%
	Total	**859,506**	**28.4%**	**310,317**	**10.3%**
	- Backfill	99,931	3.3%	99,931	3.3%
	Total Surplus	759,555	25.1%	210,386	7.0%
Article 27 Compliant					
	Non-Waste	**2,166,082**	**71.6%**	**2,715,271**	**89.7%**

Under the secondary mitigation scenario the preliminary assessment of excavated material suitability for each Irish geological domain summarised in Table E1.4.

Table E0.4: Summary Quantities for Secondary Mitigation

Domain	Unsuitable		Acceptable		Ranking
	m^3	%	m^3	%	
Domain 1	1,663,437	55%	1,362,151	45%	6
Domain 2	620,457	21%	2,405,131	79%	1
Domain 3	883,111	29%	2,142,477	71%	2
Domain 4	1,328,886	44%	1,696,702	56%	5
Domain 5	941,297	31%	2,084,291	69%	3
Domain 6	1,087,189	36%	1,938,399	64%	4
Domain 7	1,900,895	63%	1,124,693	37%	7

Risk Summary and Mitigation Measures

The potential risks associated with land contamination will primarily be during the construction phase of the proposed Project, with potential risks generally lower during operation. The identified potential risks are summarised as follows:

- Risk to construction and maintenance workers from dermal contact, ingestion and inhalation of contaminants (primarily hydrocarbons and metals, potential presence of asbestos) in the soil and groundwater, and inhalation of ground gas.
- Risks to adjacent residents / workers / transient foot traffic from dermal contact, ingestion and inhalation of wind-blown dust containing contaminants.

- Groundwater and surface water affected by mobilising of contaminants during construction and excavated material movement / storage / placement as well as operation of plant and machinery during construction and operation.

- Property affected by direct contact with soil and groundwater causing degradation.

- Risk of encountering areas of contamination not identified within the information available to date, especially in areas below existing buildings where access constraints have limited investigation, with consequent limitations on material reuse and potential increased disposal costs.

- Potential for radon build up in excavations and enclosed spaces.

These potential risks are mainly associated with the identified areas of made ground. The recommended mitigation measures to address these identified potential risks are summarised as follows:

- Development of health and safety and waste management procedures for work with potentially contaminated soils (including asbestos) and groundwater, to include risk assessment and safe systems of works using PPE (and RPE) as a last resort.

- Implementation of a watching brief during construction works and any additional GI to identify the presence of previously unidentified contamination and ground gas sources.

- Development of a stockpile and materials movement / management plan as part of the CEMP to ensure control and monitoring of excavated materials. Detailed assessment prior to placement to ensure risks are managed.

- Development of a groundwater and surface water monitoring programme during construction and operation to monitor construction and operational effects on quality.

- Development of procedures and incident response plans during construction and operation to control emissions of potentially hazardous substances during transfer and storage.

- Determine appropriate building materials via detailed assessment with respect to ground conditions.

- Implementation of a radon monitoring programme during construction to determine whether a potential risk is present.

1. Introduction

1.1 Purpose of This Report

This Land Contamination Interpretive Report presents a summary of the available information and data relating to land contamination for the Dublin Metrolink project (hereafter referred to as the proposed Project) and provides interpretation relating to the potential risks associated with land contamination to inform the Environmental Impact Assessment (EIA) and project design. This report is intended to supplement the Ground Investigation Report (GIR) (Jacobs IDOM 2022a) and Geotechnical Design Report (GDR) (Jacobs IDOM 2022b) for the project which provide interpretation of physical ground conditions.

1.2 Project Overview

The National Transport Authority's (NTA) Transport Strategy for the Greater Dublin Area, 2016-2035 (The Strategy) identified MetroLink ("the Proposed Project") as the preferred public transport project to address the transport needs of the Swords/Dublin Airport/City Centre corridor. MetroLink is the next phase of Dublin's integrated light rail network, which begins to the north of Swords, and runs southward over the Broad Meadow River and alongside the R132 trunk road and will terminate to the south of Dublin City at Charlemont.

Table 1.1 and Diagram 1.1 provide an overview of the principal infrastructural elements and the four geographical areas (assessment zones, AZ1-AZ4) for the purpose of the EIAR and this report. Diagram 1.2 presents an outline of the main elements of the proposed Construction Phase and Diagram 1.3 presents an outline of the main elements of the Operational Phase of the proposed Project.

Table 1.1: Outline Description of the Principal Project Elements

Project Elements	Outline Description
Permanent Project Elements	
Tunnels	It is proposed to construct two geographically separate, single-bore tunnels, using a Tunnel Boring Machine (TBM). Each section of tunnel will have a 8.5m inside diameter and will contain both northbound and southbound rail lines within the same tunnel. These tunnels will be located as follows: 1. The Airport Tunnel: running south from Dublin Airport North Portal (DANP) under Dublin Airport and surfacing south of the airport at Dublin Airport South Portal (DASP) and will be approximately 2.3km in length; and 2. The City Tunnel: running for 9.4km from Northwood Portal and terminating underground south of Charlemont Station.
Cut Sections	The northern section of the alignment is characterised by a shallow excavated alignment whereby the alignment runs below the existing ground level. Part of the cut sections are open at the top, with fences along the alignment for safety and security. While other sections are "cut and cover", whereby the alignment is covered.
Tunnel Portals	The openings at the end of the tunnel are referred to as portals. They are concrete and steel structures designed to provide the commencement or termination of a tunnelled section of route and provide a transition to adjacent lengths of the route which may be in retained structures or at the surface. There are three proposed portals, which are: • DANP; • DASP; and • Northwood Portal. There will be no portal at the southern end of the proposed Project, as the southern termination and turnback would be underground.
Stations	There are three types of stations: surface stations, retained cut stations and underground stations: • Estuary Station will be built at surface level, known as a 'surface station'; • Seatown, Swords Central, Fosterstown Stations and the proposed Dardistown Station will be in retained cutting, known as 'retained cut stations'; and • Dublin Airport Station and all 10 stations along the City Tunnel will be 'underground stations'.
Intervention Shaft	An intervention shaft will be required at Albert College Park to provide adequate emergency egress from the City Tunnel and to support tunnel ventilation. Following the European Standard for safety in railway tunnels TSI 1303/2014: Technical Specification for Interoperability relating to 'safety in railway tunnels' of the rail system of the European Union, it has been recommended that the maximum spacing between emergency exits is 1,000m. As the distance between Collins Avenue and Griffith Park is 1,494m, this intervention shaft is proposed to safely support evacuation/emergency service access in the event of an incident. This shaft will also function to provide

Project Elements	Outline Description
	ventilation to the tunnel. The shaft will require two 23m long connection tunnels extending from the shaft, connecting to the main tunnel. At other locations, emergency access will be incorporated into the stations and portals or intervention tunnels will be utilised at locations where there is no available space for a shaft to be constructed and located where required (see below).
Intervention Tunnels	In addition to the two main 'running' tunnels, there are three shorter, smaller diameter tunnels. These are the evacuation and ventilation tunnels (known as Intervention Tunnels): 1) Airport Intervention Tunnels: parallel to the Airport Tunnel, there will also be two smaller diameter tunnels; on the west side, an evacuation tunnel running northwards from DASP for about 315m, and on the east side, a ventilation tunnel connected to the main tunnel and extending about 600m from DASP underneath Dublin Airport Lands. In the event of an incident in the main tunnel, the evacuation tunnel will enable passengers to walk out to a safe location outside the Dublin Airport Lands. 2) Charlemont Intervention Tunnel: The City Tunnel will extend 360m south of Charlemont Station. A parallel evacuation and ventilation tunnel is required from the end of the City Tunnel back to Charlemont Station to support emergency evacuation of maintenance staff and ventilation for this section of tunnel.
Park and Ride Facility	The proposed Park and Ride Facility next to Estuary Station will include provision for up to 3,000 parking spaces.
Broadmeadow and Ward River Viaduct	A 260m long viaduct is proposed between Estuary and Seatown Stations, to cross the Broadmeadow and Ward Rivers and their floodplains.
Proposed Grid Connections	Grid connections will be provided via cable routes with the addition of new 110kV substations at DANP and Dardistown. (Approval for the proposed grid connections to be applied for separately but are assessed in the EIAR).
Dardistown Depot	A maintenance depot will be located at Dardistown. It will include: 3) Vehicle stabling; 4) Maintenance workshops and pits; 5) Automatic vehicle wash facilities; 6) A test track; 7) Sanding system for rolling stock; 8) The Operations Control Centre for the proposed Project; 9) A substation; 10) A mast; and 11) Other staff facilities and a carpark.
Operations Control Centre	The main Operations Control Centre (OCC) will be located at Dardistown Depot and a back-up OCC will be provided at Estuary.
M50 Viaduct	A 100m long viaduct to carry the proposed Project across the M50 between the Dardistown Depot and Northwood Station.
Temporary Project Elements	
Construction Compounds	There will be 34 Construction Compounds including 20 main Construction Compounds, 14 Satellite Construction Compounds required during the Construction Phase of the proposed Project. The main Construction Compounds will be located at each of the proposed station locations, the portal locations and the Dardistown Depot Location (also covering the Dardistown Station) with satellite compounds located at other locations along the alignment. Outside of the Construction Compounds there will be works areas and sites associated with the construction of all elements of the proposed Project, including an easement strip along the surface sections.
Logistics Sites	The main logistics sites will be located at Estuary, near Pinnock Hill east of the R132 Swords Bypass and north of Saint Margaret's Road at the Northwood Compound. (These areas are included within the 14 Satellite Construction Compounds).
Tunnel Boring Machine Launch Site	There will be two main tunnel boring machine (TBM) launch sites. One will be located at DASP which will serve the TBM boring the Airport Tunnel and the second will be located at the Northwood Construction Compound which will serve the TBM boring the City Tunnel.

Table 1.2: Geographical Areas

Ref.	Geographical Section	Description of Extent of Geographical Section
AZ1	Northern Section	Estuary Station to DANP. It includes the rail line crossing the Broadmeadow and Ward Rivers and associated flood plains on a viaduct. This section will include open, retained cut and cut-and-cover sections. This section includes the proposed Park and Ride Facility at Estuary Station.
AZ2	Airport Section	This section of the proposed Project includes DANP, the tunnel underneath Dublin Airport, Dublin Airport Station and DASP.
AZ3	Dardistown to Northwood	From south of DASP to the Northwood Portal. This section includes the proposed MetroLink Depot, the M50 Viaduct and the proposed Construction Compound and the TBM launch site at Northwood.
AZ4	Northwood to Charlemont	From south of the Northwood Portal to the tunnel termination location south of Charlemont Station.

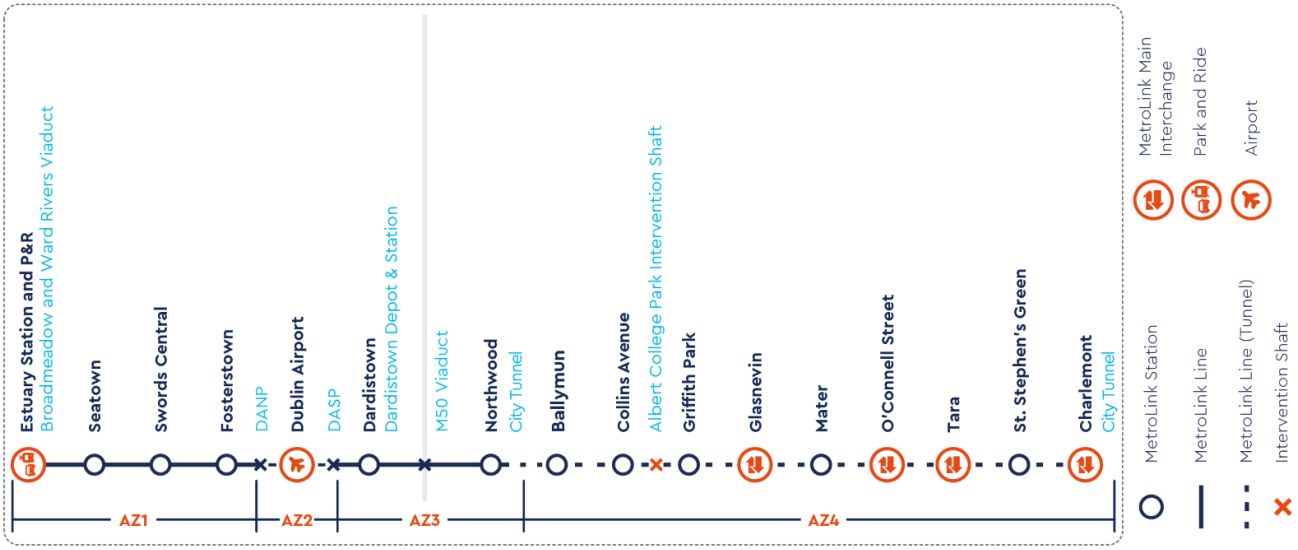

Diagram 1.1: Infographic Overview of Principal Locations along the Alignment

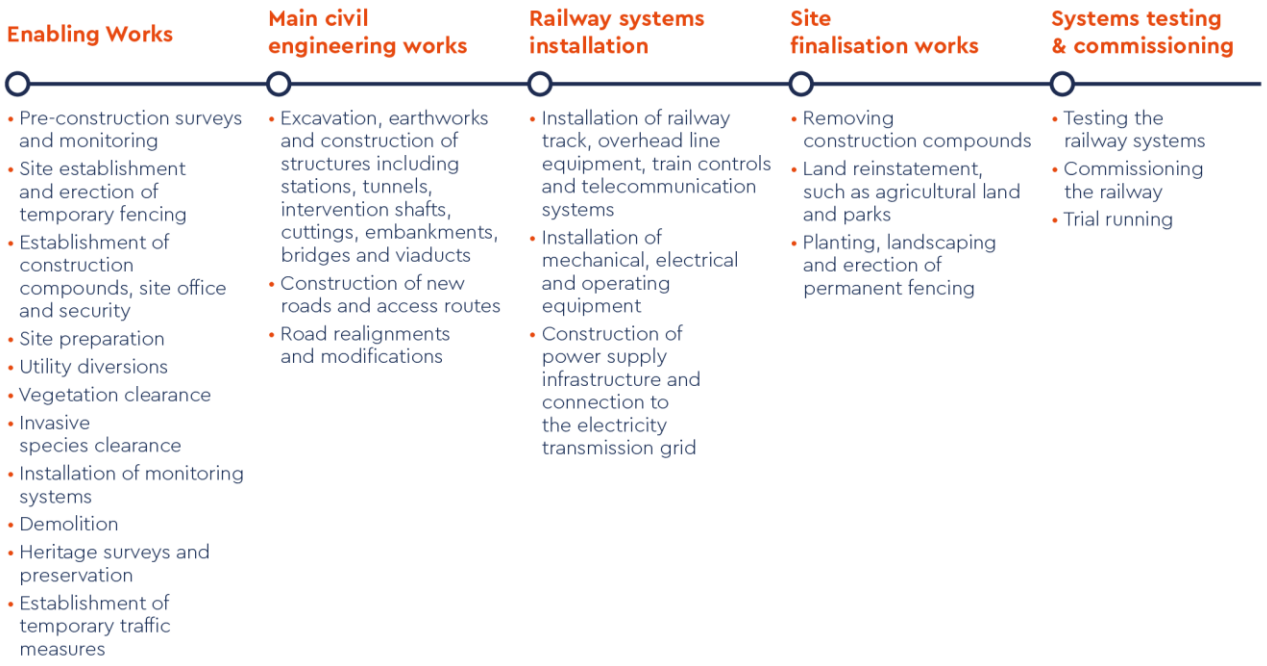

Diagram 1.2: Summary of Key Activities during the Construction Phase of the Proposed Project

Diagram 1.3: Summary of Key Activities during the Operation Phase of the Proposed Project

A Works Area has been defined for the proposed Project based on the footprint / boundary of construction and any areas required for temporary access, site compounds, working platforms and other enabling activities (refer to Figures 20.1 through to 20.15. The assessment within this report is based on this Works Area with the description of baseline ground conditions based on a 250m corridor from the Works Area termed the Study Area. This Study Area is considered a suitable distance to enable description of baseline conditions and allow assessment; in the absence of Ireland specific guidance this has been based on National House Building Council and Environment Agency (EA) guidance (NHBC and Environment Agency (2008). Guidance for the Safe Development of Housing on Land Affected by Contamination R&D66: 2008).

1.3 Report Scope

1.3.1 Scope

The scope of the report includes the following elements:

- Review of available desk study information, including studies undertaken for the Old Metro North scheme and more recent published information relating to ground conditions and regulatory data.
- Review of ground investigation (GI) data from investigations from the Old Metro North scheme and GI and monitoring undertaken between 2019 and 2021 for the Metrolink project (GI Phases 1, 2, 3, 4 and 5), including GI logs and extraction of relevant geochemical data.
- Identification of potential contamination sources relevant to the design, review of relevant pathways and receptors and development of a preliminary Conceptual Site Model (CSM).
- Generic quantitative risk assessment (GQRA) based on the available geochemical soil and water data to aid in identification of potential contaminated land risks and enable an update to the CSM.
- Identification of information gaps and potentially significant contaminated land risks which may present a constraint to the proposed Project.

All information sources are referenced in Section 3.1 and Section 8. Interpretation of physical ground conditions and geotechnical risks is beyond the scope of this report and is undertaken in the GIR (Jacobs IDOM 2022a) and GDR (Jacobs IDOM 2022b) which should be read in conjunction with this report.

1.3.2 Report Contents

The remainder of this report is structured in Sections as follows:

- 2 – Information Sources and Ground Investigation: Provides a summary of the information sources used in the preparation of the report including the ground investigations undertaken.
- 3 – Proposed Project Setting: Review and summary of the current characteristics of the study area.
- 4 – Quantitative Risk Assessment (GQRA): Screening of available geochemical data against generic assessment criteria (GAC) to provide an indication of potential risks to human health and the environment.
- 5 – Preliminary Materials and Waste Assessment: Overview of material excavation according to the Preliminary Design and preliminary assessment of waste classification taking into account material assessed as by-product under Article 27.
- 6 – Updated Conceptual Site Model: Summary of potentially significant pollutant linkages based on the available desk study and GI information.
- 7 – Risk Summary and Recommendations: Summary of potential land contamination risks identified, information gaps and recommendations for future management or mitigation of risks if identified.
- 8 – References.

2. Information Sources and Ground Investigation

2.1 Information Sources

The following sub-sections provide a list of published information, data sources and report references used within the assessment.

2.1.1 Desk Study

- An Foras Talúntais (1980) General Soil Map of Ireland (An Foras Talúntais 1980);
- Historic Mine Sites – Inventory and Risk Classification (EPA and GSI 2009);
- 1:1,000,000 scale – Bedrock Geology of Ireland (GSI 2014);
- 1:500,000 scale – Quaternary Geological Map of Ireland (GSI 2017);
- EPA Radon Map (EPA 2022),
- EPA Interactive Map (EPA 2022a),
- GSI online geology viewer (GSI 2022);
- GeoHive, Ordnance Survey Ireland online spatial data viewer (OSI 2022);
- Teagasc Irish Soil Information System online map (Teagasc 2021);
- Topographic-map.com online viewer (topographic-map 2021);
- Current and historical mapping, and
- SURGE Project, Geochemical Baseline for Heavy Metals and Organic Pollutants in Topsoil in the Dublin Area (GSI 2012).

2.1.2 Regulatory Guidance and Reference Documents

- Towards Setting Guideline Values for the Projection of Groundwater in Ireland (EPA 2003) (a consultation document titled Determining Groundwater Pollution: A proposed approach for the development and application of guideline values for groundwater was issued during January 2017, although a finalised version is yet to be issued);
- Contaminated Land and Risk Assessment: The Basics (EPA 2004);
- Environment Agency, Land Contamination: Risk Assessment (EA 2020);
- BS 10175:2011 + A2:2017 Investigation of potentially contaminated sites. Code of practice (British Standards Institute 2017);
- CIRIA C552 Contaminated Land Risk Assessment: A Guide to Good Practice (CIRIA 2001);
- CIRIA C665 Assessing Risks Posed by Hazardous Ground Gases to Buildings (CIRIA 2007);

- Code of Practice, environmental Risk Assessment for Unregulated Waste Disposal Sites (EPA 2007);
- Guidelines on Procedures for the Assessment and Treatment of Geology, Hydrology and Hydrogeology for National Road Schemes (NRA 2009);
- Guidance on the management of contaminated Land and Groundwater at EPA Licensed Sites (EPA 2013);
- Waste Management Acts 1996, as amended;
- Transport Infrastructure Ireland, The Management of Waste from National Road Construction Projects (TII 2017);
- Environmental Protection Agency, Towards Setting Guideline Values for the Protection of Groundwater in Ireland (EPA 2003b) (a consultation document titled Determining Groundwater Pollution: A proposed approach for the development and application of guideline values for groundwater was issued during January 2017, although a finalised version is yet to be issued);
- Guidelines for the Management of Waste from national Road Construction Projects (NRA 2014), and
- Guidance on Waste Acceptance Criteria at Authorised Soil Recovery Facilities (EPA 2020).

2.1.3 Proposed Project Specific Ground Investigations and Reports

Five phases of ground investigation have been undertaken specifically for the proposed Project to inform assessment of ground conditions both from a geotechnical design perspective and to inform the Soils and Geology assessment, summarised as follows:

- Metro Link Phase 1 Ground Investigation, Factual Report (Causeway 2019);
- Metro Link Phase 2 Ground Investigation, Factual Report (Causeway 2020a);
- Metro Link Phase 3 Ground Investigation, Factual Report (Causeway 2020b);
- Metro Link Phase 4 Ground Investigation, Factual Report (Causeway 2020c); and
- Metro Link Phase 5 Ground Investigation, Factual Report (Causeway 2021).

The following proposed Project specific assessments and reports have also been completed:

- Metro Link, Ground Investigation Report (Jacobs IDOM 2022a); and
- Metro Link, Geotechnical Design Report (Jacobs IDOM 2022b).

2.1.4 Supporting Reports and Ground Investigation

A list of historic published reports and ground investigations used in this report is detailed below. A number of these were undertaken for previous iterations of the project (Dublin Metro North); it should be noted that proposed design has changed considerably since these investigations took place and only information relevant to the current design has been included. In addition, information from ground investigations and reports from developments not related to the proposed Project have been included where relevant.

- Geotechnical Desk Study, City Centre and Airport (Haswell 2002);
- Identification of Possible Areas of Contamination and Proposals for Location of Soils and Geology Monitoring Points for Metro North (AWN Consulting, 2007)
- Dublin Metro North Alignments Study, Geotechnical Interpretive Report (Section 1 to 6) (Parsons Brinckerhoff 2007);
- Environmental Impact Statement – Metro North. Railway Procurement Agency, 2008 (RPA 2008);
- Dublin Metro North, Technical Note 023, Desk Study Review B0307000-010/GEO.360/002/1 (Jacobs 2008a);
- Dublin Metro North, Reference Ground Conditions Report for Information (B0307000-010/GEO.28/007/1) (Jacobs 2008b);
- SURGE Project, Geochemical Baseline for Heavy Metals and Organic Pollutants in Topsoil in the Dublin Area (GSI 2012);
- Northern Cross Route Phase 2, Site Investigation Data Volume 1 (Dublin City Council 1992);
- Dublin Light Railway, Sandyford to Ballymun Line Tunnel Link Between St Stephen's Green and Broadstone, Factual Report Volumes 1 and 2 (Wimtec 2000);
- Mater & Children's Hospital Ground Investigation (Phase II) – Main Site, Ground Investigation Report (IGSL 2002a);
- Site Investigation Works for the Proposed Dublin Light Rail Track, Draft Ground Investigation Report (Factual) (IGSL 2002b);
- Dublin Metro North (Preliminary) Ground Investigation, Factual Ground Investigation Report (IGSL 2007);
- Dublin Metro North, Main Ground Investigation – Sections 6 & 7 (Norwest Holst 2008);
- Dublin Metro North, Main Ground Investigation, Ground Investigation Report (IGSL 2008);
- Mater Stop – Additional GI, Dublin (Norwest Holst 2009);
- Metro North – Mater to Parnell, Geotechnical Site Investigation Report (IGSL 2010); and
- Metro North Depot, Dardistown, Dublin, Factual Report on Ground Investigation (Soil Mechanics 2011).

The available GI information is further summarised in Section 2.2.

2.2 Ground Investigation

A list of the ground investigation locations used in this assessment is included as Appendix A. Details of the individual ground investigations are summarised in the following sub-headings. Locations of the exploratory locations are shown on Figure 20.6.

2.2.1 IGSL 1995

This investigation was intended to characterise ground conditions on the proposed Dublin Light Railway between St Stephen's Green and Sandyford. The ground investigation comprised the following:

- 39 no. boreholes sunk via cable percussion to depths of up to 13.7mbgl; and
- In-situ and laboratory geotechnical testing.

2.2.2 Wimtec 2000

This investigation was intended to evaluate ground conditions on the route of the proposed Dublin Light Railway Sandyford to Ballymun line, including:

- 43 no. boreholes sunk via cable percussion, rotary open hole & rotary core methods;
- Installation of standpipe piezometers within 5 No. boreholes;
- In-situ and laboratory geotechnical testing;
- Groundwater level monitoring and in-situ permeability testing; and
- 13 no. soil sampling and laboratory geochemical analysis.

2.2.3 IGSL 2002a

Investigation to support development of Mater hospital comprising demolition of existing buildings and construction of a six-storey building with a basement. The GI work undertaken included:

- Formation of 11 no. cable percussion boreholes to up to 14.2mbgl;
- Advancement of 2 no. Geobore S rotary core boreholes;
- Mechanical excavation of 15 no. trial pits;
- Installation of standpipe piezometers within boreholes;
- In-situ and laboratory geotechnical testing; and
- Groundwater level monitoring and in-situ permeability testing.

2.2.4 IGSL 2002b

Investigation of the location of a proposed substation at O'Connell Street for the Dublin Light Rail Track project. The GI work undertaken included:

- Formation of 2 no. cable percussion boreholes to up to 14.2mbgl;
- Advancement of 2 no. rotary core boreholes; and
- In-situ and laboratory geotechnical testing.

2.2.5 IGSL 2007

This investigation was undertaken for the proposed Old Metro North scheme. The GI work undertaken comprised:

- 58 no. boreholes sunk via cable percussion and rotary methods up to 54.60mbgl;
- In-situ and laboratory geotechnical testing; and
- Groundwater level monitoring and in-situ permeability testing.

2.2.6 IGSL 2008

This investigation was undertaken for the proposed Dublin Metro North Line from St Stephens Green to Lissenhall. The ground investigation comprised:

- 67 no. cable percussion boreholes with 62 no. rotary follow on up to 40.7mbgl;
- In-situ and laboratory geotechnical testing;
- Groundwater and gas monitoring;
- 44 no. soil samples for chemical testing and 5 no. groundwater samples for chemical testing;

2.2.7 Norwest Holst 2008

This investigation was undertaken to determine the ground and groundwater conditions along the route of the proposed light rail public transport system between St Stephens Green and Ballymun Road. The ground investigation comprised:

- 42 no. cable percussion boreholes with 21 no. rotary follow on to up to 60.25mbgl;
- 4 no. trial pits;
- In-situ and laboratory geotechnical testing;
- Gas and groundwater monitoring; and
- 20 no. soil samples for chemical testing.

2.2.8 Norwest Holst 2009

This investigation was undertaken on the site of the Mater Hospital for the proposed Dublin Metro North project. The ground investigation comprised:

- 5 no. rotary boreholes to 16.91mbgl;
- In-situ and laboratory geotechnical testing;
- In-situ permeability testing;
- Gas and groundwater monitoring; and
- 15 no. soil chemical testing and 8 no. groundwater chemical testing.

2.2.9 IGSL 2010

This investigation was undertaken for the proposed Dublin Metro North Line from St Stephens Green to Lissenhall. The ground investigation comprised:

- 14 no. cable percussion boreholes with 9 no. rotary follow on to up to 40.5mbgl;
- In-situ and laboratory geotechnical testing;
- Groundwater level monitoring; and
- 4 no. soil samples for chemical testing.

2.2.10 Soil Mechanics 2011

This investigation was undertaken on the site of the proposed Metro North Depot in Dardistown. The ground investigation comprised:

- 4 no. cable percussion boreholes and 1 no. rotary borehole to 20.25mbgl;
- 10 no. trial pits to 4mbgl;
- 4 no. trial pits to 3mbgl for infiltration tests;
- In-situ and laboratory geotechnical testing; and
- 6 no. soil samples for chemical testing, 3 no. groundwater samples for chemical testing and 6 no. soil samples for leachate chemical testing.

2.2.11 Ground Investigations Ireland 2018

The investigation was undertaken on the site of the proposed New Metro North Line in the Griffith Park and Dardistown area. The ground investigation comprised:

- 2 no cable percussion boreholes and 4 no. rotary boreholes to 35.4mbgl;
- Groundwater monitoring;

- In-situ and laboratory geotechnical testing; and
- 2 no. soil samples for chemical testing and 4 no. groundwater samples for chemical testing.

2.2.12 Causeway Phase 1 2019

The Phase 1 GI was undertaken to inform the preliminary design and Environmental Impact Assessment for the proposed Project. The GI was undertaken throughout the whole area of the proposed Project and comprised:

- 3 no. cable percussion boreholes and 48 no. rotary boreholes to up to 50mbgl;
- In-situ and laboratory geotechnical testing;
- Groundwater monitoring and in-situ permeability testing;
- 59 no. soil samples for chemical testing and 9 no. groundwater samples for chemical testing; and
- 33 no. soil samples for Waste Acceptance Criteria (WAC) testing.

2.2.13 Causeway Phase 2 2019 – 2020

The phase 2 GI was also undertaken with coverage across the proposed Project to inform the preliminary design and EIA for. The GI comprised:

- Completion of 26 no. rotary boreholes;
- Completion of 4 no. sonic boreholes;
- Installation of 38 no. monitoring standpipes;
- 8 no. variable head permeability tests and 32 no. packer / lugeon tests;
- 5 no. machine excavated trial pits;
- 3 no. soakaway tests;
- Groundwater monitoring;
- In-situ and laboratory geotechnical testing;
- 51 no. Soil samples for chemical testing; and
- 26 no. soil samples for WAC testing.

2.2.14 Causeway Phase 3 2020

The third phase of investigation was undertaken to inform the preliminary design and EIA for the proposed Project in the Swords area. The GI comprised:

- Completion of 8 no. rotary boreholes;
- Installation of 11 no. monitoring standpipes;

- 3 no. pumping tests and groundwater monitoring;
- In-situ and laboratory geotechnical testing;
- Groundwater monitoring and in-situ permeability testing;
- 17 no. soil samples for chemical testing; and
- 9 no. soil samples for WAC testing.

2.2.15 Causeway Phase 4 2020

The fourth phase of investigation was undertaken to inform the preliminary design and EIA for the proposed Project in the Glasnevin area. The GI comprised:

- Completion of 24 no. dynamic (windowless) boreholes;
- Mechanical excavation of 12 no. trial pits;
- 45 no. retaining wall and arch cores;
- Vacuum excavation of 14 no. foundation pits and 2 no. inspection pits;
- Groundwater monitoring;
- In-situ and laboratory geotechnical testing;
- Groundwater sampling and in-situ permeability testing;
- 73 no. soil samples for chemical testing; and
- 29 no. soil samples for WAC testing.

2.2.16 Causeway Phase 5 2021

The phase 5 GI was undertaken under the design of Arup to provide data for the Article 27 application to the EPA (prepared by Arup), and included GI throughout the proposed Project. The GI comprised:

- Completion of 5 no. light cable percussion boreholes;
- Completion of 29 no. light cable percussion boreholes with rotary follow-on;
- Completion of 25 no. rotary boreholes;
- Completion of 3 no. sonic boreholes;
- Completion of 12 no. dynamic (windowless) boreholes;
- Installation of 19 no. monitoring standpipes;
- Hand excavation of 5 no. inspection pits;
- Mechanical excavation of 51 no. trial pits;

- 4 no. samples of a stockpile in Huntstown Quarry;
- Groundwater monitoring;
- In-situ and laboratory geotechnical testing;
- Groundwater sampling and in-situ permeability testing;
- 382 no. soil samples for chemical testing; and
- 355 no. soil samples for leachability testing.

2.2.17 Causeway Phase 5B 2021

The Phase 5B GI was undertaken under the design of Arup to provide geo-environmental data to support the design of a proposed substation on a section of greenfield approximately 1km north of Dublin Airport bounded by Naul Road to the south and the R132 to the east. The GI comprised:

- Completion of 2 no. rotary boreholes;
- Completion of 8 no. dynamic (windowless) boreholes;
- Hand excavation of 2 no. inspection pits;
- Mechanical excavation of 8 no. trial pits;
- In-situ and laboratory geotechnical testing;
- 20 no. soil samples for chemical testing; and
- 10 no. soil samples for WAC testing.

2.3 Groundwater and Ground Gas Monitoring

In addition, to the limited amount of groundwater and ground gas monitoring data available from the supporting GI information, up to five groundwater and ground gas monitoring rounds (including groundwater sampling and laboratory analysis) were undertaken on selected phase 1 to 5 monitoring installations between February and March 2022. Groundwater monitoring data is available for a total of 87 no. locations, and a total of 23 no. locations for ground gas. Groundwater and ground gas monitoring locations are summarised in Appendix B.

3. Proposed Project Setting

3.1 Methodology and Regional Overview

The description of the proposed Project setting has been split according to the AZs summarised in Section 1.2, described from north to south. The information in this section has been derived from the available information detailed in Section 2 comprising published regulatory information, reports / assessments and ground investigation data. The following sub-sections provide further detail of the information sources used and regional overview and are followed by the AZ description of the proposed Project setting.

3.1.1 Topography

Information on topography has been derived from a combination of available online data (OSI 2022, Topographic-map 2022), site reconnaissance and level data from the various stages of ground investigation.

The northern extent of the study area is near the Malahide Estuary, adjacent to the Broad Meadow River with a low elevation of around 7mAOD. The topography rises to high of approximately 70mAOD within the vicinity of Dublin Airport, then with minor local variations reduces to sea level at the River Liffey crossing. To the south of the River Liffey, ground levels rise to around 20mAOD in the vicinity of Charlemont. Surface gradients are generally gentle, with small areas of higher gradients generally associated with river features.

3.1.2 Geomorphology

Geomorphology information has been primarily obtained from online GSI data (GSI 2022). The morphology along the alignment is shaped principally from glacial activity, with most of the glacial sediments in the vicinity of the proposed Project being deposited during the last glaciation and subsequent fluvial processes within the vicinity of watercourses (GSI 2022). The glacial features encountered are typically linear and oriented north west to south east (refer to Figure 20.2).

3.1.3 Soils and Superficial Geology

The soils and superficial geology information has been obtained from paper and online mapping, previous assessments and ground investigations as detailed in Section 3. Overall soil conditions along the proposed Project comprise Grey Brown Podzolics, a mainly dry mineral soil comprising associated Gleys (An Foras Talúntais 1980). The Quaternary Geological Map of Ireland (GSI 2017) and GSI online maps (GSI 2022) suggest the subsoils primarily consist of till derived from limestone along with areas of alluvium and limestone derived gravels. The till is generally low permeability and cohesive apart from subordinate (although locally extensive) granular horizons, with high strength and low compressibility (Parsons Brinkerhoff 2007). Within Dublin these deposits are colloquially known as the black and brown boulder clays; the brown boulder clays are thought to be a weathered version of the underlying black boulder clay and typically have thicknesses of up to 4m. Total boulder clay thicknesses (black and brown boulder clay) in the region of the proposed Project are variable and have been recorded with thicknesses in excess of 30m.

The soil associations found within the study area are shown on Figure 20.1, and distributions of Quaternary sediments are shown on Figure 20.3.

3.1.4 Bedrock Geology

Geological maps (GSI 2014, GSI 2022) indicate that the regional bedrock geology comprises Carboniferous Tournasian limestone, and Viséan limestone and calcareous mudstone. The heavily faulted older Tournasian rocks are primarily present towards the north and include the Tober Colleen and Malahide formations, and the Waulsortian limestones. The Viséan limestone and calcareous mudstone of the Lucan Formation are primarily present south of the M50. The regional bedrock setting is shown on Figure 20.4.

Malahide Formation

The Carboniferous Malahide Formation comprises argillaceous bioclastic (fossiliferous) limestone with interbedded shale; the lower part of this formation is composed of calcareous shales, siltstones and sandstones with occasional thin limestones at the base. Thicknesses of the Malahide formation are recorded from 300m to more than 1200m (GSI 2022, RPA 2008).

Waulsortian Limestones

The Carboniferous Waulsortian Limestone is a predominantly pale grey, crudely bedded or massive lime-mudstone, biomicritic in nature with distinctive stromatactis and generally formed mounds or reefs. The Waulsortian Limestones are generally dolomitised and have a typical thickness ranging 300-500m (GSI 2022, RPA 2008).

Tober Colleen Formation

The Tober Colleen Formation is generally described as dark-grey calcareous, commonly bioturbated mudstone and subordinate thin argillaceous micritic limestones. The lower levels of this formation can include reef derived debris and large slumped reef blocks. The thickness of Tober Colleen Formation is recorded to range from 50m to 250m (GSI 2022, RPA 2008).

Lucan Formation

The Lucan (Calp) Formation refers to various units of basinal limestone and shale formed from carbonate sediment deposits. The Lucan Formation consists of muddy limestone beds inter-bedded with calcareous shale beds. The limestone beds are dark grey to black, fine grained, occasionally cherty and are classified as strong to very strong. Pyrite has also been recorded. Analysis of thin sections for the Dart Underground EIS (Irish Rail 2010) indicated pyrite concentrations ranging from <0.5% to 5% with detects in the majority of samples, with wide variation between close samples and no regional trends evident. Occasional exceptionally high concentrations of 10 to 40% were identified typically associated with lithology contact surfaces. The limestone hosts some limited fossils, such as corals and brachiopods, locally. The shale beds are less substantial and dark grey to black in appearance. These are typically moderately strong and more susceptible to weathering than the limestones. The typical thickness of the Lucan Formation is 300-800m. The bedrock surface is highly irregular with incised drainage channels including a large pre-glacial channel north of the River Liffey (GSI 2020, RPA 2008, Parsons Brinkerhoff 2007).

3.1.5 Hydrology

The majority of the Study Area is located within the Liffey and Dublin Bay Catchment (Water Framework Directive (WFD) Catchment ID 09). North of Dublin Airport, the Study Area is located within the Nanny Delvin Catchment (WFD Catchment ID 08). Watercourse flow is generally in an ESE direction. Further detail on the watercourses within each AZ is included in Sections 3.2 to 3.5.

3.1.6 Hydrogeology

The groundwater bodies within the study area have been designated WFD management units (GSI 2022). The study area falls within the Swords and Dublin groundwater bodies, which are both classified as Poorly Productive Bedrock. Smaller areas around Swords and Dublin Airport are designated as Industrial Facilities and classified as Poorly Productive Bedrock.

The GSI has classified the bedrock aquifers according to the characteristics and productivity (GSI 2022). The majority of the study area is classified as a LI (Locally Important Aquifer - Bedrock which is Moderately Productive only in Local Zones). Areas around Swords and Dublin Airport are classified as a PI (Poor Aquifer - Bedrock which is Generally Unproductive except for Local Zones).

The bedrock and superficial geology summarised in the following Sections influences the overall groundwater vulnerability (GSI 2022). The study area is largely classified as Low potential (in terms of groundwater volumes), with areas up to Very High potential around Swords, Dublin Airport and Dublin City Centre.

Groundwater levels have been collected from boreholes installed during the Phase 1 to 5 ground investigation works, groundwater levels and ranges for each AZ are described in the following sections.

3.1.7 Current and Historical Mining Sites

Available information does not indicate any active or historic mines within the Study Area.

Several historic gravel pits and quarries have been noted on the available historic mapping. There is also the potential that localized small-scale quarrying has taken place that is not shown on historic mapping. Quarried materials are likely to have comprised sand, gravel and limestone. Records indicate that there are no active quarries, sand pits or gravel pits within the study area.

3.1.8 Radon and Ground Gas

Radon is a naturally occurring radioactive gas which originates form the decay of uranium in rocks and soils. It is colourless, odourless and tasteless. As radon decays, radiation is given off in the form of alpha particles. After inhalation, the alpha particles are absorbed by the lungs and cause localized damage, which can lead to lung cancer.

Radon can accumulate in enclosed or poorly ventilated spaces in contact with the sub-surface, such as the ground floors of buildings and houses, and tunnels. The receptors to radon in relation to the proposed Project are construction and maintenance workers, future site users and adjacent residents.

Radon concentration is measured in becquerels per cubic metre of air (Bq/m^3). The Becquerel is a unit of radioactivity and corresponds to one radioactive disintegration per second.

The Radiological Protection Institute of Ireland (RPII), part of the EPA, has issued information and guidance on radon (EPA 2019a and EPA2019b). The reference level for long-term exposure to radon in a house, above which the need for remedial action should be considered, is $200Bq/m^3$ (determined in accordance with the RPII's standard protocol), while in a workplace a reference level of $300Bq/m^3$ is applicable. Based on current knowledge it is estimated that in Ireland, for the population as a whole, a lifetime exposure (i.e. 70 years) to radon in the home at the Reference Level of $200Bq/m^3$ carries a risk of about 1 in 50 of contracting fatal lung cancer.

Radon risk is determined by the percentage of homes in a given area that are estimated to be above the $200Bq/m^3$ Reference Level. The online Radon Map of Ireland (EPA 2022) has recently been updated (26 May 2022). The revised version contains more local detail on the likely risks than the previous map, which was based on classification of 10km squares. Both the current version and old versions of the map have been used to provide

an indication of the level of risk associated with the scheme (refer to Figure 20.12). These maps have been used to provide an indication of the level of risk associated with the proposed Project. Areas of high radon potential are generally located to the west and south east of Ireland, with lower potential generally present within the area of Dublin. Radon monitoring has not been undertaken within the supporting or project specific GI.

'Ground gas' refers to gases such as carbon dioxide, methane, carbon monoxide and hydrogen sulphide which can occur naturally and from anthropogenic sources. Volatile and semi-volatile organic compounds (VOCs/SVOCs) within the ground can produce potentially harmful vapours. Typical sources of ground gases and vapours include:

- Methane, carbon dioxide, carbon monoxide and hydrogen sulphide from breakdown of organic materials in the sub-surface from natural sources such as wetlands, peat and alluvium and anthropogenic sources such as landfills;
- Vapours from anthropogenic sources such as landfills or spillages/improper disposal of volatile materials such as petrol, oils or solvents;
- Methane, carbon dioxide, carbon monoxide and hydrogen sulphide from coal measures; and
- Carbon dioxide from carbonate-rich soils or bedrock.

Issues arising from the presence of ground gases are usually due to an accumulation or release of gas or vapours in an enclosed or confined space. Hazards associated with ground gases and vapours include:

- Explosion/flammability (methane, hydrogen sulphide, VOCs/SVOCs);
- Asphyxiation (methane, carbon dioxide, carbon monoxide); and
- Toxicity (carbon monoxide, hydrogen sulphide, VOCs/SVOCs).

Ground gas is considered in Section 4 based on the proposed Project specific GI data.

3.1.9 Contaminated Land

Potential areas of land contamination have been identified via a review of the available information as detailed in Section 2, including:

- Historical and current published maps;
- 2008 EIAR (RPA 2008);
- Ground investigation reports and previous assessments; and
- Consultation information.

As part of the risk-based approach to assessing the potential risk from contaminated land mandated by the EPA (EPA 2013, EPA 2007, EA 2020) a Conceptual Site Model (CSM) for the proposed Project has been developed to describe the relationships between potential contamination sources, receptors that could be affected by contaminants and the potential linking pathways. The presence of a contamination source does not automatically infer a risk; without the three components of a source, a receptor and a linking pathway a viable or complete pollutant linkage is not present and therefore a risk is not present.

The potential receptors, exposure pathways and pollutant linkages which may be present during both construction and operation of the proposed Project are summarised in the preliminary CSM presented in Appendix C. this preliminary CSM has been used as the basis for the land contamination risk assessment. Potential sources of contamination that could potentially affect the proposed Project have been identified for each AZ as detailed in Sections 3.2 to 3.5 and Figure 20.6 based on a review of the available information.

The preliminary CSM presented in Appendix C has been used as a basis for a contaminated land risk assessment. The methodology and the review of the identified potential contamination sources is included in Appendix D.

3.2 AZ1 - Northern Section

3.2.1 Topography

The ground elevation at the northernmost extent of the proposed Project is generally in the range of 3-9mAOD within the vicinity of Estuary Station with the lowest elevations recorded around Broad Meadow Water. Elevations gradually increase to the south, recorded around 10-20mAOD in the Swords area and 44-48mAOD in Fosterstown North. At the far southern extent of AZ1 at the location of the north portal for the Dublin Airport tunnel elevations increase sharply to 58-61mAOD.

3.2.2 Geomorphology

Near the northern extent of the AZ1 a glacial meltwater channel and Glaciofluvial Terraces are present associated with the Broad Meadow River. A Subglacial Lineation (Drumlin) is present where the alignment crosses the R132 at Nevinstown, and a Mega Scale Glacial Lineation is present between the Naul Road and the Dublin Airport terminal buildings. The Sluice River System Glacial Meltwater Channel and Glaciofluvial Terraces are present just to the north of Naul Road.

3.2.3 Soils and Superficial Geology

The principal soil group along the northern extent of AZ1 is the Elton association (Teagasc 2021), a fine loamy drift with limestones to depths >0.8m, categorised with moderate drainage potential, comprising six soil series (Elton, Dunboyne, Howardstown, Straffan, Kilrush and Rathowen). Smaller soil groups in AZ1 include: Crosstown association (a fine loamy drift with siliceous stones with depths from 0.4-0.8m); River alluvium association (comprising various textures of alluvium to depths >0.8m, mainly within the vicinity of Broad Meadow Water); Marine alluvium association (comprising various textures of alluvium to depths >0.8m, located in the vicinity of Malahide Estuary); Tidal Marsh (to the east, adjacent to Malahide Estuary); and Urban Soils with an undefined composition (within Swords and the boundary of Dublin Airport).

Geological mapping (GSI 2017, GSI 2022) indicates that the underlying subsoils along this section mainly comprise till derived from limestones (generally described as ‘tightly packed, unsorted, unbedded, glacial deposits possessing many different particle sizes with commonly sharp, angular to sub-angular clasts’). Areas of alluvium, gravels derived from limestones and estuarine silts and clays are indicated adjacent to the Broad Meadow River near Estuary, adjacent to Fosterstown and adjacent to the airport tunnel north portal. Lacustrine sediments are also indicated at the Pinnockhill roundabout.

An index of borehole information used to obtain information on the soil and superficial geology of AZ1 is included as Appendix A. Geological cross sections of station locations are included as Appendix I, in addition to which geological long sections of the whole proposed Project have been prepared with the GIR (refer to Drawing ML1-JAI-GEO-ROUT_XX-DR-Y-00013 sheets 0 to 27).

Where encountered during ground investigation topsoil was generally recorded at 0-0.40m below ground level (bgl).

Made ground is present in numerous exploratory locations and is primarily associated with the locations of road alignments and previous development within the urbanised area of Swords and Fosterstown. Where encountered, made ground was generally recorded at depths of around 0-1.2mbgl with the exception of 6 no locations in the vicinity of the R132 road. Borehole location NBH402 north of Seatown encountered made ground to a depth of 2.5mbl; ABH08, located near a motor breaking yard (potential source C31), and trial pits completed near Fingallians GAA Club (ATP04, ATP04A) and North Dublin Corporate Park (ATP10, ATP11) encountered made ground to depths of 3.8mbgl, 1.8mbgl, 2.5mbgl, 1.9mbgl and 4.6mbgl respectively. Encountered made ground was described as sandy gravelly clay with gravel and/or cobbles, which has been interpreted mainly as reworked natural ground. In some locations, inclusions of brick, pottery, concrete, metal, plastic and/or wood were found, no obvious unusual discolouration, oil sheens or odours were noted. It should be noted that data are not available for the car dismantler yard (C46).

Ground investigation information indicates superficial deposit thicknesses of between around 2m up to in excess of 30m. Thicknesses are generally lower towards the north, at Estuary and the northern extent of Swords with greater depths towards the south and the approach to the airport tunnel north portal, with a maximum depth just to the south of Fostertown Station (BH65).

From the northern extent of AZ1 to Estuary Roundabout, the superficial deposits comprise sandy gravelly clays and sands and/or gravels with cobbles to depths of 3-9mbgl. From Estuary Roundabout to the proposed Seatown Station superficial deposits comprise sandy gravelly clay to 1-4mbgl. From the proposed Seatown Station to Pinnock Hill Roundabout the superficial units were recorded up to 10-14mbgl and described as sandy gravelly clay with occasional cobbles interbedded with sands and gravels with cobbles and some boulders. A greater proportion of sandy gravelly clay is recorded from the Pinnock Hill Roundabout to the southern end of AZ1. Clasts within the clay are primarily of limestone with some sandstone and chert.

3.2.4 Bedrock Geology

The bedrock geology relevant to AZ1 is summarised in Table 3.1.

Table 3.1: Summary of bedrock strata (AZ2)

Location	Formation(s)	Description
AZ1	Malahide Formation	Argillaceous bioclastic limestone, shale. Present throughout this alignment section. North west – south east fault indicated near the north of swords and south west – north east trending anticlinal axis in the Fostertown area.

Malahide Formation

The Carboniferous Malahide Formation comprises argillaceous bioclastic (fossiliferous) limestone with interbedded shale; the lower part of this formation is composed of calcareous shales, siltstones and sandstones with occasional thin limestones at the base. Thicknesses of the Malahide formation are recorded from 300 m to more than 1200 m (GSI 2019, RPA 2008). The Malahide Formation is present beneath the superficial deposits throughout AZ1. A north west – south east trending fault is indicated near the north of Swords and a south west – north east trending anticlinal axis is mapped in the Fosterstown area.

The Malahide Formation is generally recorded as moderately strong bedded dark grey or black argillaceous and sometimes fossiliferous limestone. The limestone is interbedded with moderately strong to weak dark grey or black calcareous mudstone. In some locations the limestone and mudstone are distinct beds and in others they are recorded as interbedded or interlaminated. As detailed in Section 3.2.3 rockhead depth varies between around 2m up to in excess of 30m. Thicknesses are generally lower towards the north, at Estuary and the northern extent

of Swords with greater depths towards the south and the approach to the airport tunnel north portal, with a maximum depth just to the south of Fostertown Station (BH65).

3.2.5 Hydrology

Watercourses recorded in AZ1 are summarised in Table 3.2.

Table 3.2: Watercourses Within AZ1

Watercourse Name	Location
Staffordstown	300m north east of Ch 1000
Broadmeadow River	Crosses proposed alignment at Ch 1540
Ward River	Crosses proposed alignment at Ch 1640
Seapoint	230m north east of Ch 2640
Greenfields	90m east of Ch 3120
Gaybrook	230m east of Ch 5140
Sluice	Crosses proposed alignment at Ch 5960

3.2.6 Hydrogeology

The bedrock in AZ1 is classified by the GSI as a LI (Locally Important) aquifer. The area to the north of Ch 2400 and between Ch 3600 and Ch 4900 is designated under the WFD as the Swords Aquifer. Between Ch 2400 and Ch 3600 and Ch 4900 and Ch 5900 the area is designated under the WFD as the Dublin Aquifer. The areas to the west of Ward River and between Ch 5900 and the southern end of the AZ1 are classified under the WFD as Industrial Facilities (P0014-03 and P0480-02 respectively).

The majority of AZ1 is classified as low aquifer vulnerability with the following exceptions:

- The area to the north of Ch 1760 classified as moderate to high vulnerability, and the far north west as extreme vulnerability);
- An area to the west of the proposed Seatown Station associated with the Ward River is shown as moderate to extreme vulnerability; and
- The area between Ch 5700 and the southern boundary of AZ1 is classified as moderate to high vulnerability.

Three groundwater abstractions are located approximately 400m west of Ch 3200. One abstraction is recorded approximately 300m east of Ch 4960.

Groundwater levels measured in monitoring standpipes are summarised in Table 3.3.

Table 3.3: Summary of Measured Groundwater Levels (AZ1)

Monitoring Well ID	Ground Elevation	Dates of Level Monitoring	Level Range (mbgl)	Level Range (mAOD)
NBH401	7.64	25 Jan - 21 May 2021	2.91 - 4.33	4.73 - 3.32
NBH402	7.54	25 Jan - 21 May 2021	2.74 - 4.17	4.80 - 3.37
NBH403-S	7.14	25 Jan - 21 May 2021	2.55 - 3.97	4.59 - 3.17
NBH406	11.73	25 Jan - 21 May 2021	4.19 - 5.00	7.54 - 6.73
NBH408	9.68	25 Jan - 21 May 2021	3.43 - 4.28	6.25 - 5.41

3.2.7 Current and Historical Mining Sites

The historic gravel pits and quarries identified in AZ1 by the desk study are summarised in Table 3.4, with locations shown on Figure 20.6. Further details of the available information on these features are presented in the review of potential contamination sources in Appendix D.

Table 3.4: Historic mineral extraction sites within the Study Area (AZ1)

Source ID	Description	Dates Present	Approximate location
C2	Historic Quarry	1837-1864	55m NW of Works Area
C12	Multiple Historic Gravel Pits	1937	30m N of Works Area
C13	Historic Gravel Pit	1837-1842	60m WNW of Works Area
C15	Historic Gravel Pit	1837-1842	Within Works Area
C16	Historic Gravel Pit	1888-1913	Within Works Area
C24	Historic Quarry	1837-1864	180m WNW of Works Area
C25	Multiple Historic Gravel Pits	1937	195m ESE of Works Area
C41	Historic Gravel Pit	1837	100m NNW of Works Area
C42	Historic Gravel Pit	1837	125m NW of Works Area

3.2.8 Radon

The pre 2022 online Radon Map of Ireland indicates that AZ1 is entirely within the lowest classification of radon potential (<1% of homes above reference levels). The updated map indicates that the majority of AZ1 lies within the lowest classification of radon potential (about 1 in 20 homes likely to have high radon levels), while small areas around the Broad Meadow Water and just north of Naul Road are in the second highest classification (about 1 in 10 homes likely to have high radon levels).

3.2.9 Contaminated Land

Potential contamination sources identified by a review of the available documentary and GI information are presented in Appendix D with locations shown on Figure 20.6. The majority of these potential sources are outside the Works Area and / or have a minor or mild assessed severity with no specific linked instances of made ground or contamination identified. Sources considered to have potential to affect the route include a sewage works (C14), historic gravels pits (C15 and C16), a petrol station (C45) and a car dismantlers yard (C46).

As summarised in Section 3.2.3 made ground has been identified in several parts of the Works Area, mostly associated with general urban made ground, road sub-base and re-worked natural subsoils rather than being

specifically associated with the sources identified above. Anthropogenic material, generally inert in nature (brick, pottery, concrete, metal, plastic and/or wood) was found within some areas of made ground.

The assessment of land contamination based on the available GI data is included in Section 4.

3.3 AZ2 - Airport Section

3.3.1 Topography

Ground elevations at the northern portal (northern extent of AZ2) rise steeply from around 45mAOD (a local topographic low associated with a former meltwater channel) to 62-64mOD at Naul Road. The topography gently rises to around 67mAOD in the vicinity of the airport complex, then gently falls away to around 60mAOD at the southern extent of AZ2 at the south portal

3.3.2 Geomorphology

No geomorphological features of interest are indicated within AZ2.

3.3.3 Soils and Superficial Geology

Urban soils with an undefined composition are indicated directly below the footprint of Dublin Airport (Teagasc 2021). Outwith the footprint of the airport, soils are recorded as the Elton association, comprising a fine loamy drift with limestones to depths of >0.8m. The Elton Association is comprised of six soil series (Elton, Dunboyne, Howardstown, Straffan, Kilrush and Rathowen) and has a moderate drainage potential.

Geological maps indicate that the underlying subsoils within the footprint of the airport comprise till with an area of bedrock outcrop / subcrop present beneath the location of the airport terminal car park (GSI 2022). GI information suggests that made ground is present within the area of the terminal buildings, particularly at the location of a former quarry which coincides with the Dublin Airport Station location. Cohesive till with occasional granular layers is present within the remainder of AZ2.

Where encountered during GI topsoil was generally recorded at 0-0.30mbgl.

Made ground was encountered in the majority of the exploratory locations in AZ2. It was recorded at depths of up to 2.70mbgl and generally described as tarmac, concrete, sandy gravel or sandy gravelly clay. Pieces of rebar and red brick were recorded in the vicinity of the airport buildings. No obvious unusual discolouration, oil sheens or odours were noted with the exception of possible domestic waste / putrescible material within ABH12 (0.50-2.10mbgl). The area of the greatest depths of made ground (2.70mbgl at ABH13) is within an area marked as a former quarry on historical mapping (potential source C59), which is also the proposed location of Dublin Airport station. Made ground was identified at the North Portal at depths of up to 0.4mbgl, described as firm, slightly sandy slightly silty gravelly clay.

Superficial deposit thickness is variable across AZ2, at the northern portal depth to bedrock is 24.5mbgl (BH212) where rockhead elevation rises in a reflection of surface topography. Superficial deposit depths remain similar until a sharp reduction at the airport buildings, reducing to 2.6mbgl at the centre of the Dublin Airport complex. Rockhead elevation then drops away to the south and is recorded at 33mbgl at the south portal.

The superficial deposits in AZ2 generally comprise sandy gravelly clay with occasional cobbles. This is frequently underlain or interbedded with sands and gravels, often with cobbles and boulders. Clasts are primarily of limestone. Sands and gravels are particularly notable to the south of Dublin Airport station, on the approach to the south portal.

3.3.4 Bedrock Geology

The bedrock geology relevant to AZ2 is summarised in Table 3.5

Table 3.5: Summary of bedrock strata (Airport Section)

Location	Formation(s)	Description
AZ2	Malahide Formation	Agrillaceous bioclastic limestone, shale. Indicated from the start of this section to the Dublin Airport terminal buildings. Boundary with the adjacent Waulsortian Limestone marked by a fault.
	Waulsortian Limestone	Massive unbedded lime-mudstone. Present within the Dublin Airport terminal building area and proposed Dublin Airport station.
	Tober Colleen Formation	Calcareous shale, limestone conglomerate. Stratigraphic boundary with the Waulsortian Limestone present at the southern edge of the Dublin Airport terminal buildings and extends to the southern airport portal location.

Malahide Formation

The Carboniferous Malahide Formation comprises argillaceous bioclastic (fossiliferous) limestone with interbedded shale; the lower part of this formation is composed of calcareous shales, siltstones and sandstones with occasional thin limestones at the base. Thicknesses of the Malahide formation are recorded from 300 m to more than 1200 m (GSI 2019, RPA 2008).

The Malahide Formation is encountered in RC301, RC302 and RC303 at 14-25mbgl and described as moderately strong to strong bedded to laminated dark grey and black calcareous mudstone.

Waulsortian Limestones

The Carboniferous Waulsortian Limestone is a predominantly pale grey, crudely bedded or massive lime-mudstone, biomicritic in nature with distinctive stromatactis and generally formed mounds or reefs. The Waulsortian Limestones are generally dolomitised and have a typical thickness ranging 300-500m (GSI 2022, RPA 2008).

The Waulsortian Limestone is encountered in RC305 to RC307 at 2.6-5.8mbgl and is described as strong to extremely strong bedded to massive grey and locally black fine-grained siliceous limestone. It is generally fresh to slightly weathered, locally fossiliferous and with frequent styolites and calcite veining.

It can be inferred that the abrupt change in rockhead elevation may be representative of the north east-south west trending fault that just to the north Dublin Airport station.

Tober Colleen Formation

The Tober Colleen Formation is generally described as dark-grey calcareous, commonly bioturbated mudstone and subordinate thin argillaceous micritic limestones. The lower levels of this formation can include reef derived debris and large slumped reef blocks. The thickness of Tober Colleen Formation is recorded to range from 50 – 250m (GSI 2019, RPA 2008).

The Tober Coleen Formation is encountered to the south of the proposed Dublin Airport Station at depths of between 10 and 34mbgl. It is described as strong to very strong interbedded or interlaminated dark grey to black calcareous mudstone and argillaceous limestone.

3.3.5 Hydrology

The proposed Project crosses Cuckoo Stream at CH 7760, though this appears to be culverted throughout the study area.

3.3.6 Hydrogeology

The bedrock around and to the north of the proposed Dublin Airport Station is classified as a LI (Locally Important) aquifer, and the area to the south is classified as a PI (Poor) Aquifer. The area between the northern boundary of AZ2 and Ch 6900 is classified under the WFD as P0480-02 (Industrial Facilities). The remainder of AZ2 is designated as the Dublin Aquifer.

The area from the northern end of AZ2 to CH 7700 is recorded as moderate to high vulnerability, with the area directly around the proposed Dublin Airport Station recorded as extreme vulnerability with rock at or near the surface or karst. The remainder of AZ2 is recorded as low vulnerability.

One groundwater abstraction is located approximately 650m south east of the proposed Dublin Airport Station.

Groundwater levels measured in monitoring standpipes in AZ2 are summarised in Table 3.6.

Table 3.6: Summary of Measured Groundwater Levels (AZ2)

Monitoring Well ID	Ground Elevation	Dates of Level Monitoring	Level Range (mbgl)	Level Range (mAOD)
NBH05-D	59.80	03 Dec 2019 - 09 Dec 2020	4.88 - 6.58	54.92 - 53.22
NBH05-S	59.80	03 Dec 2019 - 09 Dec 2020	4.92 - 6.01	54.88 - 53.70
NBH06A	60.18	03 Dec 2019 - 09 Dec 2020	4.53 - 6.44	55.65 - 53.75
NBH06W	60.31	03 Dec 2019 - 09 Dec 2020	5.26 - 6.27	55.05 - 54.04

3.3.7 Current and Historical Mining Sites

The historic gravel pits and quarries identified in AZ2 are summarised in Table 3.7, the location of the sites is shown on Figure 20.6. Further details of the available information on these features are presented in Appendix D.

Table 3.7: Historic mineral extraction sites within the Study Area (AZ2)

Source ID	Description	Dates Present	Approximate Location
C59	Historic Quarry (including re-opened extended quarry)	1837 to 1937	In location of Dublin Airport station

3.3.8 Radon

The pre 2022 online Radon Map of Ireland indicates that AZ2 is within the lowest classification of radon potential (< 1 % of homes above reference levels).The updated map indicates that the majority of AZ2 lies within the lowest classification or radon potential (about 1 in 20 homes likely to have high radon levels), with an area coinciding with the former quarry at Dublin Airport Station falls within the highest classification (about 1 in 5 homes likely to have high radon levels), coinciding with shallow bedrock.

3.3.9 Contaminated Land

Potential contamination sources identified by a review of the available documentary and GI information are presented in Appendix D with Locations shown on Figure 20.6. The majority of these potential sources are outside the Works Area and / or have a minor or mild assessed severity with no specific linked instances of made ground or contamination identified.

Sources considered to have potential to affect the route include a vehicle storage area near the north portal (C52), a petrol station (C58), the historical use of the area as an airport (C60) and an historic infilled gravel pit (C59). Within the historic quarry at the proposed Dublin Airport station location made ground up to 2.7m thick was found, comprising gravel and gravelly sandy clay with anthropogenic inclusions including concrete, rebar, domestic waste and brick below the present-day car park.

The assessment of land contamination based on the available GI data is included in Section 4.

3.4 AZ3 - Dardistown to Northwood

3.4.1 Topography

Ground elevations are around 59-61mAOD at the northern extent of AZ3, rising to 65mAOD to the north of the M50 crossing, reducing to around 60mAOD at the proposed Northwood Station.

3.4.2 Geomorphology

Two Mega Scale Glacial Lineations are indicated to the north and south of the M50 crossing, along with a Meltwater Channel just to the north of Gulliver's Retail Park.

3.4.3 Soils and Subsoils

The principal soil group in AZ3 is the Elton Association (Teagasc 2021), comprising a fine loamy drift with limestones to depths of >0.8m. The Elton Association is comprised of six soil series (Elton, Dunboyne, Howardstown, Straffan, Kilrush and Rathowen) and has a moderate drainage potential. The areas around the M50, the R108 and Silloge Park Public Golf Course are classified as urban soil with an undefined composition.

Geological maps indicate that the subsoils predominantly comprise till with an area of alluvium present just to the south of the M50 (GSI 2022) associated with the Santry River. Engineered fill is likely to be present at the ground surface within the vicinity of the M50.

Where encountered during GI topsoil was generally recorded at 0-0.30mbgl.

Made ground was encountered at the ground surface throughout AZ3, primarily towards the northern and southern extents as well as at the embankments adjacent to the M50. Where encountered, it was recorded up to a maximum depth of 2.5mbgl and described as sandy gravelly clay or sandy gravel, with anthropogenic materials such as brick, plastic, metal and pottery noted in some locations. The area of the greatest depths of made ground (2.50m bgl in ABH19) is located in the central reservation of the R108 road, which is also adjacent to the proposed location of Northwood station. No other obvious unusual discolouration, oil sheens or odours were noted within the GI information.

The superficial deposits encountered during ground investigation generally comprise sandy gravelly clay over sandy gravelly clay with cobbles. Sandy and/or clayey gravel strata were encountered at the northern and southern ends of the Dardistown to Northwood Section. Clasts are primarily of limestone with some sandstone. Thicknesses of the superficial deposits varied from >38m in the far north of the section (BH32), to 16-18m in the centre and 15-20 m in the south of AZ3.

3.4.4 Bedrock Geology

The bedrock geology relevant to AZ3 is summarised in Table 3.8.

Table 3.8: Summary of Geological Units (AZ3)

Location	Formation(s)	Description
Dardistown to Northwood	Tober Colleen Formation	Calcareous shale, limestone conglomerate. Present within the northernmost extent of this section between the southern airport portal and the M50.
	Lucan Formation	Dark limestone and shale (also known as the Calp Limestone) Stratigraphic boundary with the Tober Colleen Formation just to the north of the M50, to the southern extent of this section.

Tober Colleen Formation

The Tober Colleen Formation is generally described as dark-grey calcareous, commonly bioturbated mudstone and subordinate thin argillaceous micritic limestones. The lower levels of this formation can include reef derived debris and large slumped reef blocks. The thickness of Tober Colleen Formation is recorded to range from 50 – 250m (GSI 2019, RPA 2008). The Tober Colleen Formation is indicated within the northernmost extent of AZ3 in the area between the airport tunnel south portal and the M50.

GI records describe the Tober Colleen Formation as strong to moderately strong medium bedded to thinly laminated dark grey or black calcareous mudstone interbedded with strong thinly bedded grey or pale grey limestone. Depth to rockhead is 32-34m at the northern extent of AZ3, and 16m to the north of the M50 crossing.

Lucan Formation

The Lucan (Calp) Formation refers to various units of basinal limestone and shale formed from carbonate sediment deposits. The Lucan Formation consists of muddy limestone beds inter-bedded with calcareous shale beds. The limestone beds are dark grey to black, fine grained, occasionally cherty and are classified as strong to very strong. Pyrite has also been recorded. Analysis of thin sections for the Dart Underground EIS (Irish Rail 2010) indicated pyrite concentrations ranging from <0.5 % to 5% with detects in the majority of samples, with wide variation between close samples and no regional trends evident. Occasional exceptionally high concentrations of 10 to 40% were identified typically associated with lithology contact surfaces. The limestone hosts some limited fossils, such as corals and brachiopods, locally. The shale beds are less substantial and dark grey to black in appearance. These are typically moderately strong and more susceptible to weathering than the limestones. The bedrock surface is highly irregular with incised drainage channels including a large pre-glacial channel north of the River Liffey (GSI 2022, RPA 2008, Parsons Brinkerhoff 2007). The Lucan Formation is indicated from the stratigraphic boundary with the Tober Colleen Formation to the north of the M50, to the southern extent of AZ3.

GI records describe the Lucan Formation as strong to moderately strong thin to medium bedded dark grey argillaceous limestone interbedded with moderately strong thinly bedded to thickly laminated dark grey or black calcareous mudstone. Depth to rockhead is between 16 and 20 m to the south of the M50 crossing.

3.4.5 Hydrology

Watercourses recorded in AZ3 are detailed in Table 3.9.

Table 3.9: Watercourses Within AZ3

Watercourse Name	Location
Turnapin Stream	CH 8648 (tributary to Mayne River)
Mayne	210m south east of Ch 8800
Santry River	Crosses proposed alignment at Ch 9980

3.4.6 Hydrogeology

AZ3 to the north of the M50 is designated as a PI (Poor) Aquifer. To the south of the M50 the bedrock is designated as a LI (Locally Important Aquifer). The entire area of AZ3 is recorded as low vulnerability and designated as the Dublin Aquifer.

Five groundwater abstractions are located in AZ3, three approximately 100m south east of Ch 9000, one approximately 420m west of Ch 8800 and one approximately 640m south east of Ch 8700.

Groundwater levels measured in monitoring standpipes in AZ3 are summarised in Table 3.10.

Table 3.10: Summary of Measured Groundwater Levels (AZ3)

Monitoring Well ID	Ground Elevation	Dates of Level Monitoring	Level Range (mbgl)	Level Range (mAOD)
NBH202-D	58.34	14 Jul 2020 - 24 May 2021	7.71 - 9.44	50.63 - 48.90

3.4.7 Current and Historical Mining Sites

No quarries, pits or mines have been recorded within the study area in AZ3.

3.4.8 Radon

The pre 2022 online Radon Map of Ireland indicates that AZ3 is within the lowest classification of radon potential (<1% of homes above reference levels). The updated map indicates that the whole of AZ3 lies within the lowest classification of radon potentials (about 1 in 20 homes likely to have high radon levels).

3.4.9 Contaminated Land

Potential contamination sources identified by a review of the available documentary and GI information are presented in Appendix D with Locations shown on Figure 20.6. The majority of these potential sources are outside the Works Area and / or have a minor or mild assessed severity with no specific linked instances of made ground or contamination identified. Sources considered to have potential to affect the route include a cooking oil wholesaler (C67), a vehicle test centre (C69) and a fuel station (C72).

Made ground material was encountered over much of this AZ, the distribution of which is summarised in Section 3.4.3.

The assessment of land contamination based on the available GI data is included in Section 4.

3.5 AZ4 - Northwood to Charlemont

3.5.1 Topography

Elevations of 63mAOD are present at the northern extent AZ4 at the TBM launch point, steadily dropping to around 10mAOD in the vicinity of the Tolka River. Elevations then rise to approximately 28mAOD in the area of the Royal Canal, before dropping to sea level where the proposed Project crosses the River Liffey which is tidal in this section. To the south of the River Liffey, elevations gradually rise to around 20mAOD in the area of the proposed Charlemont Station.

3.5.2 Geomorphology

Two Mega Scale Glacial Lineations are present to the north of Griffiths Avenue, and to the north of Glasnevin Station. The Tolka River just to the south of Griffith Park Station runs within a Meltwater Channel, as does the River Liffey (refer to Figure 20.2).

3.5.3 Soils and Subsoils

The whole of the Study Area in AZ4 is underlain by urban soils (unknown composition) associated with the urbanisation of the Dublin City area. An area around the Tolka River approximately 100 m to the west of the proposed Griffiths Park Station is classified as River alluvium, comprised of 12 soil series (Boyne, Finisk, Aherlow, Clohamon, Suir, Kilgory, Lyre, Vicarstown, Feale, Camoge, Cornafulla and Kilcullen) with depths of >0.8m. The River alluvium is recorded as having poor drainage potential.

Geological maps indicate that the majority of the subsoils comprise till, with alluvial sediments present adjacent to within the vicinity of the River Tolka and River Liffey (refer to Figure 20.3). ‘Urban’ ground is indicated within the central area of Dublin, between Mater and Charlemont Stations.

Made ground was encountered in the majority of GI exploratory holes in AZ4 to depths typically up to 2mbgl, with local variations and a maximum recorded depth of 7mbgl in the vicinity of Charlemont Station. Made ground was generally described as sandy gravelly clay with cobbles and/or boulders and anthropogenic material in many locations (typically comprising bricks and rubble). Hydrocarbon or bitumen odours were noted within the areas of the proposed stations at Collins Avenue, Tara and O’Connell Street.

GI records indicate that cohesive till predominates towards the north of AZ4 with isolated pockets / lenses of granular material (sand and gravel) present; these granular horizons are more prevalent towards the south of AZ4 and within the vicinity of the River Liffey. The thickness of the superficial deposits is typically 10 m to 30m, with greater thicknesses generally present towards the north of AZ4.

Details of the made ground and superficial geology in addition to bedrock geology encountered at each station location are detailed in Table 3.12.

3.5.4 Bedrock Geology

The bedrock geology relevant to AZ4 is summarised in Table 3.11.

Table 3.11: Summary of Bedrock Strata (AZ4)

Location	Formation(s)	Description
Northwood to Charlemont	Lucan Formation	Dark limestone and shale (also known as the Calp Limestone). Present throughout this section.

Lucan Formation

The Lucan (Calp) Formation refers to various units of basinal limestone and shale formed from carbonate sediment deposits. The Lucan Formation consists of muddy limestone beds inter-bedded with calcareous shale beds. The limestone beds are dark grey to black, fine grained, occasionally cherty and are classified as strong to very strong. Pyrite has also been recorded. Analysis of thin sections for the Dart Underground EIS (Irish Rail 2010) indicated pyrite concentrations ranging from <0.5 % to 5% with detects in the majority of samples, with wide variation between close samples and no regional trends evident. Occasional exceptionally high concentrations of 10 to 40% were identified typically associated with lithology contact surfaces. The limestone hosts some limited fossils, such as corals and brachiopods, locally. The shale beds are less substantial and dark grey to black in appearance. These are typically moderately strong and more susceptible to weathering than the limestones. The bedrock surface is highly irregular with incised drainage channels including a large pre-glacial channel north of the River Liffey (GSI 2019, RPA 2008, Parsons Brinkerhoff 2007).

In addition to the general description of conditions, the local ground conditions encountered within each station Works Area are summarised in Table 3.12.

Table 3.12: Summary of Ground Conditions at Stations (AZ4)

Station Location	Strata	Summary of Ground Conditions
Ballymun	Made ground	Encountered in all exploratory holes to depths of 0.2-4.1mbgl. Generally comprising tarmac, concrete or sandy gravelly clay with inclusions of brick, concrete and/or plastic in some locations. No other obvious unusual discolouration, oil sheens or odours were noted within the GI information.
	Superficial	Generally comprising interbedded sandy gravelly clay and sandy gravelly clay with occasional cobbles. Strata of gravel and/or cobbles encountered in some exploratory locations at greater depths (>16mbgl).
	Bedrock	Bedrock encountered in at 19.9-24.3mbgl. Strata recorded as moderately strong bedded to laminated dark grey to black calcareous mudstone interbedded with strong to very strong medium to thinly bedded dark grey argillaceous limestone.
Collins Avenue	Made ground	Encountered in most exploratory holes to depths of 0.3-2.5mbgl. Generally comprising sandy gravelly clay with cobbles and inclusions of concrete, brick, asphalt, glass, plastic and ceramics in some locations. A slight hydrocarbon odour was noted at 0.4-1.2mbgl in TP603.
	Superficial	Generally comprising sandy gravelly clay or sandy gravelly clay with cobbles, interbedded with strata of gravel and/or cobbles. Proportion of granular strata generally increases with depth.

Station Location	Strata	Summary of Ground Conditions
	Bedrock	Bedrock encountered at 19.5-24.2mbgl, comprising strong to very strong medium to thinly bedded grey to dark grey limestone, locally fossilifeous, interbedded with moderately strong to strong medium bedded dark grey to black argillaceous mudstone.
Albert College Shaft	Made ground	Encountered in 2 of 3 exploratory holes to depths of 1.3mbgl. Generally comprising sandy gravelly clay with inclusions of brick and concrete observed in NBH208. No other obvious unusual discolouration, oil sheens or odours were noted within the GI information.
	Superficial	Generally comprising sandy gravelly clay or sandy gravelly clay with low to medium cobble content, interbedded with strata of gravel and/or cobbles. Proportion of granular strata generally increases with depth.
	Bedrock	Bedrock encountered between 17.2 and 20.1mbgl, comprising strong to very strong medium to thinly bedded grey to dark grey limestone, locally fossilifeous, interbedded with moderately strong to strong medium bedded dark grey to black argillaceous mudstone.
Griffith Park	Made ground	Encountered in the majority of exploratory holes to depths of 0.75-2.3mbgl. Generally comprising sandy gravelly clay with cobbles and inclusions of brick, ceramic, glass, ash, wood and/or bitumen/tar.
	Superficial	Sandy gravelly clay interbedded with sandy gravelly clay with cobbles and occasional boulders, and strata of sand and/or gravel.
	Bedrock	Depth to bedrock varies from 4.1mbgl to the south of the Tolka River to 16.1mbgl to the northeast of the proposed Griffith Park Station box. Bedrock is described as strong grey argillaceous limestone interbedded with weak to strong black carbonaceous limestone.
Glasnevin	Made ground	**Station Box and Adjacent Road** Made ground encountered up to 2.3mbgl (GBH01) comprising a 0.1m thick layer asphalt (in some locations) over gravel (mixed lithologies) and sandy gravelly clay with fragments of red brick. No other obvious unusual discolouration, oil sheens or odours were noted within the GI information. **Railway tracks (east)** 4 no. boreholes and several inspection pits (TPCC04, TPCC06, TPCC09 to TPCC12) were undertaken on the tracks to the east of the station box, encountering Ballast (fine to coarse gravel) to a maximum depth of 1.1mbgl (GBH20, GBH21). No other obvious unusual discolouration, oil sheens or odours were noted within the GI information. **Railway tracks (west)** Made ground was encountered in the vast majority of exploratory holes to depths between 0.5 and 3.5mbgl (GBH13, adjacent to the Royal Canal). Generally comprising a layer of Ballast (up to 0.6m thick) in trackside areas directly overlying natural deposits or over sandy gravelly clay with very occasional inclusions of brick, plastic and concrete. Greater made ground thicknesses were overall found in the track areas towards the east, nearer the station box; further to the west ballast directly overlying natural deposits was encountered. No other obvious unusual discolouration, oil sheens or odours were noted within the GI information.
	Superficial	**Station Box and Adjacent Road** Firm to very stiff sandy gravelly clay with cobbles and strata of sandy gravel and gravel with cobbles (granular horizons generally at depths of greater than 10mbgl). **Railway tracks (east)** Firm to very stiff sandy gravelly clay with low cobble content, investigated to a maximum depth of 2.0mbgl. **Railway tracks (east)**

Station Location	Strata	Summary of Ground Conditions
		Firm to very stiff sandy gravelly clay interbedded with sandy gravelly clay with cobbles and strata of sandy gravel or gravel with cobbles (granular horizons generally at depths of greater than 9mbgl).
	Bedrock	**Station Box and Adjacent Road** Bedrock was recorded at depths of between 17.0mbgl (ABH37) and 20.2mbgl (NBH19, just to west of station box), generally comprising medium strong thinly bedded dark grey limestone with occasional beds of mudstone. **Railway tracks (east)** Not encountered **Railway tracks (west)** Encountered at a depth of 18.7mbgl in one borehole (GBH02) near the station box.
Mater	Made ground	Encountered in most exploratory locations to depths of 2.9mbgl, generally comprising concreate / asphalt over clayey sandy gravel or gravelly clay with inclusions of brick, glass and/or pottery. No other obvious unusual discolouration, oil sheens or odours were noted within the GI information.
	Superficial	Sandy gravelly clay interbedded with sandy gravelly clay with cobbles and strata of sandy gravel or gravel with cobbles.
	Bedrock	Depth to bedrock recorded at 24.5mbgl to 27.25mbgl, comprising moderately strong dark grey limestone interbedded with moderately strong dark grey to black calcareous mudstone.
O'Connell Street	Made ground	Encountered in most exploratory locations to depths of 1.0-4.50mbgl, generally comprising paving and/or concrete over sandy gravelly clay or silt with brick and/or concrete. Inclusions of glass, pottery, wire, tile, metal and ash were recorded in some location. A bituminous odour was noted at 1.1-3.6mbgl in BH10.
	Superficial	Generally sandy gravel overlying sandy gravelly clay with cobbles and/or boulders. Gravel with cobbles was frequently encountered in the strata overlying rockhead.
	Bedrock	Depth to bedrock recorded at 14.9-25mbgl. Bedrock is described as moderately strong to strong thin to medium bedded dark grey often argillaceous limestone interbedded with weak to moderately strong laminated dark grey or black shale or mudstone, often calcareous.
Tara	Made ground	Encountered in all exploratory locations to depths of 1.2-3.8mbgl. Generally comprising concrete and/or tarmac over sandy gravel and sandy gravelly clay with brick and some ash. Animal bone was recorded in NBH25 and NBH26C.
	Superficial	Generally comprising sandy gravelly silt or sandy gravelly clay over gravel. BH38 recorded sand with a diesel odour from 2.5-3.1mbgl and sandy gravel with cobbles with a faint hydrocarbon odour from 3.1-4.5mbgl.
	Bedrock	Depth to bedrock recorded at 6.0-9.0mbgl. Bedrock is described as laminated to medium bedded dark grey argillaceous limestone interbedded with weak black carbonaceous mudstone.
St Stephen's Green	Made ground	Encountered depths of up to 2.5mbgl comprising sandy gravel including brick and concrete over sandy gravelly clay or clayey gravelly sand with inclusions of brick, concrete, rebar, glass and wood.
	Superficial	Comprising firm to stiff sandy gravelly clay with occasional cobbles and boulders over gravel or clayey sandy gravel.
	Bedrock	Recorded in eight exploratory location at 7.3-14.9mbgl, comprising strong dark grey argillaceous limestone with occasional white calcite and pyrite bands.

Station Location	Strata	Summary of Ground Conditions
Charlemont	Made ground	Encountered in most exploratory locations to depths of 0.8-7mbgl, generally comprising clayey sandy gravel or sandy gravelly clay, often with inclusions of brick. No other obvious unusual discolouration, oil sheens or odours were noted within the GI information.
	Superficial	Silty or sandy gravelly clay over sandy gravelly clay with cobbles and boulders.
	Bedrock	Depth to bedrock recorded at 4.8-9.12mbgl and comprising medium strong laminated to medium bedded dark grey to black sometimes argillaceous limestone with widely spaced medium beds of weak black carbonaceous mudstone.

3.5.5 Current and Historical Mining Sites

No quarries, pits or mines have been recorded within the study area in AZ4.

3.5.6 Radon

The pre 2022 online Radon Map of Ireland indicates that the northern extent of AZ4 is within the lowest classification of radon potential (< 1% of homes above reference levels). To the south of around Ballymun Station, AZ4 is within the second lowest classification of radon potential (1%-5% of homes above the reference levels). The updated map indicates that the large majority of the study area falls within the lowest classification of radon potential (about 1 in 20 homes likely to have high radon levels), with an area to the south east of Griffith Park Station associated with Tolka River falling into the second lowest classification (about 1 in 10 homes likely to have high radon levels).

3.5.7 Hydrology

Watercourses recorded in AZ4 area are detailed in Table 3.13.

Table 3.13: Watercourses Within AZ4

Watercourse Name	Location
Tolka River	Crosses proposed Project at Ch 13920
Royal Canal	Crosses proposed Project at Ch 14940
River Liffey	Crosses proposed Project between Ch 17160 and Ch 17240
Grand Canal	Crosses proposed Project at Ch 19260

In addition, to the above named watercourses / water bodies which cross the proposed Project, there are a number of other named and unnamed nearby water features, some of which are culverted, including the following (further details are included in Chapter 23 (Hydrology)):

- Wad River and Wad Diversion present to the east of Collins Avenue Station and Griffith Park.
- St Stephen's Green Ponds (to the west of St Stephen's Green station), connected to the Grand Canal via 300m cast iron water main.
- The Stein River is a culverted watercourse that traverses the proposed Project near Tara and St Stephen's Green stations.
- Gallows Stream (culverted watercourse that does not traverse the proposed Project) near Tara and St Stephen's Green stations.

- Swan River (culverted watercourse near Charlemont Station).

3.5.8 Hydrogeology

The whole of AZ4 is classified as a LI (Locally Important) Aquifer and designated as the Dublin Aquifer.

The majority of AZ4 is recorded as low aquifer vulnerability. The area between Ch 13520 and Ch 14220 is recorded as medium and high vulnerability, related to the Tolka River. The area between Ch 17240 and the southern extent of AZ4 is recorded as moderate vulnerability.

Five groundwater abstractions are located in AZ4. One is located to the west of the alignment around Ch 13400, though the exact location is unknown. Two groundwater abstractions are recorded approximately 175m north west of Ch 14400, one 950m south west of Ch 15960 one 180m east of Ch 16440 and one 590m south west of Ch 16860.

Groundwater levels measured in monitoring standpipes in AZ4 are summarised in Table 3.14.

Table 3.14: Summary of Measured Groundwater Levels (AZ4)

Nearest Proposed Station	Monitoring Well ID	Ground Elevation	Dates of Level Monitoring	Level Range (mbgl)	Level Range (mAOD)
Ballymun Station	NBH203A-D	61.99	23 Jun 2020 - 24 May 2021	7.83 - 13.25	54.17 - 48.74
	NBH204	59.36	14 Jul 2020 - 24 May 2021	10.82 - 12.45	48.54 - 46.91

3.5.9 Contaminated Land

Potential contamination sources identified by a review of the available documentary and GI information are presented in Appendix D with Locations shown on Figure 20.6. The majority of these potential sources are outside the Works Area and / or have a minor or mild assessed severity with no specific linked instances of made ground or contamination identified. Sources considered to have potential to affect the route include the following:

- Ballymun shopping centre and associated tanks (C78 and C79);
- Fuel station near Intervention shaft (C86);
- Oil filled cable leaks 29, 63, 20 and 9 (C88, C106, C119 and C130);
- Potentially infilled ground at Griffith Park station (C94);
- Railway land, stations and former creosote application yard near Glasnevin station (C99A, C99B, C99C, C100 and C101);
- Mater Hospital (C105);
- Former gas testing station and hospital at Tara Station (C120 and C121); and
- Railway land at Charlemont Station (C131).

In addition to the above made ground which has not been attributed to specific sources has been identified within the Works Areas at the stations and intervention shaft where surface works will be undertaken.

The assessment of land contamination based on the available GI data is included in Section 4.

3.6 Geochemical Baseline

Information on the baseline concentrations of heavy metals and PAHs obtained as part of the Dublin SURGE Project (GSI 2012) has been reviewed. This study subjected shallow soil samples (1,058 samples from the top 0.1m of the ground) to laboratory geochemical analysis to determine the background concentration of selected contaminants across the Dublin area.

The study found that concentrations of lead, copper, zinc and mercury are strongly influenced by human activities, such as industry, combustion and traffic. Other inorganic elements are generally related to the regional bedrock parent material. PAHs were detected across the city, with the greatest concentrations in the city centre. PCBs were detected at low concentrations in isolated samples.

The SURGE dataset concentrations of metals typically identified at high concentrations within the MetroLink soils dataset are summarised in Table 3.15, along with the residential and commercial GAC used within the assessment in Section 4.

Table 3.15: Overall SURGE Dataset Concentrations, Metals (From GSI 2012)

Contaminant	Concentration – SURGE dataset (mg/kg)					GAC (mg/kg)	
	Min	Max	Mean (overall)	Median (Natural Soil)	Median (made ground)	Residential	Commercial
Arsenic	<3	402	15.5	13.4	13.7	37	640
Chromium	4.24	262	44.2	44.4	41.6	21*	49*
Lead	<3	3,120	123	70.9	130	200	2,300
Mercury	0.0135	23.9	0.339	0.20	0.29	1.2	58
Zinc	18	8,390	248	168	235	3,700	730,000

Notes

[1] - Chromium (Hexavalent) – most conservative assessment criteria used.

The maximum metal concentrations from the SURGE dataset often exceed the residential GAC with some instances of lead concentrations also exceeding the commercial GAC.

The SURGE dataset concentrations of PAHs (total plus USEPA 16 congeners) are summarised in Table 3.16, along with the residential and commercial GAC used in within the assessment in Section 4.

Table 3.16: Overall SURGE Dataset Concentrations, PAH (From GSI 2012)

Contaminant	Concentrations – SURGE dataset (mg/kg)				GAC (mg/kg)	
	Min	Max	Mean	Median	Residential	Commercial
Naphthalene	<0.03	2.4	0.08	0.02	2.3	190
Acenaphthylene	<0.03	3.9	0.12	0.02	170	83,000
Acenaphthene	<0.03	17	0.21	0.02	210	84,000
Fluorene	<0.03	26	0.25	0.02	170	63,000
Anthracene	<0.03	50	0.56	0.06	2,400	520,000
Phenanthrene	<0.03	140	2.12	0.26	95	22,000
Fluoranthene	<0.03	130	3.28	0.55	280	23,000
Pyrene	<0.03	92	2.77	0.53	620	54,000
Benzo[a]anthracene	<0.03	51	1.58	0.29	7.2	170
Chrysene	<0.03	44	1.65	0.37	15	350
Benzo[a]pyrene	<0.03	28	1.15	0.26	5	77
Benzo[b]fluoranthene	<0.03	34	1.49	0.36	2.6	44
Benzo[k]fluoranthene	<0.03	14	0.53	0.12	77	1,200
Benzo[g,h.i]perylene	<0.03	14	0.78	0.22	320	3,900
Indeno[1,2,3-c,d]pyrene	<0.03	12	0.75	0.2	27	500
Dibenzo[a,h]anthracene	<0.03	4.4	0.2	0.05	0.24	3.5
Sum of 16 PAHs	0.24	661	17.52	3.47	N/A	N/A

The maximum concentrations for several PAH congeners exceed the residential GAC, with Denzo[a,h]anthracene also exceeding the commercial GAC.

The above SURGE datasets are based on 1,058 sampling locations over the greater Dublin area. Of these locations only a small number are present within the Study Area for the proposed Project, as summarised in Table 3.17.

Table 3.17: Summary of SURGE Soil Sample Quantities Within the Study Area

AZ	No. of SURGE Sampling Locations
AZ1	7
AZ2	0
AZ3	2
AZ4	19
Total	**28**

4. Quantitative Risk Assessment

4.1 Methodology

Chemical laboratory analysis results have been collated from both the contemporary and historic ground investigations. Results from soil, groundwater, gas and leachability analysis are detailed in Appendices E to H.

4.1.1 Human Health - Soils

Risks to human health are associated with acute short term exposure to site soils (i.e. construction workers or future maintenance workers) and chronic exposure to site soils by future site users. In both cases, the exposure pathways are direct contact, ingestion and inhalation.

For the purposes of this assessment the soil chemical data, with regard to chronic exposure risk, have been screened against human health generic assessment criteria (GAC). In the absence of any Ireland-specific screening values, the assessment criteria are based primarily on UK publications including LQM/CIEH (Nathanail et al. 2015) 'Suitable for Use Levels' (S4Uls) for residential and commercial/industrial land uses and Defra Category 4 Screening Levels (C4SLs) (Defra 2014). GAC for acute short-term exposure risks are not available, the above GAC have been used to provide an indication of potential risk to construction and maintenance workers. For perfluorooctane sulfonate (PFOS), screening values have been published by the Environment Agency (Environment Agency 2022).

GAC for organic chemicals are dependent on the soil organic matter (SOM) content of the soils. GAC are published for SOM contents of 1%, 2.5% and 6%. As SOM data are not available for all of the locations subjected to chemical testing the most conservative value of 1% has been selected. The GAC used are presented within the screening spreadsheets in Appendix E.

4.1.2 Ground Gas

Ground gases such as methane, carbon dioxide, hydrogen sulphide and carbon monoxide can pose a risk to both human health and buildings and/or infrastructure. Sources of ground gases can be the underlying geological formations such as organic rich alluvium or peat, as well as anthropogenic sources such as landfills, sewage works or fuel spills.

Accumulations of ground gases in confined spaces pose a risk to human health, with effects ranging from headaches to asphyxiation. In addition methane poses a flammability / explosion risk at concentrations between 5%v/v and 15%v/v in air that can pose a risk to human health and infrastructure.

In accordance with CIRIA C665 (Assessing Risks Posed by Hazardous Ground Gases to Buildings, CIRIA 2007), results of gas monitoring have been used to calculate gas screening values (GSV). These are used to characterise built development sites into one of six Characteristic Situations (CS), with CS1 being very low risk and CS6 being very high risk. The results of the assessment are presented in Appendix F.

In addition, the carbon dioxide concentrations have been screened against the short-term UK Workplace Exposure Limit (WEL) of 1.5%v/v (HSE 2020) and the carbon monoxide concentrations against the short term WEL of 100ppm for carbon monoxide (HSA 2020) to provide an indication of occupational health risks to construction workers and maintenance workers.

4.1.3 Groundwater and Surface Water

The primary surface water courses in the study area are Broadmeadow River, Ward River, Santry River, Tolka River and the River Liffey. It is assumed that the low permeability lining of the canals in Dublin will act as a barrier to contaminants migrating via the shallow sub surface into the canal water. The majority of the study area is designated as the Locally Important Dublin Aquifer, and there are local areas of high or extreme aquifer vulnerability in AZ1 and AZ2.

Where available, the results of the soil leachate and groundwater testing have been compared to relevant water quality standards, primarily derived from Irish EPA Interim Guideline Values (IGV) (EPA 2003). Where these are not available for determinands UK Drinking Water Standards (UK DWS) (WHO 2011) or UK freshwater Environmental Quality Standards (EQS) (WFD 2015) have been used. These assessment criteria have been collectively termed Controlled Water Screening Criteria (CWSC); the results and the relevant assessment criteria are presented in Appendix G (Groundwater) and Appendix H (Leachate).

4.1.4 Cross Sections

Cross Sections have been generated for each of the station locations based on the available ground conditions data to aid with interpretation and are included in Appendix I. The sections include the Interpolated geology, GI locations, soil sample locations (with an indication of whether there is a GAC exceedance), and the location of the proposed stations and tunnel (where appropriate).

4.2 AZ1 – Northern Section

4.2.1 Soil Screening

Soil samples where GAC exceedances were recorded are summarised in Table 4.1 and VOC/ SVOC detections in Table 4.2.

Table 4.1: Summary of Soil GAC Exceedances in AZ1

Exploratory Location	Sample Depth (m)	No. of Residential GAC Exceedances	No. of Commercial GAC Exceedances	Detail

Notes

[1] - Chromium (Hexavalent) not tested - most conservative assessment criteria used.

Results reported below Laboratory Method Detection Limit (MDL) but greater than GAC are not presented in this table

Table 4.2: Summary of VOC/ SVOC Detections in AZ1

Exploratory Location	Sample Depth (m)	No. of VOCs / SVOCs >LOD	Detail
Inside Works Area			
ABH02	5	1	Isopropylbenzene
ABH08	3.8	1	2-Methylnaphthalene
ABH08	4.8	1	2-Methylnaphthalene
ABH09	3	2	1,2-Dichloroethane, Toluene
ABH09	11.5	3	Dibenzofuran, Carbazole, 2-Methylnaphthalene
ATP14	1.5	1	1,2-Dichloroethane
NBH403	7.3	2	Toluene, Trichloromethane
NBH404	5.1	2	Toluene, Trichloromethane

The majority of soil geochemical results in AZ1 did not exceed residential or commercial GAC. Where recorded, exceedances were primarily of chromium and PAHs.

The chromium exceedances and the VOC/SVOC detections were recorded in the north of AZ1 on greenfield land to the south east of the proposed Estuary Station. Chromium exceedances, one arsenic exceedance and one 1,2-Dichloroethane exceedance were also found in the area of the proposed Swords Station at the roundabout on the R132 associated with made ground. The 1,2-Dichloroethane exceedances and VOC/ SVOC detections recorded in ABH09 in the south of AZ1 are likely to be associated with the historical use of the land for vehicle storage (Source C52), with detections of 2-methylnaphthalene in ABH08 likely associated with a car dismantling yard (Source C31). The PAH exceedances at ATP17 can be attributed to the made ground associated with the R132 corridor.

The detections of VOCs were found on greenfield land to the north east of the roundabout on the R132 in the north of the proposed works area at depth and the source is unclear. The source of Isopropylbenzene in soil samples recovered from ABH02 within the proposed Seatown Station area are unclear, however, it should be noted that reported concentrations of 1.3µg/kg are within the same order of magnitude as the laboratory method detection limit (MDL) of 1.0µg/kg.

No asbestos was recorded in AZ1.

4.2.2 Groundwater and Surface Water

Groundwater samples within AZ1 were collected from three boreholes (RC104, RC108, RC143) during one monitoring round in January 2008 (IGSL, 2008), from four boreholes (NBH401, NBH402, NBH406, NBH72) during two monitoring rounds in January and March 2021, located within the Estuary and the Seatown Areas, and from three boreholes (ABH08, ABH08ii, and ABH09) during three monitoring rounds between May and July 2021, located within the Fostertown and North Portal Areas. Exceedances of the CWSC are summarized in Table 4.3.

Table 4.3: Summary of CWSC Exceedances (Groundwater) in AZ1

Works Area	Exploratory Location	No. of GAC Exceedances	Criteria Source	Details of Exceedances
ESTUARY PARK & RIDE	NBH72-S	1	DWS	Ammoniacal Nitrogen as N
		4	IGV	Chloride, Iron, Manganese, Total Petroleum Hydrocarbons
ESTUARY - SEATOWN	NBH401	3	IGV	Chloride, Potassium, Boron
	NBH402	1	DWS	Phosphorus
		3	IGV	Chloride, Potassium, Boron

Works Area	Exploratory Location	No. of GAC Exceedances	Criteria Source	Details of Exceedances
	NBH406	3	IGV	Manganese, Potassium, Boron
	RC104	1	IGV	Boron
	RC108	1	IGV	Boron
BROAD MEADOW VIADUCT	RC143-D	1	IGV	Boron
FOSTERTOWN CUT AND COVER	ABH08	1	DWS	Ammoniacal Nitrogen as N
		1	EQS	Biological Oxygen Demand
		2	IGV	Chloride, Barium
	ABH08ii	1	DWS	Ammoniacal Nitrogen as N
		3	IGV	Calcium, Chloride, Total Petroleum Hydrocarbons
NORTH PORTAL	ABH09	1	DWS	Ammoniacal Nitrogen as N
		1	IGV	Chloride

Concentrations of boron exceeded the IGV in six of 10 locations. Manganese and potassium exceeded the IGV in two and three locations respectively, while iron and chloride exceeded the IGV in one and six locations respectively. Concentrations of Ammoniacal Nitrogen as N and Phosphorus were found to exceed DWS three locations and one location respectively. Total Petroleum Hydrocarbon (TPH) concentrations at NBH72 in the Estuary area was around 10 times higher than IGV of 10µg/l, primarily comprising the Aliphatic C12-C16 fraction (a large constituent of diesel).

4.2.3 Soil Leachate

23 no. soil samples were subject to BSEN12457-3 Waste Acceptance Criteria (WAC) two stage leachate analysis, and the results of the 2:1 ratio leaching values have been compared with the CWSC. Exceedances of the screening criteria are summarised in Table 4.4.

Table 4.4: Summary of CWSC Exceedances (Leachate) in AZ1

Works Area	Exploratory Location	Sample Depth (m)	No. of GAC Exceedances	Criteria Source	Details of Exceedances
ESTUARY - SEATOWN	ATP07	0.5	1	IGV	Phenols
		4.1	2	DWS	Antimony, Selenium
		11	1	DWS	Antimony
		11	1	IGV	Nickel
	NBH402	0.5	1	IGV	Chloride
	NBH403	7.3	1	DWS	Selenium
	NBH406	0.5	1	IGV	Mercury
	NBH407	0.5	1	IGV	Mercury
	NBH408	0.5	1	IGV	Mercury
SEATOWN STATION	ABH01	1	1	IGV	Phenols
		4	1	DWS	Selenium
		5	1	DWS	Selenium
		5	1	IGV	Phenols
		7.6	1	IGV	Phenols

		11.5	1	DWS	Selenium
		19.8	1	DWS	Selenium

Leachate exceedances in AZ1 were identified in thirty-seven of the scheduled samples, mostly of mercury (IGV) and antimony and selenium (DWS), along with three exceedances of chloride, two of chromium and one of nickel (IGV). Four detections of Phenol exceeded IGV criteria in soil samples recovered immediately to the north and to the south of the R132 Seatown Road roundabout and can be attributed to the made ground associated with the R132 corridor.

4.2.4 Ground Gas

Two rounds of ground gas monitoring data are available, undertaken on 2 no. locations (for methane, carbon dioxide, oxygen, hydrogen sulphide and gas flow) during February and March 2021. The ground gas monitoring undertaken is summarised in Table 4.5, full monitoring results are presented in Appendix F.

Table 4.5: Summary of Ground Gas Monitoring Locations

AZ	Location	BH References	Monitoring Date(s)	No. of Monitoring Rounds
AZ1	ESTUARY PARK & RIDE	NBH72-S	09/02/2021, 23/03/2021	2
	ESTUARY - SEATOWN	NBH403-S	09/02/2021, 23/03/2021	2

GSVs have been calculated based on the worst-case scenario, i.e. using the highest concentrations of methane and carbon dioxide and highest ground gas flow for boreholes in each area. Based on the monitoring results for all areas the GSV for carbon dioxide and methane was <0.07 litres / hour and therefore all areas would be classified as CS1 for both carbon dioxide and methane. This indicates a Very Low risk to buildings from ground gas according to the CIRIA C665 methodology. The measured gas concentrations, flow rates and calculated GSVs are presented in Table 4.6.

Table 4.6: Summary of Calculated GSV and CS Values

AZ	Location	Number of data points[1]	Maximum Concentration (%v/v)		Max Flow (l/hr)	Maximum GSV (l/hr)		Maximum CS	
			Methane	Carbon Dioxide		Methane	Carbon Dioxide	Methane	Carbon Dioxide
AZ1	ESTUARY - SEATOWN	2	0.8	1.8	0.8	0.0064	0.0144	1	1
	ESTUARY PARK & RIDE	2	0.1	2	0.7	0.0007	0.014	1	1

Notes:

1. Sum of number of monitoring locations and rounds of ground gas monitoring undertaken. Indicates number of data points in assessment.

GSV: Gas screening value, flow rate X gas concentration as a %

CS: Characteristic situation for gas protection measures

Table 4.7 shows the comparison of the monitoring data with the 15-minute reference period under EH40/2020 (Workplace Exposure Limits) for carbon dioxide and carbon monoxide.

Table 4.7: Summary of Ground Gas Data Comparison with WELs

AZ	Location	Number of data points[1]	Max Carbon Dioxide %v/v	Max CO Steady State ppm	Carbon Dioxide Short Term Exposure Limit[1] %v/v	Carbon Monoxide Short Term Exposure Limit[1] ppm
AZ1	ESTUARY - SEATOWN	2	2	No data	1.5	100
	ESTUARY PARK & RIDE	2	1.8	No data		

Notes:

1. Refers to 15 minute reference period under EH40/2020 workplace exposure limits

Exceedances of WEL highlighted by grey fill

Maximum measured concentrations of Carbon Dioxide concentrations exceed the short term WEL. Carbon monoxide concentration data was not available. Hydrogen sulphide concentrations were all below instrument detection limits.

4.3 AZ2 – Airport Section

4.3.1 Soil Screening

Soil samples where GAC exceedances were recorded, asbestos was detected and/or VOCs/SVOCs detected are summarised in Table 4.8 to Table 4.10.

Table 4.8: Summary of Soil GAC exceedances in AZ2

Exploratory Location	Sample Depth (m)	Asbestos Detected	Detail
Within 250m of Works Area			
ATP27	0.3	Amosite	Fibres/clumps, 0.001%

All investigation locations found to exceed soil GAC within the Dublin Airport area are located within the footprint of an historic quarry operational 1837 – 1937 which is thought to be infilled. This area of the site is predominantly used for car parking with bus terminals to the north and south. The exceedances are likely mainly attributable to the quarry fill material itself, there also is potential for the use of the area as a car park to affect sub-surface (e.g. by leaks / spills of fuel and lubricants from vehicles. There is no strong evidence of the influence of airport operations (e.g. fuelling, maintenance and de-icing) on the proposed Dublin Airport Station location.

Four soil samples from the airport and historic quarry area were subjected to PFAS analysis. All determinands were below the limit of detection with the exception of NBH60 0.5m, where PFOS was detected at 0.001mg/kg. This is equal to the analysis method detection limit and below the EA soil screening value of 0.014 mg/kg.

One soil sample recovered from ATP27 at 0.3mbgl was found to contain amosite fibres with total asbestos measured at 0.001%. No other asbestos was recorded in AZ2.

4.3.2 Groundwater and Surface Water

Groundwater samples were obtained from six locations at the Dublin Airport station location (NBH04, NBH60, NBH61, NBH62, ABH10, ABH12) and four at the South Portal (MN/104/BH/003, NBH06, NBH06A, NBH06W). Exceedances of CWSC are summarised in Table 4.11.

Table 4.11: Summary of CWSC Exceedances (Groundwater) in AZ2

Works Area	Exploratory Location	No. of GAC Exceedances	Criteria Source	Details of Exceedances
Inside Works Area				
DUBLIN AIRPORT	NBH04	3	DWS	1,1,1,2-Tetrachloroethane, Ammoniacal Nitrogen as N, Aliphatic TPH >C12-C16
		1	EQS	Cobalt
		7	IGV	Chloride, 1,1,1-Trichloroethane, Iron, Manganese, Barium, Boron, Total Petroleum Hydrocarbons
	NBH60	3	DWS	1,1,1,2-Tetrachloroethane, Aromatic TPH >C16-C21, Aromatic TPH >C21-C35
		6	IGV	Chloride, Benzo[g,h,i]perylene, Indeno(1,2,3-c,d)Pyrene, Fluoranthene, Benzo[a]pyrene, Total Petroleum Hydrocarbons
	NBH61	1	IGV	Chloride
	NBH62	1	DWS	Phosphorus
		5	IGV	Chloride, Manganese, Barium, Boron, Total Petroleum Hydrocarbons
SOUTH PORTAL	MN/104/BH/003	2	DWS	N-Nitrosodi-N-propylamine, Ammoniacal Nitrogen as N
		1	IGV	Chloride
	NBH06A	1	DWS	Ammoniacal Nitrogen as N
		4	IGV	Chloride, Iron, Manganese, Boron
	NBH06W	1	DWS	Ammoniacal Nitrogen as N
		1	EQS	Biological Oxygen Demand
		4	IGV	Chloride, Fluoride, Potassium, Boron
Within 250m of Works Area				
DUBLIN AIRPORT <250	ABH12	1	DWS	Ammoniacal Nitrogen as N
		1	EQS	Biological Oxygen Demand
		4	IGV	Chloride, Barium, Iron, Potassium

The PAH congeners Benzo(a)pyrene (0.042mg/l), benzo(ghi)perylene (0.023mg/l), fluoranthene (0.054mg/l) and indeno(123cd)pyrene (0.022mg/l) were encountered at NBH60 at concentrations of approximately 50 to 4000 times higher than IGV. IGV exceedances of total TPH were recorded at NBH04 and NBH60, with concentrations of 1.86mg/l and 1.81mg/l respectively, around 180 times the IGV. It should be noted that the distribution of individual hydrocarbon fractions was different at both boreholes NBH04 and NBH60 suggestive of different contamination sources. Additionally, these hydrocarbons were detected at different depths; the well screen interval of NBH60 is between 0.8 and 1.5 m bgl and the origin of encountered hydrocarbons is likely to be related with made ground as elevated concentration of TPH (420 mg/kg) was encountered at 0.5mbgl in made ground. NBH04 has a well screen interval between 16 and 30mbgl, within the bedrock.

The following metals exceeded the relevant IGV: barium, boron, cobalt, manganese, potassium and total iron. Chloride concentrations were above screening levels (IGV) at all locations, with ammoniacal nitrogen above DWS at two locations. The EQS was slightly exceeded by Biological Oxygen Demand (BOD) at two locations. Four selected locations from the airport and historic quarry were subjected to PFAS Total Oxidisable Precursor (TOP) analysis; all the PFAS/PFOA/PFOS compounds within the analysis suite were below the limit of laboratory detection (0.00005mg/l).

4.3.3 Soil Leachate

Thirty soil samples were subject to BSEN12457-3 Waste Acceptance Criteria (WAC) two stage leachate analysis, and the results of the 2:1 ratio leaching values have been compared with the CWSC. Exceedances of the screening criteria are summarised in Table 4.12.

Table 4.12: Summary of CWSC Exceedances (Leachate) in AZ2

Works Area	Exploratory Location	Sample Depth (m)	No. of GAC Exceedances	Criteria Source	Details of Exceedances
Inside Works Area					
DUBLIN AIRPORT	ABH14	0.3	1	IGV	Barium
	ABH14a	0.7	1	DWS	Antimony
	NBH60	1	1	IGV	Sulphate (2:1 Water Soluble) as SO4
SOUTH PORTAL	ABH17	0.4	1	IGV	Phenols
		10	1	DWS	Selenium
Within 250m of Works Area					
FTWN - NTH PRTL <250	NTP501	0.5	1	IGV	Total Dissolved Solids (TDS)
	NTP504	0.5	1	IGV	Lead
	NTP506	0.5	1	IGV	Lead
DUBLIN AIRPORT <250	ABH11	20	1	DWS	Selenium

Comparison of the 2:1 ratio leaching values from the WAC analysis of eight soil samples indicated exceedances of IGV (barium, lead, sulphate, phenols, and TDS) and DWS (antimony and selenium). All observed exceedances were marginally above the respective criteria.

4.3.4 Ground Gas

Up to three rounds of ground gas monitoring data are available, undertaken during January, February and March 2021 of locations at Dublin Airport and the South Portal, as summarised in Table 4.13. Full monitoring results are presented in Appendix F.

Table 4.13: Summary of Ground Gas Monitoring Locations

AZ	Location	BH References	Monitoring Date(s)	No. of Monitoring Rounds
AZ2	DUBLIN AIRPORT	NBH04, NBH60, NBH61, NBH62	09/02/2021, 25/03/2021	2
	SOUTH PORTAL	NBH05-S, NBH07	28/01/2021, 09/02/2021, 26/03/2021	3

GSVs have been calculated based on the worst-case scenario, i.e. using the highest concentrations of methane and carbon dioxide and highest ground gas flow for boreholes in each area. Based on the monitoring results for all areas the GSV for carbon dioxide and methane was <0.07 litres / hour and therefore all areas would be classified as CS1 for both carbon dioxide and methane. This indicates a Very Low risk to buildings from ground gas according to the CIRIA C665 methodology. The measured gas concentrations, flow rates and calculated GSVs are presented in Table 4.14.

Table 4.14: Summary of Calculated GSV and CS Values

AZ	Location	Number of data points[1]	Maximum Concentration (%v/v)		Max Flow (l/hr)	Maximum GSV (l/hr)		Maximum CS	
			Methane	Carbon Dioxide		Methane	Carbon Dioxide	Methane	Carbon Dioxide
AZ2	DUBLIN AIRPORT	8	1	3.8	0.8	0.008	0.0304	1	1
	SOUTH PORTAL	5	0.3	1.2	0.8	0.0024	0.0096	1	1

Notes:

1. Sum of number of monitoring locations and rounds of ground gas monitoring undertaken. Indicates number of data points in assessment.

GSV: Gas screening value, flow rate X gas concentration as a %

CS: Characteristic situation for gas protection measures

Table 4.15 shows the comparison of the monitoring data with the 15-minute reference period under EH40/2020 (Workplace Exposure Limits) for carbon dioxide and carbon monoxide.

Table 4.15: Summary of Ground Gas Data Comparison with WELs

AZ	Location	Number of data points[1]	Max Carbon Dioxide %v/v	Max CO Steady State ppm	Carbon Dioxide Short Term Exposure Limit[1] %v/v	Carbon Monoxide Short Term Exposure Limit[1] ppm
AZ2	DUBLIN AIRPORT	8	3.8	No data	1.5	100
	SOUTH PORTAL	5	1.2	No data		

Notes:

1. Refers to 15 minute reference period under EH40/2020 workplace exposure limits

Exceedances of WEL highlighted by grey fill

The carbon dioxide short term WEL was breached within Dublin Airport. No data is available for carbon monoxide. Hydrogen sulphide concentrations were all below instrument detection limits.

4.4 AZ3 - Dardistown to Northwood Section

4.4.1 Soil Screening

Soil samples where GAC exceedances were recorded are summarised in Table 4.16.

Table 4.16: Summary of Soil GAC Exceedances in AZ3

Exploratory Location	Sample Depth (m)	No. of Residential GAC Exceedances	No. of Commercial GAC Exceedances	Detail
Inside Works Area				
NBH08	1	3	0	Benzo[a]pyrene, Benzo[b]fluoranthene, Dibenz(a,h)Anthracene
NBH73	0.5	1	0	Chromium[1]
ABH19	2	1	0	Naphthalene

Notes

1 - Chromium (Hexavalent) not tested - most conservative assessment criteria used.

Results reported below Laboratory Method Detection Limit (MDL) but greater than GAC are not presented in this table

Where recorded, GAC exceedances were of chromium or PAHs. Chromium exceedances were recorded in the northern and southern extents of the AZ3 study area and were associated with shallow made ground, natural or reworked natural ground. PAH exceedances were associated with made ground in the vicinity of the proposed depot (NBH08) and the central reservation of the R108 road (ABH19). However, the locations of the made ground areas cannot be directly associated with any of the sources detailed in Section 3.5.8 or Appendix D and are likely to be the result of historic unmapped activities.

4.4.2 Groundwater and Surface Water

Groundwater samples were collected from six boreholes within AZ3 (AWN01, AWN02, MN/104/BH/002A, MN/104/TP/006, NBH12, NBH73-S) during five monitoring rounds, exceedances of CWSC are summarized in Table 4.17.

Table 4.17: Summary of CWSC (Groundwater) Exceedances in AZ3

Works Area	Exploratory Location	No. of GAC Exceedances	Criteria Source	Details of Exceedances
DARDISTOWN DEPOT	AWN01	1	DWS	Ammoniacal Nitrogen as N
		5	IGV	Chloride, Iron, Manganese, Potassium, Boron
	AWN02	2	DWS	Selenium, Ammoniacal Nitrogen as N
		2	IGV	Manganese, Boron
	MN/104/BH/002A	1	DWS	Ammoniacal Nitrogen as N
		5	IGV	Bis(2-Ethylhexyl)Phthalate, Chloride, Benzo[b]fluoranthene, Benzo[k]fluoranthene, Total TPH
	MN/104/TP/006	1	DWS	Ammoniacal Nitrogen as N
		3	IGV	Nitrite, Chloride, Conductivity, Sulphate, Total TPH
NORTHWOOD C/C&C	NBH12	1	DWS	Ammoniacal Nitrogen as N
		3	IGV	Chloride, Manganese, Boron
NORTHWOOD TUNNEL	NBH73-S	2	IGV	Manganese, Boron

Exceedances of ammoniacal nitrogen and chloride were widespread throughout the groundwater samples. Hydrocarbons were also recorded, though the concentrations were only marginally elevated above DWS. PAHs were also recorded in one sample.

4.4.3 Soil Leachate

Forty soil samples were subjected to leachate analysis and the exceedances of CWSC are detailed in Table 4.18.

Table 4.18: Summary of CWSC (Leachate) Exceedances in AZ3

Works Area	Exploratory Location	Sample Depth (m)	No. of GAC Exceedances	Criteria Source	Details of Exceedances
DARDISTOWN DEPOT	ATP30i	2.5	1	DWS	Selenium
	MN/104/TP/005	4.2	2	IGV	Barium, Zinc
	MN/104/TP/006	0.4	1	IGV	Barium
	MN/104/TP/007	1.1	1	DWS	Antimony
		1.1	1	IGV	Barium
	MN/104/TP/009	1.8	2	IGV	Chloride, Barium
	MN/104/TP/010	1.6	2	IGV	Barium, Zinc
	MN104/TP/001	0.8	2	IGV	Barium, Zinc
NORTHWOOD C/C&C	ABH18	9	1	DWS	Selenium
		11.5	1	DWS	Selenium
		21.8	1	DWS	Selenium
	ABH19	0.5	1	IGV	Sulphate (2:1 Water Soluble) as SO4
		2	1	DWS	Selenium
		10	1	DWS	Selenium
		13	1	DWS	Selenium
		23	1	DWS	Selenium
	ABH20	2	1	DWS	Selenium
		4	1	DWS	Selenium
		7.45	1	DWS	Selenium

Leachable barium in exceedance of the IGV was widespread in the northern part of the section, with some instances of chloride, zinc and antimony. Leachable selenium was found to exceed DWS in multiple locations.

4.4.4 Ground Gas

Two rounds of ground gas monitoring data are available, undertaken during February and March 2021 of locations at Dardistown and Northwood as summarised in Table 4.19. Full monitoring results are presented in Appendix F.

Table 4.19: Summary of Ground Gas Monitoring Locations

AZ	Location	BH References	Monitoring Date(s)	No. of Monitoring Rounds
AZ3	NORTHWOOD TUNNEL	NBH73-S	09/02/2021, 12/03/2021	2
	DARDISTOWN DEPOT	AWN01, AWN02	26/03/2021	1

GSVs have been calculated based on the worst-case scenario, i.e. using the highest concentrations of methane and carbon dioxide and highest ground gas flow for boreholes in each area. Based on the monitoring results for all areas the GSV for carbon dioxide and methane was <0.07 litres / hour and therefore all areas would be classified as CS1 for both carbon dioxide and methane. This indicates a Very Low risk to buildings from ground

gas according to the CIRIA C665 methodology. The measured gas concentrations, flow rates and calculated GSVs are presented in Table 4.20.

Table 4.20: Summary of Calculated GSV and CS Values

AZ	Location	Number of data points[1]	Maximum Concentration (%v/v)		Max Flow (l/hr)	Maximum GSV (l/hr)		Maximum CS	
			Methane	Carbon Dioxide		Methane	Carbon Dioxide	Methane	Carbon Dioxide
AZ3	DARDISTOWN DEPOT	2	0.3	0.7	0.4	0.0012	0.0028	1	1
	NORTHWOOD TUNNEL	2	0.3	1.9	0.7	0.0021	0.0133	1	1

Notes:

1. Sum of number of monitoring locations and rounds of ground gas monitoring undertaken. Indicates number of data points in assessment.

GSV: Gas screening value, flow rate X gas concentration as a %

CS: Characteristic situation for gas protection measures

Table 4.21 shows the comparison of the monitoring data with the 15-minute reference period under EH40/2020 (Workplace Exposure Limits) for carbon dioxide and carbon monoxide.

Table 4.21: Summary of Ground Gas Data Comparison with WELs

AZ	Location	Number of data points[1]	Max Carbon Dioxide %v/v	Max CO Steady State ppm	Carbon Dioxide Short Term Exposure Limit[1] %v/v	Carbon Monoxide Short Term Exposure Limit[1] ppm
AZ3	DARDISTOWN DEPOT	2	2	No data	1.5	100
	NORTHWOOD TUNNEL	0.7	1.9	No data		

Notes:

1. Refers to 15 minute reference period under EH40/2020 workplace exposure limits

Exceedances of WEL highlighted by grey fill

The carbon dioxide short term WEL was breached within both the Dardistown Depot and Northwood Tunnel monitoring locations. Carbon monoxide concentrations are not available. Hydrogen sulphide concentrations were all below instrument detection limits.

4.5 AZ4 - Northwood to Charlemont Section

The results are detailed on a station-by-station basis under the following sub-headings.

4.5.1 Ballymun Station

4.5.1.1 Soil Screening

Soil samples where GAC exceedances were recorded, asbestos was detected and/or VOCs/SVOCs detected are summarised in Table 4.22 to Table 4.24.

Table 4.22: Summary of GAC Exceedances in the Ballymun Station Area

Exploratory Location	Sample Depth (m)	No. of Residential GAC Exceedances	No. of Commercial GAC Exceedances	Detail
Within 250m of Works Area				
NBH204	0.4	1	0	Chromium[1]

Notes

1 - Chromium (Hexavalent) not tested - most conservative assessment criteria used.

Results reported below Laboratory Method Detection Limit (MDL) but greater than GAC are not presented in this table

Table 4.23: Summary of VOC/SVOC Detections in the Ballymun Station Area

Exploratory Location	Sample Depth (m)	No. of VOCs / SVOCs >LOD	Detail
Inside Works Area			
ABH23	19.24	3	Toluene, 1,2,4-Trimethylbenzene, 1,3,5-Trimethylbenzene
NBH203A	0.5	1	Bis(2-Ethylhexyl)Phthalate
Within 250m of Works Area			
NBH101	2.5	7	Ethylbenzene, o-Xylene, m & p-Xylene, 1,2,4-Trimethylbenzene, 1,3,5-Trimethylbenzene, N-Butylbenzene, N-Propylbenzene

Table 4.24: Detail of Asbestos Detections the Ballymun Station Area

Exploratory Location	Sample Depth (m)	Asbestos Detected	Detail
Within 250m of Works Area			
NBH80	0.3	Amosite	< 0.001%
NBH80	1.2	Amosite	< 0.001%

One exceedance of the residential GAC for chromium was reported in the study area, approximately 100m south of the Works Area. This was in made ground likely associated with the road network. VOCs were detected in the north and centre of the study, associated with general urban made ground and an area of fill at the now derelict Ballymun Shopping Centre. Marginal detections of VOCs were reported in soil samples recovered from ABH23 at 19.24m. Five other samples were recovered from ABH23 at 0.5, 2.0, 5.5, 10.5, and 29.7m bgl all of which reported VOCs below the laboratory MDL.

Two soil samples recovered from NBH80, located approximately 380m north of Ballymun Station (chainage 10780), were found to contain fibres of Amosite asbestos, quantified at <0.001%.

4.5.1.2 Groundwater and Surface Water

Groundwater samples were collected from three boreholes (NBH203A-S, NBH203A-D, ABH25) within the Ballymun Station area during three monitoring rounds between January and July 2021. ABH25 was sampled on 3 occasions, NBH203A-D on 2 occasions and NBH203A-S on 1 occasion. Exceedances of CWSC are summarized in Table 4.25.

Table 4.25: Summary of CWSC Exceedances (Groundwater) in the Vicinity of Ballymun Station

Exploratory Location	No. of GAC Exceedances	Criteria Source	Details of Exceedances
NBH203A-D	4	DWS	Vinyl Chloride, Ammoniacal Nitrogen as N, Aromatic TPH >C12-C16, Aliphatic TPH >C12-C16
	6	IGV	Chloride, Aluminum, Manganese, Potassium, Boron, Total Petroleum Hydrocarbons

ABH25	1	DWS	Ammoniacal Nitrogen as N
	3	IGV	Chloride, Total Dissolved Solids, Total Petroleum Hydrocarbons

TPH fractions Aliphatic TPH C_6-C_{21}, Aromatic TPH C_{12}-C_{16}, Aliphatic TPC C_8-C_{16}, C_{21}-C_{35} and Aromatic TPH C_{21}-C_{35} were detected in NBH203A-D and NBH203A-S respectively during the groundwater monitoring round completed in January 2021. Groundwater samples were collected from NBH203A-D on a second occasion in March 2021 where all TPH fractions were reported below laboratory MDL.

NBH203A-S is installed with a well screen between 18.4 and 18.5mbgl within a band of slightly sandy slightly clayey gravel. NBH203A-D is installed with a well screen between 22.0 and 35.0mbgl within the limestone bedrock.

The encountered TPH could be related to potential historical storage tanks associated with Ballymun Shopping Centre, or an historic tank noted on mapping between 1937 and 1975 (Source No. 54). However, as the detection was not repeated during the second monitoring round cross contamination of the initial sample during sampling or transport cannot be ruled out at this stage.

4.5.1.3 Soil Leachate

Twenty-five soil samples were subjected to leachate analysis, the exceedances of CWSC are detailed in Table 4.26.

Table 4.26: Summary of CWSC Exceedances (Leachate) in the Vicinity of Ballymun Station

Exploratory Location	Sample Depth (m)	No. of GAC Exceedances	Criteria Source	Details of Exceedances
Inside Works Area				
ABH23	5.5	1	DWS	Selenium
	10.5	1	DWS	Selenium
	29.7	2	IGV	Arsenic, Chromium
ABH24A	1.5	1	DWS	Selenium
ABH24B	0.7	1	IGV	Phenols
	1.8	1	IGV	Phenols
	4.8	1	DWS	Selenium
	22	2	DWS	Antimony, Selenium
ABH25	8.7	1	DWS	Selenium
ATP37	2.6	1	DWS	Selenium
Within 250m of Works Area				
NBH204	0.4	5	IGV	Chloride, Barium, Chromium, Total Dissolved Solids, pH

Leachable arsenic and chromium were reported to exceed IGV in one location, with two exceedances of Phenols noted in shallow samples recovered from ABH24B in the vicinity of the derelict Ballymun Shopping Centre. Leachable selenium was found to exceed DWS in multiple locations with one exceedance of antimony.

4.5.1.4 Ground Gas

No ground gas monitoring has been completed in the vicinity of the Ballymun Station works area at the time of reporting.

4.5.2 Collins Avenue Station

4.5.2.1 Soil Screening

Soil samples where GAC exceedances were recorded, asbestos was detected and/or VOCs/SVOCs detected are detailed in Table 4.27 to Table 4.29.

Table 4.27: Summary of GAC Exceedances in the Collins Avenue Station Area

Exploratory Location	Sample Depth (m)	No. of Residential GAC Exceedances	No. of Commercial GAC Exceedances	Detail
Within 250m of Works Area				
NBH206	0.5	3	0	Benzo[b]fluoranthene, Dibenz(a,h)Anthracene, Chromium[1]
NBH207	0.5	2	0	Dibenz(a,h)Anthracene, Chromium[1]
NBH207	1	2	0	Dibenz(a,h)Anthracene, Pentachlorophenol

Notes

1 - Chromium (Hexavalent) not tested - most conservative assessment criteria used.

Results reported below Laboratory Method Detection Limit (MDL) but greater than GAC are not presented in this table

Table 4.28: Detail of Asbestos Detections in the Collins Avenue Station Area

Exploratory Location	Sample Depth (m)	Asbestos Detected	Detail
Within 250m of Works Area			
NBH206	0.5	Chrysotile	Fibres/clumps, 0.002%
NBH207	0.5	Chrysotile	Free fibres, 0.002%

Table 4.29: Detail of VOC/SVOC Detections in the Collins Avenue Station Area

Exploratory Location	Sample Depth (m)	No. of VOCs/SVOCs >LOD	Detail
Within 250m of Works Area			
NBH207	1	1	Pentachlorophenol

Exceedances of soils GAC were not recorded within the Works Area, however exceedances were encountered for chromium and PAHs within the Study Area, within 250m of the Works Area. Asbestos was recorded at 0.002% in two exploratory locations, also within 25m of the Works Area. VOCs/SVOCs were encountered to the south of the Works Area. The GAC exceedances can be attributed to made ground likely associated with the R108 corridor.

4.5.2.2 Groundwater and Surface Water

Groundwater samples were collected from two boreholes within the Collins Avenue Station area during two monitoring rounds, exceedances of CWSC are summarized in Table 4.30.

Table 4.30: Summary of CWSC Exceedances (Groundwater) in the Vicinity of Collins Avenue

Exploratory Location	No. of GAC Exceedances	Criteria Source	Details of Exceedances
Inside Works Area			
NBH207-D	1	DWS	Ammoniacal Nitrogen as N
	3	IGV	Chloride, Manganese, Boron
Within 250m of Works Area			
NBH102-S	1	DWS	Ammoniacal Nitrogen as N
	4	IGV	Chloride, Iron, Manganese, Boron

Detections of chloride, manganese, and boron were reported to exceed IGV in both monitoring locations, along with an exceedance for iron concentrations in one location. Ammoniacal Nitrogen as N exceeded DWS in both monitoring locations.

4.5.2.3 Soil Leachate

Twenty-four soil samples were subjected to leachate analysis, the exceedances of CWSC are detailed in Table 4.31.

Table 4.31: Summary of CWSC Exceedances (Leachate) in the Vicinity of Collins Avenue Station

Exploratory Location	Sample Depth (m)	No. of GAC Exceedances	Criteria Source	Details of Exceedances
ABH27	3	1	DWS	Selenium
	29.1	2	DWS	Antimony, Selenium
ABH28	4	1	DWS	Selenium
	14.8	1	DWS	Selenium
	21.2	1	DWS	Antimony
	27	1	DWS	Antimony
ABH29	2.5	2	IGV	Barium, Total Dissolved Solids
	3.5	1	DWS	Selenium
	3.5	1	IGV	Barium
	6.2	1	DWS	Selenium
	11.3	1	DWS	Selenium
	26.5	1	DWS	Selenium
NBH207	0.5	4	IGV	Fluoride, Nickel, Zinc, pH

Leachable selenium and antimony concentrations exceeded DWS in several samples from both made ground and natural deposits within the Works Area. Barium concentrations exceeded the IGV at shallow depths in two locations along with fluoride, nickel and zinc adjacent to the Works Area (NBH207).

4.5.2.4 Ground Gas

No ground gas monitoring has been completed in the vicinity of the Collins Avenue Station Works Area at the time of reporting.

4.5.3 Albert College Park Intervention Shaft

4.5.3.1 Soil Screening

Soil samples where GAC exceedances were recorded are summarised in Table 4.32 and VOC/ SVOC detections in Table 4.33.

Table 4.32: Summary of GAC Exceedances in the Albert College Intervention Shaft Area

Exploratory Location	Sample Depth (m)	No. of Residential GAC Exceedances	No. of Commercial GAC Exceedances	Detail
Inside Works Area				
ABH30i	13	1	0	Arsenic
Within 250m of Works Area				
MGI/BH/604	1	1	0	Chromium[1]
MGI/BH/612	1	1	0	Chromium[1]

Notes
1 - Chromium (Hexavalent) not tested - most conservative assessment criteria used.
Results reported below Laboratory Method Detection Limit (MDL) but greater than GAC are not presented in this table

Table 4.33: Detail of VOC/SVOC Detections in the Albert College Intervention Shaft Area

Exploratory Location	Sample Depth (m)	No. of VOCs / SVOCs >LOD	Detail
Within 250m of Works Area			
MGI/BH/604	1	1	Bromodichloromethane
MGI/BH/612	1	1	Bromodichloromethane

One exceedance of the residential GAC was recorded in the Works Area for arsenic at 13mbgl, in natural ground, which may represent natural background concentrations. Within the study area chromium exceeded the residential GAC at shallow depths, with bromodichloromethane also detected in these two locations. These instances are from samples of natural ground with no obvious attributable potential source.

4.5.3.2 Groundwater and Surface Water

Groundwater samples were collected from 1 no. borehole within the Albert College Park Intervention Shaft Works Area during two monitoring rounds, exceedances of CWSC are summarized in Table 4.34.

Table 4.34: Summary of CWSC Exceedances (Groundwater) in the vicinity of the Albert College Park Intervention Shaft

Exploratory Location	No. of GAC Exceedances	Criteria Source	Details of Exceedances
ABH30i	2	DWS	Selenium, Ammoniacal Nitrogen as N
	1	EQS	Biological Oxygen Demand
	7	IGV	Nitrite, Chloride, Iron, Manganese, Nickel, Potassium, Boron

Exceedances of assessment criteria have been encountered for metals (selenium, manganese, potassium, boron) and inorganic compounds (ammoniacal nitrogen, biological oxygen demand, chloride and nitrite) during both monitoring rounds. Potential sources of contamination have not been identified in the Works Area in this location.

4.5.3.3 Soil Leachate

Two soil samples were subjected to leachate analysis, the exceedances of CWSC are detailed in Table 4.35

Table 4.35: Summary of CWSC Exceedances (Leachate) in the vicinity of the Albert College Park Intervention Shaft

Exploratory Location	Sample Depth (m)	No. of GAC Exceedances	Criteria Source	Details of Exceedances
ABH30i	28	1	DWS	Antimony
NBH208	0.5	1	IGV	Phenols

Leachable antimony and phenols exceeded the DWS and IGV respectively. The Phenols exceedance is associated with shallow made ground, while the antimony exceedance is associated with a bedrock sample and may represent background concentrations.

4.5.3.4 Ground Gas

One round of ground gas monitoring data is available, undertaken during March 2021 of one location at Albert College Park Intervention Shaft as summarised in Table 4.36, full monitoring results are presented in Appendix F.

Table 4.36: Summary of Ground Gas Monitoring Locations

AZ	Location	BH References	Monitoring Date(s)	No. of Monitoring Rounds
AZ4	ALBERT COLLEGE PARK	ABH30i	25/03/2021	1

GSVs have been calculated based on the worst-case scenario, i.e. using the highest concentrations of methane and carbon dioxide and highest ground gas flow for boreholes in each area. Based on the monitoring results for all areas the GSV for carbon dioxide and methane was <0.07 litres / hour and therefore all areas would be classified as CS1 for both carbon dioxide and methane. This indicates a Very Low risk to buildings from ground gas according to the CIRIA C665 methodology. The measured gas concentrations, flow rates and calculated GSVs are presented in Table 4.37.

Table 4.37: Summary of Calculated GSV and CS Values

AZ	Location	Number of data points[1]	Maximum Concentration (%v/v)		Max Flow (l/hr)	Maximum GSV (l/hr)		Maximum CS	
			Methane	Carbon Dioxide		Methane	Carbon Dioxide	Methane	Carbon Dioxide
AZ4	ALBERT COLLEGE PARK	1	0.6	1.6	0.6	0.0036	0.0096	1	1

Notes:

1. Sum of number of monitoring locations and rounds of ground gas monitoring undertaken. Indicates number of data points in assessment.

GSV: Gas screening value, flow rate X gas concentration as a %

CS: Characteristic situation for gas protection measures

Table 4.38 shows the comparison of the monitoring data with the 15-minute reference period under EH40/2020 (Workplace Exposure Limits) for carbon dioxide and carbon monoxide.

Table 4.38: Summary of Ground Gas Data Comparison with WELs

AZ	Location	Number of data points[1]	Max Carbon Dioxide %v/v	Max CO Steady State ppm	Carbon Dioxide Short Term Exposure Limit[1] %v/v	Carbon Monoxide Short Term Exposure Limit[1] ppm
AZ4	ALBERT COLLEGE PARK	1	1.6	No data	1.5	100

Notes:

1. Refers to 15 minute reference period under EH40/2020 workplace exposure limits

Exceedances of WEL highlighted by grey fill

Maximum measured concentrations of Carbon Dioxide marginally exceed the short term WEL. No carbon monoxide data was available. Hydrogen sulphide concentrations were all below instrument detection limits.

4.5.4 Griffith Park Station

4.5.4.1 Soil Screening

Soil samples where GAC exceedances were recorded and/or VOCs/SVOCs detected are detailed in Table 4.39 and Table 4.40.

Table 4.39: Summary of GAC Exceedances in the Griffith Park Area

Exploratory Location	Sample Depth (m)	No. of Residential GAC Exceedances	No. of Commercial GAC Exceedances	Detail	
Inside Works Area					
NBH17	1	1	0	Chromium[1]	
NBH211	0.5	1	0	Chromium[1]	
ABH32	14.5	6	1	Residential	Aromatic TPH >C8-C10, Aromatic TPH >C10-C12, Aromatic TPH >C12-C16, Aliphatic TPH >C8-C10, Aliphatic TPH >C10-C12, Aliphatic TPH >C12-C16
				Commercial	Aliphatic TPH >C8-C10
Within 250m of Works Area					
SURGE_2132	0.1	1	0	Beryllium	

Notes

1 - Chromium (Hexavalent) not tested - most conservative assessment criteria used.

Results reported below Laboratory Method Detection Limit (MDL) but greater than GAC are not presented in this table

Table 4.40: Detail of VOC/SVOC detections in the Griffith Park area

Exploratory Location	Sample Depth (m)	No. of VOCs/SVOCs >LOD	Detail
Within 250m of Works Area			
ABH32	14.5	2	Benzene, Toluene

Two exceedances of the residential chromium GAC were encountered at shallow depths associated with made ground. Several TPH fractions exceeded the residential GAC within ABH32 at 14.5mbgl, with Aliphatic TPH >C8-

C10 also exceeding the commercial GAC at this location in addition to which benzene and toluene were detected. This sample is a limestone sample from 0.6m below rockhead, hydrocarbons were not evident in samples from shallower depths and no obvious evidence of discolouration or unusual odours were identified. A potential source for the observed hydrocarbons is not clear.

4.5.4.2 Groundwater and Surface Water

Groundwater samples were collected from 4 no. boreholes within the Griffith Park Station area over two monitoring rounds, exceedances of CWSC are summarized in Table 4.41.

Table 4.41: Summary of CWSC Exceedances (Groundwater) in the Vicinity of Griffith Park Station

Exploratory Location	No. of GAC Exceedances	Criteria Source	Details of Exceedances
NBH17	1	DWS	Selenium
	1	EQS	Biological Oxygen Demand
	7	IGV	Nitrite, Nitrate, Iron, Manganese, Mercury, Potassium, Boron
NBH211	1	DWS	Ammoniacal Nitrogen as N
	4	IGV	Chloride, Iron, Manganese, Boron
NBH223-D	1	DWS	Ammoniacal Nitrogen as N
	4	IGV	Chloride, Manganese, Potassium, Barium
NBH223-S	1	DWS	Ammoniacal Nitrogen as N
	1	EQS	Biological Oxygen Demand
	7	IGV	Chloride, Benzene, Iron, Manganese, Potassium, Barium, Boron

The nitrogen species nitrate, nitrate and ammoniacal nitrogen as well as chloride were identified in several locations; these compounds often result from organic decay and could be a result of the presence of an historical burial ground at this location. In addition, some metals (manganese, potassium boron, manganese, iron barium) have been identified.

One detection of benzene was made at the eastern extent of the Works Area (NBH223-S), no obvious source for this has been identified.

4.5.4.3 Soil Leachate

Three soil samples were subjected to leachate analysis, the exceedances of CWSC are detailed in Table 4.42.

Table 4.42: Summary of CWSC Exceedances (Leachate) in the Vicinity of Griffith Park Station

Exploratory Location	Sample Depth (m)	No. of GAC Exceedances	Criteria Source	Details of Exceedances
Inside Works Area				
ABH33	10.5	1	DWS	Antimony
	26.5	1	DWS	Antimony
NBH223	0.5	1	IGV	Mercury
Within 250m of Works Area				
BH04 (GII)	1.5	1	DWS	Molybdenum
	1.5	3	IGV	Chloride, Fluoride, Total Dissolved Solids

Leachable antimony and mercury exceeded the DWS and IGV respectively. The antimony exceedances are associated with natural boulder clay and bedrock and may represent background concentrations while the mercury

is associated with shallow made ground. Outside the Works Area the exceedances DWS for molybdenum and the IGV for chloride, fluoride and TDS are associated with he made ground adjacent to St Mobni road.

4.5.4.4 Ground Gas

Two rounds of ground gas monitoring data are available, undertaken during February and March 2021 of one location at Griffith park Station as summarised in Table 4.43. Full monitoring results are presented in Appendix F.

Table 4.43: Summary of Ground Gas Monitoring Locations

AZ	Location	BH References	Monitoring Date(s)	No. of Monitoring Rounds
AZ4	GRIFFITH PRK STATION	NBH223-S	09/02/2021, 15/03/2021	2

GSVs have been calculated based on the worst-case scenario, i.e. using the highest concentrations of methane and carbon dioxide and highest ground gas flow for boreholes in each area. Based on the monitoring results for all areas the GSV for carbon dioxide and methane was <0.07 litres / hour and therefore all areas would be classified as CS1 for both carbon dioxide and methane. This indicates a Very Low risk to buildings from ground gas according to the CIRIA C665 methodology. The measured gas concentrations, flow rates and calculated GSVs are presented in Table 4.44.

Table 4.44: Summary of Calculated GSV and CS Values

AZ	Location	Number of data points[1]	Maximum Concentration (%v/v)		Max Flow (l/hr)	Maximum GSV (l/hr)		Maximum CS	
			Methane	Carbon Dioxide		Methane	Carbon Dioxide	Methane	Carbon Dioxide
AZ4	GRIFFITH PRK STATION	2	0.4	0.6	0.9	0.0036	0.0054	1	1

Notes:

1. Sum of number of monitoring locations and rounds of ground gas monitoring undertaken. Indicates number of data points in assessment.

GSV: Gas screening value, flow rate X gas concentration as a %

CS: Characteristic situation for gas protection measures

Table 4.45 shows the comparison of the monitoring data with the 15-minute reference period under EH40/2020 (Workplace Exposure Limits) for carbon dioxide and carbon monoxide.

Table 4.45: Summary of Ground Gas Data Comparison with WELs

AZ	Location	Number of data points[1]	Max Carbon Dioxide %v/v	Max CO Steady State ppm	Carbon Dioxide Short Term Exposure Limit[1] %v/v	Carbon Monoxide Short Term Exposure Limit[1] ppm
AZ4	GRIFFITH PRK STATION	2	0.6	No data	1.5	100

Notes:

1. Refers to 15 minute reference period under EH40/2020 workplace exposure limits

Exceedances of WEL highlighted by grey fill

Maximum measured concentrations of Carbon Dioxide did not exceed the short term WEL in the area. Carbon monoxide data is not available. Hydrogen sulphide concentrations were all below instrument detection limits.

4.5.5 Glasnevin Station

4.5.5.1 Soil Screening

Soil samples where GAC exceedances were recorded and/or VOCs/SVOCs detected are detailed in Table 4.46 and Table 4.47.

Table 4.46: Summary of GAC Exceedances in the Glasnevin Area

Exploratory Location	Sample Depth (m)	No. of Residential GAC Exceedances	No. of Commercial GAC Exceedances	Detail

SURGE_2129	0.1	7	0	Benzo[a]pyrene, Lead, Benzo[b]fluoranthene, Dibenz(a,h)Anthracene, Benzo[a]anthracene, Mercury, Beryllium

Notes

1 - Chromium (Hexavalent) not tested - most conservative assessment criteria used.

Results reported below Laboratory Method Detection Limit (MDL) but greater than GAC are not presented in this table

Table 4.47: Detail of VOC/SVOC (including BTEX) Detections in the Glasnevin Area

Exploratory Location	Sample Depth (m)	No. of VOCs / SVOCs >LOD	Detail
Inside Works Area (Station Box)			
ABH37	0.5	1	Carbazole
ABH38	0.5	2	1,2,4-Trimethylbenzene, 1,3,5-Trimethylbenzene
Inside Works Area (West of Station Box)			
GTP25	1	1	Carbazole
NBH19A	0.5	3	2-Methylnaphthalene, Carbazole, Dibenzofuran
TPCC04	0.6	9	Benzene, Toluene, Ethylbenzene, o-Xylene, m & p-Xylene, 1,2,4-Trimethylbenzene, 1,3,5-Trimethylbenzene, Isopropylbenzene, N-Propylbenzene
Within 250m of Works Area			
ABH35	19	1	1,2-Dichloroethane
NBH104	0.3	3	2-Methylnaphthalene, Carbazole, Dibenzofuran

Within the station box area exceedances of residential GAC were encountered for metals (arsenic, lead, mercury), PAHs and dichloroethane associated with made ground at shallow depths. VOCs (carbazole, 1,2,4-trimethylbenzene and 1,3,5-trimethylbenzene) were also detected in the made ground. Mercury was above the residential GAC at 10.5mbgl in the natural deposits which may be indicative of background concentrations.

No exceedances were encountered in the samples from the track to the east of the station box. To the west of the station box residential exceedances were widespread for metals (arsenic, chromium, lead), various PAH congeners and TPH, all associated with the made ground and track ballast. Detections of VOCs/SVOCs were also recorded within the works area at NBH19A, GTP25 and TPCC04.

4.5.5.2 Groundwater and Surface Water

Groundwater samples were collected from 16 no. boreholes within the Glasnevin Station area during up to four monitoring rounds, exceedances of CWSC are summarized in Table 4.48.

Table 4.48: Summary of CWSC Exceedances (Groundwater) in the Vicinity of Glasnevin Station

Exploratory Location	No. of GAC Exceedances	Criteria Source	Details of Exceedances
Inside Works Area (station box)			
GBH01-D	1	DWS	Ammoniacal Nitrogen as N
	4	IGV	Chloride, Iron, Manganese, Hardness,Calcium as CaCO3
GBH01-S	1	DWS	Ammoniacal Nitrogen as N
	1	EQS	Biological Oxygen Demand
	4	IGV	Chloride, Iron, Manganese, Potassium
Inside Works Area (west of station box)			
GBH02-D	1	DWS	Ammoniacal Nitrogen as N
	4	IGV	Chloride, Iron, Manganese, Potassium
GBH02-S	1	DWS	Ammoniacal Nitrogen as N
	3	IGV	Chloride, Iron, Manganese
GBH04-D	1	DWS	Ammoniacal Nitrogen as N
	6	IGV	Chloride, Iron, Manganese, Potassium, Barium, Sulphate
GBH04-S	1	DWS	Ammoniacal Nitrogen as N
	1	EQS	Cobalt
	4	IGV	Chloride, Iron, Manganese, Hardness,Calcium as CaCO3
GBH13	1	DWS	Ammoniacal Nitrogen as N
	3	IGV	Chloride, Iron, Manganese
NBH19A	3	IGV	Chloride, Manganese, Boron
NBH19W	1	EQS	Biological Oxygen Demand
	4	IGV	Chloride, Iron, Manganese, Boron
NBH20-S	1	DWS	Ammoniacal Nitrogen as N
	3	IGV	Manganese, Barium, Boron
Within 250m of Works Area			
BH02A	1	DWS	Ammoniacal Nitrogen as N
	4	IGV	Chloride, Iron, Manganese, Potassium
GBH06	1	DWS	Ammoniacal Nitrogen as N
	4	IGV	Chloride, Fluoride, Iron, Manganese
GBH09	1	DWS	Ammoniacal Nitrogen as N
	1	EQS	Biological Oxygen Demand
	2	IGV	Chloride, Manganese
GBH11	1	DWS	Ammoniacal Nitrogen as N
	2	IGV	Manganese, Potassium
NBH18-S	1	DWS	Ammoniacal Nitrogen as N
	5	IGV	Nitrite, Chloride, Iron, Manganese, Boron
NBH213	2	DWS	Ammoniacal Nitrogen as N, Antimony
	3	IGV	Total Dissolved Solids, Chloride, Potassium

Ammoniacal nitrogen and chloride appear to be widespread above assessment criteria both within the Works Area (station box and west of station box) and adjacent to the Works Area. These determinants could result from a variety of sources including cemeteries which are present in the area. In addition, metals are present including iron, manganese, potassium and boron as well as elevated hardness and BOD.

4.5.5.3 Soil Leachate

Ten soil samples were subjected to leachate analysis, the exceedances of CWSC are detailed in Table 4.49.

Table 4.49: Summary of CWSC Exceedances (Leachate) in the Vicinity of Glasnevin Station

Exploratory Location	Sample Depth (m)	No. of GAC Exceedances	Criteria Source	Details of Exceedances

	2	1	IGV	Phenols
	4	1	DWS	Selenium
	4	2	IGV	Chloride, Phenols

Leachable Arsenic, antimony, selenium, barium, molybdenum, barium and chloride concentration exceeded their respective DWS and IGV within and outside the Works area, primarily associated with the made ground although antimony and selenium are present within a bedrock sample (ABH38 at 24.3mbgl) which may represent natural background concentrations. In addition, phenols were identified in one location (GBH11) outside the Works Area.

4.5.5.4 Ground Gas

Up to three rounds of ground gas monitoring data are available, undertaken during February and March 2021 of three locations at Glasnevin Station as summarised in Table 4.50, full monitoring results are presented in Appendix F.

Table 4.50: Summary of Ground Gas Monitoring Locations

AZ	Location	BH References	Monitoring Date(s)	No. of Monitoring Rounds
AZ4	**Inside Works Area**			
	GLASNEVIN STATION	GBH02-S, GBH04-S	09/02/2021, 28/02/2021, 22/03/2021	3
	Within 250m of Works Area			
	GLASNEVIN STN <250	NBH18-S	09/02/2021, 16/03/2021	2

GSVs have been calculated based on the worst-case scenario, i.e. using the highest concentrations of methane and carbon dioxide and highest ground gas flow for boreholes in each area. Based on the monitoring results for all areas the GSV for carbon dioxide and methane was <0.07 litres / hour and therefore all areas would be classified as CS1 for both carbon dioxide and methane. This indicates a Very Low risk to buildings from ground gas according to the CIRIA C665 methodology. The measured gas concentrations, flow rates and calculated GSVs are presented in Table 4.51.

Table 4.51: Summary of Calculated GSV and CS Values

AZ	Location	Number of data points[1]	Maximum Concentration (%v/v)		Max Flow (l/hr)	Maximum GSV (l/hr)		Maximum CS	
			Methane	Carbon Dioxide		Methane	Carbon Dioxide	Methane	Carbon Dioxide
AZ4	GLASNEVIN STATION	5	0.3	2.7	0.9	0.0027	0.0243	1	1
	GLASNEVIN STN <250	2	0.4	0.7	0.5	0.002	0.0035	1	1

Notes:

1. Sum of number of monitoring locations and rounds of ground gas monitoring undertaken. Indicates number of data points in assessment.

GSV: Gas screening value, flow rate X gas concentration as a %

CS: Characteristic situation for gas protection measures

Table 4.52 shows the comparison of the monitoring data with the 15-minute reference period under EH40/2020 (Workplace Exposure Limits) for carbon dioxide and carbon monoxide.

Table 4.52: Summary of Ground Gas Data Comparison with WELs

AZ	Location	Number of data points[1]	Max Carbon Dioxide %v/v	Max CO Steady State ppm	Carbon Dioxide Short Term Exposure Limit[1] %v/v	Carbon Monoxide Short Term Exposure Limit[1] ppm
AZ4	GLASNEVIN STATION	5	2.7	No data	1.5	100
	GLASNEVIN STN <250	2	0.7	No data		

Notes:

1. Refers to 15 minute reference period under EH40/2020 workplace exposure limits

Exceedances of WEL highlighted by grey fill

The carbon dioxide short term WEL was breached at monitoring locations within the Glasnevin Station works area. Carbon monoxide data was not available. Hydrogen sulphide concentrations were all below instrument detection limits.

4.5.6 Mater Station

4.5.6.1 Soil Screening

Soil samples where GAC exceedances were recorded and/or VOCs/SVOCs detected are detailed in Table 4.53 and Table 4.54.

Table 4.53: Summary of GAC Exceedances in the Mater Station Area

Exploratory Location	Sample Depth (m)	No. of Residential GAC Exceedances	No. of Commercial GAC Exceedances	Detail	
Inside Works Area					
ABH40	14.6	1	0	Mercury

NBH217	0.6	1	Di-N-Octyl Phthalate
NBH217	1.4	2	Bis(2-Ethylhexyl)Phthalate, Di-N-Octyl Phthalate

The majority of the samples tested in the Study Area recorded residential GAC exceedances including locations within the Works Area as well as outside the Works Area in the north-eastern part of Mater Hospital, and the far north west and south east of the Study Area.

Exceedances comprised metals (primarily arsenic, chromium and lead) aromatic hydrocarbons and PAHs within the made ground in the Works Area. Mercury was found at depth within natural ground in the superficial deposits (ABH40 and ABH41 and 14.6 and 13mbgl respectively) which may represent natural background concentrations.

In NBH216 (to the south east of the Works Area) exceedances of chromium, aromatic hydrocarbons and PAHs were recorded throughout the made ground. VOCs/SVOCs were also detected within and adjacent to the Works Area. PAH concentrations also exceeded the commercial GAC within the made ground. Within ABH41 and NBH216A.

The exceedances beneath the footprint of Mater Hospital are likely to be attributed to historic construction and hospital operation activities on the site. Due to the distance from the Works Area this is unlikely to affect the proposed Project.

4.5.6.2 Groundwater and Surface Water

Groundwater samples were collected from 13 boreholes within the Mater Station area. Sampling of five of these locations (B1, C-D, E1-D, E1-S, E2) was completed in one monitoring round undertaken in 2008 (Norwest Holst). All other groundwater samples were collected during up to three monitoring rounds undertaken between January and July 2021. Exceedances of CWSC are summarised in Table 4.55.

Table 4.55: Summary of CWSC Exceedances (Groundwater) in the Vicinity of Mater Station

Exploratory Location	No. of GAC Exceedances	Criteria Source	Details of Exceedances
Inside Works Area			
NBH215-D	2	DWS	Ammoniacal Nitrogen as N, Aliphatic TPH >C12-C16
	5	IGV	Chloride, Iron, Manganese, Boron, Total Petroleum Hydrocarbons
NBH215-S	1	DWS	Ammoniacal Nitrogen as N
	1	EQS	Biological Oxygen Demand
	3	IGV	Chloride, Manganese, Total Petroleum Hydrocarbons
NBH216A-D	2	DWS	Ammoniacal Nitrogen as N, Aromatic TPH >C21-C35
	5	IGV	Chloride, Manganese, Arsenic, Boron, Total Petroleum Hydrocarbons
NBH216A-S	1	DWS	Aromatic TPH >C21-C35
	10	IGV	Bis(2-Ethylhexyl)Phthalate, Chloride, Benzo[g,h,i]perylene, Indeno(1,2,3-c,d)Pyrene, Fluoranthene, Benzo[a]pyrene, Manganese, Boron, Naphthalene, Total Petroleum Hydrocarbons
NBH21-S	1	DWS	Ammoniacal Nitrogen as N
	4	IGV	Nitrite, Chloride, Manganese, Boron
ABH40	1	EQS	Biological Oxygen Demand
	1	IGV	Chloride
Within 250m of Works Area			
ABH39	1	DWS	Ammoniacal Nitrogen as N
	1	IGV	Chloride
B1	1	IGV	Lead
C-D	4	DWS	Ammoniacal Nitrogen as N, Total PAH 16, Aromatic TPH >C12-C21
	2	IGV	Boron, Benzo(a)pyrene
E1-D	1	DWS	Total PAH 16
	1	IGV	Benzo(a)pyrene
E1-S	2	DWS	Total PAH 16, Aliphatic TPH >C21-C35
	1	EQS	Vanadium
	2	IGV	Benzo(a)pyrene, Benzo(g,h,i)perylene
E2	2	IGV	Boron, Nitrate
NBH217	5	IGV	Calcium, Chloride, Magnesium, Nickel, Potassium

Petroleum hydrocarbons and PAHs were identified in several locations above CWSC in the groundwater at proposed Mater Station location which may be reflective of the hydrocarbon content associated with the made

ground. Nitrogen species (ammoniacal nitrogen, nitrite) and some metals (manganese, iron, boron and arsenic) are also present.

4.5.6.3 Soil Leachate

Three soil samples were subjected to leachate analysis, the exceedances of CWSC are detailed in Table 4.56.

Table 4.56: Summary of CWSC Exceedances (Leachate) in the Vicinity of Mater Station

Exploratory Location	Sample Depth (m)	No. of GAC Exceedances	Criteria Source	Details of Exceedances
Inside Works Area				
ABH40	9.3	1	DWS	Selenium
	9.3	1	IGV	Phenols
	29.6	1	DWS	Antimony
NBH21	1	1	IGV	Chloride
NBH215	0.5	2	DWS	Molybdenum, Selenium
	0.5	2	IGV	Chloride, Arsenic
NBH216A	0.25	1	IGV	Phenols
Within 250m of Works Area				
ABH39	23.7	1	DWS	Selenium
NBH214	0.5	1	DWS	Molybdenum
	0.5	1	IGV	pH
NBH217	0.6	2	IGV	Chloride, Chromium

Leachable Arsenic, antimony, selenium, molybdenum, and chloride concentrations exceeded their respective DWS and IGV within and outside the Works area, primarily associated with the made ground although antimony and selenium are present within bedrock samples (ABH40 at 29.6mbgl and ABH39 and 23.7mbgl) which may represent natural background concentrations. In addition, phenols were identified in one location (ABH40) at depth in the natural soils within the Works Area.

4.5.6.4 Ground Gas

Up to 9 no. rounds of ground gas monitoring data are available (historical, not part of the scheme specific GI) of two locations outside the Works Area associated with Mater Hospital as summarised in Table 4.57, full monitoring results are presented in Appendix F.

Table 4.57: Summary of Ground Gas Monitoring Locations

AZ	Location	BH References	Monitoring Date(s)	No. of Monitoring Rounds
AZ4	**Within 250m of Works Area**			
	MATER STATION <250	C, E2	C (04/12/2018 - 18/12/2008), E2 (16/12/2018 - 18/12/2018)	9 (C), 3 (E2)

GSVs have been calculated based on the worst-case scenario, i.e. using the highest concentrations of methane and carbon dioxide and highest ground gas flow for boreholes in each area. Based on the monitoring results for all areas the GSV for carbon dioxide and methane was <0.07 litres / hour and therefore all areas would be classified as CS1 for both carbon dioxide and methane. This indicates a Very Low risk to buildings from ground gas according to the CIRIA C665 methodology. The measured gas concentrations, flow rates and calculated GSVs are presented in Table 4.58.

Table 4.58: Summary of Calculated GSV and CS Values

AZ	Location	Number of data points[1]	Maximum Concentration (%v/v)		Max Flow (l/hr)	Maximum GSV (l/hr)		Maximum CS	
			Methane	Carbon Dioxide		Methane	Carbon Dioxide	Methane	Carbon Dioxide
AZ4	**Within 250m of Works Area**								
	MATER STATION <250	12	0	3.7	0	0	0	1	1

Notes:

				Commercial	Benzo[b]fluoranthene, Dibenz(a,h)Anthracene
NBH24	0.3	1	0	Arsenic	
NBH24	1	1	0	Arsenic	
NBH304	0.5	1	0	Chromium[1]	
NBH304	1	1	0	Chromium[1]	
Within 250m of Works Area					
NBH303	0.5	2	0	Lead, Chromium[1]	
SURGE_2118	0.1	2	0	Lead, Beryllium	

Notes

1 - Chromium (Hexavalent) not tested - most conservative assessment criteria used.

Results reported below Laboratory Method Detection Limit (MDL) but greater than GAC are not presented in this table

Table 4.61: Detail of VOC/SVOC Detections in the O'Connell Street Station Area

Exploratory Location	Sample Depth (m)	No. of VOCs / SVOCs >LOD	Detail
Inside Works Area			
ABH45	0.5	3	2-Methylnaphthalene, Carbazole, Dibenzofuran
ABH45	1	2	2-Methylnaphthalene, Carbazole
ABH45	3	3	2-Methylnaphthalene, Carbazole, Dibenzofuran
ABH45	3.5	1	Toluene
ABH45	5.5	4	Trichloroethene, Trichloromethane, Tetrachloroethene, Carbazole
ABH45	10.5	2	Trichloroethene, Tetrachloroethene
ABH46	29.8	3	Benzene, Toluene, 1,2-Dichloroethane
ATP47	0.2	1	Carbazole
ATP47	2.2	3	2-Methylnaphthalene, Carbazole, Dibenzofuran
NBH23A	0.5	8	Ethylbenzene, m & p-Xylene, o-Xylene, 1,2,4-Trimethylbenzene, 1,3,5-Trimethylbenzene, 2-Methylnaphthalene, Carbazole, Dibenzofuran
NBH23A	1.2	3	2-Methylnaphthalene, Carbazole, Dibenzofuran
NBH304	0.5	2	1,2-Dichlorobenzene, 1,2-Dichloroethane

Exceedances of residential GAC are widespread within the made ground for PAHs, TPH and some metals (arsenic, chromium); the commercial GACs were also exceeded for PAHs in ABH45 and NBH23A at 0.5mbgl and 1.2mbgl. The residential GAC were also exceeded within the natural deposits and bedrock for dibenz[a,h]anthracene (ABH45 at 6mbgl), trichloroethene (ABH45 at 6mbgl and 10.5mbgl), benzene and 1,2-dichloroethene (ABH46 at 29.8mbgl).

4.5.7.2 Groundwater and Surface Water

Groundwater samples were collected from 5 boreholes within the O'Connell Street Station area during up to two monitoring rounds, exceedances of CWSC are summarized in Table 4.62.

Table 4.62: Summary of CWSC Exceedances (Groundwater) in the Vicinity of O'Connell Street Station

Exploratory Location	No. of GAC Exceedances	Criteria Source	Details of Exceedances
Inside Works Area			
NBH22-S	5	IGV	Nitrite, Chloride, Manganese, Potassium, Boron
NBH23A	1	DWS	Ammoniacal Nitrogen as N
	4	IGV	Chloride, Manganese, Potassium, Boron
NBH23W	1	DWS	Ammoniacal Nitrogen as N
	2	IGV	Boron, Potassium
NBH24-S	2	DWS	Phosphorus, Aromatic TPH >C21-C35
	4	IGV	Tetrachloroethene, Potassium, Boron, Total Petroleum Hydrocarbons
Within 250m of Works Area			
NBH23	1	DWS	Selenium
	2	IGV	Chloride, Total Dissolved Solids

Organic contaminants were identified in the groundwater towards the south of the Works Area (TPH, tetrachoroethene in NBH24-S), elsewhere exceedances of criteria were mainly for inorganic (nitrite, chloride, phosphorous) and metals (manganese, potassium, boron and selenium).

4.5.7.3 Soil Leachate

Four soil samples were subjected to leachate analysis, the exceedances of CWSC are detailed in Table 4.63.

Table 4.63: Summary of CWSC Exceedances (Leachate) in the Vicinity of O'Connell Street Station

Exploratory Location	Sample Depth (m)	No. of GAC Exceedances	Criteria Source	Details of Exceedances
Inside Works Area				
ABH45	0.5	1	IGV	Phenols

Inside Works Area				
NBH22	0.7	3	IGV	Phenols, Chromium, pH
NBH23A	0.5	2	IGV	Sulphate (2:1 Water Soluble) as SO4, pH
NBH304	0.5	1	IGV	pH
Within 250m of Works Area				
NBH302	0.5	1	IGV	Fluoride

Leachable Arsenic, phenols, coper and chromium concentrations exceeded their respective DWS and IGV within the Works area, primarily associated with the made ground although antimony and selenium are present within bedrock samples (ABH45A at 22.0mbgl and ABH46 and 20.0mbgl) which may represent natural background concentrations.

4.5.7.4 Ground Gas

Up to 3 no. rounds of ground gas monitoring data are available of three locations within the Works Area as summarised in Table 4.64. Full monitoring results are presented in Appendix F.

Table 4.64: Summary of Ground Gas Monitoring Locations

AZ	Location	BH References	Monitoring Date(s)	No. of Monitoring Rounds
AZ4	O'CONNELL ST STATION	NBH22-S, NBH24-S, NBH63	28/01/2021, 09/02/2021, 19/03/2021	3

GSVs have been calculated based on the worst-case scenario, i.e. using the highest concentrations of methane and carbon dioxide and highest ground gas flow for boreholes in each area. Based on the monitoring results for all areas the GSV for carbon dioxide and methane was <0.07 litres / hour and therefore all areas would be classified as CS1 for both carbon dioxide and methane. This indicates a Very Low risk to buildings from ground gas according to the CIRIA C665 methodology. The measured gas concentrations, flow rates and calculated GSVs are presented in Table 4.65.

Table 4.65: Summary of Calculated GSV and CS Values

AZ	Location	Number of data points[1]	Maximum Concentration (%v/v)		Max Flow (l/hr)	Maximum GSV (l/hr)		Maximum CS	
			Methane	Carbon Dioxide		Methane	Carbon Dioxide	Methane	Carbon Dioxide

Notes

1 - Chromium (Hexavalent) not tested - most conservative assessment criteria used.

Results reported below Laboratory Method Detection Limit (MDL) but greater than GAC are not presented in this table

Table 4.68: Detail of Asbestos Detections in the Tara Station Area

Exploratory Location	Sample Depth (m)	Asbestos Detected	Detail
Within 250m of Works Area			
ABH48	0.5	Chrysotile	0.086%

Table 4.69: Detail of VOC/SVOC Detections in the Tara Station Area

Exploratory Location	Sample Depth (m)	No. of VOCs / SVOCs >LOD	Detail
Inside Works Area			
ABH50	1.5	1	Carbazole
NBH64	1	1	2-Methylnaphthalene
Within 250m of Works Area			
ABH48	0.5	1	Tetrachloroethene
MGI/BH/715	1	5	Tetrachloroethene, Bromodichloromethane, 2-Methylnaphthalene, Carbazole, Dibenzofuran
MGI/BH/715	11	1	Bis(2-Ethylhexyl)Phthalate
MGI/BH/718	1	1	Tetrachloroethene
MGI/BH/718	3.65	9	Benzene, m & p-Xylene, 1,2-Dichlorobenzene, 1,4-Dichlorobenzene, Tetrachloroethene, N-Butylbenzene, N-Propylbenzene, 4-Chlorotoluene, Bromodichloromethane

Exceedances of GAC were recorded in two clusters, one within the Works Area and one in the northwest of the study area. Those in the northwest comprise lead and PAHs, though are unlikely to influence the proposed Project due to the distance to the Works Area and position in the vicinity of the River Liffey. The exceedances within the Works Area comprise arsenic, mercury, lead and PAHs, and are associated with the made ground. VOCs/SVOCs were also recorded in the same locations, although the majority of the detections were recorded near the boundary of the study area.

4.5.8.2 Groundwater and Surface Water

Groundwater samples were collected from 4 boreholes within the Tara Station area during two monitoring rounds, exceedances of CWSC are summarized in Table 4.70.

Table 4.70: Summary of CWSC Exceedances (Groundwater) in the Vicinity of Tara Station

Exploratory Location	No. of GAC Exceedances	Criteria Source	Details of Exceedances
NBH25-S	1	DWS	Ammoniacal Nitrogen as N
	1	EQS	Cobalt
	11	IGV	Chloride, Magnesium, Manganese, Nickel, Potassium, Sodium, Barium, Boron, Calcium, Total Dissolved Solids, Sulphate

Exploratory Location	No. of GAC Exceedances	Criteria Source	Details of Exceedances
NBH26CA	2	DWS	Phosphorus, Ammoniacal Nitrogen as N
	11	IGV	Chloride, Iron, Magnesium, Manganese, Potassium, Sodium, Barium, Boron, Calcium, Total Dissolved Solids, Sulphate
NBH26CW	2	DWS	Phosphorus, Ammoniacal Nitrogen as N
	1	EQS	Biological Oxygen Demand
	11	IGV	Chloride, Iron, Magnesium, Manganese, Potassium, Sodium, Barium, Boron, Calcium, Total Dissolved Solids, Sulphate
NBH64	1	DWS	Phosphorus
	3	IGV	Potassium, Boron, Calcium

Exceedances of assessment criteria were primarily for inorganic (ammoniacal nitrogen, chloride, sulphate, TDS and phosphorous) and metallic (cobalt, magnesium, manganese, nickel, potassium, sodium barium, boron, calcium, iron) contaminants, likely to be associated with the urban nature of the area.

4.5.8.3 Soil Leachate

Two soil samples were subjected to leachate analysis, the exceedances of CWSC are detailed in Table 4.71.

Table 4.71: Summary of CWSC Exceedances (Leachate) in the Vicinity of Tara Station

Exploratory Location	Sample Depth (m)	No. of GAC Exceedances	Criteria Source	Details of Exceedances
Inside Works Area				
ABH49	0.35	1	IGV	Arsenic
	0.85	1	DWS	Antimony
	0.85	2	IGV	Sulphate (2:1 Water Soluble) as SO4, Total Dissolved Solids
	3	2	DWS	Molybdenum, Antimony
	3	1	IGV	Chloride
	4.5	1	IGV	Chloride
	17.7	1	DWS	Antimony
	17.7	1	IGV	Arsenic
ABH50	1.5	1	IGV	Fluoride
	2	1	DWS	Antimony
	3	1	DWS	Antimony
	3	1	IGV	Arsenic
	6	1	DWS	Antimony
	6	1	IGV	Chloride
	8.3	1	IGV	Arsenic
	13.5	1	DWS	Antimony
	23.5	2	DWS	Antimony, Selenium
NBH26CA	1	1	DWS	Molybdenum
NBH27	1	1	DWS	Antimony
	1	1	IGV	Chloride
NBH64	1	1	DWS	Antimony
	1	1	IGV	Arsenic
Within 250m of Works Area				
ABH48	0.5	1	DWS	Antimony

Exploratory Location	Sample Depth (m)	No. of GAC Exceedances	Criteria Source	Details of Exceedances
	0.5	1	IGV	Lead
	4.5	1	IGV	Chloride
	7.9	1	IGV	Chloride

Leachable Arsenic, antimony, molybdenum, chloride and sulphate concentrations exceeded their respective DWS and IGV within the Works area, primarily associated with the made ground although antimony, arsenic and selenium are present within bedrock samples (ABH49 at 17.7mbgl, ABH50 at 13.5 and 23.5mbgl) which may represent natural background concentrations.

4.5.8.4 Ground Gas

Up to 3 no. rounds of ground gas monitoring data are available of two locations within the Works Area as summarised in Table 4.72, full monitoring results are presented in Appendix F.

Table 4.72: Summary of Ground Gas Monitoring Locations

AZ	Location	BH References	Monitoring Date(s)	No. of Monitoring Rounds
AZ4	TARA STATION	NBH25-S, NBH64	28/01/2021, 09/02/2021, 11/03/2021	3

GSVs have been calculated based on the worst-case scenario, i.e. using the highest concentrations of methane and carbon dioxide and highest ground gas flow for boreholes in each area. Based on the monitoring results for all areas the GSV for carbon dioxide and methane was <0.07 litres / hour and therefore all areas would be classified as CS1 for both carbon dioxide and methane. This indicates a Very Low risk to buildings from ground gas according to the CIRIA C665 methodology. The measured gas concentrations, flow rates and calculated GSVs are presented in Table 4.73.

Table 4.73: Summary of Calculated GSV and CS Values

AZ	Location	Number of data points[1]	Maximum Concentration (%v/v)		Max Flow (l/hr)	Maximum GSV (l/hr)		Maximum CS	
			Methane	Carbon Dioxide		Methane	Carbon Dioxide	Methane	Carbon Dioxide
AZ4	TARA STATION	6	1	4.3	0.9	0.009	0.0387	1	1

Notes:

1. Sum of number of monitoring locations and rounds of ground gas monitoring undertaken. Indicates number of data points in assessment.

GSV: Gas screening value, flow rate X gas concentration as a %

CS: Characteristic situation for gas protection measures

Table 4.74 shows the comparison of the monitoring data with the 15-minute reference period under EH40/2020 (Workplace Exposure Limits) for carbon dioxide and carbon monoxide.

Table 4.74: Summary of Ground Gas Data Comparison with WELs

AZ	Location	Number of data points[1]	Max Carbon Dioxide %v/v	Max CO Steady State ppm	Carbon Dioxide Short Term Exposure Limit[1] %v/v	Carbon Monoxide Short Term Exposure Limit[1] ppm
AZ4	TARA STATION	6	4.3	No data	1.5	100

Notes:

1. Refers to 15 minute reference period under EH40/2020 workplace exposure limits

Exceedances of WEL highlighted by grey fill

The carbon dioxide short term WEL was breached within Tara Station. Carbon monoxide concentrations was not available. Hydrogen sulphide concentrations were all below instrument detection limits.

4.5.9 St Stephen's Green Station

4.5.9.1 Soil Screening

Soil samples where GAC exceedances were recorded and/or VOCs/SVOCs detected are detailed in Table 4.75 and Table 4.76.

Table 4.75: Summary of GAC Exceedances in the St Stephen's Green Station Area

Exploratory Location	Sample Depth (m)	No. of Residential GAC Exceedances	No. of Commercial GAC Exceedances	Detail	
Inside Works Area					
NBH219B	0.5	9	1	Residential	Benzo[a]anthracene, Benzo[a]pyrene, Benzo[b]fluoranthene, Chrysene, Dibenz(a,h)Anthracene, Naphthalene, Aromatic TPH >C16-C21, Aromatic TPH >C21-C35, Lead
				Commercial	Dibenz(a,h)Anthracene
ABH52	0.45	2	0	Benzo[b]fluoranthene, Dibenz(a,h)Anthracene	
ABH52	1	3	0	Benzo[a]pyrene, Benzo[b]fluoranthene, Dibenz(a,h)Anthracene	
ABH53	4	4	0	Benzo[a]anthracene, Benzo[a]pyrene, Benzo[b]fluoranthene, Dibenz(a,h)Anthracene	
ABH53	7.1	2	0	Benzo[b]fluoranthene, Dibenz(a,h)Anthracene	
ABH53	22.4	1	0	Nickel	
ABH54	0.5	1	0	Dibenz(a,h)Anthracene	
ABH54	31	2	0	Nickel, Cadmium	
ATP51WS	0.5	4	0	Benzo[a]pyrene, Benzo[b]fluoranthene, Dibenz(a,h)Anthracene, Lead	
Within 250m of Works Area					
NBH220	0.5	2	0	Dibenz(a,h)Anthracene, Lead	
SURGE_2015	0.1	3	0	Lead, Benzo[b]fluoranthene, Dibenz(a,h)Anthracene	

Notes

Results reported below Laboratory Method Detection Limit (MDL) but greater than GAC are not presented in this table

Table 4.76: Detail of VOC/SVOC Detections in the St Stephen's Green Station Area

Exploratory Location	Sample Depth (m)	No. of VOCs / SVOCs >LOD	Detail
Inside Works Area			
NBH219B	0.5	3	2-Methylnaphthalene, Carbazole, Dibenzofuran
Within 250m of Works Area			
NBH220	0.5	1	Toluene
NBH220	1.2	1	Toluene

Exceedances of GAC were recorded within and approximately 65m south of the Works Area and comprised lead, aromatic hydrocarbons and PAHs. One location within the Works Area recorded VOCs/SVOCs. Both areas are associated with urban made ground up to 3.8m thick comprising sandy gravel and sandy gravelly clay with inclusions of brick, concrete, glass and wood.

4.5.9.2 Groundwater and Surface Water

Groundwater samples were collected from 2 boreholes within the St Stephen's Green Station area during one monitoring round, exceedances of CWSC are summarized in Table 4.77.

Table 4.77: Summary of CWSC Exceedances (Groundwater) in the Vicinity of St Stephen's Green Station

Exploratory Location	No. of GAC Exceedances	Criteria Source	Details of Exceedances
NBH219B-S	4	IGV	Iron, Manganese, Potassium, Boron
NBH219B-D	5	IGV	Chloride, Iron, Manganese, Boron, Total Petroleum Hydrocarbons
ABH53	1	DWS	Ammoniacal Nitrogen as N
	1	IGV	Chloride

Exceedances of assessment criteria were primarily for inorganic (chloride, ammoniacal nitrogen) and metallic (iron, manganese, potassium and boron) contaminants, likely to be associated with the urban nature of the area with one instance of hydrocarbons (TPH) being present.

4.5.9.3 Soil Leachate

Six soil samples were subjected to leachate analysis, the exceedances of CWSC are detailed in Table 4.78.

Table 4.78: Summary of CWSC Exceedances (Leachate) in the Vicinity of St Stephen's Green Station

Exploratory Location	Sample Depth (m)	No. of GAC Exceedances	Criteria Source	Details of Exceedances
Inside Works Area				
NBH219	0.5	1	DWS	Molybdenum
	0.5	2	IGV	Mercury, Arsenic
NBH219B	0.5	2	DWS	Molybdenum, Antimony
ABH52	4.5	1	DWS	Selenium
ABH52	7.7	1	DWS	Selenium
ABH52	21.5	1	DWS	Anitmony
ABH52	25.5	1	DWS	Anitmony
		1	IGV	Barium

Exploratory Location	Sample Depth (m)	No. of GAC Exceedances	Criteria Source	Details of Exceedances
ABH53	22.4	1	DWS	Anitmony
ABH54	9	1	DWS	Anitmony
ABH54	19	1	DWS	Anitmony
ABH54	31	1	IGV	Barium
ATP51WS	0.5	1	IGV	Fluoride
Within 250m of Works Area				
ABH55	23.0	1	DWS	Antimony
NBH107	0.5	1	IGV	pH
NBH220	0.5	1	IGV	Chloride

Leachable antimony, selenium, mercury, molybdenum and arsenic concentrations exceeded their respective DWS and IGV within the Works area, primarily associated with the made ground. Antimony and selenium within ABH52 - ABH55 represent deeper superficial and bedrock samples and may represent natural background concentrations.

4.5.9.4 Ground Gas

No ground gas monitoring has been completed in the vicinity of the St Stephen's Green Station works area at the time of reporting.

4.5.10 Charlemont Station

4.5.10.1 Soil Screening

Soil samples where GAC exceedances were recorded and/or VOCs/SVOCs detected are detailed in Table 4.79 and Table 4.80.

Table 4.79: Summary of GAC Exceedances in the Charlemont Station Area

Exploratory Location	Sample Depth (m)	No. of Residential GAC Exceedances	No. of Commercial GAC Exceedances	Detail	
Inside Works Area					
ABH57	5.5	2	0	Arsenic, Nickel	
ATP55	1	2	0	Arsenic, Lead	
NBH29	0.5	1	0	Chromium[1]	
NBH30	0.5	4	0	Arsenic, Chromium[1], Lead, Mercury	
NBH31	1	3	0	Arsenic, Chromium[1], Lead	
Within 250m of Works Area					
NBH222B	0.3	9	1	Residential	Benzo[a]anthracene, Benzo[a]pyrene, Benzo[b]fluoranthene, Chrysene, Dibenz(a,h)Anthracene, Naphthalene, Aromatic TPH >C16-C21, Aromatic TPH >C21-C35, Aromatic TPH >C35-C44
				Commercial	Dibenz(a,h)Anthracene
NBH222B	0.6	5	0	Benzo[a]pyrene, Benzo[b]fluoranthene, Dibenz(a,h)Anthracene, Lead, Mercury	
SURGE_2003	0.1	2	0	Lead, Beryllium	

Notes
1 - Chromium (Hexavalent) not tested - most conservative assessment criteria used.
Results reported below Laboratory Method Detection Limit (MDL) but greater than GAC are not presented in this table

Table 4.80: Detail of VOC/SVOC Detections in the Charlemont Station Area

Exploratory Location	Sample Depth (m)	No. of VOCs/SVOCs >LOD	Detail
Inside Works Area			
NBH30	0.5	1	1,2,4-trichlorobenzene
Within 250m of Works Area			
NBH222B	0.3	1	Carbazole

The majority of samples tested in the study area exceeded GAC for at least one determinant. The greatest number of exceedances was recorded in NBH222B in the north of the study area; however, this is separated from the Works Area by the Grand Canal and is unlikely to influence the proposed Project. Within the Works Area, exceedances comprised arsenic, nickel, chromium, mercury and lead and were associated with the made ground, in addition to which 1,2,4-trichorobenzene was encountered in one sample.

4.5.10.2 Groundwater and Surface Water

Groundwater samples were collected from three boreholes within the Charlemont Station area during three monitoring rounds, exceedances of CWSC are summarized in Table 4.81.

Table 4.81: Summary of CWSC Exceedances (Groundwater) in the Vicinity of Charlemont Station

Exploratory Location	No. of GAC Exceedances	Criteria Source	Details of Exceedances
NBH30W	1	IGV	Chloride
NBH31	1	DWS	Ammoniacal Nitrogen as N
	5	IGV	Nitrite, Chloride, Manganese, Boron, Potassium
ABH59	1	DWS	Ammoniacal Nitrogen as N
	5	IGV	Chloride, Potassium

Exceedances of assessment criteria were primarily for inorganic (chloride, ammoniacal nitrogen and chloride) and metallic (manganese, boron, and potassium) contaminants, likely to be associated with the urban nature of the area.

4.5.10.3 Soil Leachate

19 no. soil samples were subjected to leachate analysis, the exceedances of CWSC are detailed in Table 4.82.

Table 4.82: Summary of CWSC Exceedances (Leachate) in the Vicinity of Charlemont Station

Exploratory Location	Sample Depth (m)	No. of GAC Exceedances	Criteria Source	Details of Exceedances
Inside Works Area				
ABH56	25.5	1	DWS	Antimony
ABH57	2.4	1	DWS	Selenium
	4.5	1	DWS	Selenium
	5.5	2	DWS	Antimony, Selenium
	15.5	1	DWS	Antimony
ABH58	28.5	2	DWS	Antimony, Selenium
ABH59	22.2	1	DWS	Antimony
NBH29	0.5	1	IGV	Chloride
NBH31	1	1	DWS	Antimony
Within 250m of Works Area				
NBH110	0.5	5	IGV	Mercury, Barium, Chromium, Total Dissolved Solids, pH
NBH222	0.3	1	DWS	Antimony
	0.3	1	IGV	pH

Leachable antimony, selenium and chloride concentrations exceeded their respective DWS and IGV within the Works area, primarily associated with the made ground. Antimony within ABH56 at 25.5mbgl, ABH57 at 15.5mbgl and ABH59 at 22.2mbgl are bedrock samples and may represent natural background concentrations.

4.5.10.4 Ground Gas

No ground gas monitoring has been completed in the vicinity of the Charlemont Station works area at the time of reporting.

5. Preliminary Materials and Waste Assessment

5.1 Introduction

The overall excavated material quantities expected to be generated by the proposed Project according to the Business Case, based on the Preliminary Design, are summarised in Appendix J and Table 5.1. Of the total estimate of 3,025,588m^3 the majority (1,895,716m^3) is expected to comprise superficial deposits, with the remainder comprising bedrock (974,570m^3) and mixed superficial / bedrock (155,302m^3). There is limited scope for reusing excavated material within the proposed Project for backfill; bunds and landscaping features only require an estimated 99,931m^3, and, as such the remainder will have to be removed from the site either for reuse as a by-product (subject to confirmation of suitability of geochemical and geotechnical properties) or disposal.

Table 5.1: Summary of Expected Excavated Material Quantities

Material	Quantity (m^3)
Superficial Deposits	1,895,716
Mixed	155,302
Rock	974,570
Total	**3,025,588**
Backfill Required	99,931
Total Surplus	**2,925,657**

5.1.1 Material Assessment Scenarios

The three following scenarios for material re-use/ removal have been assessed for the purposes of the EIAR:

- Scenario 1: Unmitigated scenario – all excavated material will require disposal as waste.
- Scenario 2: An application under Article 27 of the European Communities (Waste Directive) Regulations 2011 (Article 27) for removal of site-won material as product is being progressed, and if successful between 71.6% (worst case) and 89.7% (best case) of the excavated material will be covered under this mechanism, the remainder being removed from site as waste.
- Scenario 3: The Article 27 application is unsuccessful; the next best option is to send excavated material that complies with acceptance criteria to Soil Recovery Facilities (SRFs).

The preferred scenario for the EIAR is that the A27 application is successful resulting in a relatively small quantity of material requiring disposal as waste.

5.2 Methodology

5.2.1 Waste classification of generated materials

The approach used to estimate the excavated material quantities involves the use of geological data including logs and cross section, historical land use information and geochemical data to determine the excavated material properties and assign a preliminary waste classification.

Excavated material is classed as ‘soil and stone’ which has a European Waste Code (EWC) of either 17 05 03 or 17 05 04 depending on whether it has hazardous properties. This assessment has been undertaken on the solid

phase geochemical data, based on European Waste Classification guidance, including UK Guidance on the classification and assessment of waste 2018 (WM3) as applicable to Ireland (using the HazWasteOnline facility).

Once an initial classification of hazardous / non-hazardous waste has been determined Waste Acceptance Criteria (WAC) testing results can be applied to confirm waste is within leachability limits for hazardous, non-hazardous and inert classifications. For non-hazardous classifications if the results of the WAC fall below the 'inert' leaching limits the waste can be classified as inert, with the remaining material in the non-hazardous classification. For an initial classification of hazardous waste, the hazardous WAC limit determines whether the material can be accepted as hazardous waste without further treatment to reduce its leaching limits to below the hazardous WAC limits.

It should be noted that full WAC analysis (BSEN12457-3, two stage leaching test) is not available for all locations. Single stage leachability testing (BSEN12457-2) data has been used to supplement the WAC data to provide an indication of leachability.

It should be noted that the criteria used in the Article 27 assessment differ from the criteria used in the preliminary waste assessment. The total organic carbon (TOC) concentration is identical (3%) however the limits for organic compounds including BTEX, PCBs, TPH and PAH are higher for waste classification, and assessment for metals and some inorganics is based on solid phase analysis for Article 27 and leachability analysis for waste acceptance. In addition to inert criteria, increased inert criteria (as provided by Eastern Midlands Waste Region) have been applied to the data.

The full WM3 assessment is included as Appendix M, and the WAC screening assessment as Appendix N.

5.2.2 Article 27 Application

An application under Article 27 of the European Communities (Waste Directive) Regulations 2011 (S.I. No. 126 of 2011), as amended (Waste Directive Regulations (2011)) (referred to as Article 27) is being progressed on behalf of TII for the proposed Project by Arup.

An initial estimate of the material to be included within the application provided by Arup dated 15th October 2021 indicates the following:

- An estimated 10% of excavated material comprises made ground and is not considered suitable for the Article 27 application.
- Given elevated concentrations of metals / metalloids and organic contaminants within natural materials an estimated further 10-20% of excavated material may be unsuitable for inclusion within the Article 27 application.
- Between around 89.7% ('best case' scenario) and 71.6% ('worst case' scenario) of excavated material will be Article 27 compliant (subject to agreement with the EPA and site operator).

Table 5.2: Summary of Arup Article 27 Compliance Estimates

	Best Case Estimate (m^3)	Worst Case Estimate (m^3)
Total Excavated Material	3,025,588	
A27 Compliant*	2,715,271 (89.7%)	2,166,082 (71.6%)
A27 Non-Compliant*	310,317 (10.3%)	859,506 (28.4%)
*Based on estimate provided by Arup on 15th October 2021		

The estimates provided by Arup have been taken forward for this assessment, and the remainder of the material classified using the methodology highlighted in Section 5.2.1.

5.2.3 Assessing suitability of material for Soil Recovery Facilities

The Irish Environmental Protection Agency (EPA) developed Calculated Maximum Concentrations (CMC) and/or Soil Trigger Levels (STL) for waste acceptance for authorised SRFs (EPA, 2020) following a joint project with the Geological Survey of Ireland (GSI). Large scale sampling and analytical testing of topsoil, soil and stone was completed to assess natural background concentrations of metals, the results of which are presented in the National Soils Database (Teagasc, 2021). The STLs for metals are based on the 98th percentile of the values presented in the National Soils Database and are divided across seven distinct geological domains.

STLs for organic compounds (including BTEX, Mineral Oil, PAHs, PCBs) are equivalent to the readily available laboratory method of detection limits as these compounds should not be present within uncontaminated soils. The criterion for inert waste landfills of 3% by weight has been adopted as the STL for Total Organic Carbon (TOC).

The Guidance on Waste Acceptance Criteria at Authorised Recovery Facilities (EPA, 2020) Chapter 4 ("Interpretation of Maximum Concentrations and/or Soil Trigger Levels") outlines the following approach for basic characterisation of non-greenfield soil and stone:

- TOC, total BTEX, mineral oils, total PCBs, total PAH or asbestos in soil to exceed the respective STL.
- For metals, the analytical results for up to three parameters in any particular soil and stone sample may exceed the respective maximum concentration and/or soil trigger level. However, no individual result should exceed 1.5 times the respective maximum concentration and/or soil trigger level

As with the waste classification assessment in Section 5.2.1, the approach used to estimate the material quantities involves the use of geological data including logs and cross sections, historical land use information and comparison of geochemical data with STLs (EPA 2020).

Soil and rock laboratory geochemical data were compared directly to the STL for each of the seven distinct geological domains to provide an initial estimation of compliant material. Further assessment and interpretation of the data was completed based on the EPA guidance Chapter 4 (EPA, 2020).

For the purposes of the assessment the estimated quantity of mixed soil/rock has been equally divided between soil and rock (final volumes of compliant / non-compliant materials are presented for soil and rock only).

5.2.4 Assessment notes and limitations

The following notes and limitations apply to the assessments presented in this Section:

- Estimates are based on the preliminary design and available GI data up to and including phase 5.
- Changes to the proposed Project at detailed design phase will alter these quantities.
- Additional GI at detailed design stage has the potential to alter these quantities.
- GI, while conducted according to best practice and suitable for the current stage of the project, only samples a small quantity of the sub-surface; as such, uncertainty is inherent in such investigations and final confirmation of material properties is only possible at excavation.
- It should be noted that the assessment presented here is preliminary only, and that any material destined for disposal as waste may require further confirmatory testing by the waste producer (i.e. construction

contractor) in agreement with the disposal facility operator and regulator, taking into account any specific limits and requirements the operator may have.

5.3 Results

The characteristics of the primary geological units are summarised in Table 5.3.

Table 5.3: Summary Primary Geological Unit Properties

Material	Geological Description	Geochemical Characteristics
Made Ground	Highly variable, including reworked glacial till with brick / concrete inclusions (mainly north of the M50) and mixed / granular material at the Dublin Airport and City station locations.	Highly variable. Elevated concentrations of metals in some areas (mainly associated with granular / mixed made ground) and 'hot spots' of hydrocarbons (including TPH and PAH), primarily at Dublin Airport, Mater, Glasnevin and Griffith Park stations.
Glacial Till	Predominantly cohesive (known colloquially as the black and brown boulder clays) with some granular horizons (also some minor areas of natural alluvium and granular material at transition to bedrock).	Some slightly elevated natural metals concentrations (e.g. molybdenum and selenium), some localised 'hot spots' of hydrocarbon impacts from anthropogenic sources.
Bedrock	Limestone (Malahide, Waulsortian, Tober Colleen and Lucan).	Some slightly elevated metals concentrations (e.g. molybdenum, selenium and cadmium), some localised 'hot spots' of hydrocarbon impacts from anthropogenic sources.

The business case excavated material volume estimate does not include an estimate of the volume of made ground. The volume of made ground has been estimated via:

- Reviewing the GI logs to estimate the composition, depth and profile of made ground for each section of the proposed Project as detailed in the business case; and
- 3D statistical modelling of observed geological information using Earth Volumetric Studio (EVS) 3D modelling software (C Tech Development Corporation, Earth Volumetric Studio Version 2020.12, licensed for use by Jacobs).

The volume estimate breakdown by each business case area is provided in Table K1, Appendix K including further details of made ground occurrences. The overall quantity of made ground for the proposed Project is summarised in Table 5.4.

Table 5.4: Summary Material Type Quantities

Material Type	Volume (m^3)	%
Made Ground	153,458	5%
Superficial Deposits	1,742,258	58%
Mixed	155,302	5%
Rock	974,570	32%
Total	**3,025,588**	

It should be noted that all the made ground is considered to be Article 27 non-compliant by the Arup assessment, and soil and stone containing over 2% non-natural materials by weight is considered unacceptable for SRFs according to the relevant guidance (EPA 2020).

5.3.1 Scenario 1: All Waste

Under scenario 1 all excavated material is deemed to be waste, requiring off-site disposal and hence a waste classification. As such the waste assessment methodology as summarised in Section 5.2.1 has been applied to all material.

The resulting preliminary waste classification for all excavated material for the proposed Project is summarised in Table 5.5. The results are detailed in Table K2, Appendix K.

Table 5.5: Summary of Quantities (Assuming all Excavated Material is Waste)

Material Type	Volume (m^3)	Preliminary Waste Classification	Volume (m^3)	Percentage
Made ground	58,656	Hazardous	94,775	3.1%
Natural material	36,119			
Made ground	94,802	Non-Hazardous	221,121	7.3%
Natural material	126,319			
		Increased Inert	104,554	3.5%
		Inert	2,605,138	86.1%
Total	**3,025,588**			
Backfill Required	**99,931**			
Total Waste	**2,925,657**			

5.3.2 Scenario 2: Article 27 Successful

Under this scenario between 71.6% and 89.7% of the material will be Article 27 compliant with the remainder potentially requiring off-site disposal. The quantities of the Article 27 compliant material are defined by Arup and are included in Table K3 Appendix K with assessed cross sectional areas included in Appendix L.

To determine the waste classification of the remaining Article 27 non-compliant material the methodology as described in Section 5.2 has been applied. The results are detailed in Table K3, Appendix K and the overall estimated quantities are summarised in Table 5.6.

Table 5.6: Summary of Quantities for Scenario 2

Material Type	Preliminary Waste Classification	A27 Worst Case		A27 Best Case	
		Volume (m^3)	%	Volume (m^3)	%
Article 27 non-compliant					
	Hazardous	94,775	3.1%	94,775	3.1%
	Non-hazardous	155,481	5.1%	155,481	5.1%
	Increased Inert	49,093	1.6%	49,093	1.6%
	Inert	560,157	18.5%	10,968	0.4%
	Total	**859,506**	**28.4%**	**310,317**	**10.3%**
	- Backfill	99,931	3.3%	99,931	3.3%
	Total Surplus	759,555	25.1%	210,386	7.0%

Material Type	Preliminary Waste Classification	A27 Worst Case		A27 Best Case	
		Volume (m^3)	%	Volume (m^3)	%
Article 27 Compliant					
	Non-Waste	**2,166,082**	**71.6%**	**2,715,271**	**89.7%**

5.3.3 Scenario 3: Consignment to Soil Recovery Facilities

Scenario 3 has involved review of whether excavated material is SRF compliant according to EPA guidance. 'Greenfield' soils are considered suitable for SRFs and only require a letter of suitability, however, only small areas of the proposed Project (restricted to the Park & Ride and Dardistown Depot areas) are considered to be greenfield. For non-greenfield soils (i.e. including urban areas, made ground and material including >2% anthropogenic inclusions) assessment against STLs based on geological domains as outlined in Section 5.2.2 is required.

Assessed volumes for each of the geological domains are detailed in the following sub-sections. An overall summary of the estimated material quantities complying with the STLs for each domain is provided in Table 5.7, along with a ranking indicating the order of greatest compliance (1 being highest, 7 being lowest). The proposed Project is located within Domain 2, which has the highest compliance with the SRF criteria (which is to be expected as the criteria are based on background geochemistry).

Table 5.7: Summary of Preliminary Assessment of SRF Compliance for Excavated Material

Domain	Unsuitable		Acceptable		Ranking
	m^3	%	m^3	%	
Domain 1	1,663,437	55%	1,362,151	45%	6
Domain 2	619,905	20%	2,405,683	80%	1
Domain 3	882,559	29%	2,143,029	71%	2
Domain 4	1,328,595	44%	1,696,993	56%	5
Domain 5	940,745	31%	2,084,843	69%	3
Domain 6	1,087,160	36%	1,938,428	64%	4
Domain 7	1,900,866	63%	1,124,722	37%	7

5.3.3.1 Summary of Material Assessment for SRF - Domain 1

The estimated quantities of material compliant for approved SRFs in Domain 1 are summarised in Table 5.8. Further detailed information and justification of the estimated volumes is included in Table K4 in Appendix K.

Table 5.8: Summary of Material Suitability Assessment for SRF (Domain 1)

Material	Non-Compliant with SRF Criteria		Compliant with SRF Criteria	
	Volume (m^3)	Percentage (%)	Volume (m^3)	Percentage (%)
Made Ground	153,458	5%	0	0%
Natural Superficial Deposits	744,126	25%	1,075,783	36%
Bedrock	765,853	25%	286,368	9%

6. Updated Conceptual Site Model

The preliminary CSM presented in Appendix C has been reviewed and updated based on the information and assessments detailed in Sections 3 and 4 and the review of potential contamination sources presented in Appendix D. This updated CSM is primarily based on and takes into account the following guidance:

- Guidance on the Management of Contaminated Land and Groundwater at EPA Licensed Sites (EPA, 2013);
- Land Contamination: Risk Management (EA, 2020); and
- Contaminated land risk assessment: A guide to good practice (CIRIA C552) (CIRIA, 2001).

The methodology used to determine the overall risk includes consideration of:

- The likelihood of the event (probability), which takes into account both the presence of the hazard and receptor and the integrity of the pathway; and
- The severity of the potential consequence, which takes into account both the potential severity of the hazard and the sensitivity of the receptor.

The classification of likelihood (based on Contaminated Land Risk Assessment: A Guide to Good Practice (CIRIA 552) (CIRIA, 2001)) is detailed in Table 6.1 and the classification of severity is detailed in Table 6.2.

Table 6.1: Classification of likelihood

Classification	Definition
High Likelihood	An event is very likely to occur in the short term, and is almost inevitable over the long term OR there is evidence at the receptor of harm or pollution.
Likely	It is probable that an event will occur. It is not inevitable, but possible in the short term and likely over the long term.
Low Likelihood	Circumstances are possible under which an event could occur. It is by no means certain that even over a longer period such an event would take place, and less likely in the short term.
Unlikely	It is improbable that an event would occur even in the very long term.

Table 6.2: Classification of severity

Classification	Definition
Severe	• Acute risks to human health. • Short-term risk of pollution of sensitive water resource (e.g. major spillage into the water environment). • Impact on controlled waters e.g. large-scale pollution or very high levels of contamination. • Catastrophic damage to buildings or property 9e.g. explosion causing building collapse). • Ecological system effects – irreversible adverse changes to a protected location. Immediate risks.
Medium	• Chronic risks to human health. • Pollution of sensitive water resources (e.g. leaching of contaminants into the water environment). • Ecological system effects – substantial adverse changes to a protected location. • Significant damage to buildings, structures and services (e.g. damage rendering a building unsafe to occupy, such as foundation damage).
Mild	• Non-permanent health effects to human health. • Pollution of non-sensitive water resources . • Damage to buildings, structures and services (e.g. damage rendering a building unsafe to occupy, such as foundation damage). • Substantial damage to non-sensitive environments (unprotected ecosystems e.g. crops).

Classification	Definition
Minor / Negligible	• Non-permanent health effects to human health (easily prevented by appropriate use of PPE). • Minor pollution to non-sensitive water resources. • Minor damage to non-sensitive environments (unprotected ecosystems e.g. crops). • Easily repairable effects of damage to buildings, structures, services or the environment (e.g. discoloration of concrete, loss of plants in a landscaping scene).

To determine the overall risk to the identified receptor the likelihood and severity for the potential hazard are combined in accordance with the risk assessment matrix in Table 6.3. The definitions of the outcomes are summarised in Table 6.4.

Table 6.3: Risk assessment matrix

		Consequence			
		Severe	Medium	Mild	Minor/Negligible
Probability (Likelihood)	High Likelihood	Very high risk	High risk	Moderate risk	Moderate/Low risk
	Likely	High risk	Moderate risk	Moderate/Low risk	Low risk
	Low Likelihood	Moderate risk	Moderate/Low risk	Low risk	Negligible risk
	Unlikely	Moderate/Low risk	Low risk	Negligible risk	Negligible risk

Table 6.4: Definitions of risk

Term	Description
Very high risk	Severe harm to a receptor may already be occurring OR a high likelihood that severe harm will arise to a receptor, unless immediate remedial action works / mitigation measures are undertaken.
High risk	Harm is likely to arise to a receptor, and is likely to be severe, unless appropriate remedial actions / mitigation measures are undertaken. Remedial works may be required in the short term, but likely to be required over the long term.
Moderate risk	Possible that harm could arise to a receptor but low likelihood that such harm would be severe. Harm is likely to be medium. Some remedial works may be required in the long term.
Moderate / low risk	Possible that harm could arise to a receptor, but where a combination of likelihood and consequence results in a risk that is above low, but is not of sufficient concern to be classified as medium. It can be driven by cases where there is an acute risk which carries a severe consequence, but where the exposure is unlikely.
Low risk	Possible that harm could arise to a receptor. Such harm would at worse normally be mild.
Negligible risk	Low likelihood that harm could arise to a receptor. Such harm unlikely to be any worse than mild.

The updated CSM is summarised in Table 6.5. This updated CSM is an overall summary for the proposed Project and is based on the 'worst case' scenario for each potential pollutant linkage, detail of the presence of contamination is included in Section 5.

Table 6.5: Updated Conceptual Site Model

Source	Receptor	Pathway	Pollutant Linkage	Severity	Likelihood	Consequence
Construction						
Contaminants within soil and groundwater	Human health (construction workers)	Dermal contact, ingestion and inhalation of impacted soil, dust, fibres (asbestos) and waters	PL1	**Medium** Contaminants identified above residential GAC, mainly PAH and metals in multiple locations with occasional commercial GAC exceedances in primarily associated with made ground, along with asbestos fibres in some locations.	**Likely** Made ground and natural ground will be excavated for infrastructure including stations box locations and retained cut which will result in construction workers coming into direct contact with excavated material and mobilised dust and fibres.	Moderate
		Migration of ground gases and vapours to shallow pits or enclosed spaces	PL2	**Medium** Ground gas (carbon dioxide) above WELs in several locations. Methane also detected in some locations. Carbon dioxide can be present in sub-surface from both natural (e.g. organic decay, carbonate rocks) and anthropogenic sources.	**Likely** Construction will involve excavation of enclosed spaces in which ground gas is likely to build up to potentially hazardous concentrations, and in which construction workers will enter.	Moderate
	Human health (adjacent residents / workers, transient foot traffic	Dermal contact, ingestion and inhalation of windblown soil, dust, fibres (asbestos) during construction	PL3	**Medium** Contaminants identified above residential GAC, mainly PAH and metals in multiple locations with occasional GAC exceedances primarily associated with made ground, along with asbestos fibres in some locations.	**Likely** Made ground will be excavated for infrastructure including stations and retained cut which has potential to mobilise dust and fibres which can spread beyond the immediate Works Area, particularly in dry 'dust generating' conditions.	Moderate
		Migration of ground gases into homes or workplaces via preferential pathways during construction	PL4	**Mild** Ground gas (carbon dioxide and methane) detected in sub surface in several areas, however, flow rates are generally low and initial C665 assessment indicates a Characteristic Situation (CS) of 1 (low risk potential source) with no gas protection measures necessary.	**Unlikely** Low risk gas source identified, unlikely that complete pollutant linkage will be present.	Negligible
	Groundwater	Leaching and migration of contaminants through natural deposits and made ground	PL5	**Medium** Various contaminants have been identified in the groundwater including metallic (mainly lead, arsenic, chromium, iron), inorganic (ammoniacal nitrogen, chloride) and organic (TPH, PAH) contaminants. The majority of the impact was observed within the Dublin Airport station location as well as Dublin city centre, where many of the contaminants cannot be attributed to a specific source. The majority of the groundwater across the route is considered to be of low vulnerability, with some smaller areas of higher vulnerability associated with higher permeability superficial deposits and limestone bedrock near the ground surface (Dublin Airport).	**Low Likelihood** Construction will involve excavation and removal of made ground (potential contaminant source) in station locations as well as retained cut sections. There will be some short-term potential for contaminant migration during construction as ground is disturbed however construction will include use of retaining walls (e.g. secant pile walls) in cut and station locations which will limit creation of new groundwater pathways.	Moderate / Low
		Surface water run-off from stockpiled excavated material	PL6	**Medium** Made ground contains potentially leachable metallic, inorganic and organic contaminants which have the potential to migrate to surrounding ground and water.	**Low Likelihood** While a pathway is potentially present the majority of groundwater throughout the proposed Project is considered to be of low vulnerability with areas of moderate to high at Dublin Airport Station (limestone at or near surface), near Tara Station and Griffith Park Station.	Moderate / Low
		Leaks and spills from site plant and materials storage	PL7	**Severe** Plant will be in use throughout construction of the proposed Project requiring storage of fuel and lubricants to operate. A worst-case scenario of a large-scale fuel spill could result in acute risks to human health or short-term pollution of sensitive groundwater receptors.	**Low Likelihood** Likelihood of the worst-case scenario occurring is considered low, however smaller spills could occur on a more regular basis.	Moderate
		Discharge of intercepted contaminated groundwater during passive or active dewatering	PL8	This scenario is not considered in this assessment, separate hydrogeological assessments have been undertaken.	This scenario is not considered in this assessment, separate hydrogeological assessments have been undertaken.	Not assessed
	Surface water, ecological receptors	Migration / mobilisation of contaminated shallow groundwater through drift deposits / made ground	PL9	**Mild** Various contaminants have been identified in the groundwater including metallic (mainly lead, arsenic, chromium, iron), inorganic (ammoniacal	**Low Likelihood** Surface water present in some locations, generally not directly adjacent to surface works with some exceptions (e.g. Broad Meadow River),	Low

Source	Receptor	Pathway	Pollutant Linkage	Severity	Likelihood	Consequence
				nitrogen, chloride) and organic (TPH, PAH) contaminants. The majority of the impact was observed within the Dublin Airport station location as well as Dublin city centre, where many of the contaminants cannot be attributed to a specific source.	however a potential pathway remains. Construction will involve excavation and removal of made ground (potential source) in station locations as well as retained cut sections. There will be some short-term potential for contaminant migration as ground is disturbed however construction will include use of retaining walls (e.g. secant pile walls) which will limit creation of new groundwater pathways.	
		Surface water run-off from stockpiled excavated material	PL10	**Medium** Made ground contains potentially leachable metallic, inorganic and organic contaminants which have the potential to affect surrounding ground and water.	**Low Likelihood** While a pathway is potentially present surface watercourses are not widespread across the proposed Project, and pathway will only be present in small areas.	Moderate / Low
		Leaks and spills from site plant and materials storage	PL11	**Severe** Plant will be in use throughout construction of the proposed Project. A worst-case scenario of a large-scale fuel spill could result in acute risks to human health or short-term pollution of sensitive waters such as rivers.	**Low Likelihood** Likelihood of the worst-case scenario occurring is considered low, however smaller spills could occur on a more regular basis.	Moderate
		Discharge of intercepted contaminated groundwater during passive or active dewatering	PL12	This scenario is not considered in this report, separate hydrogeological assessments have been undertaken.	This scenario is not considered in this report, separate hydrogeological assessments have been undertaken.	Not assessed
	Property	Direct contact with sub-surface materials including made ground.	PL13	**Mild** Chemical attack / aggressive ground conditions resulting in damage and degradation to sub surface structures.	**Likely** Direct contact of construction materials with sub-surface likely.	Moderate / Low
		Migration of ground gases into property through preferential pathways posing a potential explosion risk from ignition of explosive gases	PL14	**Mild** No specific source identified with high methane potential according to the available information. Ground gas monitoring indicates methane concentrations below the LEL within the subsurface.	**Unlikely** C665 assessment based on the available data suggests CS1 (low risk) category with no gas protection measures necessary.	Negligible
Operation						
Contaminants within soil and groundwater	Human health (maintenance workers)	Dermal contact, ingestion and inhalation of soil, dust, fibres (asbestos) and waters during routine maintenance	PL15	**Medium** Contaminants identified above residential GAC, mainly PAH and metals in multiple locations with occasional commercial GAC exceedances in primarily associated with made ground, along with asbestos fibres in some locations.	**Low Likelihood** Exposure to sub-surface materials will be more limited post-construction, however access may still be required to areas of the sub surface including areas that may contain made ground where it is not covered or enclosed.	Moderate / Low
		Migration of ground gases and vapours to enclosed spaces	PL16	**Medium** Ground gas (carbon dioxide) present above WELs in several locations. Methane also detected in some locations albeit at low concentrations. Carbon dioxide can be present in sub-surface from both natural sources (e.g. organic decay, carbonate rocks)	**Low Likelihood** Enclosed spaces will be present mainly in station and tunnel locations as well as service ducts. These structures will be fully sealed to prevent water ingress which will also limit potential for gas migration in addition to which these spaces will have air circulation / ventilation systems. However, some potential remains for maintenance workers to access service ducts or runs outside the main station areas which could be at risk of gas accumulations.	Moderate / Low
	Human health (end users, adjacent residents, workers)	Dermal contact, ingestion and inhalation of wind-blown soil, dust, fibres (asbestos) from retained surface soils	PL17	**Medium** Contaminants identified above residential GAC, mainly PAH and metals in multiple locations with occasional GAC exceedances primarily associated with made ground, along with asbestos fibres in some locations.	**Unlikely** Made ground will be excavated and removed from the site for infrastructure including stations and retained cut which will reduce the potential contaminant source in some areas and limit potential for exposure. Any residual made ground will mostly be covered by hard standing and soft landscaping / planting which will further reduce potential for mobilising soil and dust. Small residual risk of exposure during operation.	Low

Source	Receptor	Pathway	Pollutant Linkage	Severity	Likelihood	Consequence
		Migration and accumulation of ground gases into homes or workplaces via preferential pathways created during construction	PL18	**Mild** Ground gas (carbon dioxide and methane) detected in sub surface in several areas, however, flow rates are generally low and initial C665 assessment indicates a Characteristic Situation (CS) of 1 (low risk potential source) with no gas protection measures necessary.	**Unlikely** Low risk gas source identified, unlikely that complete pollutant linkage will be present during operation.	Negligible
	Groundwater	Leaching and migration of contaminants	PL19	**Mild** Various contaminants have been identified in the groundwater including metallic (mainly lead, arsenic, chromium, iron), inorganic (ammoniacal nitrogen, chloride) and organic (TPH, PAH) contaminants. The majority of the impact was observed within the Dublin Airport station location as well as Dublin city centre, where many of the contaminants cannot be attributed to a specific source. The majority of the groundwater across the route is considered to be of low vulnerability, with some smaller areas of higher vulnerability associated with higher permeability superficial deposits and limestone bedrock near the ground surface (Dublin Airport).	**Unlikely** Construction will involve excavation and removal of made ground (potential source) in station locations as well as retained cut sections reducing potential contaminant input in many areas. Operation will not result in further disturbance to the ground and subsequent additional mobilisation of contaminants is considered unlikely	Negligible
		Surface water runoff from placed excavated material	PL20	**Medium** Made ground contains potentially leachable metallic, inorganic and organic contaminants which have the potential to affect surrounding ground and water.	**Low Likelihood** If excavated material containing contaminants is reused within the scheme there is the potential for new migration pathways to be introduced, albeit the majority of groundwater throughout the proposed Project is considered to be of low vulnerability with areas of moderate to high at Dublin Airport Station (limestone at or near surface), near Tara Station and Griffith Park Station.	Moderate / Low
		Migration of contaminated shallow groundwater through drainage channels and associated granular bedding materials	PL21	**Medium** Made ground contains potentially leachable metallic, inorganic and organic contaminants which have the potential to affect surrounding ground and water.	**Low Likelihood** New pathways may be introduced via construction of drainage runs and channels required to enable operation of the scheme.	Moderate / Low
		Discharge of intercepted contaminated groundwater	PL22	This scenario is not considered in this report, separate hydrogeological assessments have been undertaken.	This scenario is not considered in this report, separate hydrogeological assessments have been undertaken.	Not assessed
		Leaks / spills from trains and other operational plant	PL23	**Mild** While trains are electrically powered they will still require lubricants and maintenance; in addition other maintenance plant will be hydrocarbon powered with the potential for leaks and spills during operation, fuelling and maintenance.	**Unlikely** Likelihood of the worst-case leak / spill scenario occurring is considered low, however smaller spills could occur on a more regular basis. The scheme includes a track drainage system which will capture emissions from the track, and the depot and station areas also include drainage systems and provision for safe storage and transfer of materials.	Negligible
	Surface water, ecological receptors	Leaching and migration of contaminants	PL24	**Mild** Various contaminants have been identified in the groundwater including metallic (mainly lead, arsenic, chromium, iron), inorganic (ammoniacal nitrogen, chloride) and organic (TPH, PAH) contaminants. The majority of the impact was observed within the Dublin Airport station location as well as Dublin city centre, where many of the contaminants cannot be attributed to a specific source.	**Unlikely** Construction will involve excavation and removal of made ground (potential source) in station locations as well as retained cut sections reducing contaminant input in many areas. Operation will not result in further disturbance to the ground and subsequent additional mobilisation of contaminants is considered unlikely.	Negligible
		Surface water runoff from placed excavated material	PL25	**Medium** Made ground contains potentially leachable metallic, inorganic and organic contaminants which have the potential to affect surface water.	**Low Likelihood** If excavated material containing contaminants is reused within the scheme there is the potential for new migration pathways to be introduced, albeit the majority of the proposed Project is not adjacent to surface water.	Moderate / Low
		Migration of contaminated shallow groundwater through drainage channels and associated granular bedding materials	PL26	**Medium**	**Low Likelihood** New pathways may be introduced via construction of drainage runs and channels required to enable operation of the scheme.	Moderate / Low

Source	Receptor	Pathway	Pollutant Linkage	Severity	Likelihood	Consequence

		Migration of ground gases into property through preferential pathways posing a potential explosion risk from ignition of explosive gases	PL30	**Mild** No specific source identified with high methane potential. Ground gas monitoring indicates methane concentrations below the LEL within the subsurface.	**Unlikely** C665 assessment suggests CS1 (low risk) category with no gas protection measures necessary.	Negligible

7. Risk Summary and Recommendations

7.1 Limitations

This assessment is based on the data available at the time of writing. Soil and leachability analysis results have been included from the supporting GI information as well as from MetroLink GI Phases 1 to 5, along with groundwater and ground gas monitoring undertaken in monitoring standpipes installed up to Phase 5. Phase 5 GI in the vicinity of St Stephen's Green, together with groundwater and ground gas monitoring, is ongoing at the time of writing. The additional GI and monitoring data have the potential to alter this assessment and the conclusions and recommendations presented in this section.

The GI, particularly in urban locations such as central Dublin have been constrained by the presence of infrastructure such as buildings and services. Ground conditions beneath buildings and other infrastructure that is to be removed may vary from conditions established by the GI undertaken to date.

7.2 Risk Summary

7.2.1 AZ1 - Northern Section

The primary potentially contaminative sources in AZ1 which have the potential to impact on the proposed Project are gravel pits, a sewage works, a car dismantlers yard, a petrol station and general urban made ground.

In AZ1 made ground was generally encountered up to 1.2m thick associated with the existing road network and previous development of the Swords area. A thicker layer of made ground was identified in 5 no. locations, up to a maximum of 4.6mbgl. The made ground generally comprised sandy gravelly clay with inclusions of brick, pottery, concrete, metal, plastic and/or wood in some locations, and has been mainly interpreted as re-worked natural ground. No other obvious unusual discolouration, oil sheens or odours were encountered. It should be noted that investigation was not possible at a car dismantlers yard (C46) due to access issues.

The made ground overlies mainly cohesive deposits of glacial till comprising sandy gravelly clay with strata of sands and gravels. Superficial deposit thickness varies from 2.0mbgl to in excess of 30.0mbgl in the south of AZ1. The glacial till is primarily underlain by the argillaceous limestone and interbedded shale of the Malahide Formation.

7.2.1.1 AZ1 Construction Phase

The majority of soil geochemical results did not exceed the residential GAC, and no exceedances of commercial GAC were encountered. The majority of residential GAC exceedances were for chromium, with some arsenic, mercury and PAH, in the vicinity of Estuary Station (greenfield land) and around Swords Station. Overall, based on the available data, the risks to construction workers and adjacent users from soil are likely to be low over the majority of AZ1 as limited quantities of made ground and evidence of contamination has been identified to date.

The groundwater quality and leachability testing results indicate a number of metallic, organic and inorganic contaminants above assessment criteria. The metals (boron, manganese, potassium, antimony, selenium, chromium and antimony) are primarily associated with natural deposits and are likely to be representative of natural background concentrations. Ammoniacal nitrogen in the area of Estuary Station may be associated with the agricultural use of the area (e.g. from fertiliser). TPH (diesel range) was identified near the proposed Estuary Station however this was not identified in the soil samples and could be a result of a small, localised spill from agricultural machinery. Additionally, the leachate analysis suggested exceedances of assessment criteria for mercury; mercury, however, was not detected in soil nor in groundwater.

The ground gas data assessment is limited to two points located at the Estuary Park & Ride and in the Estuary – Seatown area. Based on the results there is a very low risk to buildings from ground gas according to the CIRIA C665 methodology (Characteristic GSVs below 0.07 L/h). Carbon dioxide concentrations are, however, above the short term WEL which indicates a potential risk to construction workers in confined and / or enclosed spaces. No potential sources with high gas generation potential have been identified from the available information, however, it should be noted that this assessment is based on a limited number of data points.

Taking into account the uncertainties and information gaps it is not anticipated that land contamination will place a major constraint on the construction of the proposed Project in AZ1.

There is a residual risk for previously unidentified areas of made ground and contaminants to be present, particularly in areas that have not been investigated to date (e.g. the car dismantlers yard, C46) and urbanised areas of Swords where a greater risk to construction workers and adjacent users may be present from contaminants in the soil (including asbestos).

7.2.1.2 AZ1 Operational Phase

Potential exposure to end users during operation will be restricted to the stations and access routes, and, as such are unlikely to be exposed to soils / subsoils except in areas of soft landscaping. In additional the currently available data shows that no exceedances of commercial GAC have been encountered, suggesting that should contact of end users with soils occur, risks are likely to be low. Potential risks to maintenance workers are present from direct exposure to soils and entering confined spaces and encountering hazardous ground gases.

7.2.2 AZ2 - Airport Section

The primary potentially contaminative sources within AZ2 are an historic quarry at the proposed Dublin Airport Station location and the airport development itself.

Construction work in AZ2 primarily comprises tunnel with the exception of the North and South Portals and Dublin Airport Station. At the proposed Dublin Airport Station made ground up to 2.7m thick was encountered, associated with a former quarry (potential source C59), which was described as tarmac, concrete, sandy gravel or gravelly clay with rebar and red brick. No obvious unusual discolouration, oil sheens or odours were noted with the exception of possible domestic waste / putrescible material within ABH12 (0.50-2.10mbgl).

The superficial deposits comprise glacial till in the form of sandy gravelly clay with sand and gravel substrata. Depth to bedrock is highly variable across the section, recorded at 24.5 and 33 mbgl at the northern and southern ends of the section respectively, and rising to 2.6 mbgl at Dublin Airport Station. Bedrock in the north of the section comprises the calcareous shale of the Malahide Formation. In the centre of the section, bedrock comprises bedded to massive siliceous limestone (Waulsortian Limestone), and it can be inferred that the abrupt change in rockhead elevation can be attributed to a fault marking the boundary between the units. The south of the section is underlain by interlaminated calcareous mudstone and argillaceous limestone of the Tober Colleen Formation.

7.2.2.1 AZ2 Construction Phase

Residential GAC exceedances in the Airport Section associated with the made ground at the proposed Dublin Airport Station comprised metals (chromium, lead, arsenic), PAHs and TPH. Arsenic above the residential GAC was also identified within the bedrock up to a depth of 20mbgl which may represent natural background concentrations. Commercial GAC exceedances were identified for PAH congeners (Benzo[b]fluoranthene and dibenzo[a,h]anthracene) in two samples (NBH60 and NBH61 at 1mbgl). Some VOCs were encountered above detection limits, primarily associated with the made ground with one sample encountering VOCs (diethyl phthalate, 2-methylnaphthalene) at a depth of 10mbgl.

The groundwater and leachability analysis data indicates assessment criteria exceedances of a variety of metallic (cobalt, iron, manganese, barium and boron), inorganic (ammoniacal nitrogen, chloride and phosphorous) and organic (TPH, PAH, 1,1,1,2 tetrachoroethane and 1,1,1-trichloroethane) contaminants within the vicinity of the proposed Dublin Airport Station location. These contaminants are likely to be associated with the fill material deposited in the former quarry. No convincing evidence of the presence of PFAS in the sub-surface from airport operations has been identified in the soil and groundwater monitoring undertaken to date.

Asbestos (amosite) fibres were identified within the soil at one location (ATP27) within the Study Area in AZ2.

At the South Portal assessment criteria were primarily exceeded for metals (iron, manganese, boron, potassium) and inorganic (ammoniacal nitrogen, chloride, fluoride) contaminants. Given the absence of a specific potential contamination source at this location these contaminants are likely to be a combination of natural background concentrations and use of the area for agriculture.

Ground surface disturbance is only anticipated at the Dublin Airport Station location and the North and South Portals with the remainder of the proposed Project comprising tunnel. While there is made ground present potential risks to construction workers this is mainly restricted to a small area and the top 3m of the sub surface according to the available information. The potential issue of contaminated groundwater during construction phase is mainly related to elevated concentrations of hydrocarbons including total TPH and some PAHs. These assessment criteria exceedances could be partially related to made ground deposited at an historical quarry (C61) and former airport operations in the area. The hydrocarbons were detected in both shallow (NBH60) and deep (NBH04) monitoring wells.

The ground gas data at the proposed Dublin Airport Station (four locations) and the South Portal (two locations) indicates a Very Low risk to buildings from ground gas according to the CIRIA C665 methodology. Carbon dioxide concentrations however exceeded the short term WEL indicating a potential risk to construction workers entering confined or enclosed spaces.

Taking into account the uncertainties and information gaps it is not anticipated that land contamination will place a major constraint on the construction of the proposed Project in the majority of AZ2. The presence of contaminants within the shallow sub-surface and groundwater, and potential effects on construction workers will need to be taken into account in the proposed Dublin Airport Station location. There is a residual risk for previously unidentified areas of made ground and contaminants to be present, particularly in areas that have not been investigated to date.

7.2.2.2 AZ2 Operational Phase

Potential exposure to end users during operation will be restricted to the Dublin Airport Station and access routes, and, as such are unlikely to be exposed to soils / subsoils except in areas of soft landscaping. The currently available data indicates that should exposure of soil to end users occur, risks are on the whole likely to be low. Potential risks to maintenance workers are present from direct exposure to soils and entering confined spaces and encountering hazardous ground gases.

7.2.3 AZ3 - Dardistown to Northwood Section

The primary potentially contaminative sources in AZ3 are a petrol station, cooking oil wholesaler, vehicle test centre and general urban made ground.

Made ground up to 2.5m thick was encountered within AZ3, mainly confined to the northern and southern areas and the M50 embankments, associated with the road network and potential unmapped historic activities. It generally comprised sandy gravelly clay or sandy gravel with anthropogenic materials such as brick, plastic, metal or pottery. No other obvious unusual discolouration, oil sheens or odours were noted within the GI information.

Superficial deposits comprise glacial till of sandy gravelly clay with cobbles and granular horizons. Depth to bedrock ranged from >38mbgl in the north of AZ1 to 16-18mbgl in the centre and 15-20mbgl in the south. Bedrock in the north of the section comprises the bedded to thinly laminated limestone and calcareous mudstone of the Tober Colleen Formation, and in the south of the section comprises the pyrite rich interbedded argillaceous limestone and calcareous mudstone of the Lucan Formation.

7.2.3.1 AZ3 Construction Phase

Residential GAC exceedances were encountered for PAH and chromium in 3 samples within AZ3 associated with the shallow made ground (PAH) and reworked natural ground (chromium). No commercial GAC exceedances were encountered.

Groundwater exceedances were primarily for chloride, ammoniacal nitrogen and TPH. Leachate exceedances comprised barium, selenium antimony, chloride and zinc. It is likely that the chloride and ammoniacal nitrogen exceedances are reflective of the largely agricultural use of the area. The widespread barium and selenium exceedances in leachate samples are likely reflective of the natural ground chemistry. Bis(2-ethylhexyl)phthalate was also recorded in one location. Hydrocarbon exceedances were only marginally above assessment criteria and mainly in the proposed Dardistown Depot area; there is no obvious source for the observed TPH.

Ground gas data for three locations at the proposed Northwood Station and Dardistown Depot areas are available. The CIRIA C665 assessment suggests a very low risks to buildings from ground gas, however carbon dioxide concentrations exceeded the short term WEL for carbon dioxide in the Northwood Station location suggesting a potential risk to construction workers.

Much of the works will be undertaken at the ground surface within AZ3, and direct contact of the soils and groundwater by construction workers is likely. However, taking into account the uncertainties and information gaps it is not anticipated that land contamination will place a major constraint on construction of the proposed Project in AZ3. There is a residual risk for previously unidentified areas of made ground and contaminants to be present, particularly in areas that have not been investigated to date.

7.2.3.2 AZ3 Operational Phase

Potential exposure to end users during operation will be restricted to the stations and access routes, and, as such are unlikely to be exposed to soils / subsoils except in areas of soft landscaping. In additional the currently available data shows that no exceedances of commercial GAC have been encountered, suggesting that should contact of end users with soils occur, risks are likely to be low. Potential risks to maintenance workers are present from direct exposure to soils and entering confined spaces and encountering hazardous ground gases.

7.2.4 AZ4 - Northwood to Charlemont

AZ4 predominantly comprises tunnel section at depth through natural superficial deposits and bedrock with station and intervention shaft locations where interaction with the shallow sub-surface will be required. General urban made ground associated with the historical development of Dublin was encountered at all station locations, however limited evidence of the majority of potential historical contamination sources identified by the desk study review was identified by the various phases of GI. The made ground encountered is reflective of the historic urban development of Dublin and is not necessarily associated with specific land use types and associated potential contamination sources.

Made ground was typically found up to around 3m thick and generally described as sandy gravelly clay with brick, concrete, glass, ash and / or plastic. Notable GI observations outside this general description include:

- Hydrocarbon odours in the proposed Collins Avenue and Tara Station locations;

- Bitumen odour noted at the proposed O'Connell Street Station location at 1.1-3.6mbgl.
- Track ballast present along the railway tracks in the area of Glasnevin Station.
- Animal bone encountered in two locations at the proposed Tara Station.
- Bone fragments encountered in one location at the proposed St Stephen's Green Station.
- Made ground up to 7mbgl encountered at the proposed Charlemont Station.

The made ground is underlain by glacial till, comprising sandy gravelly clay with cobbles in some horizons. There were also sand and gravel strata within the glacial till. Depth to bedrock ranged from 4.1 to 27.25mbgl and was generally deeper in the north and central areas of the AZ4. The section is underlain by the pyrite rich interbedded calcareous mudstone and argillaceous limestone of the Lucan Formation.

7.2.4.1 AZ4 Construction Phase

Residential GAC exceedances of chromium were recorded throughout AZ4. As noted in the Dublin SURGE Project, it is likely that these exceedances across the whole proposed Project study area are reflective of natural background concentrations as the exceedances are generally within the range of GI data. The majority of other residential GAC exceedances were associated with the made ground and comprised lead, arsenic, mercury, TPH and PAHs, with the greatest concentrations of exceedances within the proposed Glasnevin, Mater, O'Connell Street and Charlemont stations; VOCs have also been occasionally recorded above detection limits in these locations and the proposed Ballymun station.

Commercial GAC exceedances have been recorded for TPH, PAH, particularly at the proposed Mater, Glasnevin, O'Connell Street and to a lesser extent at St Stephen's Green and Charlemont stations, primarily associated with the made ground. Asbestos fibres (amosite) were found in the made ground within the Study Area near the proposed Ballymun, Collin Avenue and Tara stations.

Groundwater monitoring and leachability data indicate the presence of a variety of metallic (iron, manganese, potassium, boron, antimony, mercury, arsenic), inorganic (chloride, ammoniacal nitrogen, nitrite and nitrate) and organic (TPH, PAH and VOCs) above assessment criteria at various locations within AZ4. Specific sources have not been identified for many of the contaminants encountered. Many of the metals encountered are associated with natural deposits and bedrock and may be reflective of natural background conditions.

Inorganic contaminants (e.g. nitrogen species such as nitrate, nitrite and ammoniacal nitrogen) could result from the presence of extensive burial grounds and cemeteries in some parts of Dublin particularly in the Glasnevin area. Organic compounds have been identified in the groundwater in some locations which correspond to where TPH, PAH and VOCs have been identified in the soils (including the proposed Mater, and O'Connell Street stations).

Ground gas data for all the monitoring locations in AZ4 suggests a very low risk to buildings from ground gas according to the CIRIA C665 assessment. However carbon dioxide concentrations exceeded the short term WEL for carbon dioxide in several locations suggesting a potential risk to construction workers.

Potential risks to construction workers and adjacent residents are present from dermal contact and inhalation of dust mobilized by construction at the majority of proposed station locations. The made ground is heterogeneous in nature and there is the potential for unrecorded asbestos to be present throughout AZ4. In addition there is the potential for free phase hydrocarbons to be present, including in locations near former oil-filled power cables.

At the station locations in AZ4 direct contact of construction workers with contaminants within the soils and groundwater is likely, along with the potential for mobilisation of dust which could affect surrounding residents,

workers and transient traffic. There is a residual risk for previously unidentified areas of made ground and contaminants to be present, particularly in areas that have not been investigated to date due to existing infrastructure constraints. During excavation of urban areas, foundations and basements may be present in which asbestos is likely to be present which hasn't been identified or quantified to date. In addition, buildings such as hospitals may have emergency back-up generators with fuel supplies (such as diesel tanks) which may be present in basements, which have not been identified within the available documentary information.

7.2.4.2 AZ4 Operational Phase

Potential exposure to end users during operation will be restricted to the stations and access routes, and, as such are unlikely to be exposed to soils / subsoils except in areas of soft landscaping. The currently available data shows that exceedances of commercial GAC have been encountered in some locations, suggesting that should contact of end users with soils occur, potential risks are present. Potential risks to maintenance workers are present from direct exposure to soils and entering confined spaces and encountering hazardous ground gases.

7.2.5 Risks Associated with Radon

While the proposed Project is in an area of the lowest and second lowest radon potential rankings, these classifications are based on assessment of surface buildings and are at a national scale rather than detailed classifications at a local scale or based on specific geological units. As such, the potential for accumulation of radon in the excavations, tunnels and confined spaces that will be developed during construction and building up to potentially hazardous levels (i.e. above the reference level of 300 Bq/m^3 for workplaces) cannot be discounted.

Article 65 of the Radiological Protection Act 1991 (Ionising Radiation) Regulations of 2019 (referred to as IRR19) places a duty on employers to test for radon. If the reference level is exceeded employers are required to take remedial action or implement a system of radiation protection for the duration of the work (EPA 2019a).

Post construction underground areas of the proposed Project will be fully sealed from the surrounding sub-surface to prevent water ingress which will limit the potential for any radon from the surrounding sub-surface to enter occupied below ground spaces. Furthermore, occupied below ground spaces will be ventilated which will reduce the likelihood of radon build up.

7.2.6 Risks Associated with Pyrite

The Lucan Formation has high concentrations of pyrite, which may be susceptible to expansion when exposed to air, moisture and heat. This may limit the reuse of this rock for uses such as structural fill, contact with concrete or confined conditions without specific testing of rock properties although restrictions may not apply for bulk fill or landscaping / restoration material.

Specific assessment of the presence of pyrite will be required for the Lucan Formation which will be excavated during construction to account for potential swelling properties and environmental risks and to inform potential reuse options. Material will be required to comply with an appropriate specification for earthworks such as the NRA Specification for Road Works Series 600 – Earthworks (TII 2013).

7.3 Preliminary Materials and Waste Assessment

The project will result in generation of an estimated 3,025,588m^3 of excavated material, of which only 99,931m^3 is expected to be reused within the project primarily due to space constraints (refer to Table 7.1).

Table 7.1: Summary of Excavated Material Quantities

Material Type	Volume (m^3)	%
Made Ground	153,458	5%
Superficial Deposits	1,742,258	58%
Mixed	155,302	5%
Rock	974,570	32%
Total	**3,025,588**	

The preferred scenario for managing the excavated material is use as restoration material off site via an application under Article 27 of the European Communities (Waste Directive) Regulations 2011 (S.I. No. 126 of 2011), as amended (Waste Directive Regulations (2011)) (referred to as Article 27) progressed by Arup. If this approach is unsuccessful two other scenarios are considered below:

- Scenario 1: Unmitigated scenario – all excavated material will require disposal as waste.
- Scenario 2: The Article 27 application is successful and between 71.6% (worst case) and 89.7% (best case) of the excavated material is removed from site as a by-product, the remainder being removed from site as waste.
- Scenario 3: The Article 27 application is unsuccessful; the next best option is to send excavated material that complies to Soil Recovery Facilities (SRFs).

Under Scenario 1 all excavated material is deemed to be waste requiring off-site disposal and has been provided a waste classification, as summarised in Table 7.2.

Table 7.2: Summary of Quantities (Assuming All Material is Waste)

Material Type	Volume (m^3)	Preliminary Waste Classification	Volume (m^3)	Percentage
Made ground	58,656	Hazardous	94,775	3.1%
Natural material	36,119			
Made ground	94,802	Non-Hazardous	221,121	7.3%
Natural material	126,319			
		Increased Inert	104,554	3.5%
		Inert	2,605,138	86.1%
Total	**3,025,588**			
Backfill Required	**99,931**			
Total Waste	**2,925,657**			

Under scenario 2 between 71.6% and 89.7% of the materials are likely to be Article 27 compliant with the remainder potentially requiring off-site disposal, as summarised in Table 7.3.

Table 7.3: Summary of Quantities for Scenario 2

Material Type	Preliminary Waste Classification	A27 Worst Case		A27 Best Case	
		Volume (m^3)	%	Volume (m^3)	%
Article 27 Non-compliant					
	Hazardous	94,775	3.1%	94,775	3.1%
	Non-hazardous	155,481	5.1%	155,481	5.1%
	Increased Inert	49,093	1.6%	49,093	1.6%
	Inert	560,157	18.5%	10,968	0.4%
	Total	**859,506**	**28.4%**	**310,317**	**10.3%**
	- Backfill	99,931	3.3%	99,931	3.3%
	Total Surplus	759,555	25.1%	210,386	7.0%
Article 27 Compliant					
	Non-Waste	**2,166,082**	**71.6%**	**2,715,271**	**89.7%**

Under scenario 3 the preliminary assessment of excavated material suitability for each Irish geological domain summarised in Table 7.4.

Table 7.4: Summary of Preliminary Assessment of SRF Compliance for Excavated Material

Domain	Unsuitable		Acceptable		Ranking
	m^3	%	m^3	%	
Domain 1	1,663,437	55%	1,362,151	45%	6
Domain 2	619,905	20%	2,405,683	80%	1
Domain 3	882,559	29%	2,143,029	71%	2
Domain 4	1,328,595	44%	1,696,993	56%	5
Domain 5	940,745	31%	2,084,843	69%	3
Domain 6	1,087,160	36%	1,938,428	64%	4
Domain 7	1,900,866	63%	1,124,722	37%	7

7.4 Risks and Recommendations for Mitigation Measures

Following the assessment presented in the previous sections, the primary land contamination related risks to the project and the recommended mitigation measures for the identified risks are summarised in Table 7.5 (risks associated with radon and pyrite are summarised in Sections 7.2.5 and 7.2.6).

Table 7.5: Summary of risks and recommendations

Primary Potential Sources	Pollutant Linkage	Consequence	Recommended Mitigation Measures
Construction			
Contaminants within Soils & Groundwater	PL1: Construction Workers affected by dermal contact, ingestion and inhalation of impacted soil, dust, fibres (asbestos) and waters	**Moderate Risk** Contaminants identified above residential and commercial GAC, asbestos identified, contact with sub-surface soils and groundwater and mobilised dust / fibres likely.	Development prior to construction of appropriate health and safety and waste management procedures for working with potentially contaminated soils (including asbestos) and water. Implementation of a watching brief during construction works and any additional GI to identify the presence of previously unidentified contamination sources. Personnel should be appropriately trained if involved in GI and earthworks activities. Such instances of previously unidentified contamination should be recorded, the associated risks assessed, and mitigation implemented such as application of safe systems of work and / or development of a remedial strategy as appropriate.
	PL2: Construction workers affected by migration of ground gases and vapours to shallow pits or enclosed spaces.	**Moderate Risk** Ground gas (mainly carbon dioxide) above WELs in several locations, methane also detected. Build up likely in encloses spaces during construction.	Risks to construction workers can be mitigated via risk assessment and the implementation of safe systems of work including use of PPE (and RPE) as a last resort.
	PL3: Adjacent residents / workers / transient foot traffic affected by dermal contact, ingestion and inhalation of windblown soil, dust, fibres (asbestos)	**Moderate Risk** Contaminants identified above residential and commercial GAC, asbestos identified, made ground will be excavated, moved and stockpiled in multiple locations which has potential to mobilise dust and fibres beyond immediate work areas.	Development prior to construction of appropriate health and safety and waste management procedures for working potentially contaminated soils (including asbestos) and water. Development of a stockpile management and materials movement plan as part of the CEMP with measures including but not limited to construction of stockpile bunds and covers to reduce potentially contaminated runoff and generation of leachate, isolating from open excavations and drainage points, damping down to prevent wind-blown dust and monitoring of stockpile emissions.
	PL4: Adjacent residents / workers affected by migration of ground gas into homes or workplaces via preferential pathways during construction	**Negligible Risk** Ground gas classified as low risk potential source with respect to buildings with no specific mitigation measures required.	Implementation of a watching brief during construction works and any additional GI to identify the presence of previously unidentified ground gas sources. Such instances should be recorded, and the associated risks and a remedial strategy developed to manage the identified risks as appropriate

Primary Potential Sources	Pollutant Linkage	Consequence	Recommended Mitigation Measures
	PL5: Groundwater affected by leaching and migration of contaminants	**Moderate / Low Risk** Metallic, inorganic and organic contaminants present in the soil and groundwater in some parts of the proposed Project, construction will disturb ground and result in short term potential for contaminant migration.	Development of a monitoring programme to be followed during construction works to determine whether construction activities are affecting the groundwater and surface water quality in areas of high receptor vulnerability. Should the monitoring programme indicate a change in baseline conditions and/or unacceptable risk further mitigation may be required. Implementation of a watching brief during construction works and any additional GI to identify the presence of previously unidentified contamination. Personnel should be appropriately trained if involved in GI and earthworks activities. Such instances of previously unidentified contamination should be recorded, the associated risks assessed, and mitigation implemented such as application of safe systems of work and / or development of a remedial strategy as appropriate.
	PL6: Groundwater affected by surface water run-off from stockpiled material	**Moderate / Low Risk** Metallic, inorganic and organic contaminants present in the soil which have the potential to leach to surrounding ground and water, some areas of high groundwater vulnerability are present.	Development of a stockpile management and materials movement plan as part of the CEMP with measures including but not limited to construction of stockpile bunds and covers to reduce potentially contaminated runoff and generation of leachate, isolating from open excavations and drainage points, damping down to prevent wind-blown dust and monitoring of stockpile emissions.
	PL7: Groundwater affected by leaks and spill from site plant and materials storage	**Moderate Risk** Plant will be in used throughout construction requiring movement and storage of fuel and materials which have potential to affect sensitive receptors.	Fuelling and maintenance of construction vehicles will be undertaken in designated and controlled zones with measures incorporated to prevent the spread of potential spillages from storage and transfer (e.g. bunds around storage containers and drainage interceptors). An incident response plan will be developed detailing the procedures to be implemented by the contractor in the event of spillage of fuel, lubricant or other potentially hazardous substance. The response plan will include requirements for staff training, equipment requirements (e.g. spill kits), response plans for likely incident scenarios and methods for logging incidents as well as non-compliance with procedures which could result in pollution events.
	PL8: Groundwater affected by discharge of intercepted contaminated groundwater during active or passive dewatering	This scenario is not considered in this assessment, separate hydrogeological assessments have been undertaken.	This scenario is not considered in this assessment, separate hydrogeological assessments have been undertaken.
	PL9: Surface water and ecological receptors affected by mobilisaiton of contaminated shallow groundwater	**Low Risk** Metallic, inorganic and organic contaminants present in the soil and groundwater in some	Development of a monitoring programme to be followed during construction works to determine whether construction activities are affecting the groundwater and surface water quality in areas of high receptor vulnerability. Should the monitoring

Primary Potential Sources	Pollutant Linkage	Consequence	Recommended Mitigation Measures
	through drift deposits and made ground.	parts of the proposed Project, construction will disturb ground and result in short term potential for contaminant migration.	programme indicate a change in baseline conditions and/or unacceptable risk further mitigation may be required. Implementation of a watching brief during construction works and any additional GI to identify the presence of previously unidentified contamination. Personnel should be appropriately trained if involved in GI and earthworks activities. Such instances of previously unidentified contamination should be recorded, the associated risks assessed, and mitigation implemented such as application of safe systems of work and / or development of a remedial strategy as appropriate..
	PL10: Surface water and ecological receptors affected by surface water run-off from stockpiled excavated material.	**Moderate / Low Risk** Metallic, inorganic and organic contaminants present in the soil which have the potential to leach to surrounding ground and water, watercourses present in some areas of project.	Development of a stockpile management and materials movement plan as part of the CEMP with measures including but not limited to construction of stockpile bunds and covers to reduce potentially contaminated runoff and generation of leachate, isolating from open excavations and drainage points, damping down to prevent wind-blown dust and monitoring of stockpile emissions.
	PL11: Surface water and ecological receptors affected by leaks and spill from site plant and materials storage.	**Moderate Risk** Plant will be in used throughout construction requiring movement and storage of fuel and materials which have potential to affect sensitive receptors.	Fuelling and maintenance of construction vehicles will be undertaken in designated and controlled zones with measures incorporated to prevent the spread of potential spillages from storage and transfer (e.g. bunds around storage containers and drainage interceptors). An incident response plan will be developed detailing the procedures to be implemented by the contractor in the event of spillage of fuel, lubricant or other potentially hazardous substance. The response plan will include requirements for staff training, equipment requirements (e.g. spill kits), response plans for likely incident scenarios and methods for logging incidents as well as non-compliance with procedures which could result in pollution events.
	PL12: Surface water and ecological receptors affected by discharge of intercepted contaminated groundwater during active or passive dewatering	This scenario is not considered in this assessment, separate hydrogeological assessments have been undertaken.	This scenario is not considered in this assessment, separate hydrogeological assessments have been undertaken.
	PL13: Property affected by direct contact with sub-surface materials including made ground.	**Moderate / Low Risk** Chemical attack / aggressive ground conditions resulting in damage and degradation to sub surface structures via direct contact.	Prior to construction, a detailed assessment will be undertaken to determine the most appropriate building material is used for construction with respect to the existing ground conditions and the potential for chemical attack via direct contact with contaminants in soil and groundwater.
	PL14: Property affected by migration of ground gases into property	**Negligible Risk**	Implementation of a watching brief during construction works and any additional GI to identify the presence of previously unidentified ground gas sources. Such

Primary Potential Sources	Pollutant Linkage	Consequence	Recommended Mitigation Measures
	through preferential pathways posing a potential explosion risk from ignition of explosive gases.	No specific methane source identified, and all measured methane concentrations below LEL based on the available data.	instances should be recorded, the associated risks assessed, and mitigation implemented such as application of safe systems of work and / or development of a remedial strategy as appropriate.
Operation			
Contaminants within Soils & Groundwater	PL15: Maintenance workers affected by dermal contact, ingestion and inhalation of soil, dust, fibres (asbestos) and waters	**Moderate / Low Risk** Contaminants identified above residential and commercial GAC, asbestos identified, contact with sub-surface soils and groundwater and mobilised dust / fibres could happen during routine operations.	Implementation of safe systems of work including the use of PPE as a last resort for maintenance workers. Recording of site conditions during construction works including identification of areas where residual contamination may be present.
	PL16: Maintenance workers affected by migration of ground gases and vapours to enclosed spaces.	**Moderate / Low Risk** WELs in several locations, methane also detected. Underground station and tunnel spaces will be fully sealed to prevent water ingress and ventilated, however some potential remains for build-up in service ducts or runs outside the main station areas.	Risks to maintenance workers can be mitigated via risk assessment and the implementation of safe systems of work including use of PPE (and RPE) as a last resort.
	PL17: End users, adjacent residents and workers affected by dermal contact, ingestion and inhalation of wind-blown soil, dust and fibres (asbestos) from retained surface soils.	**Low Risk** Contaminants identified above residential and commercial GAC, asbestos identified, made ground will be and removed from site which will reduce potential exposure, some residual made ground will be present, mainly covered by hard standing or soft landscaping, small residual risk of exposure during operation.	Implementation of a watching brief during construction works and any additional GI to identify the presence of previously unidentified contamination. Personnel should be appropriately trained if involved in GI and earthworks activities. Such instances of previously unidentified contamination should be recorded, the associated risks assessed, and mitigation implemented such as application of safe systems of work and / or development of a remedial strategy as appropriate. Assessment of areas of soft landscaping to be retained within the proposed Project to ensure risks are acceptable.
	PL18: End users, adjacent residents and workers affected by migration of ground gases into homes or workplaces via preferential pathways created during construction	**Negligible Risk** Ground gas classified as low risk potential source with respect to buildings with no specific mitigation measures required.	Implementation of a watching brief during construction works and any additional GI to identify the presence of previously unidentified ground gas sources. Such instances should be recorded, the associated risks assessed, and mitigation implemented such as application of safe systems of work and / or development of a remedial strategy as appropriate.

Primary Potential Sources	Pollutant Linkage	Consequence	Recommended Mitigation Measures
	PL19: Groundwater affected by leaching and migration of contaminants	**Negligible Risk** Metallic, inorganic and organic contaminants present in the soil and groundwater in some parts of the proposed Project. Construction will remove made ground in some areas (potential source) reducing contaminant inputs, operation unlikely to result in further mobilisation of contaminants.	No specific mitigation measures recommended.
	PL20: Groundwater affected by surface run-off / leaching from placed excavated material.	**Moderate / Low Risk** Metallic, inorganic and organic contaminants present in the soil and groundwater in some parts of the proposed Project. Potential for new migration pathways to be introduced if material is reused within the scheme near vulnerable receptors.	Prior to reuse and placement of any excavated material within the proposed Project locations specific risk assessment will be required to demonstrate that it will take into account the provisions of the Waste Management Act (as amended) and relevant guidance such as The Management of Waste from National Road Construction Projects (TII 2017) and that it is suitable for reuse (i.e. does not pose a risk to human health or the environment).
	PL21: Groundwater affected by migration of contaminated shallow groundwater through drainage channels and associated granular belling materials.	**Moderate / Low Risk** Metallic, inorganic and organic contaminants present in the soil and groundwater in some parts of the proposed Project. New pathways may be introduced via construction of drainage runs and channels for scheme operation.	Design of drainage runs will require to account for the presence of contaminants within soil and groundwater and incorporate measures to prevent creation of new preferential pathways.
	PL22: Groundwater affected by discharge of intercepted contaminated groundwater.	This scenario is not considered in this assessment, separate hydrogeological assessments have been undertaken.	This scenario is not considered in this assessment, separate hydrogeological assessments have been undertaken.
	PL23: Groundwater affected by leaks / spills from trains and other operational plant.	**Negligible Risk** Trains will be electrically powered but still required lubricants and maintenance, and other plant will require fuelling and maintenance. The proposed Project design includes track and depot drainage management systems and safe storage provision to reduce this risk.	No specific additional mitigation measures recommended.

Primary Potential Sources	Pollutant Linkage	Consequence	Recommended Mitigation Measures
	PL24: Surface water and ecological receptors affected by leaching and migration of contaminants.	**Negligible Risk** Metallic, inorganic and organic contaminants present in the soil and groundwater in some parts of the proposed Project. Construction will remove made ground in some areas (potential source) reducing contaminant inputs, operation unlikely to result in further mobilisation of contaminants.	No specific mitigation measures recommended.
	PL25: Surface water and ecological receptors affected by surface water run-off from placed excavated material.	**Moderate / Low Risk** Metallic, inorganic and organic contaminants present in the soil and groundwater in some parts of the proposed Project. Potential for new migration pathways to be introduced if material is reused within the scheme near vulnerable receptors.	Prior to reuse and placement of any excavated material within the proposed Project locations specific risk assessment will be required to demonstrate that it will take into account the provisions of the Waste Management Act (as amended) and relevant guidance such as The Management of Waste from National Road Construction Projects (TII 2017) and that it is suitable for reuse (i.e. does not pose a risk to human health or the environment).
	PL26: Surface water and ecological receptors affected by migration of contaminated shallow groundwater through drainage channels and associated granular belling materials.	**Moderate / Low Risk** Metallic, inorganic and organic contaminants present in the soil and groundwater in some parts of the proposed Project. New pathways may be introduced via construction of drainage runs and channels for scheme operation.	Design of drainage runs will require to account for the presence of contaminants within soil and groundwater and incorporate measures to prevent creation of new preferential pathways.
	PL27: Surface water and ecological receptors affected by discharge of intercepted contaminated groundwater.	This scenario is not considered in this assessment, separate hydrogeological assessments have been undertaken.	This scenario is not considered in this assessment, separate hydrogeological assessments have been undertaken.
	PL23: Surface water and ecological receptors affected by leaks / spills from trains and other operational plant.	**Negligible Risk** Trains will be electrically powered but still required lubricants and maintenance, and other plant will require fuelling and maintenance. The proposed Project design includes track and depot drainage management systems and safe storage provision to reduce this risk.	No specific additional mitigation measures recommended.

Primary Potential Sources	Pollutant Linkage	Consequence	Recommended Mitigation Measures
	PL29: Property affected by direct contact with sub-surface materials including made ground.	**Moderate / Low Risk** Chemical attack / aggressive ground conditions resulting in damage and degradation to sub surface structures via direct contact.	Prior to construction, a detailed assessment will be undertaken to determine the most appropriate building material is used for construction with respect to the existing ground conditions and the potential for chemical attack via direct contact with contaminants in soil and groundwater.
	PL30: Property affected by migration of ground gases into property through preferential pathways posing a potential explosion risk from ignition of explosive gases.	**Negligible Risk** No specific methane source identified, and all measured methane concentrations below LEL based on the available data.	Implementation of a watching brief during construction works and any additional GI to identify the presence of previously unidentified ground gas sources. Such instances should be recorded, and the associated risks and a remedial strategy developed to manage the identified risks as appropriate
Radon			
Naturally occurring radon	Construction workers being affected by build-up of radon in excavations and enclosed spaces up to potentially hazardous levels.	**Moderate / Low Risk** Excavation of new underground spaces and excavations will provide enclosed environment for radon build up during construction, potential carcinogenic risk.	To mitigate potential risks from radon migration into tunnels, excavations and other enclosed spaces during construction an occupational monitoring programme should be implemented to identify whether radon migration and build up is occurring. The monitoring will be undertaken in accordance with the EPA Protocol for the Measurement of Radon in Homes and Workplaces (EPA 2019b). If the workplace reference level of 300Bq/m^3 is exceeded (EPA 2019a) mitigation measures will be required during construction, such as the development of safe systems of work to ensure protection of construction personnel, potentially including measures such as use of respiratory equipment (RPE) and working time restrictions.
	End users and maintenance workers being affected by build-up of radon in enclosed spaces up to potentially hazardous levels.	**Negligible Risk** Post construction the sub-surface occupied areas will be sealed to prevent water ingress which will also reduce the risk of radon accumulation, in addition to which ventilation systems will aid air circulation which will again reduce the likelihood of radon accumulation in enclosed spaces.	No specific mitigation measures are proposed for radon in station and tunnel areas. Should access be required to unvented or un sealed enclosed spaces development of a location specific safe system of work will be required, including use of PPE and RPE as a last resort.

Appendix C. Preliminary CSM

Source	Receptor	Pathway	Pollutant Linkage
Construction			
Contaminants within soil and groundwater	Human health (construction workers)	Dermal contact, ingestion and inhalation of impacted soil, dust, fibres (asbestos) and waters	PL1
		Migration of ground gases and vapours to shallow pits or enclosed spaces	PL2
	Human health (adjacent residents / workers, transient foot traffic	Dermal contact, ingestion and inhalation of windblown soil, dust, fibres (asbestos) during construction	PL3
		Migration of ground gases into homes or workplaces via preferential pathways during construction	PL4
	Groundwater	Leaching and migration of contaminants through natural deposits and made ground	PL5
		Surface water run-off from stockpiled excavated material	PL6
		Leaks and spills from site plant and materials storage	PL7
		Discharge of intercepted contaminated groundwater during passive or active dewatering	PL8
	Surface water, ecological receptors	Migration / mobilisations of contaminated shallow groundwater through drift deposits / made ground	PL9
		Surface water run-off from stockpiled excavated material	PL10
		Leaks and spills from site plant and materials storage	PL11
		Discharge of intercepted contaminated groundwater during passive or active dewatering	PL12
	Property	Direct contact with sub-surface materials including made ground.	PL13
		Migration of ground gases into property through preferential pathways posing a potential explosion risk from ignition of explosive gases	PL14
Operation			
Contaminants within soil and groundwater	Human health (maintenance workers)	Dermal contact, ingestion and inhalation of soil, dust, fibres (asbestos) and waters during routine maintenance	PL15
		Migration of ground gases and vapours to enclosed spaces	PL16
	Human health (end users, adjacent residents, workers)	Dermal contact, ingestion and inhalation of windblown soil, dust, fibres (asbestos) from retained surface soils	PL17
		Migration and accumulation of ground gases into homes or workplaces via preferential pathways created during construction	PL18
	Groundwater	Leaching and migration of contaminants	PL19
		Surface water runoff from placed excavated material	PL20
		Migration of contaminated shallow groundwater through drainage channels and associated granular bedding materials	PL21

Source	Receptor	Pathway	Pollutant Linkage
		Discharge of intercepted contaminated groundwater	PL22
		Leaks / spills from trains and other operational plant	PL23
	Surface water, ecological receptors	Leaching and migration of contaminants	PL24
		Surface water runoff from placed excavated material	PL25
		Migration of contaminated shallow groundwater through drainage channels and associated granular bedding materials	PL26
		Discharge of intercepted contaminated groundwater	PL27
		Leaks / spills from trains and other operational plant	PL28
	Property	Direct contact with sub-surface materials including made ground.	PL29
		Migration of ground gases into property through preferential pathways posing a potential explosion risk from ignition of explosive gases	PL30

Appendix D. Review of Potential Contamination Sources

The preliminary CSM is presented in Appendix C and has been used as the basis for the contaminated land risk assessment. The methodology used to determine overall risk includes consideration of:

- The likelihood of the event (probability), which takes into account both the presence of the hazard and receptor and the integrity of the pathway; and
- The severity of the potential consequence, which takes into account both the potential severity of the hazard and the sensitivity of the receptor.

The classification of likelihood (based on Contaminated Land risk Assessment: A Guide to Good Practice (CIRIA 552) (CIRIA, 2001)) is detailed in Table D1 and the classification of severity is detailed in Table D2.

Table D1: Classification of Likelihood

Classification	Definition
High Likelihood	An event is very likely to occur in the short term, and is almost inevitable over the long term OR there is evidence at the receptor of harm or pollution
Likely	It is probable that an event will occur. It is not inevitable, but possible in the short term and likely over the long term
Low Likelihood	Circumstances are possible under which an event could occur. It is by no means certain that even over a longer period such an event would take place, and less likely in the short term
Unlikely	It is improbable that an event would occur even in the very long term

Table D2: Classification of Severity

Classification	Definition
Severe	• Acute risks to human health • Short-term risk of pollution of sensitive water resource (e.g. major spillage into the water environment) • Impact on surface water or groundwater e.g. large-scale pollution or very high levels of contamination • Catastrophic damage to buildings or property (e.g. explosion causing building collapse) • Ecological system effects – irreversible adverse changes to a protected location. Immediate risks.
Medium	• Chronic risks to human health • Pollution of sensitive water resources (e.g. leaching of contaminants into the water environment) • Ecological system effects – substantial adverse changes to a protected location. • Significant damage to buildings, structures and services (e.g. damage rendering a building unsafe to occupy, such as foundation damage)
Mild	• Non-permanent health effects to human health • Pollution of non-sensitive water resources • Damage to buildings, structures and services (e.g. damage rendering a building unsafe to occupy, such as foundation damage) • Substantial damage to non-sensitive environments (unprotected ecosystems e.g. crops)
Minor / Negligible	• Non-permanent health effects to human health (easily prevented by appropriate use of PPE) • Minor pollution to non-sensitive water resources • Minor damage to non-sensitive environments (unprotected ecosystems e.g. crops) • Easily repairable effects of damage to buildings, structures, services or the environment (e.g. discoloration of concrete, loss of plants in a landscaping scene).

To determine the overall risk to the identified receptor the likelihood and severity for the potential hazard are combined in accordance with the risk assessment matrix in Table D3. The definitions of the outcomes are summarised in Table D4.

Table D3: Risk Assessment Matrix

		Consequence			
		Severe	Medium	Mild	Minor/Negligible
Probability (Likelihood)	High Likelihood	Very high risk	High risk	Moderate risk	Moderate/Low risk
	Likely	High risk	Moderate risk	Moderate/Low risk	Low risk
	Low Likelihood	Moderate risk	Moderate/Low risk	Low risk	Negligible risk
	Unlikely	Moderate/Low risk	Low risk	Negligible risk	Negligible risk

Table D4: Definitions of Risk

Term	Description
Very high risk	Severe harm to a receptor may already be occurring OR a high likelihood that severe harm will arise to a receptor, unless immediate remedial action works / mitigation measures are undertaken.
High risk	Harm is likely to arise to a receptor, and is likely to be severe, unless appropriate remedial actions / mitigation measures are undertaken. Remedial works may be required in the short term, but likely to be required over the long term.
Moderate risk	Possible that harm could arise to a receptor but low likelihood that such harm would be severe. Harm is likely to be medium. Some remedial works may be required in the long term.
Moderate / low risk	Possible that harm could arise to a receptor, but where a combination of likelihood and consequence results in a risk that is above low, but is not of sufficient concern to be classified as medium. It can be driven by cases where there is an acute risk which carries a severe consequence, but where the exposure is unlikely.
Low risk	Possible that harm could arise to a receptor. Such harm would at worse normally be mild.
Negligible risk	Low likelihood that harm could arise to a receptor. Such harm unlikely to be any worse than mild.

Table D5: Review of Potential Contamination Sources

Source No.	Description	Easting	Northing	Section	Nearest Chainage	Distance from Centreline (m)	Distance / Direction from Works Boundary	Information and assessment Summary	Severity	Construction Likelihood	Construction Risk	Operation Likelihood	Operation Risk
C1	Historic Pump (1888-1937)	718653	748951	AZ1	1000	145	55m NW	Small area with low potential for contamination within a greenfield area. Not specifically targeted by GI within 5m of location footprint. At distance from Works Area, unlikely to be source of contaminants and unlikely to be disturbed by construction or operational activities.	Minor	Unlikely	Negligible	Unlikely	Negligible
C2	Historic Quarry (1837-1864)	718397	748848	AZ1	1000	225	90m W	Small area within a greenfield area, unknown fill type. Not specifically targeted by GI within 5m of location footprint. At distance from Works Area, fill could be potential source of contaminants however unlikely to be disturbed by construction or operational activities.	Mild	Unlikely	Negligible	Unlikely	Negligible
C3	Farm (present)	718849	748709	AZ1	1080	175	0m	Small to moderate area of farm buildings with low potential for contamination. Not specifically targeted by GI. Adjacent to Works Area, possibility for minor contamination however unlikely to be disturbed by construction or operational activities.	Minor	Low Likelihood	Negligible	Low Likelihood	Negligible
C4	Historic Pump (1888-1913)	718356	748664	AZ1	1140	275	130m W	Small area with low potential for contamination within a greenfield area. Not specifically targeted by GI within 5m of location footprint. At distance from Works Area, unlikely to be source of contaminants and unlikely to be disturbed by construction or operational activities.	Minor	Unlikely	Negligible	Unlikely	Negligible
C5	Tank, unspecified (2008-present)	718864	748658	AZ1	1140	210	0m	Small area with low potential for contamination associated with farm buildings (C3). Not specifically targeted by GI within 5m of location footprint. Small scale tank associated with farm of unknown type, possibility for minor contamination however unlikely to be disturbed by construction or operation activities.	Minor	Low Likelihood	Negligible	Low Likelihood	Negligible
C6	Historic Pump (1864-1913)	718295	748619	AZ1	1180	340	205m WSW	Small area with low potential for contamination within a greenfield area. Not specifically targeted by GI within 5m of location footprint. At distance from Works Area, unlikely to be source of contaminants and unlikely to be disturbed by construction or operational activities.	Minor	Unlikely	Negligible	Unlikely	Negligible
C7	Cold Storage and Distribution depot (present) Construction date unknown	718879	748187	AZ1	1540	110	10m S	Extensive area, current industrial activity however with fairly low potential for pollution (may have fuel storage and distribution facilities though). Not specifically targeted by GI within 5m of location footprint, however existing information suggests there is no widespread contamination within this area. Unlikely to be disturbed by construction or operational activities.	Mild	Unlikely	Negligible	Unlikely	Negligible
C8	Historic Pumping Station (1937)	718578	748207	AZ1	1600	60	0m	Small area with low potential for contamination, at edge of Works Area. Not specifically targeted by GI within 5 m of location footprint.	Minor	Low Likelihood	Negligible	Unlikely	Negligible
C9	Industrial estate (present) Construction date unknown	718408	748059	AZ1	1660	125	65m SW	Moderate area with low potential for contamination (commercial / office properties rather than heavy industrial). Not specifically targeted by GI within 5 m of source footprint. Nearest GI locations suggest contamination is not widespread in this area.	Minor	Unlikely	Negligible	Unlikely	Negligible
C10	Factory (2008-present)	718729	748012	AZ1	1760	55	35m SE	Moderate area occupied by current industrial activity (Bostik Industries Limited). Active site subject to pollution controls.	Mild	Unlikely	Negligible	Unlikely	Negligible

Source No.	Description	Easting	Northing	Section	Nearest Chainage	Distance from Centreline (m)	Distance / Direction from Works Boundary	Information and assessment Summary	Severity	Construction Likelihood	Construction Risk	Operation Likelihood	Operation Risk
								Not specifically targeted by GI, nearest GI locations suggest contamination not widespread in area.					
C11	Scrapyard (present) Construction date unknown	718830	747892	AZ1	1820	210	195m NE	Small to moderate area with some potential for pollution depending on environmental protection measures in place. Not specifically targeted by GI within 5 m of source footprint. Adjacent potential sources likely to provide greater risk.	Mild	Unlikely	Negligible	Unlikely	Negligible
C12	Multiple historic Gravel pits (1937)	718723	747810	AZ1	1940	160	30m N	Moderate area, unknown fill type, adjacent to Sewage works (C14). Not specifically targeted by GI within 5m of location footprint, former gravel pits closer to proposed Project likely to provide greater risk.	Mild	Unlikely	Negligible	Unlikely	Negligible
C13	Historic Gravel Pit (1837-1842)	718312	747907	AZ1	1960	160	60m WNW	Moderate sized area, now under Balheary Industrial Park and outside Works Area. Unknown fill type. Not specifically targeted by GI within 5m of location footprint.	Mild	Unlikely	Negligible	Unlikely	Negligible
C14	Sewage Works (1937-present)	718824	747751	AZ1	2000	190	0m	Extensive area, currently active, built on site of former gravel pits. Minor interaction with Works Area (Intersects end of access road which is part of Works Area). Actively managed site subject to pollution controls. Not specifically targeted by GI within 5m of location footprint, nearest GI locations suggest contamination not widespread in area.	Medium	Low likelihood	Moderate/Low	Unlikely	Low
C15	Historic Gravel Pit (1837-1842)	718556	747680	AZ1	2140	30	0m	Small area. 1 No. ground investigation location within footprint (NBH405) recorded made ground to 1.20mbgl comprising sandy gravelly clay with fragments of plastic, ceramics, pottery, brick, concrete and fabric. No obvious discolourations / odours noted. Intersects edge of Works Area and some disturbance may occur.	Mild	Low Likelihood	Low	Unlikely	Negligible
C16	Historic Gravel Pit (1888-1913)	718643	747657	AZ1	2180	65	0m	Moderate sized area, unknown fill type. Not specifically targeted by GI within 5m of location footprint. Nearest GI locations suggest contamination not widespread in area. Crossed by access road as part of Works Area.	Mild	Low Likelihood	Low	Unlikely	Negligible
C17	Industrial estate (present) Construction date unknown	718004	747429	AZ1	2220	410	205m WSW	Moderate to extensive area, commercial / office units rather than industrial use. Not specifically targeted by GI within 5m of location footprint. Nearest GI locations suggest contamination not widespread in area. At distance from Works Area, unlikely to interact with construction and operational activities.	Minor	Unlikely	Negligible	Unlikely	Negligible
C18	Fire Station (2008-present)	718219	747521	AZ1	2240	275	80m W	Small area, current potential source. Not a training facility with low contamination potential (possible source of fire fighting foam and materials containing PFAS). Not specifically targeted by GI within 5m of site footprint. Nearest GI locations suggest contamination not widespread in area	Mild	Unlikely	Negligible	Unlikely	Negligible
C19	Garage (present) Construction date unknown	718404	747549	AZ1	2240	90	10m S	Small area with low potential for contamination. Not specifically targeted by GI within 5m of location footprint. Nearest GI locations suggest contamination not widespread in area	Mild	Unlikely	Negligible	Unlikely	Negligible
C20	Electricity Stations (1930-1937)	718233	747472	AZ1	2280	275	90m SW	Small historic area with low potential for contamination. Not specifically targeted by GI within 5m of location footprint. Nearest GI locations suggest contamination not widespread in area	Minor	Unlikely	Negligible	Unlikely	Negligible
C21	Industrial unit (present) Construction date unknown	718353	747510	AZ1	2280	120	10m S	Small area, commercial / office use with low potential for contamination (rather than industrial). Not specifically targeted by GI within 5m of location footprint. Nearest GI locations suggest contamination not widespread in area.	Minor	Unlikely	Negligible	Unlikely	Negligible

Source No.	Description	Easting	Northing	Section	Nearest Chainage	Distance from Centreline (m)	Distance / Direction from Works Boundary	Information and assessment Summary	Severity	Construction Likelihood	Construction Risk	Operation Likelihood	Operation Risk
C22	Factory area with tanks (present) Construction date unknown	718055	747210	AZ1	2320	330	190m SW	Extensive area of industrial land use (SK Biotek Ireland). Active site subject to pollution controls. Not specifically targeted by GI within 5m of location footprint. Nearest GI locations suggest contamination not widespread in area. At distance from Works Area, unlikely to interact with construction and operational activities.	Mild	Unlikely	Negligible	Unlikely	Negligiblw
C23	Historic Pump (1906)	718338	747360	AZ1	2380	220	190m WSW	Small area with low potential for contamination. Not specifically targeted by GI within 5m of location footprint. At distance from Works Area, unlikely to be source of contaminants and unlikely to be disturbed by construction or operational activities.	Minor	Unlikely	Negligible	Unlikely	Negligible
C24	Historic Quarry (1837-1864)	718362	747277	AZ1	2440	240	180m WSW	Small area, unknown fill type. Not specifically targeted by GI within 5m of location footprint. At distance from Works Area, unlikely to be disturbed by or interact with construction or operational activities	Mild	Unlikely	Negligible	Unlikely	Negligible
C25	Multiple historic Gravel pits (1937)	718991	747573	AZ1	2560	330	195m ESE	Small area, unknown fill type. Not specifically targeted by GI within 5m of location footprint. At distance from Works Area, unlikely to be disturbed by or interact with construction or operational activities	Mild	Unlikely	Negligible	Unlikely	Negligible
C26	Historic Gravel Pit (1888-1937)	718952	747418	AZ1	2600	300	265m ENE	Small area, unknown fill type. Not specifically targeted by GI within 5m of location footprint. At distance from Works Area, unlikely to be disturbed by or interact with construction or operational activities	Minor	Unlikely	Negligible	Unlikely	Negligible
C27	Industrial estate / distribution depot (present) Construction date unknown	718904	747257	AZ1	2700	75	0m	Moderate area comprising commercial and transport units (rather than heavy industry) which are subject to environmental controls. Intersects edge of Works Area so interactions likely to be minimal. Not specifically targeted by GI within 5m of location footprint. Nearest GI locations suggest contamination not widespread in area.	Mild	Unlikely	Negligible	Unlikely	Negligible
C28	Tank (2008-2016)	718835	747161	AZ1	2740	120	25m E	Small area, current potential source, subject to environmental controls, unknown tank type with some potential for contamination however interactions with proposed Project not expected. Not specifically targeted by GI within 5m of location footprint. Nearest GI locations suggest contamination not widespread in area.	Mild	Unlikely	Negligible	Unlikely	Negligible
C29	Historic Tank and Pump (1906-1937)	718920	747153	AZ1	2760	190	25m N	Small area, low potential for contamination. Not specifically targeted by GI within 5m of location footprint. Nearest GI locations suggest contamination not widespread in area.	Minor	Unlikely	Negligible	Unlikely	Negligible
C30	Pump (1906-1937)	718422	747031	AZ1	2800	290	110m WSW	Small area, low potential for contamination. Not specifically targeted by GI within 5m of location footprint. At distance from Works Area, unlikely to be disturbed by or interact with construction or operational activities	Minor	Unlikely	Negligible	Unlikely	Negligible
C31	Various Tanks (2008-present)	718827	746971	AZ1	2880	60	0m	Tanks of unknown type associated with building (Hertz Europe), active and will be subject to environmental controls. Not specifically targeted by GI within 5m of location footprint. Nearest GI locations suggest contamination not widespread in area. At edge of Works Area however direct disturbance of these tanks as part of construction or operation considered unlikely.	Mild	Unlikely	Negligible	Unlikely	Negligible
C32	Industrial Estate (present) Construction date unknown	719143	746972	AZ1	3020	335	125m E	Moderate area, commercial / office use rather than industrial. Not specifically targeted by GI within 5m of location footprint. Nearest GI locations suggest contamination not widespread in area.	Mild	Unlikely	Negligible	Unlikely	Negligible

Source No.	Description	Easting	Northing	Section	Nearest Chainage	Distance from Centreline (m)	Distance / Direction from Works Boundary	Information and assessment Summary	Severity	Construction Likelihood	Construction Risk	Operation Likelihood	Operation Risk
								At distance from Works Area, unlikely to be disturbed by or interact with construction or operational activities.					
C33	Industrial estate (present) Construction date unknown, extended 2008	718947	746775	AZ1	3020	80	0m	Moderate area, commercial / office use rather than industrial. Not specifically targeted by GI within 5m of location footprint. Nearest GI locations suggest contamination not widespread in area. At edge of Works Area however presence of a viable pollutant linkage considered unlikely.	Mild	Unlikely	negligible	Unlikely	Negligible
C34	Tank (2008-present)	718551	746814	AZ1	3060	180	125m W	Small area, current potential source, unknown type of tank. Not specifically targeted by GI within 5m of location footprint. At distance from Works Area, unlikely to be disturbed by or interact with construction or operational activities	Mild	Unlikely	Negligible	Unlikely	Negligible
C35	Graveyard (1864/5-present)	718407	746768	AZ1	3140	200	110m WNW	Moderate area, current potential source, low potential for pollution. Not specifically targeted by GI within 5m of location footprint. At distance from Works Area, unlikely to be disturbed by or interact with construction or operational activities	Mild	Unlikely	Negligible	Unlikely	Negligible
C36	Various Tanks (2008-present)	718896	746711	AZ1	3140	120	40m SE	Moderate area, current industrial activity (associated with Siemens Healthcare Diagnostics), subject to environmental controls. Not specifically targeted by GI within 5m of location footprint. Nearest GI locations suggest contamination not widespread in area.	Mild	Unlikely	Negligible	Unlikely	Negligible
C37	Factory (2008-present)	718865	746637	AZ1	3200	75	20m SE	Moderate area current industrial activity (Siemens Healthcare Diagnostics), subject to environmental controls. Not specifically targeted by GI within 5m of location footprint. Nearest GI locations suggest contamination not widespread in area.	Mild	Unlikely	Negligible	Unlikely	Negligible
C38	Factory/Storage areas (2008-present)	719012	745808	AZ1	3680	390	115m SE	Extensive area, current industrial activity (MSD Biotech), subject to environmental controls. Not specifically targeted by GI within 5m of location footprint. Nearest GI locations suggest contamination not widespread in area. At distance from Works Area, unlikely to interact with construction and operational activities.	Mild	Unlikely	Negligible	Unlikely	Negligible
C39	Historic Pump (1888-1913)	718301	746458	AZ1	3780	305	90m NW	Small area, now Pavilions Shopping Centre. Low potential for pollution. Not specifically targeted by GI within 5m of location footprint. At distance from Works Area, unlikely to be source of contaminants and unlikely to be disturbed by construction or operational activities.	Minor	Unlikely	Negligible	Unlikely	Negligible
C40	Electricity Substations (2008-present)	718316	745998	AZ1	3980	25	10m S/W	Current industrial use associated with Airside Business Park. Low potential for pollution. Not specifically targeted by GI within 5m of location footprint. Nearest GI locations suggest contamination not widespread in area	Minor	Unlikely	Negligible	Unlikely	Negligible
C41	Gravel Pit 1837	717997	746113	AZ1	4200	145	100m NNW	Small area, unknown fill type. Not specifically targeted by GI within 5m of location footprint. At distance from Works Area, unlikely to be disturbed by or interact with construction or operational activities	Mild	Unlikely	Negligible	Unlikely	Negligible
C42	Gravel Pit 1837	717939	746111	AZ1	4260	175	125m NW	Small area, unknown fill type. Not specifically targeted by GI within 5m of location footprint. At distance from Works Area, unlikely to be disturbed by or interact with construction or operational activities	Mild	Unlikely	Negligible	Unlikely	Negligible
C43	Pump and Tank (1937)	718097	745793	AZ1	4280	170	5m S	Small area with low potential for contamination. Not specifically targeted by GI within 5m of location footprint.	Minor	Unlikely	Negligible	Unlikely	Negligible

Source No.	Description	Easting	Northing	Section	Nearest Chainage	Distance from Centreline (m)	Distance / Direction from Works Boundary	Information and assessment Summary	Severity	Construction Likelihood	Construction Risk	Operation Likelihood	Operation Risk
								Unlikely to be source of contaminants and unlikely to be disturbed by construction or operational activities.					
C44	Pump (1937-1975)	717702	745337	AZ1	5000	5	0m	Small area, low potential for pollution. Adjacent ground investigation information (TP203) recorded made ground to 1.70mbgl comprising sandy gravel or sandy gravelly clay with fragments of wood, brick, plastic and road cones. No obvious evidence of discolouration, unusual odours or sheens.	Minor	Low Likelihood	Negligible	Unlikely	Negligible
C45	Texaco Petrol Station (present) Construction date unknown, extended 2008	717641	745228	AZ1	5160	15	5m W	Small area, current potential source with possibility of fuel leaks / spills. 1 No. ground investigation location within site footprint (TP204). Made ground recorded up to 0.80mbgl comprising gravelly sand with concrete and plastic. No obvious evidence of discolouration, unusual odours or sheens.	Medium	Low likelihood	Moderate/Low	Unlikely	Low
C46	Car Dismantler Yard (present) Construction date unknown	717679	745069	AZ1	5220	0	0m	Moderate area, current potential source (Boland Car Dismantler) with possibility of fuel and lubricant leaks / spills. Not specifically targeted by GI within 5m of location footprint (no access available) although nearby locations suggest contamination is not widespread in the surrounding area.	Medium	Likely	Moderate	Unlikely	Low
C47	Tank (covered) (1937)	717394	744990	AZ1	5440	185	50m WNW	Small area with low potential for contamination. Not specifically targeted by GI within 5m of location footprint. At distance from Works Area, unlikely to be source of contaminants and unlikely to be disturbed by construction or operational activities.	Minor	Unlikely	Negligible	Unlikely	Negligible
C48	Concrete supplier (present) Construction date unknown	717336	744995	AZ1	5480	175	40m WNW	Moderate area, concrete products supplier (McComish Ltd). Not specifically targeted by GI within 5m of location footprint. Nearby locations suggest contamination is not widespread in the surrounding area. Interactions with construction and operation activities likely to be minimal.	Mild	Unlikely	Negligible	Unlikely	Negligible
C49	Farm (1837-present)	717956	744808	AZ1	5480	290	160m SE	Small to moderate area of farm buildings with low potential for contamination. Not specifically targeted by GI. At distance from Works Area possibility for minor contamination however unlikely to be disturbed by construction or operational activities.	Minor	Unlikely	Negligible	Unlikely	Negligible
C50	Pump (1888-1975)	717840	744778	AZ1	5500	295	180m SE	Small area with low potential for contamination. Not specifically targeted by GI within 5m of location footprint. Unlikely to be source of contaminants and unlikely to be disturbed by construction or operational activities.	Minor	Unlikely	Negligible	Unlikely	Negligible
C51	Tank (1937)	717389	744697	AZ1	5720	95	60m NW	Small area with low potential for contamination. Not specifically targeted by GI within 5m of location footprint. Unlikely to be source of contaminants and unlikely to be disturbed by construction or operational activities.	Negligible	Unlikely	Negligible	Unlikely	Negligible
C52	Vehicle storage area / earthworks (2002-2013)	717400	744338	AZ2	6040	0	Within	Small area, potential for pollution however not clear if breaking activities are undertaken. 3 No. ground investigation locations within footprint (TP212, ATP25 and ABH09) recorded made ground up to 0.4m thick (sandy gravelly clay with stone fragments) or obvious evidence of discolouration, unusual odours or oil sheens. Within Works Area at the north portal, disturbance of ground in area likely.	Mild	Likely	Moderate/Low	Unlikely	Negligible
C53	Earthworks / Storage units (2008-present)	717316	744026	AZ2	6200	0	30m SW	Moderate to extensive area, potential fuelling/storage area with potential for pollution. 2 No ground investigation location within site footprint (RC302, ABH10). Made ground recorded in RC302 only	Mild	Unlikely	negligible	Unlikely	Negligible

Source No.	Description	Easting	Northing	Section	Nearest Chainage	Distance from Centreline (m)	Distance / Direction from Works Boundary	Information and assessment Summary	Severity	Construction Likelihood	Construction Risk	Operation Likelihood	Operation Risk
								up to 1.2mbgl comprising sandy gravel and sandy clay. No obvious evidence of discolouration, unusual odours or oil sheens. Not within works Area although above tunnel alignment, direct disturbance of site unlikely.					
C54	Airport hardstanding and storage areas (present) Construction date unknown	716620	743367	AZ2	6640	0	160m NE	Extensive area covered by hard standing used for aircraft movement and fuelling. Currently subject to environmental management and pollution prevention measures. 5 No ground investigation locations recorded within site footprint (RC309, RC311, BH60, ABH11, ABH15). Made ground up to 3.65mbgl comprising sandy gravel, asphalt and sandy clay with brick, wood and plastic fragments recorded in the vicinity of the tunnel alignment. Made ground up to 5.80mbgl comprising sandy clay with plastic recorded approximately 600m from the proposed Project centreline. No obvious evidence of discolouration, unusual odours or oil sheens. Direct disturbance associated with this source is unlikely although it is noted that historic activities have the potential to have resulted in pollution.	Mild	Unlikely	Negligible	Unlikely	Negligible
C55	Various tanks and Electricity Substations (2008-present)	717266	743641	AZ2	6760	145	200m ENE	Small area, current potential source, tanks of unknown type. Not specifically targeted by GI within 5m of location footprint. Unlikely to be disturbed by construction or operational activities.	Mild	Unlikely	Negligible	Unlikely	Negligible
C56	Pump (1864-present)	717097	743678	AZ2	6780	35	140m NE	Small area, low potential for pollution. Not specifically targeted by GI within 5m of location footprint. Unlikely to be disturbed by construction or operational activities.	Minor	Unlikely	Negligible	Unlikely	Negligible
C57	Airport buildings and infrastructure (present) Construction date unknown	717024	743668	AZ2	6780	0	60m NE	Extensive current area with of airport passenger and administration buildings, pollution potential considered to be limited. 2 No ground investigation locations recorded within footprint of buildings (BH303, RC303A). Made ground recorded up to 0.50mbgl comprising sandy gravelly clay. No obvious evidence of discolouration, unusual odours or oil sheens. Buildings do not overlap with Works Area however overlie tunnel alignment.	Mild	Unlikely	Negligible	Unlikely	Negligible
C58	Circle K Petrol Station (present) Construction date unknown	717328	743532	AZ2	6800	295	295m E	Small area, current potential source with possibility of fuel leaks / spills. Not specifically targeted by GI within 5m of location footprint. Unlikely to be disturbed by construction or operational activities given distance form proposed Project.	Medium	Unlikely	Low	Unlikely	Low
C59	Historic Quarry (1837-1937)	716952	743455	AZ2	6980	0	0m	Moderate area. 14 No. ground investigation locations within 5m of site footprint. Made ground comprising gravel or gravelly sandy clay recorded to depths of 0.40 to 2.7 mbgl. Anthropogenic material includes concrete, rebar and/or brick and possible domestic waste in one location. Exceedances of residential and commercial GAC for PAHs and chromium. Metallic, inorganic and organic (PAH, TPH) contaminants identified in groundwater. Excavation / disturbance of ground will be required as part of construction of Dublin Airport station.	Medium	Likely	Moderate	Unlikely	Low
C60	Historic Collinstown Aerodrome with hangars, pumps and tanks (1937)	716737	743469	AZ2	7260	0	45m NE	Moderate area with potential for historic contamination such as hydrocarbon from fuelling operations. Not specifically targeted by GI within 5m of location footprint.	Medium	Low likelihood	Moderate/Low	Unlikely	Low

Source No.	Description	Easting	Northing	Section	Nearest Chainage	Distance from Centreline (m)	Distance / Direction from Works Boundary	Information and assessment Summary	Severity	Construction Likelihood	Construction Risk	Operation Likelihood	Operation Risk
								Metallic, inorganic and organic (PAH, TPH) contaminants identified in groundwater nearby.					
C61	Airport buildings and infrastructure (present) Construction date unknown	717045	743084	AZ2	7280	0	125m SW	Extensive current area with of airport passenger and administration buildings, pollution potential considered to be limited. 1 No ground investigation location recorded within site footprint. Made ground recorded to 1.10mbgl comprising reinforced concrete and sandy gravel. No obvious evidence of discolouration, unusual odours or oil sheens. Buildings do not overlap with Works Area however overlie tunnel alignment.	Mild	Unlikely	Negligible	Unlikely	Negligible
C62	Pumps (x2) (1864-1937)	716745	743056	AZ2	7460	0	315m NNE	Small area, low, historical potential for pollution. Not specifically targeted by GI within 5m of location footprint. Unlikely to be disturbed by construction or operational activities given distance from Works Area.	Minor	Unlikely	Negligible	Unlikely	Negligible
C63	Pump (1937)	716557	742796	AZ2	7780	35	515m NE	Small area, low, historical potential for pollution. Not specifically targeted by GI within 5m of location footprint. Unlikely to be disturbed by construction or operational activities given distance form Works Area.	Minor	Unlikely	Negligible	Unlikely	Negligible
C64	Pump (1906-1937)	716067	742079	AZ3	8720	50	0m	Small area, low, historical potential for pollution. 1 No. ground investigation location within 5m of the site footprint (MN/104/TP/006) recorded made ground to 1.40mbgl comprising clay and sand with rubble, concrete, bricks, plastic and steel (may not be associated with this historical source). No obvious evidence of discolouration, unusual odours or oil sheens.	Minor	Low likelihood	Negligible	Unlikely	Negligible
C65	Tanks (2008-present)	716045	741798	AZ3	8940	110	85m SE	Moderate area, current potential source, unknown tank type (likely water treatment / waste water treatment works). Not specifically targeted by GI within 5m of location footprint. Unlikely to be disturbed by construction or operational activities given distance from Works Area.	Mild	Unlikely	Negligible	Unlikely	Negligible
C66	Pump (1937)	715475	741734	AZ3	9340	145	0m	Small area, low potential for pollution. Not specifically targeted by GI within 5m of location footprint. Within Works Area so disturbance is possible during construction however minor historical source.	Minor	Low likelihood	Negligible	Unlikely	Negligible
C67	Cooking oil wholesaler including storage tanks (present) Construction date unknown	715757	741586	AZ3	9380	50	0m	Moderate area, current industrial activity, subject to environmental controls. Not specifically targeted by GI within 5m of location footprint. Nearby GI suggests contamination is not widespread in area. At boundary of Works Area direct disturbance of this potential source is unlikely, however immediate area may be affected.	Mild	Low likelihood	Low	Unlikely	Negligible
C68	Commercial unit / area of potential tipping and storage (2002-present)	715172	741436	AZ3	9500	270	35m W	Moderate area, current commercial activity. Not specifically targeted by GI within 5m of location footprint. Possible material storage and tipping with unknown environmental controls. Unlikely to be disturbed by construction or operational activities given distance from Works Area.	Mild	Low likelihood	Negligible	Unlikely	Negligible
C69	Vehicle test centre / earthworks (present) Construction date unknown, earthworks /	715702	741440	AZ3	9640	15	0m	Moderate area, current commercial activity including vehicle testing, storage and maintenance. Not specifically targeted by GI within 5m of location footprint. Nearby GI suggests contamination is not widespread in area.	Mild	Low likelihood	Low	Unlikely	Negligible

Source No.	Description	Easting	Northing	Section	Nearest Chainage	Distance from Centreline (m)	Distance / Direction from Works Boundary	Information and assessment Summary	Severity	Construction Likelihood	Construction Risk	Operation Likelihood	Operation Risk
	potential tipping from 2003							At boundary of Works Area direct disturbance of this potential source is unlikely, however immediate area may be affected.					
C70	Distribution depot / vehicle storage area (2002-present)	715950	741181	AZ3	9860	135	100m E	Moderate area, current industrial activity, subject to environmental controls (may have fuel storage and distribution facities). Not specifically targeted by GI within 5m of location footprint. Unlikely to be disturbed by construction or operational activities given distance from Works Area.	Mild	Unlikely	Negligible	Unlikely	Negligible
C71	Pumps (1837-1937)	715465	741061	AZ3	9980	60	20m NW	Small area, low, historical potential for pollution. Not specifically targeted by GI within 5m of location footprint. Unlikely to be disturbed by construction or operational activities given distance from Works Area.	Minor	Unlikely	Negligible	Unlikely	Negligible
C72	Circle K Petrol Station (present) Construction date unknown	715397	740627	AZ3	10400	65	0m	Small area, current potential source with possibility of fuel leaks / spills. Not specifically targeted by GI within 5m of location footprint. Adjacent to Works Area boundary so direct disturbance unlikely, however any leaks / spills to the subsurface may affect construction.	Medium	Low likelihood	Moderate/Low	Unlikely	Low
C73	Electricity substation (2008-present)	714895	740919	AZ3	10420	450	165m W	Small area, low pollution potential. Not specifically targeted by GI within 5m of location footprint. At distance from Works Area, unlikely to be disturbed by construction or operational activities.	Minor	Unlikely	Negligible	Unlikely	Negligible
C74	Tanks (Current) (2008-present)	714983	740820	AZ3	10440	360	90m W	Small area, current potential source associated with commercial estate. Not specifically targeted by GI within 5m of location footprint. At distance from Works Area, unlikely to be disturbed by construction or operational activities.	Mild	Unlikely	Negligible	Unlikely	Negligible
C75	Industrial estate (present) Construction date unknown	714953	740691	AZ3	10580	185	0m W	Moderate area, current commercial / office buildings rather than industrial activity so low pollution potential. Not specifically targeted by GI within 5m of location footprint. Next to Works Area boundary however unlikely to be disturbed by construction and operation activities.	Mild	Unlikely	Negligible	Unlikely	Negligible
C76	Derelict building/area of earthworks (present) Construction date unknown	715200	740456	AZ3	10620	0	Within	Small area, low potential for pollution. Not specifically targeted by GI within 5m of location footprint. Composition of any made ground unknown. Adjacent to works Area however unlikely to be directly disturbed by construction and operation activities although immediate area may be affected.	Minor	Low likelihood	Negligible	Unlikely	Negligible
C77	Pump (1906-1937)	715443	740440	AZ3	10680	175	20m NE	Small area, low, historical potential for pollution. Not specifically targeted by GI within 5m of location footprint. Unlikely to be disturbed by construction or operational activities given distance from Works Area.	Minor	Unlikely	Negligible	Unlikely	Negligible
C78	Ballymun Shopping centre (derelict) and potential tanks. Constructed 1960s	715331	739861	AZ4 - Ballymun	11280	0	0m	Moderate area, derelict shopping centre. Adjacent GI locations recorded made ground to 4.1mbgl comprising sandy gravel or sandy gravelly clay over concrete. No obvious evidence of discolouration, unusual odours or oil sheens. Hydrocarbons / VOCs identified in soil and groundwater which could potentially present a risk, exact source not identified. Contamination potential not considered to be high however area will be directly disturbed during construction.	Mild	Likely	Moderate/Low	Unlikely	Negligible
C79	Historic Tank (elevated) (1937-1975)	715449	739802	AZ4 - Ballymun	11320	35	0m	Part of the now derelict Ballymun shopping centre, historic tanks of unknown types. Small area, some potential of residual pollution. Tanks not specifically targeted by GI within 5m of location	Mild	Likely	Moderate/Low	Unlikely	Negligible

Source No.	Description	Easting	Northing	Section	Nearest Chainage	Distance from Centreline (m)	Distance / Direction from Works Boundary	Information and assessment Summary	Severity	Construction Likelihood	Construction Risk	Operation Likelihood	Operation Risk
								footprint. Area of shopping centre will be directly disturbed during construction.					
C80	Pumps (x2) (1864-1975)	715503	739476	AZ4	11640	90	255m S	Small area associated with buildings to east of Trinity Comprehensive School. Low potential for pollution. Not specifically targeted by GI within 5m of location footprint. Unlikely to be disturbed by construction or operational activities given distance from Works Area.	Minor	Unlikely	Negligible	Unlikely	Negligible
C81	Historic Pump (1888-1937)	715420	739435	AZ4	11680	5	290m S	Small area, low potential for pollution. Not specifically targeted by GI within 5m of location footprint. Unlikely to be disturbed by construction or operational activities given distance from Works Area.	Minor	Unlikely	Negligible	Unlikely	Negligible
C82	Electricity Substations and tank (2008-present)	715391	739403	AZ4	11720	15	280m N	Small area, low pollution potential. Not specifically targeted by GI within 5m of location footprint. At distance from Works Area, unlikely to be disturbed by construction or operational activities.	Minor	Unlikely	Negligible	Unlikely	Negligible
C83	Pump (1864-1906)	715510	739100	AZ4 - Collins Avenue	12020	100	0m	Small area, low potential for pollution. Not specifically targeted by GI within 5m of location footprint. Within Works Area so disturbance is possible during construction however minor historical source.	Minor	Low Likelihood	Negligible	Unlikely	Negligible
C84	Electricity Substations (2008-present)	715472	739088	AZ4 - Collins Avenue	12020	40	0m	Small area, low potential for pollution. 1 No. ground investigation location within 5m of site footprint (TP601) recorded made ground to 0.80mbgl comprising sandy gravel. No obvious evidence of discolouration, unusual odours or oil sheens. At northern boundary of Works Area, disturbance may occur during construction.	Minor	Low likelihood	Negligible	Unlikely	Negligible
C85	Pumps (x2) (1864-1937)	715672	738345	AZ4	12720	260	200m E	Small area, low potential for pollution. Not specifically targeted by GI within 5m of location footprint. Unlikely to be disturbed by construction or operational activities given distance from Works Area.	Minor	Unlikely	Negligible	Unlikely	Negligible
C86	Circle K Petrol Station (present) Construction date unknown	715351	738249	AZ4	12900	25	35m W	Small area, current potential source with possibility of fuel leaks / spills. Not specifically targeted by GI within 5m of location footprint. 35 m from Works Area boundary so direct disturbance unlikely, however any leaks / spills to the subsurface may affect construction.	Medium	Low likelihood	Moderate/Low	Unlikely	Low
C87	Electricity Substations (2008-present)	715304	738190	AZ4	12940	75	105m SW	Small area, low pollution potential. Not specifically targeted by GI within 5m of location footprint. At distance from Works Area, unlikely to be disturbed by construction or operational activities.	Minor	Unlikely	Negligible	Unlikely	Negligible
C88	Oil-filled Cable Leak 29 (unidare – Whitehall 38kV) – 450l Linear Alkyl Benzene	715431	737889	AZ4	13220	0	340m S	Small area, known pollution event. Not specifically targeted by GI within 5m of location footprint. At distance from Works Area so direct disturbance unlikely however above the tunnel alignment.	Medium	Unlikely	Low	Unlikely	Low
C89	Historic Tank (1937)	715372	737864	AZ4	13240	50	390m S	Small area, low pollution potential. Not specifically targeted by GI within 5m of location footprint. At distance from Works Area, unlikely to be disturbed by construction or operational activities.	Minor	Unlikely	Negligible	Unlikely	Negligible
C90	Historic Tank (1937)	715386	737694	AZ4	13420	70	305m N	Small area, low pollution potential. Not specifically targeted by GI within 5m of location footprint. At distance from Works Area, unlikely to be disturbed by construction or operational activities.	Minor	Unlikely	Negligible	Unlikely	Negligible
C91	Graveyard (1864-present)	715257	737666	AZ4	13500	180	275m NW	Small area, low pollution potential. Not specifically targeted by GI within 5m of location footprint. At distance from Works Area, unlikely to be disturbed by construction or operational activities.	Minor	Unlikely	Negligible	Unlikely	Negligible

Source No.	Description	Easting	Northing	Section	Nearest Chainage	Distance from Centreline (m)	Distance / Direction from Works Boundary	Information and assessment Summary	Severity	Construction Likelihood	Construction Risk	Operation Likelihood	Operation Risk
C92	Bon Secours Hospital (1951-present)	715263	737603	AZ4 - Griffith Park	13540	125	180m NW	Moderate area, current potential source, low potential for pollution (potential for back-up generator on site with associated fueld storage). Not specifically targeted by GI within 5m of location footprint. At distance from Works Area, unlikely to be disturbed by construction or operational activities.	Minor	Unlikely	Negligible	Unlikely	Negligible
C93	Burial Ground 1888-1913	715125	737424	AZ4 - Griffith Park	13740	300	250m NW	Small area, low pollution potential. Not specifically targeted by GI within 5m of location footprint. At distance from Works Area, unlikely to be disturbed by construction or operational activities.	Minor	Unlikely	Negligible	Unlikely	Negligible
C94	Potentially infilled ground/burial ground	715440	737267	AZ4 - Griffith Park	13840	0	Within	Moderate area. 2 No. ground investigation locations within site footprint (NBH17). Made ground recorded up to 2.30mbgl comprising sandy gravelly silt with fragments of brick, glass and wood. No soil GAC exceedances. No obvious evidence of discolouration, unusual odours or oil sheens. Will be directly disturbed by construction of Griffith Park station.	Mild	Likely	Moderate/Low	Unlikely	Negligible
C95	Electricity Substations (2008-present)	715363	737189	AZ4 - Griffith Park	13940	45	5m W	Small area, low pollution potential. Not specifically targeted by GI within 5m of location footprint. Unlikely to be disturbed by construction or operational activities.	Minor	Unlikely	Negligible	Unlikely	Negligible
C96	Tobacco Factory/printworks (post 1888-present)	715241	736691	AZ4	14460	45	470m NNE	Moderate area, now derelict former tobacco factory. Some potential for residual contamination. Not specifically targeted by GI within 5m of location footprint, nearby GI locations suggests contamination not widespread in area. Unlikely to be directly disturbed by construction or operation given distance from Works Area.	Mild	Unlikely	Negligible	Unlikely	Negligible
C97A	Glasnevin Cemetery (1830- present)	714578	737158	AZ4	14540	140	350m SW	Large area, current potential source however low potential for pollution. Not specifically targeted by GI within 5m of location footprint. Unlikely to be directly disturbed by construction or operation given distance from Works Area.	Mild	Unlikely	Negligible	Unlikely	Negligible
C97B	Glasnevin Cemetery (Extension) (unknown – present)	714407	736716	AZ4	14680	450	0m	Large area, current potential source however low potential for pollution. Not specifically targeted by GI within 5m of location footprint. While adjacent to Works Area direct disturbance during construction and operation is considered unlikely.	Mild	Low likelihood	Negligible	Unlikely	Negligible
C98	Printing Works (1930s-2012)	715224	736614	AZ4	14540	65	550m NNE	Moderate area, site has been demolished/cleared. Some potential for residual pollution. 1 No. ground investigation location within footprint (RC18). Made ground recorded up to 1.40mbgl. No obvious evidence of discolouration, unusual odours or oil sheens. Unlikely to be directly disturbed by construction or operation given distance from Works Area.	Minor	Unlikely	Negligible	Unlikely	Negligible
C99A	Glasnevin Station (1888-present)	714858	736412	AZ4	14880	0	0m	Moderate area, current / historical station / railway land. 21 No. ground investigation locations within site footprint. Mage ground generally comprising ballast or sandy gravelly clay recorded up to 3.50mbgl. No obvious evidence of discolouration, unusual odours or oil sheens. Exceedances of residential soil GAC for metals, PAHs and TPH in area of station and track upgrades. Groundwater assessment criteria exceeded for metals and inorganics. The proposed construction works for the Glasnevin station box and track realignment will directly disturb this area.	Medium	Likely	Moderate	Unlikely	Low

Source No.	Description	Easting	Northing	Section	Nearest Chainage	Distance from Centreline (m)	Distance / Direction from Works Boundary	Information and assessment Summary	Severity	Construction Likelihood	Construction Risk	Operation Likelihood	Operation Risk
C99B	Glasnevin Railway (1888-present)	714365	736651	AZ4	14800	280	0m	Moderate area, current / historical potential source. 22 No. ground investigation locations within site footprint. Made ground generally comprising ballast or sandy gravelly clay recorded up to 2.40mbgl. No obvious evidence of discolouration, unusual odours or oil sheens. Exceedances of soil GAC for metals, PAHs and TPH in area of station and track upgrades. Groundwater assessment criteria exceeded for metals and inorganics. The proposed construction works for the track realignment will directly disturb this area.	Medium	Likely	Moderate	Unlikely	Low
C99C	Railway Yard (1888-unknown)	714160	736667	AZ4	14720	780	0m	Moderate area, historical potential source. Waterways Ireland indicate that yard was historically used to apply creosote to railway sleepers resulting in contamination of the area and leakage into the Grand Canal. 1 No. adjacent ground investigation location (BH46). Made ground recorded to 1.20mbgl comprising ash and clinker over sandy clay. No obvious evidence of discolouration, unusual odours or oil sheens. Further GI coverage need to fully evaluate this source. The proposed construction works for a bridge across the Grand Canal and access track will directly disturb this area.	Medium	Likely	Moderate	Unlikely	Low
C99D	Tank (1888-1914)	714013	736796	AZ4	14640	1015	50m W	Small area, historic potential source. Not specifically targeted by GI within 5m of location footprint. At distance from Works Area, unlikely to be disturbed by construction or operational activities.	Mild	Unlikely	Negligible	Unlikely	Negligible
C100	Glasnevin Station / Railway (1888-present)	715251	736350	AZ4	14900	40	0m	Moderate area, current / historical potential source. 2 No. ground investigation locations within site footprint (GBH27, GBH28). Made ground comprising ballast recorded up to 0.80mbgl. No obvious evidence of discolouration, unusual odours or oil sheens. Exceedances of soil GAC for metals, PAHs and TPH in area of station and track upgrades. Groundwater assessment criteria exceeded for metals and inorganics. The proposed construction works for the track realignment will directly disturb this area.	Medium	Likely	Moderate	Unlikely	Low
C101	Railway (1888-present)	715228	736241	AZ4	14940	50	0m	Moderate area, current / historical potential source. 2 No. ground investigation locations within site footprint (GBH20, GBH21). Made ground comprising ballast recorded up to 1.10mbgl. No obvious evidence of discolouration, unusual odours or oil sheens. Exceedances of soil GAC for metals, PAHs and TPH in area of station and track upgrades. Groundwater assessment criteria exceeded for metals and inorganics. The proposed construction works for the track realignment will directly disturb this area.	Medium	Likely	Moderate	Unlikely	Low
C102	Flour Mill (1888-1913) and Disused Pin Mill (1888)	714858	736331	AZ4	14980	0	5m S	Former flour mill has now been converted into apartments. Considered to have a low residual potential for contamination since redevelopment. NBH20 adjacent to former mill on the southern back of the Royal Canal, made ground to 1.2mbgl recorded comprising slightly sandy slightly gravelly clay with fragments of brick and timber. No obvious evidence of discolouration, unusual odours or oil sheens. On the opposite side of the Grand Canal to the majority of works to be undertaken at Glasnevin Station.	Mild	Unlikely	Negligible	Unlikely	Negligible

Source No.	Description	Easting	Northing	Section	Nearest Chainage	Distance from Centreline (m)	Distance / Direction from Works Boundary	Information and assessment Summary	Severity	Construction Likelihood	Construction Risk	Operation Likelihood	Operation Risk
C103	Tramway Depot 1888-1913	714916	735935	AZ4	15280	95	260m NW	Small area, historical land use considered to have low potential for pollution. Not specifically targeted by GI within 5m of location footprint. Unlikely to be directly disturbed by construction or operation given distance from Works Area.	Minor	Unlikely	Negligible	Unlikely	Negligible
C104	Infilled canal (fill date unknown)	715063	735762	AZ4 - Mater	15380	0	75m NW	Large area, former canal with unknown fill materials. Not specifically targeted by GI within 5m of location footprint. Overlies tunnel section however at distance from Works Area, fill could be potential source of contaminants however unlikely to be disturbed by construction or operational activities.	Mild	Unlikely	Negligible	Unlikely	Negligible
C105	Mater Hospital (1864-present)	715378	735730	AZ4	15560	5	0m	Large area, current potential source. Potential for pollution from activities such as fuel / material storage and incinerators. 43 No. ground investigation locations within hospital site however majority at greater distance than 5m of site footprint. Made ground recorded to depths of 1 – 4.10mgbl, generally comprising clayey sandy gravel or gravelly clay with inclusions of brick, glass and/or pottery. Analysis of soil samples shows concentrations of heavy metals/PAHS in excess of GAC. Hospital site as adjacent to northern boundary of Works Area at Mater Station, and disturbance of made ground around the hospital / potential migration of contaminants is possible during construction.	Medium	Low likelihood	Moderate/low	Unlikely	Low
C106	Oil-filled Cable Leak 63 (Phibsborough – Granby Row) – 285l Linear Alkyl Benzene / Mineral Oil mix	715037	735635	AZ4 - Mater	15600	145	100m SW	Small area, known pollution event though exact location unclear. Not specifically targeted by GI within 5m of location footprint. At distance from Works Area so direct disturbance during construction or operation activities unlikely.	Medium	Unlikely	Low	Unlikely	Low
C107	Historic Pump (1864)	715435	735387	AZ4	16020	5	265m SE	Small area, low potential for pollution. Not specifically targeted by GI within 5m of location footprint. Unlikely to be disturbed by construction or operational activities given distance from Works Area.	Minor	Unlikely	Negligible	Unlikely	Negligible
C108	Rotunda Hospital (1906-present)	715626	735045	AZ4 - O'Connell Street	16380	0	15m NW	Moderate area, current potential source. Potential for pollution from activities such as fuel / material storage and incinerators. 7 No. ground investigation locations located within site or 5m of site footprint. Made ground recorded up to 4.0mbgl, generally comprising clayey sandy gravel or sandy gravelly clay with ash, brick, ceramic and/or concrete. No obvious evidence of discolouration, unusual odours or oil sheens. At distance from Works Area so direct disturbance during construction or operation activities unlikely.	Mild	Unlikely	Negligible	Unlikely	Negligible
C109	Print Works 1936	715791	735110	AZ4 - O'Connell Street	16400	105	150m NE	Small area, historical potential source. Not specifically targeted by GI within 5m of location footprint. C121A	Tile works (1938)			AZ4 - Tara	17420	50	20m E	Small area, historic source and area has since been redeveloped, likely to have a low contamination potential. Not specifically targeted by GI within 5 m of location. Outside Works Area boundary and unlikely to be directly affected by construction or operation.	Mild	Unlikely	Negligible	Unlikely	Negligible
C121B	Foundry (unknown)			AZ4 - Tara	17420	60	50m E	Anecdotal evidence suggests presence of an historical foundary to the east of Tara Station. Location not specifically targeted by GI. Area has since been redeveloped. Outside Works Area boundary and unlikely to be directly affected by construction or operation.	Mild	Unlikely	Negligible	Unlikely	Negligible
C122	Coal Yard 1888-1913	716547	734361	AZ4 - Tara	17560	230	210m ENE	Small area, historical potential source. Not specifically targeted by GI within 5m of location footprint. At distance from Works Area so direct disturbance during construction or operation activities unlikely.	Mild	Unlikely	Negligible	Unlikely	Negligible
C123	Church/graveyard 1888-present	716469	734145	AZ4 - Tara	17660	60	140m SE	Small area, low potential for pollution. Not specifically targeted by GI within 5m of location footprint. At distance from Works Area so direct disturbance during construction or operation activities unlikely.	Minor	Unlikely	Negligible	Unlikely	Negligible
C124	Electricity Substation (2008-present)	716489	733710	AZ4	18000	170	420m NE	Small area, low potential for pollution. Not specifically targeted by GI within 5m of location footprint. At distance from Works Area so direct disturbance during construction or operation activities unlikely.	Minor	Unlikely	Negligible	Unlikely	Negligible
C125	Grave Yard (1888-1913)	716014	733689	AZ4	18240	205	260m NW	Small area, low potential for pollution. Not specifically targeted by GI within 5m of location footprint. At distance from Works Area so direct disturbance during construction or operation activities unlikely.	Minor	Unlikely	Negligible	Unlikely	Negligible
C126	French Burial Ground (1888-present)	716222	733468	AZ4 - St Stephens Green	18320	40	50m NE	Small area, low potential for pollution. Not specifically targeted by GI within 5m of location footprint. At distance from Works Area so direct disturbance during construction or operation activities unlikely.	Minor	Unlikely	Negligible	Unlikely	Negligible
C127	Historic Tank (1937)	716220	733300	AZ4 - St Stephens Green	18480	115	60m S	Small area, historic source with low potential for pollution. Not specifically targeted by GI within 5m of location footprint. At distance from Works Area so direct disturbance during construction or operation activities unlikely.	Minor	Unlikely	Negligible	Unlikely	Negligible
C128	St Vincent's Hospital (1906-2008)	716145	733211	AZ4 - St Stephens Green	18580	35	5m SE	Moderate area, now redeveloped, could be some minor historic pollution potential from activities such as fuel / material storage and incinerators. Not specifically targeted by GI within 5m of location footprint. Near eastern edge of St Stephens Green station Works Area, direct disturbance of ground during construction considered unlikely.	Mild	Unlikely	Negligible	Unlikely	Negligible
C129	Engine Shed 1888-1913	715919	732666	AZ4 - Charlemont	19200	110	120m NW	Small area, historic potential for leaks / spills from engine maintenance activities. Not specifically targeted by GI within 5m of location footprint.	Mild	Unlikely	Negligible	Unlikely	Negligible

Source No.	Description	Easting	Northing	Section	Nearest Chainage	Distance from Centreline (m)	Distance / Direction from Works Boundary	Information and assessment Summary	Severity	Construction Likelihood	Construction Risk	Operation Likelihood	Operation Risk
								At distance from Works Area so direct disturbance during construction or operation activities unlikely.					
C130	Oil-filled Cable Leak 9 (Inchicore – Poolbeg Two 220kV) – 3989l Linear Alkyl Benzene	716082	732619	AZ4 - Charlemont	19240	5	20m NE	Small area, known pollution event though exact location unclear. Not specifically targeted by GI within 5m of location footprint. Close to northern boundary Works Area, albeit on opposite side of the Royal canal from Charlemont Station, so unlikely to be affected by direct disturbance, however, potential remains for hydrocarbon migration.	Medium	Low Likelihood	Moderate / Low	Unlikely	Low
C131	Railway (1888-present)	715962	732543	AZ4 - Charlemont	19460	0	Within	Moderate to large area, current/historic source. 11 No. ground investigation locations located within site or 5m of site footprint. Made ground recorded up to 7mbgl generally comprising gravelly and/or silty clay with ash, glass, pottery and brick. No obvious evidence of discolouration, unusual odours or oil sheens. Exceedances of soil GAC (mainly residential) for metals, PAHs and. Groundwater assessment criteria exceeded for metals and inorganics. Disturbance of ground likely during construction activities for Charlemont station.	Medium	Likely	Moderate	Unlikely	Low
C132	Orphanage 1888	716269	732364	AZ4 - Charlemont	19500	145	110m SE	Small area, low potential for pollution. Not specifically targeted by GI within 5m of location footprint. At distance from Works Area so direct disturbance during construction or operation activities unlikely.	Minor	Unlikely	Negligible	Unlikely	Negligible
N/A	Urban made ground	N/A	N/A	Whole alignment	N/A	N/A	N/A	Made ground and fill material that can't be linked to specific current or historical land use is present throughout much of the urbanised areas including Swords, suburban Dublin, and, particularly Dublin City Centre and the stations within AZ4. Screening of soil chemical analysis data from the available ground investigation data showed exceedances GAC (mainly residential, with a few commercial exceedances) for metals (largely chromium, lead, arsenic and mercury), PAHs and aromatic hydrocarbons. Groundwater assessment criteria exceeded for metallic, inorganic and organic contaminants. This is an overall classification and made ground is discussed in more detail on a location by location basis in the main body of the Report.	Medium	Likely	Moderate	Unlikely	Negligible

Key

XXX Exceedance of Controlled Waters GAC

Appendix I. Geological Models: Stations

The geological and soil geochemical screening information has been incorporated into models using Earth Volumetric Studio (EVS) 3D modelling software (C Tech Development Corporation, Earth Volumetric Studio Version 2020.12, licensed for use by Jacobs). The observed geology from GI locations has been interpolated by EVS using statistical kriging to determine the vertical extents of each stratigraphic layer. The result of the screening of soil geochemical data against residential GAC have been included within the models to allow 3D characterisation of the geochemical data within the sub-surface. The sections presented within this Appendix are a 2D representation of a 3D model.

Appendix K. Estimated Excavated Material Quantities and Material Compliance Data

Table K1: Estimated Excavated Material Quantities with encountered Made Ground

Section	Estimate of Excavated Material Quantities (m^3)					Made Ground Detail	
	Made Ground	Soil	Mixed	Rock	Total	Summary of Made Ground encountered	Maximum made ground depth
AZ1						**AZ1**	
Park & Ride		24,530	-	1,047	25,577		
Start of route to Seatown Station	6,420	102,370	-	2,941	111,731	Little / no made ground in Estuary station area (agricultural fields), south of Broad Meadow River some made ground present associated with R132 corridor. Generally described as firm sandy gravelly clay with fragments of brick, wood & plastic, often considered to be re-worked natural deposits or road sub-base.	2.5m (R132), 1.2m (Seatown Station)
Seatown Station to Malahide Roundabout	7,073	95,823	-	13,250	116,146	Made ground associated with R132 corridor Generally described as firm sandy gravelly clay with fragments of brick, wood & plastic, often considered to be re-worked natural deposits or road sub-base.	Generally up to 1.2m, locally deeper up to 4.6mbgl maximum
Malahide Roundabout to Pinnockhill Roundabout	6,678	114,947	-	3,821	125,446	Made ground absent in much of section, where encountered generally described as firm sandy gravelly clay with fragments of brick, wood & plastic, often considered to be re-worked natural deposits or road sub-base.	1.2m
Pinnockhill Roundabout to North Portal	6,872	154,718	-	4,055	165,645	Made ground mainly absent towards south in presence of agricultural fields between R132 & north portal. Some made ground associated with R132 (generally described as firm sandy gravelly clay with fragments of brick), thicker deposit adjacent to car breakers yard.	Generally up to 1.2m, up to 3.8m adjacent to car breakers yard
AZ2						**AZ2**	
Dublin Airport Station	6,530	-	1,500	67,730	75,760	Made ground identified directly overlying bedrock in area of former quarry, described as tarmac, concrete, sandy gravel or sandy gravelly clay with pieces of rebar & red brick. Possible domestic / putrescible waste in one location.	2.7m
Dublin Airport North Portal	845	10,217	-	139	11,492	Made ground identified in two exploratory holes, firm slightly sandy slightly silty gravelly clay.	0.4m
Dublin Airport South Portal	3,704	36,749	-	-	40,743	Made ground identified in two exploratory holes, described as sandy gravelly silt with fragments of red brick.	0.8m
AZ3						**AZ3**	
Central Section Surface Works	25,056	256,762	-	7,950	289,768	Made ground absent in some much of the greenfield areas around the depot, thicker deposits towards N extent, M50 embankments and Northwood Station area, generally described as silty sandy clay with brick fragments.	2.5m maximum, mostly <1.2m
Dardistown Depot	25,124	255,553	-	-	280,677	Little/ no made ground in the proposed Dardistown Depth (agricultural fields). Where observed, MG is generally described as sandy gravelly clay with inlusions of brick, plastics and metals.	Maximum 0.6m
Northwood Portal	1,170	11,427	-	10,800	23,397	As per Northwood Station (sandy gravelly clay).	2.5m
AZ4						**AZ4**	
Northwood Station	3,300	45,222	1,500	26,521	76,543	Made ground comprising silty sandy gravelly clay.	2.5m
Ballymun Station	4,077	44,295	1,500	27,157	77,029	Tarmac, concrete and sandy gravelly clay with inclusions of brick, concrete and occasionally plastic.	4.1m

Made Ground Detail	
Summary of Made Ground encountered	Maximum made ground depth
Sandy gravelly clay with cobbles & contrete, brick, tarmac, glass, plastic & ceramics. Slight hydrocarbon odours in one location <1.2mbgl.	2.1m
Sandy gravelly clay with cobbles & inclusions of brick, ceramic, glass, ash, wood, some bitumen tar.	2.3m
Tarmac, sandy gravelly clay with brick fragments. Ballast found in trackside areas up to 0.6m thick.	2.3m (station box), 3.5m (track areas)
Concrete / asphalt over clayey sandy gravel or gravelly clay with brick, glass & pottery fragments.	2.9m
Paving / concrete over sandy gravelly clay or silt with brick & concrete fragments. Bituminous odour at 1-3m in one location.	4.5m
Concrete / asphalt over sandy gravel & gravelly clay with brick & some ash. Animal bone recorded in one location.	3.8m
Sandy gravel including brick & concrete over sandy gravelly clay or clayey gravelly sand with inclusions of brick, concrete glass & wood.	3.8m
Clayey sandy gravel or sandy gravelly clay with inclusions of brick.	7m
Route Wide

WORKING DRAFT ARUP

Legend for Phase 5 ground investigation locations:

- Cut and cover section
- TOR — Rail Level (TOR
- By-Product — Assessed to be suitable for use as By-Product Soil and Stone
- Waste — Not suitable for use as a By-Product
- (PAH Se Mo) — The geo-chemical results indicate a low but acceptable level of polycyclic aromatic hydrocarbons (PAH), selenium (Se) or molybdenum (Mo)
- Estimated maximum extent of anticipated waste soil based on the Phase 5 GI results
- Estimated minimum extent of anticipated waste soil based on the Phase 5 GI results

Hole offset is +ve to the RIGHT of the baseline — HoleID (Offset)

Topsoil (TOP); Silt (DST); Made Ground (MG); Gravel (GR); Sand (Sa); Rock (RCk); Upper Brown Boulder Clay (UBrBC); Upper Black Boulder Clay (UBkBC)

Made Ground - Fill; Fill (Made Ground); Silty sandy gravelly CLAY; Sandy gravelly CLAY; Clayey sandy GRAVEL; Silty sandy cobbly Gravel; Silty sandy Gravel; TOPSOIL

Sandy gravelly cobbly CLAY; LIMESTONE; Silty sandy gravelly cobbly CLAY; NO RECOVERY; Sandy cobbly GRAVEL; Sandy GRAVEL; Cobbly GRAVEL; Gravelly SAND

Silty SAND; Clayey gravelly SAND; MUDSTONE; Silty gravelly cobbly SAND; Clayey SAND; Sandy CLAY; CLAY; Silty sandy CLAY

Legend for Jacobs Idom geological section:

Soil layers:
- Made ground (QX)
- Alluvial sand and gravels (QAG)
- Fluvio-Glacial sands within Glacial deposits
- Brown Boulder Clay (QBR)
- Black Boulder Clay (QBL)
- Sands & gravels at the bottom of the Glacial deposits
- Upper weathered rock level
- Phreatic level
- Interpreted Bedding
- Interpreted Faults

Rock layers:
- Argillaceous Bioclastic Limestone (CMUP) Upper member of Malahide Formation
- Biomicritic Limestone with thin shale interbedded (CMLO) Lower member of Malahide Formation
- Micritic Limestone (CWA) Waulsortian Formation
- Calcareous Shale (CTO) Tober Colleen Formation
- Argillaceous Limestone (CLU) Lucan Formation

Jacobs IDOM Reference: ML1-JAI-GEO-ROUT_XX-DR-Y00021 Sheet 7 of 29

Notes:
1. The geological interpretation presented on the figure has been taken from the drawings (ML1-JAI-GEO-ROUT_XX-DR-Y-00021 dated 3/4/20) prepared by Jacobs IDOM. Arup have not provided any interpretation.
2. The geological and geo-chemical information presented on the borehole logs is derived from the records of Phase 5 Ground Investigation undertaken by Causeway between December 2020 and May 2021.

Legend for Jacobs Idom geological section:

Soil layers:
- Made ground (QX)
- Alluvial sand and gravels (QAG)
- Fluvio-Glacial sands within Glacial deposits
- Brown Boulder Clay (QBR)
- Black Boulder Clay (QBL)
- Sands & gravels at the bottom of the Glacial deposits
- Upper weathered rock level
- Phreatic level
- Interpreted Bedding
- Interpreted Faults

Rock layers:
- Argillaceous Bioclastic Limestone (CMUP) Upper member of Malahide Formation
- Biomicritic Limestone with thin shale interbedded (CMLO) Lower member of Malahide Formation
- Micritic Limestone (CWA) Waulsortian Formation
- Calcareous Shale (CTO) Tober Colleen Formation
- Argillaceous Limestone (CLU) Lucan Formation

Jacobs IDOM Reference: ML1-JAI-GEO-ROUT_XX-DR-Y00021 Sheet 9 of 29

Notes:
1. The geological interpretation presented on the figure has been taken from the drawings (ML1-JAI-GEO-ROUT_XX-DR-Y-00021 dated 3/4/20) prepared by Jacobs IDOM. Arup have not provided any interpretation.
2. The geological and geo-chemical information presented on the borehole logs is derived from the records of Phase 5 Ground Investigation undertaken by Causeway between December 2020 and May 2021.

Notes:
1. The geological interpretation presented on the figure has been taken from the drawings (ML1-JAI-GEO-ROUT_XX-DR-Y-00021 dated 3/4/20) prepared by Jacobs IDOM. Arup have not provided any interpretation.
2. The geological and geo-chemical information presented on the borehole logs is derived from the records of Phase 5 Ground Investigation undertaken by Causeway between December 2020 and May 2021.

Appendix M. WM3 Assessment

Waste Classification Report

HazWasteOnline™ classifies waste as either **hazardous** or **non-hazardous** based on its chemical composition, related legislation and the rules and data defined in the current UK or EU technical guidance (Appendix C) (note that HP 9 Infectious is not assessed). It is the responsibility of the classifier named below to:

a) understand the origin of the waste
b) select the correct List of Waste code(s)
c) confirm that the list of determinands, results and sampling plan are fit for purpose
d) select and justify the chosen metal species (Appendix B)
e) correctly apply moisture correction and other available corrections
f) add the meta data for their user-defined substances (Appendix A)
g) check that the classification engine is suitable with respect to the national destination of the waste (Appendix C)

To aid the reviewer, the laboratory results, assumptions and justifications managed by the classifier are highlighted in pale yellow.

Key

	User supplied data
	Determinand values ignored for classification, see column 'Conc. Not Used' for reason
	Determinand defined or amended by HazWasteOnline (see Appendix A)
	Speciated Deteminand - Unless the Determinand is Note 1, the Conversion Factor is used to calculate the compound concentration
<LOD	Below limit of detection
ND	Not detected
CLP: Note 1	Only the metal concentration has been used for classification

Appendix A: Classifier defined and non CLP determinands

chromium(III) oxide (worst case) (EC Number: 215-160-9, CAS Number: 1308-38-9)

Description/Comments: Data from C&L Inventory Database
Data source: https://echa.europa.eu/information-on-chemicals/cl-inventory-database/-/discli/details/33806
Data source date: 17 Jul 2015
Hazard Statements: Acute Tox. 4 H332 , Acute Tox. 4 H302 , Eye Irrit. 2 H319 , STOT SE 3 H335 , Skin Irrit. 2 H315 , Resp. Sens. 1 H334 , Skin Sens. 1 H317 , Repr. 1B H360FD , Aquatic Acute 1 H400 , Aquatic Chronic 1 H410

ethylbenzene (EC Number: 202-849-4, CAS Number: 100-41-4)

CLP index number: 601-023-00-4
Description/Comments:
Data source: Commission Regulation (EU) No 605/2014 – 6th Adaptation to Technical Progress for Regulation (EC) No 1272/2008. (ATP6)
Additional Hazard Statement(s): Carc. 2 H351
Reason for additional Hazards Statement(s):
03 Jun 2015 - Carc. 2 H351 hazard statement sourced from: IARC Group 2B (77) 2000

pH (CAS Number: PH)

Description/Comments: Appendix C4
Data source: WM3 1st Edition 2015
Data source date: 25 May 2015
Hazard Statements: None.

acenaphthylene (EC Number: 205-917-1, CAS Number: 208-96-8)

Description/Comments: Data from C&L Inventory Database
Data source: http://echa.europa.eu/web/guest/information-on-chemicals/cl-inventory-database
Data source date: 17 Jul 2015
Hazard Statements: Acute Tox. 4 H302 , Acute Tox. 1 H330 , Acute Tox. 1 H310 , Eye Irrit. 2 H319 , STOT SE 3 H335 , Skin Irrit. 2 H315

acenaphthene (EC Number: 201-469-6, CAS Number: 83-32-9)

Description/Comments: Data from C&L Inventory Database
Data source: http://echa.europa.eu/web/guest/information-on-chemicals/cl-inventory-database
Data source date: 17 Jul 2015
Hazard Statements: Eye Irrit. 2 H319 , STOT SE 3 H335 , Skin Irrit. 2 H315 , Aquatic Acute 1 H400 , Aquatic Chronic 1 H410 , Aquatic Chronic 2 H411

fluorene (EC Number: 201-695-5, CAS Number: 86-73-7)

Description/Comments: Data from C&L Inventory Database
Data source: http://echa.europa.eu/web/guest/information-on-chemicals/cl-inventory-database
Data source date: 06 Aug 2015
Hazard Statements: Aquatic Acute 1 H400 , Aquatic Chronic 1 H410

phenanthrene (EC Number: 201-581-5, CAS Number: 85-01-8)

Description/Comments: Data from C&L Inventory Database
Data source: http://echa.europa.eu/web/guest/information-on-chemicals/cl-inventory-database
Data source date: 06 Aug 2015
Hazard Statements: Acute Tox. 4 H302 , Eye Irrit. 2 H319 , STOT SE 3 H335 , Carc. 2 H351 , Skin Sens. 1 H317 , Aquatic Acute 1 H400 , Aquatic Chronic 1 H410 , Skin Irrit. 2 H315

anthracene (EC Number: 204-371-1, CAS Number: 120-12-7)

Description/Comments: Data from C&L Inventory Database
Data source: http://echa.europa.eu/web/guest/information-on-chemicals/cl-inventory-database
Data source date: 17 Jul 2015
Hazard Statements: Eye Irrit. 2 H319 , STOT SE 3 H335 , Skin Irrit. 2 H315 , Skin Sens. 1 H317 , Aquatic Acute 1 H400 , Aquatic Chronic 1 H410

fluoranthene (EC Number: 205-912-4, CAS Number: 206-44-0)

Description/Comments: Data from C&L Inventory Database
Data source: http://echa.europa.eu/web/guest/information-on-chemicals/cl-inventory-database
Data source date: 21 Aug 2015
Hazard Statements: Acute Tox. 4 H302 , Aquatic Acute 1 H400 , Aquatic Chronic 1 H410

pyrene (EC Number: 204-927-3, CAS Number: 129-00-0)

Description/Comments: Data from C&L Inventory Database; SDS Sigma Aldrich 2014
Data source: http://echa.europa.eu/web/guest/information-on-chemicals/cl-inventory-database
Data source date: 21 Aug 2015
Hazard Statements: Skin Irrit. 2 H315 , Eye Irrit. 2 H319 , STOT SE 3 H335 , Aquatic Acute 1 H400 , Aquatic Chronic 1 H410

indeno[123-cd]pyrene (EC Number: 205-893-2, CAS Number: 193-39-5)

Description/Comments: Data from C&L Inventory Database
Data source: http://echa.europa.eu/web/guest/information-on-chemicals/cl-inventory-database
Data source date: 06 Aug 2015
Hazard Statements: Carc. 2 H351

benzo[ghi]perylene (EC Number: 205-883-8, CAS Number: 191-24-2)

Description/Comments: Data from C&L Inventory Database; SDS Sigma Aldrich 28/02/2015
Data source: http://echa.europa.eu/web/guest/information-on-chemicals/cl-inventory-database
Data source date: 23 Jul 2015
Hazard Statements: Aquatic Acute 1 H400 , Aquatic Chronic 1 H410

salts of hydrogen cyanide with the exception of complex cyanides such as ferrocyanides, ferricyanides and mercuric oxycyanide and those specified elsewhere in this Annex

CLP index number: 006-007-00-5
Description/Comments: Conversion factor based on a worst case compound: sodium cyanide
Data source: Commission Regulation (EC) No 790/2009 - 1st Adaptation to Technical Progress for Regulation (EC) No 1272/2008. (ATP1)
Additional Hazard Statement(s): EUH032 >= 0.2 %
Reason for additional Hazards Statement(s):
14 Dec 2015 - EUH032 >= 0.2 % hazard statement sourced from: WM3, Table C12.2

polychlorobiphenyls; PCB (EC Number: 215-648-1, CAS Number: 1336-36-3)

CLP index number: 602-039-00-4
Description/Comments: Worst Case: IARC considers PCB Group 1; Carcinogenic to humans; POP specific threshold from ATP1 (Regulation 756/2010/EU) to POPs Regulation (Regulation 850/2004/EC). Where applicable, the calculation method laid down in European standards EN 12766-1 and EN 12766-2 shall be applied.
Data source: Regulation 1272/2008/EC - Classification, labelling and packaging of substances and mixtures. (CLP)
Additional Hazard Statement(s): Carc. 1A H350
Reason for additional Hazards Statement(s):
29 Sep 2015 - Carc. 1A H350 hazard statement sourced from: IARC Group 1 (23, Sup 7, 100C) 2012

Appendix B: Rationale for selection of metal species

antimony {antimony trioxide}

Worst case CLP species based on hazard statements/molecular weight and low solubility. Industrial sources include: flame retardants in electrical apparatus, textiles and coatings (edit as required)

arsenic {arsenic trioxide}

Reasonable case CLP species based on hazard statements/molecular weight and most common (stable) oxide of arsenic. Industrial sources include: smelting; main precursor to other arsenic compounds (edit as required)

cadmium {cadmium oxide}

Reasonable case CLP species based on hazard statements/molecular weight, very low solubility in water. Industrial sources include: electroplating baths, electrodes for storage batteries, catalysts, ceramic glazes, phosphors, pigments and nematocides. (edit as required) Worst case compounds in CLP: cadmium sulphate, chloride, fluoride & iodide not expected as either very soluble and/or compound's industrial usage not related to site history (edit as required)

chromium in chromium(III) compounds {chromium(III) oxide (worst case)}

Reasonable case species based on hazard statements/molecular weight. Industrial sources include: tanning, pigment in paint, inks and glass (edit as required)

chromium in chromium(VI) compounds {chromium (VI) compounds, with the exception of barium chromate and of compounds specified elsewhere in this Annex}

Worst case species based on hazard statements/molecular weight (edit as required)

copper {dicopper oxide; copper (I) oxide}

Reasonable case CLP species based on hazard statements/molecular weight and insolubility in water. Industrial sources include: oxidised copper metal, brake pads, pigments, antifouling paints, fungicide. (edit as required) Worse case copper sulphate is very soluble and likely to have been leached away if ever present and/or not enough soluble sulphate detected. (edit as required)

lead {lead chromate}

Worst case CLP species based on hazard statements/molecular weight (edit as required)

mercury {mercury dichloride}

Worst case CLP species based on hazard statements/molecular weight (edit as required)

molybdenum {molybdenum(VI) oxide}

Worst case CLP species based on hazard statements/molecular weight (edit as required)

nickel {nickel chromate}

Worst case CLP species based on hazard statements/molecular weight (edit as required)

selenium {nickel selenate}

Worst case CLP species based on hazard statements/molecular weight (edit as required)

zinc {zinc chromate}

Worst case CLP species based on hazard statements/molecular weight (edit as required)

cyanides {salts of hydrogen cyanide with the exception of complex cyanides such as ferrocyanides, ferricyanides and mercuric oxycyanide and those specified elsewhere in this Annex}

Harmonised group entry used as most reasonable case as complex cyanides and those specified elsewhere in the annex are not likely to be present in this soil: [Note conversion factor based on a worst case compound: sodium cyanide] (edit as required)

Appendix C: Version

HazWasteOnline Classification Engine: WM3 1st Edition v1.1, May 2018
HazWasteOnline Classification Engine Version: 2021.246.4869.9247 (05 Sep 2021)
HazWasteOnline Database: 2021.246.4869.9247 (05 Sep 2021)

This classification utilises the following guidance and legislation:
WM3 v1.1 - Waste Classification - 1st Edition v1.1 - May 2018
CLP Regulation - Regulation 1272/2008/EC of 16 December 2008
1st ATP - Regulation 790/2009/EC of 10 August 2009
2nd ATP - Regulation 286/2011/EC of 10 March 2011
3rd ATP - Regulation 618/2012/EU of 10 July 2012
4th ATP - Regulation 487/2013/EU of 8 May 2013
Correction to 1st ATP - Regulation 758/2013/EU of 7 August 2013
5th ATP - Regulation 944/2013/EU of 2 October 2013
6th ATP - Regulation 605/2014/EU of 5 June 2014
WFD Annex III replacement - Regulation 1357/2014/EU of 18 December 2014
Revised List of Waste 2014 - Decision 2014/955/EU of 18 December 2014
7th ATP - Regulation 2015/1221/EU of 24 July 2015
8th ATP - Regulation (EU) 2016/918 of 19 May 2016
9th ATP - Regulation (EU) 2016/1179 of 19 July 2016
10th ATP - Regulation (EU) 2017/776 of 4 May 2017
HP14 amendment - Regulation (EU) 2017/997 of 8 June 2017
13th ATP - Regulation (EU) 2018/1480 of 4 October 2018
14th ATP - Regulation (EU) 2020/217 of 4 October 2019
15th ATP - Regulation (EU) 2020/1182 of 19 May 2020
The Chemicals (Health and Safety) and Genetically Modified Organisms (Contained Use)(Amendment etc.) (EU Exit) Regulations 2019 - UK: 2019 No. 720 of 27th March 2019
The Chemicals (Health and Safety) and Genetically Modified Organisms (Contained Use)(Amendment etc.) (EU Exit) Regulations 2020 - UK: 2020 No. 1567 of 16th December 2020
The Waste and Environmental Permitting etc. (Legislative Functions and Amendment etc.) (EU Exit) Regulations 2020 - UK: 2020 No. 1540 of 16th December 2020
POPs Regulation 2019 - Regulation (EU) 2019/1021 of 20 June 2019

Waste Classification Report

HazWasteOnline™ classifies waste as either **hazardous** or **non-hazardous** based on its chemical composition, related legislation and the rules and data defined in the current UK or EU technical guidance (Appendix C) (note that HP 9 Infectious is not assessed). It is the responsibility of the classifier named below to:

a) understand the origin of the waste
b) select the correct List of Waste code(s)
c) confirm that the list of determinands, results and sampling plan are fit for purpose
d) select and justify the chosen metal species (Appendix B)
e) correctly apply moisture correction and other available corrections
f) add the meta data for their user-defined substances (Appendix A)
g) check that the classification engine is suitable with respect to the national destination of the waste (Appendix C)

To aid the reviewer, the laboratory results, assumptions and justifications managed by the classifier are highlighted in pale yellow.

Classification of sample: ATP03A[2]

Non Hazardous Waste
Classified as **17 05 04**
in the List of Waste

Sample details

Sample name:
ATP03A[2]
Sample Depth:
1.5 m

LoW Code:
Chapter: 17: Construction and Demolition Wastes (including excavated soil from contaminated sites)
Entry: 17 05 04 (Soil and stones other than those mentioned in 17 05 03)

Hazard properties

None identified

Classification of sample: ATP04[2]

Non Hazardous Waste
Classified as **17 05 04**
in the List of Waste

Sample details

Sample name:
ATP04[2]
Sample Depth:
1.5 m

LoW Code:
Chapter: 17: Construction and Demolition Wastes (including excavated soil from contaminated sites)
Entry: 17 05 04 (Soil and stones other than those mentioned in 17 05 03)

Hazard properties

None identified

Supplementary Hazardous Property Information

HP 3(i): Flammable "flammable liquid waste: liquid waste having a flash point below 60°C or waste gas oil, diesel and light heating oils having a flash point > 55°C and <= 75°C"

Force this Hazardous property to non hazardous because Considered unlikely that the noted low concentrations would be flammable in soils. Threshold set at carcinogenic trigger value.

Hazard Statements hit:

Flam. Liq. 3; H226 "Flammable liquid and vapour."

Because of determinand:

TPH (C6 to C40) petroleum group: (conc.: 0.0188%)

Classification of sample: ATP06B

Non Hazardous Waste
Classified as **17 05 04**
in the List of Waste

Key

	User supplied data
	Determinand values ignored for classification, see column 'Conc. Not Used' for reason
	Determinand defined or amended by HazWasteOnline (see Appendix A)
	Speciated Deteminand - Unless the Determinand is Note 1, the Conversion Factor is used to calculate the compound concentration
<LOD	Below limit of detection
ND	Not detected
CLP: Note 1	Only the metal concentration has been used for classification

Classification of sample: ATP07

Non Hazardous Waste
Classified as **17 05 04**
in the List of Waste

Sample details

Sample name:
ATP07
Sample Depth:
0.5 m

LoW Code:
Chapter: 17: Construction and Demolition Wastes (including excavated soil from contaminated sites)
Entry: 17 05 04 (Soil and stones other than those mentioned in 17 05 03)

Hazard properties

None identified

Determinands

Moisture content: 0% No Moisture Correction applied (MC)
