Hi Keelin

Coimisiún na Meán does not perform an in-depth analysis of the effect of wind turbines on FM networks. However, we are not aware of any issues from existing windfarms into existing FM networks. Also, the proposed windfarms are not located close to any existing or planned FM transmission sites.

Roger

Dear Sir/Madam,

CGN Europe Energy Ireland Ltd are proposing to apply to Wexford County Council to extend the operational lifetime of the existing Ballywater Wind Farm for an additional 10 years after its current planning permission period runs out in June 2025. The existing wind farm is located 4 km northeast Kilmuckridge village and 19 km east of Ferns, Co. Wexford. Further details on the proposed development can be found within the attached scoping letter.

If you have any comments or queries in relation to the attached scoping document, please don't hesitate to get back to me. All information will be gratefully received.

Kind regards,
Keelin.

A Chara,

I acknowledge receipt of your recent consultation.

In the event of observations, you will receive a co-ordinated heritage-related response by email from Development Applications Unit (DAU).

The normal target turnaround for pre-planning and other general consultations is six weeks from date of receipt. In relation to general consultations from public bodies under the European Communities (Environmental Assessment of Certain Plans and Programmes) Regulations 2004 to 2011, the Department endeavours to meet deadline dates, where requested.

If you have not heard from DAU and wish to receive an update, please email manager.dau@npws.gov.ie.

Regards,

Simon Dolan

Re: Scoping Request for the proposed extension of operation at Ballywater Wind Farm near Kilmuckridge, Co Wexford.

Dear Sir/Madam,

The following are the comments from this Division in relation to the proposed development:

If the proposed development will involve the felling or removal of any trees, the developer must obtain a Felling Licence from this Department before trees are felled or removed. A Felling Licence application form can be obtained from **Felling Section, Department of Agriculture, Food and the Marine, Johnstown Castle Estate, Co. Wexford**. Email: felling.forests@agriculture.gov.ie or Web gov.ie - [Tree Felling Licences \(www.gov.ie\)](http://gov.ie)

A Felling Licence granted by the Minister for Agriculture, Food and the Marine provides authority under the Forestry Act 2014 to fell or otherwise remove a tree or trees and/or to thin a forest for silvicultural reasons. The Act prescribes the functions of the Minister and details the requirements, rights and obligations in relation to felling licences. The principal set of regulations giving further effect to the Forestry Act 2014 are the Forestry Regulations 2017 (S.I. No. 191 of 2017).

The developer should take note of the contents of **Felling and Reforestation Policy** document which provide a consolidated source of information on the legal and regulatory framework relating to tree felling; gov.ie - [Tree Felling Licences \(www.gov.ie\)](http://gov.ie). As this development is within forest lands, particular attention should be paid to deforestation, turbulence felling and the requirement to afforest alternative lands.

In order to ensure regulated forestry operations in Ireland accord with the principles of sustainable forest management (SFM), as well fulfilling the requirements of other relevant environmental protection laws, the Department (acting through its Forest Service division) must undertake particular consultations, and give certain matters full consideration during the assessment of individual Felling Licence applications. This includes consultation with relevant bodies, the application of various protocols and procedures (e.g. Forest Service Appropriate Assessment Procedure), and the requirement for applicants on occasion to provide further information (e.g. a Natura Impact Statement).

Consequently, when the Forest Service is considering an application to fell trees, the following applies:

1. The interaction of these proposed works with the environment locally and more widely, in addition to potential direct and indirect impacts on designated sites and water, is assessed. Consultation with relevant environmental and planning authorities may be required where specific sensitivities arise (e.g. local authorities, National Parks & Wildlife Service, Inland Fisheries Ireland, and the National Monuments Service);
2. Where a tree Felling Licence application is received, the Department will publish a notice of the application before making a decision on the matter. The notice shall state that any person may make a submission to the Department within 30 days from the date of the notice. The notices are published online at: gov.ie - [Felling Licence Applications \(www.gov.ie\)](http://gov.ie)

3. Third parties that make a submission or observation will be informed of the decision to grant or refuse the licence, and on request, details of the conditions attached to the licence, the main reasons and considerations on which the decision to grant or refuse the licence was based, and where conditions are attached to any licence, the reasons for the conditions. Both third parties and applicants will be also informed of their right to appeal any decision within 14 days to the Forestry Appeals Committee. Felling Licence decision are published online at:
gov.ie - [Felling Licence Decisions \(www.gov.ie\)](http://www.gov.ie)

It is important to note that when applying to a **Local Authority**, or **An Bord Pleanála**, for planning permission where developments are:

- a) subject to an EIA procedure (including screening in the case of a sub-threshold development) and any resulting requirement to produce an EIAR; and/or
- b) subject to an Appropriate Assessment procedure (including screening) and any resulting requirement to a Natura Impact Statement (NIS); and
- c) the proposed development in its construction or operational phases, or any works ancillary thereto, would directly or indirectly involve the felling and replanting of trees, deforestation for the purposes of conversion to another type of land use, or replacement of broadleaf high forest by conifer species,
 - 1. that there is a requirement inter alia under the EIA Directive for an overall assessment of the effects of the project or the alteration thereof on the environment to be undertaken, including the direct and indirect environmental impact of the project;
 - and
 - 2. pursuant to Article 2(3) of the EIA Directive, the Department of Agriculture, Food and the Marine strongly recommends that, notwithstanding the fact that a parallel consent in the form of felling licence may also have to be applied for, any EIAR and/or NIS produced in connection with the application for planning permission to the Local Planning Authority or An Bord Pleanála, should include an assessment of the impact of and measures, as appropriate, to prevent, mitigate or compensate for any significant adverse effects direct or indirect identified on the environment arising from such felling and replanting of trees, deforestation for the purposes of conversion to another type of land use, or replacement of broadleaf high forest by conifer species.
- 3. Please note that there must be absolute spatial consistency between the felling licence areas submitted to DAFM (second authority) and all related planning documents submitted to the first authority in respect of the felling area(s)

Yours sincerely,

Catherine Boyce
Felling Section
Department of Agriculture, Food and the Marine
Johnstown Castle
Co Wexford

Hello Keelin,

Thank you for your email and scoping letter regarding the extension of the operational lifetime of the existing Ballywater Wind Farm for an additional 10 years after its current planning permission period runs out in June 2025.

Please see attached letter in response to the invitation to make a submission in relation to the EIAR Scoping Report for the Arklow Bank Wind Park 2. Also attached a copy of Fáilte Ireland's Guidelines for the Treatment of Tourism in an EIA, which you may find informative for the preparation of the Environmental Impact Assessment for the proposed project. The purpose of this report is to provide guidance for those conducting Environmental Impact Assessment and compiling an Environmental Impact Assessment Reports (EIAR), or those assessing EIARs, where the project involves tourism or may have an impact upon tourism. These guidelines are non-statutory and act as supplementary advice to the EPA EIAR Guidelines outlined in section 2.

Regards & thanks,

Yvonne

Re: Informal EIA Scoping Request for Proposed Extension of Operation of the existing Ballywater Wind Farm, Co. Wexford

Your Ref: 230417

Our Ref: 23/278

Dear Keelin,

Geological Survey Ireland is the national earth science agency and is a division of the Department of the Environment, Climate and Communications. We provide independent geological information and gather various data for that purpose. Please see our [website](#) for data availability. We recommend using these various data sets, when conducting the EIA, SEA, planning and scoping processes. Use of our data or maps should be attributed correctly to 'Geological Survey Ireland'.

The publicly available data referenced/presented here, should in no way be construed as Geological Survey Ireland support for or objection to the proposed development or plan. The data is made freely available to all and can be used as independent scientific data in assessments, plans or policies. It should be noted that in many cases this data is a baseline or starting point for further site specific assessments.

With reference to your email received on the 25 September 2023, concerning the EIA Scoping Request for Proposed Extension of Operation of the existing Ballywater Wind Farm, Co. Wexford, Geological Survey Ireland would encourage use of and reference to our datasets. Please find attached a list of our publicly available datasets that may be useful to the environmental assessment and planning process. We recommend that you review this list and refer to any datasets you consider relevant to your assessment. The remainder of this letter and following sections provide more detail on some of these datasets.

Geoheritage

A national inventory of geoheritage sites known as County Geological Sites (CGSs) is managed by the Geoheritage Programme of Geological Survey Ireland. CGSs, as adopted under the National Heritage Plan, include sites that are of national importance which have been selected as the very best examples for NHA (Natural Heritage Areas) designation. NHA designation will be completed in partnership with the National Parks and Wildlife Service (NPWS). CGSs are now routinely included in County Development Plans and in the GIS of planning departments, to ensure the recognition and appropriate protection of geological heritage within the planning system. CGSs can be viewed online under the Geological Heritage tab on the online [Map Viewer](#).

The audit for Co. Wexford was carried out in 2019. The full report details can be found [here](#). **Our records show that there is a that there are no CGSs in the vicinity of the wind farm.**

Groundwater

Geological Survey Ireland's [Groundwater and Geothermal Unit](#), provides advice, data and maps relating to groundwater distribution, quality and use, which is especially relevant for safe and secure drinking water supplies and healthy ecosystems. Proposed developments need to consider any potential impact on specific groundwater abstractions and on groundwater resources in general. We recommend using the groundwater maps on our [Map viewer](#) which should include: wells; drinking water source protection areas; the national map suite - aquifer, groundwater vulnerability, groundwater recharge and subsurface permeability maps. For areas underlain by limestone, please refer to the karst specific data layers (karst features, tracer test database; turlough water levels ([gwlevel.ie](#)). Background information is also provided in the Groundwater Body Descriptions. Please read all disclaimers carefully when using Geological Survey Ireland data.

The Groundwater Data Viewer indicates an aquifer classed as a 'Poor Aquifer - Bedrock which is Generally Unproductive except for Local Zones' underlies the wind farm.

The Groundwater Vulnerability map indicates the area covered is classed as 'Low' Vulnerability.

GWClimate is a groundwater monitoring and modelling project that aims to investigate the impact of climate change on groundwater in Ireland. This is a follow on from a previous project (GWFlood) and the data may be useful in relation to Flood Risk Assessment (FRA) and management plans. Maps and data are available on the [Map viewer](#).

Geological Survey Ireland has completed Groundwater Protection Schemes (GWPSs) in partnership with Local Authorities, and there is now national coverage of GWPS mapping. A Groundwater Protection Scheme provides guidelines for the planning and licensing authorities in carrying out their functions, and a framework to assist in decision-making on the location, nature and control of developments and activities in order to protect groundwater. **The Groundwater Protection Response overview and link to the main reports is here:** <https://www.gsi.ie/en-ie/programmes-and-projects/groundwater/projects/protecting-drinking-water/what-is-drinking-water-protection/county-groundwater-protection-schemes/Pages/default.aspx>

Geological Mapping

Geological Survey Ireland maintains online datasets of bedrock and subsoils geological mapping that are reliable and accessible. We would encourage you to use these data which can be found [here](#), in your future assessments.

Please note we have recently launched QGIS compatible bedrock (100K) and Quaternary geology map data, with instructional manuals and videos. This makes our data more accessible to general public and external stakeholders. QGIS compatible data can be found in our downloadable bedrock 100k .zip file on the [Data & Maps](#) section of our website.

Geohazards

Geohazards can cause widespread damage to landscapes, wildlife, human property and human life. In Ireland, landslides, flooding and coastal erosion are the most prevalent of these hazards. We recommend that geohazards be taken into consideration, especially when developing areas where these risks are prevalent, and we encourage the use of our data when doing so.

Geological Survey Ireland has information available on landslides in Ireland via the National Landslide Database and Landslide Susceptibility Map both of which are available for viewing on our dedicated [Map Viewer](#). Associated guidance documentation relating to the National Landslide Susceptibility Map is also available.

Geological Survey Ireland also engaged in a national project on Groundwater Flooding. The data from this project may be useful in relation to Flood Risk Assessment (FRA) and management plans, and is described in more detail under 'Groundwater' above.

Coastal Vulnerability while seen as a potential geohazard, is discussed in more detail under our marine and coastal unit information below.

Geochemistry of soils, surface waters and sediments

Geological Survey Ireland provides baseline geochemistry data for Ireland as part of the Tellus programme. Baseline geochemistry data can be used to assess the chemical status of soil and water at a regional scale and to support the assessment of existing or potential impacts of human activity on environmental chemical quality. Tellus is a national-scale mapping programme which provides multi-element data for shallow soil, stream sediment and stream water in Ireland. At present, mapping consists of the border, western and midland regions. Data is available at <https://www.gsi.ie/en-ie/data-and-maps/Pages/Geochemistry.aspx>. This page also hosts Geochemical Mapping of Agricultural and Grazing Land Soil of Europe (GEMAS) and lithogeochemistry (rock geochemistry) from southeast Ireland datasets. Geological Survey Ireland and partners are undertaking applied geochemistry projects to provide data for agriculture ([Terra Soil](#)), waste soil characterisation ([Geochemically Appropriate Levels for Soil Recovery Facilities](#)) and mineral exploration ([Mineral Prospectivity Mapping](#)).

Marine and Coastal Unit

Our marine environment is hugely important to our bio-economy, transport, tourism and recreational sectors. It is also an important indicator of the health of our planet. Geological Survey Ireland's Marine and Coastal Unit in partnership with the Marine Institute, jointly manages **INFOMAR**, Ireland's national marine mapping programme; providing key baseline data for Ireland's marine sector. The programme delivers a wide range of benefits to multi-sectoral end-users across the national blue economy with an emphasis on enabling our stakeholders. Demonstrated applications for the use of INFOMAR's suite of mapping products include Shipping & Navigation, Fisheries Management, Aquaculture, Off-shore Renewable Energies, Marine Leisure & Tourism and Coastal Behaviour.

INFOMAR also produces a wide variety of seabed mapping products that enable public and stakeholders to visualize Ireland's seafloor environment <https://www.infomar.ie/maps/downloadable-maps/maps>. **Story maps** have also been developed providing a different perspective of some of the bays and harbors of the Irish coastline. We would therefore recommend use of our Marine and Coastal Unit datasets available on our [website](#) and [Map Viewer](#).

National Coastal Change Assessment

Geological Survey Ireland is undertaking a National Coastal Change Assessment. As part of this initiative two mapping products will be delivered for the entire Irish coastline: **coastal vulnerability mapping and shoreline change**.

Coastal vulnerability maps will provide an insight into the relative susceptibility of the Irish coast to adverse impacts of sea-level rise through the use of a **Coastal Vulnerability Index (CVI)**. Currently the project is being carried out on the east coast and will be rolled out nationally over the next couple of years, detailed information and maps are available [here](#). **Shoreline change rates** for the period 2000 to 2023 are being prioritised and will be released by county on a rolling basis over the next 12 months. Shoreline change rates database and reports will be accessible from [GSI](#) web mapping viewers. These suite of coastal mapping products are aimed at coastal managers to prioritise or concentrate efforts on adaptation.

Guidelines

The following guidelines may also be of assistance:

- Institute of Geologists of Ireland, 2013. Guidelines for the Preparation of the Soils, Geology and Hydrogeology Chapters of Geology in Environmental Impact Statements.
- [EPA, 2022](#). Guidelines on the information to be contained in Environmental Impact Assessment Reports (EIAR)

Other Comments

Should development go ahead, all other factors considered, Geological Survey Ireland would much appreciate a copy of reports detailing any site investigations carried out. The data would be added to Geological Survey Ireland's national database of site investigation boreholes, implemented to provide a better service to the civil engineering sector. Data can be sent to the Geological Mapping Unit, at <mailto:GeologicalMappingInfo@gsi.ie>, 01-678 2795.

I hope that these comments are of assistance, and if we can be of any further help, please do not hesitate to the Geological Survey Ireland Planning Team at GSIPlanning@gsi.ie.

Yours sincerely,

Geoheritage and Planning Programme

Dear Ms. Trish Smullen,

CGN Europe Energy Ireland Ltd are proposing to apply to Wexford County Council to extend the operational lifetime of the existing Ballywater Wind Farm for an additional 10 years after its current planning permission period runs out in June 2025. The existing wind farm is located 4 km northeast Kilmuckridge village and 19 km east of Ferns, Co. Wexford. Further details on the proposed development can be found within the attached scoping letter.

If you have any comments or queries in relation to the attached scoping document, please don't hesitate to get back to me. All information will be gratefully received.

Kind regards,
Keelin.

HSE EIA Scoping

National Environmental Health Service Submission Report

Date: 31st October 2023
Our reference: EHIS 3454
Report to: Keelin Bourke, MKO Consulting
Type of Consultation: EIA Scoping ref: **230417**

Informal EIA Scoping Request for Proposed Extension of Operation of the existing Ballywater Wind Farm, Co. Wexford

Proposed Development: To extend the operational period of the existing Ballywater Wind Farm for an additional 10 years after the expiry of its current planning permission in 2025. Ballywater Wind Farm is located on the coast of Co. Wexford, approximately 4 km northeast Kilmuckridge village. The site comprises 21 no. Enercon E-70 turbines, each with a tip height of 99 metres. The wind farm has a total capacity of 42 Megawatts (MW).

The following HSE stakeholders were consulted on the scoping on the 28th September 2023:

HSE South Emergency Management
Estates
Director of National Health Protection
CHO

Clarification on the content of this submission should be made, in the first instance, to Jane Power, Principal Environmental Health Officer, Wexford (JaneM.Power@hse.ie)

General Comments

The National Environmental Health Service makes the following general comments on scoping the EIA:

- a) Because this is an application for extension of the operation of an existing development the predictive methodology routinely employed in EIA can be supported by actual data of operation of the existing Wind Farm,
- b) Therefore, any assessment of likely significant impacts from the continued use should be supported by data of actual impacts during the operation phase of the development,
- c) This assessment should include the effectiveness of any existing mitigation measures and identify where mitigation should be continued and/or reviewed,
- d) Particularly, the EIA should consider any significant impacts from Noise and Shadow Flicker and any impacts on local drainage and water systems as a result of construction and operation of the existing Wind Farm,
- e) Any complaints received over the existing lifetime of the development should be considered in the EIA,
- f) The public consultation should include consultation on how the Wind Farm might or might not be impacting on local communities,
- g) It is important that the EIA for the continued operation is not over reliant on the original EIS. This was a predictive assessment based on methodology of the time. Assessment and knowledge of Wind Turbines and likely significant impacts has evolved in the intervening time. The National Guidance for EIA has been updated since the original EIA.

The following documents should be taken into consideration when preparing the Environmental Impact Assessment Report:

- Guidelines for Planning Authorities and An Bord Pleanála on carrying out Environmental Impact Assessment

https://www.housing.gov.ie/sites/default/files/publications/files/guidelines_for_planning_authorities_and_an_bord_pleanála_on_carrying_out_eia_-_august_2018.pdf

EU publication: Environmental Impact Assessment of Projects Guidance on the preparation of the Environmental Impact Assessment Report, EU, 2017

http://ec.europa.eu/environment/eia/pdf/EIA_guidance_EIA_report_final.pdf

Adoption of the Directive (2014/52/EU) in April 2014 initiated a review of the National Guidance for EIA and the EIAR accompanying a planning application. New guidelines can be seen at:

<https://www.epa.ie/publications/monitoring--assessment/assessment/guidelines-on-the-information-to-be-contained-in-environmental-impact-assessment.php>

The introduction of the new Guidance is supported by a Webinar produced by the EPA and can be found at: <https://www.youtube.com/embed/ejKVFUztBY>

Generally the Environmental Impact Assessment should examine all likely significant impacts of the continued use of the Wind Farm and provide the following information for each:

- a) Description of the receiving environment;
- b) The nature and scale of the impact;
- c) An assessment of the significance of the impact;
- d) Proposed mitigation measures;
- e) Residual impacts.

Directive 2014/52/EU has an enhanced requirement to assess likely significant impacts on Population and Human Health. It is the experience of the Environmental Health Service (EHS) that impacts on human health are often inadequately assessed in EIAs in Ireland. It is recommended that the wider determinants of health and wellbeing are considered in a proportionate manner when considering the EIA. Guidance on wider determinants of health can be found at www.publichealth.ie

In addition to any likely significant negative impacts from the proposed development, any positive likely significant impacts should also be assessed.

The applicant should consider any opportunities for positive health gain from the proposed extension of the operation of the Wind Farm. These opportunities might have changed since the original EIA.

The HSE will consider the final EIAR accompanying the planning application and will make comments to An Bord Pleanála/Local Planning Authority on the methodology used for assessing the likely significant impacts and the evaluation criteria used in assessing the significance of the impact.

The Environmental Health Service (EHS) recommends that the following matters are included and assessed in the EIAR:

- Public Consultation
- Decommissioning phase of the proposed wind farm
- Noise & Vibration
- Shadow Flicker
- Surface and Groundwater Quality
- Geological Impacts
- Cumulative impacts

Public Consultation

It is recommended that early and meaningful public consultation with the local community is undertaken to ensure any potential existing impacts of the Wind Farm are identified.

All parties affected by the proposed development, **including those who may benefit financially from the project**, must be fully informed of what the proposal entails especially with regard to potential impacts on surrounding areas.

The Environmental Impact Assessment Report (EIAR) should clearly demonstrate the link between public consultations and how those consultations have influenced the decision-making process in the EIA.

Decommissioning

The EIAR should detail the eventual fate of the wind turbines and associated material i.e. will the material be recycled or how will it be disposed of.

Information should also be provided regarding the proposed methodology to be used for the disposal of the materials forming the foundations of the wind turbines.

The EIAR should indicate the proposed future use of the development site at the end of the planning permission period.

The Draft Revised Wind Energy Development Guidelines were published in December 2019. Whilst these have yet to be adopted, any proposed Wind Farm development should have consideration of the draft Guidelines.

https://www.housing.gov.ie/sites/default/files/public-consultation/files/draft_revised_wind_energy_development_guidelines_december_2019.pdf .

Shadow Flicker

It is recommended that a shadow flicker assessment is undertaken to identify if any dwellings or sensitive receptors are being impacted by shadow flicker and if any additional mitigation is required. The assessment must include all proposed mitigation measures. Dwellings should include all occupied properties and any existing or proposed properties for which planning consent has been granted for construction or refurbishment.

Surface and Ground Water Quality

The EIA should consider whether there has been any significant impacts to drinking water sources and any impacts on surface water as a result of the operation of the Wind farm and whether any mitigation is required for continued use of the development.

Cumulative Impacts

All existing or proposed wind farm developments in the vicinity should be clearly identified in the EIAR.

The impact on sensitive receptors of the continued operation of the Wind Farm with any other Wind Farm/renewable energy developments in the vicinity should be considered. The EIAR should include a detailed assessment of any likely significant cumulative impacts of the proposed extension of the planning permission.

HSE South Emergency Management Consultation Report

Report to	Jane Power, PEHO, Wexford	Date	2 nd October, 2023
Type of consultation: EIS ☐ Scoping X Screening ☐ EIAR ☐ EPA ☐			
Other (please specify):			
Authority	Wexford County Council		
Authority Reference Number	EHIS 3454		
EM Reference Number	EMENV 178		
Applicant / Consultants	CGN Europe Energy Ireland Ltd., via MKO, Tuam Road, Galway H91 VW84		
Proposal	Permission sought by Ballywater Wind Farm, Co. Wexford to extend the 21-turbine operational period of the wind farm for an additional 10 years - current permission period expires 2025		

HSE South Emergency Management Observations: Please be advised that the HSE South Emergency Management function does not have any specific observations to make with respect to this application. However, please note the following recommendations within the context of site operations:

1. Should an incident occur at the site and the site operator requires the assistance of the emergency services, the incident information should be provided in the 'ETHANE' format (please see attached).
2. Emergency Services access to the site should be clearly identified. This should be undertaken via appropriate high visibility signage, i.e.; a green sign with a yellow border and white lettering citing the abbreviation RVP
3. The site should have a mechanism in place to account for personnel during an evacuation in order to provide the responding emergency services with an estimate of the number of people accounted and unaccounted for.
4. The site should identify any critical / vulnerable facilities within the geographical catchment area, such as hospitals, schools, nursing homes, etc, that could be directly or indirectly affected by an incident at the site.
5. Where the 'off-site' impacts of an incident at the site affects a vulnerable cohort / population such as children within crèches, schools; patients / clients / residents within nursing homes, etc; the emergency services will require assistance from the site operator in determining the impact on the local community.
6. The site operator is encouraged to develop a business continuity plan that includes a plan for severe weather. For more advice on this, please see the Department of Business, Enterprise and Innovation, *Business Continuity Planning in Severe Weather*.
<https://dbei.gov.ie/en/Publications/Publication-files/Business-Continuity-Planning-in-Severe-Weather-Check-List-for-Businesses.pdf>

Dear Ms. Bourke,

Thank you for your email and associated attachment regarding input into the Environmental Scoping Assessment in relation to the proposal to extend the operational period of the existing Ballywater Wind Farm.

Based on the information provided, IAA's Aerodromes Division has no requirements for incorporation into the Environmental Scoping Assessment Report.

Best regards,

Dave

Subject: 230417 - Proposed Lifetime Extension of Ballywater Wind Farm - Scoping

* This message originated from outside the Irish Aviation Authority. Please treat hyperlinks, attachments and instructions in this email with caution. *

Dear Sir/Madam,

CGN Europe Energy Ireland Ltd are proposing to apply to Wexford County Council to extend the operational lifetime of the existing Ballywater Wind Farm for an additional 10 years after its current planning permission period runs out in June 2025. The existing wind farm is located 4 km northeast Kilmuckridge village and 19 km east of Ferns, Co. Wexford. Further details on the proposed development can be found within the attached scoping letter.

If you have any comments or queries in relation to the attached scoping document, please don't hesitate to get back to me. All information will be gratefully received.

Kind regards,
Keelin.

20th October 2023

Dear Keelin/CGN Europe Energy Ireland Ltd

We hope this finds you all well in these challenging times. The IRGCT is writing to you in relation to an important matter regarding the management of Ireland's natural environments.

We are making this submission on behalf of our members and supporter as well as the native flora and fauna of the island of Ireland. The IRGCT fully supports the governments drive for renewable energy but feels mitigation efforts should be significantly increased to help combat the damage that anthropogenic activities are causing to our planet.

In light of the climate and biodiversity emergency that Ireland now faces, the IRGCT finds it extremely pertinent that funds from wealthy wind farm developments should be put in place to achieve a net biodiversity gain during and after the development of such a site. One such example could be to employ local contractors to carry out sensitive habitat management work coupled with legal nest protection work as this combination of land management options is scientifically proven to increase wading bird productivity three-fold.

The IRGCT strongly believes large multi-national corporations across Ireland should also adopt this forward-thinking conservation measure as without it many species face imminent extinction in less than 10 years. Local employment will support local communities to protect their native, living heritage and this in the grand scheme of things would cost very little when project budgets stretch into many millions of euros.

Many red listed species like meadow pipit, yellowhammer, and lapwing, all of which reside/nest on or around the Ballywater Windfarm site, are vanishing in front of our very eyes. The question is, will large financial corporations stand by and ignore this wipeout of our natural heritage, or will they stand together for the protection and preservation of our precious natural environments through meaningful practical land management actions that delivers tangible results at grass root level.

Yours sincerely

Merlin Becker

Re: EIA Scoping Request for Proposed Wind Farm Development, Co. Tipperary

The Department of Transport makes the following comments on consultation request relating to the Scoping Report for the proposed Wind Farm in Co. Tipperary.

It should be noted that the Department considers the construction involved in providing this development and especially, the connection cables to the national grid may have effects on both the environment and the Regional and Local Road network.

Where the developer proposes the placement of any cables (or additional cables) in one or more trenches within the extents of the (regional and local) public road network, it is necessary to consider the following:

- Their presence within the public road will likely significantly restrict the Road Authority in carrying out its function to construct and maintain the public road and will likely add to the costs of those works.
- Their installation within the lands associated with the public road may affect the stability of the road. In particular where the road is a "legacy road" (where there is no designed road structure and the subgrade may be poor or poorly drained) the design needs to take account of all the variable ground conditions and not be based on a sample of the general soil conditions.
- The possible effect on the remaining available road space (noting that there may be need to accommodate other utilities within the road cross-section in the future).
- The necessity to have the power in the cables switched off where the Road Authority considers this necessary in order to carry out its function to construct and maintain the public road.

The Department consider it important that the examination of the proposal should include consideration of the following:

- Examination of options other than the routing of cables along the public road,
- Examination of options for connection to the national grid network at a point closer to the wind farm in order to reduce the adverse impact on public roads.
- Details of where within the road cross section cables are to be placed so as to minimise the effect on the Roads Authority in its role of construction and maintenance,
- Examination of details of any chambers proposed within the public road cross section so as to minimise the effect on the Roads Authority in its role of construction and maintenance,
- Elimination of jointing bays from beneath the road pavement to protect the integrity of the road structure for the safety of those driving on the public road by eliminating hard spots and also preserve the road width for other utilities,
- Prevention of the attachment of cables to all bridge structures and culverts by diverting them beneath or away from these structures and,
- Rationalisation of the number of cables involved (including existing electric or possible future cables) and their diversion into one trench, in order to minimise the impacts on the road network and the environment along the road boundary (hedgerows).

The Department considers the following should be considered when applying conditions to any approval.

1. A condition requiring the specific approval of the local authority to the detail of the final route of cables through the public road space. If during construction there is a need to deviate from the detailed design then the approval of the local authority would again be sought. This would assist in minimising the impact on the public road.
2. A condition requiring the developer to comply with all appropriate standards and, inter alia the Guidelines for Managing Openings in Public Roads, 2017 in order to ensure orderly development.
3. A condition requiring that the location of the cables would be recorded as exactly as possible (maybe using BIM type technology) so as to facilitate the further use of road space for utilities and the maintenance/construction of the public road by the Roads

authority. This record should include as constructed surveys of all infrastructure altered, added, removed or relocated and exact detail of the road construction including any drains or other features encountered. The record should be lodged with the local authority and with the ESB Networks for retention on their records.

4. A condition to require the elimination of jointing bays from under the road pavement to protect the integrity of the road structure, thereby improving safety for those driving on the public road by eliminating hard spots and preserving the road width for other utilities.
5. A condition requiring the developer to route cables away from bridge structures and specifically preventing the developer from attaching cables to road bridges. This would allow for the future maintenance of bridges without interruption of the electricity supply along the cables.
6. A condition requiring the replacement of culverts that have been excavated during the cable duct placement operation. The replacement culverts should be designed appropriately and include an allowance for the effects of climate change.
7. A condition requiring the developer to notify the Roads Authority of the owner of the cables (Owner) and the controller (Power Controller) of the power transmitted along the cables. In addition, the condition should require Owner and Power Controller to notify the Roads Authority of any change in ownership of the cables or change of Power Controller transmitting power along the cables. In all instances the Owner and Power Controller should be required to maintain an agreed contacts list with the Roads Authority.

Subject: TII23-124547 - 230417 - Proposed Lifetime Extension of Ballywater Wind Farm – Scoping.

You don't often get email from information@tii.ie. [Learn why this is important](#)

Caution: This is an external email and may be malicious. Please take care when clicking links or opening attachments.

A Chara,

Thank you for your correspondence of 25 September 2023 regarding the above. The position in relation to your enquiry is as follows.

In the first instance, Transport Infrastructure Ireland (TII) wishes to advise that it is not a planning authority. Our core function in relation to national roads is to deliver a modern, efficient, and safe network. The authority has, however, the status of a statutory consultee under planning legislation.

TII is not in a position to engage directly with planning applicants with respect to proposed developments. TII will endeavour to consider and respond to planning applications referred to it given its status and duties as a statutory consultee under the Planning Acts. As a statutory consultee, submissions, or comments to planning authorities on planning applications, if any, on proposed development represent TII's primary input to the planning process. The approach adopted in making such submissions or comments seeks to uphold the official national planning policy outlined in the DoECLG Spatial Planning and National Roads Guidelines for Planning Authorities (2012). Regard should also be had to other relevant guidance available at www.TII.ie.

The issuing of this correspondence is provided as best practice guidance only and does not prejudice TII's statutory right to make any observations, requests for further information, objections or appeals following the examination of any valid planning application referred.

1 Developer/scheme promoter should have regard, inter alia, to the following:

- Consultations should be had with the relevant Local Authority/National Roads Design Office with regard to locations of existing and future national road schemes,
- TII would be specifically concerned with the potential significant impacts the development would have on the national road network (and junctions with national roads) in the proximity of the proposed development,
- The developer should assess the visual impacts of existing national roads,

- The developer should have regard to any environmental impact statement and all conditions and/or modifications imposed by An Bord Pleanála regarding road schemes in the area. The developer should in particular have regard for any potential cumulative impacts,
- The developer, in preparing EIAR, should have regard to TII Publications (formerly DMRB and the Manual of Contract Documents for Road Works),
- The developer, in preparing EIAR, should have regard to TII's Environmental Assessment and Construction Guidelines, including the Guidelines for the Treatment of Air Quality During the Planning and Construction of National Road Schemes (National Roads Authority, 2006),
- The EIAR/EIS should consider the Environmental Noise Regulations 2006 (SI 140 of 2006) and, in particular, how the development will affect future action plans by the relevant competent authority. The developer may need to consider the incorporation of noise barriers to reduce noise impacts (see Guidelines for the Treatment of Noise and Vibration in National Road Schemes (1st Rev., National Roads Authority, 2004)),
- It would be important that, where appropriate, subject to meeting the appropriate thresholds and criteria and having regard to best practice, a Traffic and Transport Assessment (TTA) be carried out in accordance with relevant guidelines, noting traffic volumes attending the site and traffic routes to/from the site with reference to impacts on the national road network and junctions of lower category roads with national roads. In relation to national roads, TII's Traffic and Transport Assessment Guidelines (2014) should be referred to. The scheme promoter is also advised to have regard to Section 2.2 of the NRA/TII TTA Guidelines which addresses requirements for sub-threshold TTA. Any improvements required to facilitate development should be identified. It will be the responsibility of the developer to pay for the costs of any improvements to national roads to facilitate the private development proposed as TII will not be responsible for such costs,
- The designers are asked to consult TII Publications to determine whether a road safety audit is required,
- In the interests of maintaining the safety and standard of the national road network, the EIAR should identify the methods/techniques proposed for any works traversing/in proximity to the national road network,
- TII recommends that the applicant/developer should clearly identify the haul routes proposed and fully assess the network to be traversed. Where abnormal 'weight' loads are proposed, separate structure approvals/permits, and other licences may be required in connection with the proposed haul route and all structures on the haul route through all the relevant County Council administrative areas should be checked by the applicant/developer to confirm their capacity to accommodate any abnormal 'weight' load proposed.

Notwithstanding any of the above, the developer should be aware that this list is non-exhaustive, thus site and development-specific issues should be addressed in accordance with best practice.

I trust that this information is of assistance to you.

Dear Mr. Alban Mills,

CGN Europe Energy Ireland Ltd are proposing to apply to Wexford County Council to extend the operational lifetime of the existing Ballywater Wind Farm for an additional 10 years after its current planning permission period runs out in June 2025. The existing wind farm is located 4 km northeast Kilmuckridge village and 19 km east of Ferns, Co. Wexford. Further details on the proposed development can be found within the attached scoping letter.

If you have any comments or queries in relation to the attached scoping document, please don't hesitate to get back to me. All information will be gratefully received.

Kind regards,

Keelin.

Re: EIA Scoping Request – Proposed Lifetime Extension of existing Ballywater
Wind Farm, Co. Wexford

Dear Keelin Bourke,

Uisce Éireann has received notification of your Environmental Impact Assessment (EIA) scoping request relating to the forthcoming planning application for a proposed life time extension of the existing Wind Farm development in Ballywater, Co. Wexford.

Please see attached, Uisce Éireann's scoping opinion in relation to Water Services. On receipt of the planning referral, Uisce Éireann will review the finalised Environmental Impact Assessment Report (EIAR) as part of the planning process.

Queries relating to the terms and observations above should be directed to planning@water.ie

Yours sincerely,

PP *Alí Robinson*

Signed on behalf of Yvonne Harris

Connections and Developer Services

Uisce Éireann's Response to EIA Scoping Requests

At present, Uisce Éireann does not have the capacity to advise on the scoping of individual projects. However, in general the following aspects of Water Services should be considered in the scope of an EIA where relevant;

- a) Where the development proposal has the potential to impact an Uisce Éireann Drinking Water Source(s), the applicant shall provide details of measures to be taken to ensure that there will be no negative impact to Uisce Éireann's Drinking Water Source(s) during the construction and operational phases of the development. Hydrological / hydrogeological pathways between the applicant's site and receiving waters should be identified as part of the report.
- b) Where the development proposes the backfilling of materials, the applicant is required to include a waste sampling strategy to ensure the material is inert.
- c) Mitigations should be proposed for any potential negative impacts on any water source(s) which may be in proximity and included in the environmental management plan and incident response.
- d) Any and all potential impacts on the nearby reservoir as public water supply water source(s) are assessed, including any impact on hydrogeology and any groundwater/ surface water interactions.
- e) Impacts of the development on the capacity of water services (*i.e. do existing water services have the capacity to cater for the new development*). This is confirmed by Uisce Éireann in the form of a Confirmation of Feasibility (COF). If a development requires a connection to either a public water supply or sewage collection system, the developer is advised to submit a Pre-Connection Enquiry (PCE) enquiry to Uisce Éireann to determine the feasibility of connection to the Irish Water network. All pre-connection enquiry forms are available from <https://www.water.ie/connections/connection-steps/>.
- f) The applicant shall identify any upgrading of water services infrastructure that would be required to accommodate the proposed development.
- g) In relation to a development that would discharge trade effluent – any upstream treatment or attenuation of discharges required prior to discharging to an Uisce Éireann collection network.
- h) In relation to the management of surface water; the potential impact of surface water discharges to combined sewer networks and potential measures to minimise and or / stop surface waters from combined sewers.

- i) Any physical impact on Uisce Éireann assets – reservoir, drinking water source, treatment works, pipes, pumping stations, discharges outfalls etc. including any relocation of assets.
- j) When considering a development proposal, the applicant is advised to determine the location of public water services assets, possible connection points from the applicant's site / lands to the public network and any drinking water abstraction catchments to ensure these are included and fully assessed in any pre-planning proposals. Details, where known, can be obtained by emailing an Ordnance Survey map identifying the proposed location of the applicant's intended development to datarequests@water.ie
- k) Other indicators or methodologies for identifying infrastructure located within the applicant's lands are the presence of registered wayleave agreements, visible manholes, vent stacks, valve chambers, marker posts etc. within the proposed site.
- l) Any potential impacts on the assimilative capacity of receiving waters in relation to Uisce Éireann discharge outfalls including changes in dispersion / circulation characterises. Hydrological / hydrogeological pathways between the applicant's site and receiving waters should be identified within the report.
- m) Any potential impact on the contributing catchment of water sources either in terms of water abstraction for the development (*and resultant potential impact on the capacity of the source*) or the potential of the development to influence / present a risk to the quality of the water abstracted by Uisce Éireann for public supply should be identified within the report.
- n) Where a development proposes to connect to an Uisce Éireann network and that network either abstracts water from or discharges wastewater to a "protected"/ sensitive area, consideration as to whether the integrity of the site / conservation objectives of the site would be compromised should be identified within the report.
- o) Mitigation measures in relation to any of the above ensuring a zero risk to any Irish Water drinking water sources (Surface and Ground water).

This is not an exhaustive list.

Please note;

- Where connection(s) to the public network is required as part of the development proposal, applicants are advised to complete the Pre-Connection Enquiry process and have received a Confirmation of Feasibility letter from Uisce Éireann ahead of any planning application.
- Uisce Éireann will not accept new surface water discharges to combined sewer networks.

Subject: 230417 - Proposed Lifetime Extension of Ballywater Wind Farm - Scoping

Dear Ms. Sabine Browne,

CGN Europe Energy Ireland Ltd are proposing to apply to Wexford County Council to extend the operational lifetime of the existing Ballywater Wind Farm for an additional 10 years after its current planning permission period runs out in June 2025. The existing wind farm is located 4 km northeast Kilmuckridge village and 19 km east of Ferns, Co. Wexford. Further details on the proposed development can be found within the attached scoping letter.

If you have any comments or queries in relation to the attached scoping document, please don't hesitate to get back to me. All information will be gratefully received.

Kind regards,
Keelin.

Hi Robert,

2rn don't have any fixed or off-air linking nearby, and we are not aware of any issues with the existing windfarm. There is a risk that reflections from the site may interfere with viewers receiving from our site at Mt Leinster, but as this is an existing site any issues should have been identified and addressed by this stage. If any changes are to be made to the site, for example, repowering with larger turbines, we would ask that a protocol be signed between the developer and 2rn.

[CAUTION: This email originated from outside of the organisation. Do not click links or open attachments unless you recognise the sender and know the content is safe]

Hi Matthew, and Johnny,

We are working on a constraints study for Ballywater Wind Farm (Co. Wexford), located approximately 4 km northeast of Kilmuckridge Village and 12 km south of Courtown, Co. Wexford. The coordinates for the approximate centre of the site are 720443 (X, ITM) ; 644836 (Y, ITM). The site location can be seen in the attached map, and the EIAR Site Boundary in the attached .kml file.

Could you let us know if there are any existing or planned links in this area, and we shall incorporate these into our constraints mapping. If there are any links in the area, could you also send me the associated buffer of said links. Ballywater is an existing windfarm that we are applying for an extension of duration for, therefore it will be helpful if you could let us know if there have been any pre-existing issues for the same.

If you have any queries, please do not hesitate to contact me. Thank you for your time and consideration to this matter.

Regards,
Rob

Dear Peter,

We are working on a constraints study for Ballywater Wind Farm (Co. Wexford), located approximately 4km northeast of Kilmuckridge Village and 12 km south of Courtown, Co. Wexford. The coordinates for the approximate centre of the site are 720443 (X, ITM) ; 644836 (Y, ITM). The site location can be seen in the attached map, and EIAR Site Boundary in the attached .kml file.

Could you let us know if there are any existing or planned links in this area, and we shall incorporate these into our constraints mapping. If there are any links in the area, could you also send me the associated buffer of said links. Ballywater is an existing windfarm that we are applying for an extension duration for, therefore it will be helpful if you could let us know if there have been any pre-existing issues for the same.

If you have any queries, please do not hesitate to contact me. Thank you for your time and consideration to this matter,

Kind regards,
Keelin.

Hi Keelin,

There are no existing or planned links that would be affected by this windfarm.

Please note I don't work in this area now so in future could you please contact wfanalysis (ESB Networks) <wfanalysis@esb.ie> which is a dedicated inbox to look after these requests.

Regards,

Myles

Hi Robert,

The proposed site is not within the GSM-R (Mobile Network for Railways) exclusion zone but is within the Coordination Zone. Please see below:

From a study carried out by the ANFR (Agence Nationale des Frequences in France), the output calls for 2 main recommendations by defining 2 main zones as follows:

- 1- **Exclusion zone:** wind farm not less than 5 Km from antenna
- 2- **Coordination zone:** : 5Km<wind farm <30Km: this area, coordination between operators is required to fix any issue and impact on the signal propagation

Hi Robert,

Currently, we have no issue with links with your proposed windfarm.

However, we reserve the right, to bring to your attention and expect that you will remedy the cost, of any links that might be put in place in the future while awaiting planning approval for your project.

Many Thanks

[Some people who received this message don't often get email from kbourke@mkoireland.ie. Learn why this is important at <https://aka.ms/LearnAboutSenderIdentification>]

CAUTION! External Email.

Dear Alister,

We are working on a constraints study for Ballywater Wind Farm (Co. Wexford), located approximately 4km northeast of Kilmuckridge Village and and 12 km south of Courtown, Co. Wexford. The coordinates for the approximate centre of the site are 720443 (X, ITM) ; 644836 (Y, ITM). The site location can be seen in the attached map, and EIAR Site Boundary in the attached .kml file.

Could you let us know if there are any existing or planned links in this area, and we shall incorporate these into our constraints mapping. If there are any links in the area, could you also send me the associated buffer of said links. Ballywater is an existing windfarm that we are applying for an extension of duration for, therefore it will be helpful if you could let us know if there have been any pre-existing issues for the same.

If you have any queries, please do not hesitate to contact me. Thank you for your time and consideration to this matter,

Kind regards,
Keelin.

APPENDIX 2-2

COMMUNITY ENGAGEMENT REPORT

1.

INTRODUCTION

This Community Engagement Report has been compiled by MKO on behalf of CGN Europe Energy (CGNEE) to document the processes of community engagement and public consultation carried out during the pre-planning stage of the application for an extension of life for the pre-existing Ballywater Wind Farm in Co Wexford.

This report sets out the aims and objectives of a proactive programme of community engagement over a period of several months prior to the lodgement of the application for planning permission with Wexford County Council. The report will outline the steps that CGNEE have taken to achieve these objectives and will demonstrate the developers' commitment to establishing an ongoing dialogue with residents up to and beyond the submission of an application for planning permission.

CGNEE have placed open and transparent community engagement at the heart of their plans to apply for an extension of life for the Ballywater Wind Farm. The developers believe that effective community engagement is crucial to ensure that the voices of the residents are heard and respected. Engaging proactively with local stakeholders enables developers of projects to understand local needs, preferences and expectations, and can also help to build trust between the developers of a project and the community in which it is located.

These community engagement activities have been completed in line with the recommendations as set out in the *Draft Revised Wind Energy Development Guidelines (December 2019) – Community Engagement* which state that developers of wind farms should, in advance of submitting applications for planning permission, take:

“Active steps to: inform local communities as they begin to develop their proposals; take the views of local communities into account in designing their proposals; demonstrate what practical effect that process of engagement has had; and, set out how the project will perform as a good neighbour in the context of the long-term economic and social development of the community or communities within which it is situated.”

All community engagement and public consultation activities have been carried out according to the fundamental principle that proactive consultation and open discussion with local stakeholders is a crucial element of any wind energy project. In carrying out these community engagement activities, CGNEE endeavoured to put the community at the heart of the process to ensure meaningful consultation was carried out. This, in turn, generated constructive feedback which made a tangible impact on the final project design.

1.1

Project background

The Ballywater Wind Farm has been operational since 2005. The original grant of permission from Wexford County Council (PI Ref 2001/0458) included amongst its conditions that *“the use of the site shall cease at the end of the current 20-year grant of permission unless permission for its retention for a further period has been granted by the planning authorities.”* The current grant is due to expire in June 2025.

The existing Ballywater Wind Farm comprises 21 Enercon E70 model wind turbines of 99m tip height, 70m rotor diameter and 64m hub height, and associated hardstands, as well as a 110kV substation. The turbines are grouped into two clusters, with the larger of the two clusters comprising 17 turbines in the south-west of the site, and the smaller of the clusters comprising four turbines to the north-east. The connection to the national grid runs from the substation via an underground cable to the ESNB substation at Crane, Co Wexford, approximately 20 kilometres inland to the west.

Enercon turbines of the sort installed at Ballywater have an operational lifespan of over 30 years. CGNEE, as owners and operators of the wind farm, therefore wish to apply for a grant of permission to extend the operational life of the wind farm for another ten years, up to 2035.

It is important to note that there are no modifications to the existing development being proposed as part of this application for planning permission. None of the existing wind turbines will be altered in any way, and no more turbines will be added. This has been one of the key messages of the community engagement process.

1.2

Objectives of the community engagement process

Before the process of community engagement began, it was important to set out clear and specific objectives and goals for the process. The overall goal of the project team was to manage communications around the project by providing clear, accurate information to the local community and by providing the means and opportunities by which members of the community could provide their feedback, ask questions and voice concerns about the project.

Emerging from these overarching goals, the specific objectives of the community engagement process were as follows:

- To put the needs of the local community at the centre of the engagement process
- To identify the appropriate groups with whom to engage, based on their proximity to the wind farm site and the impact the wind farm has, and will continue to have, on their day-to-day lives
- To reach out to the community in a manner that was timely, proactive and respectful
- To ascertain the main concerns being expressed by the community in relation to the wind farm and address these concerns as comprehensively as possible
- To establish and maintain an open, two-way dialogue between the developers and the local community for the duration of the planning process
- To counteract the potential spread of speculation and misinformation relating to the extension of life application.

1.3

Community Engagement Strategy

Prior to the start of communication activities, MKO compiled a comprehensive Community Engagement Strategy (CES) which set out how the objectives of the process would be achieved. The methods to be employed over the course of the engagement process were set out in the CES. The CES was an evolving document which could be continually reviewed and amended throughout the engagement process to reflect the specific demands of the project as they were encountered, and to integrate feedback from the community.

2.

CONSULTATION ACTIVITIES

Once the objectives of the engagement process had been established, the project team set out on the implementation of the strategy. The engagement process was led by MKO's dedicated Project Communications unit, with expert input from MKO's environmental and ecological teams. The process was overseen by representatives of the project team from CGNEE and Ballywater Windfarm Ltd.

A range of methodologies were used over the course of the engagement process in an effort to connect with as many members of the community as possible. These methods included, but were not limited to:

- An initial leaflet drop to homes within a 1.5km radius of the turbine locations
- The delivery of feedback questionnaires to homes within the same radius
- The creation of a dedicated project website and email address, for members of the community to communicate their questions or concerns directly to the project team
- The hosting of an in-person Public Information Event, at which detailed plans for the extension of life were displayed
- Engagement with local elected representatives (county councillors, TDs, etc)

This multifaceted approach to the community engagement process sought to ensure that members of the community were kept fully informed of the project plans and were given ample opportunity to provide whatever feedback they wished, via as many different communications channels as were feasible.

2.1

Initial leaflet drop

The first phase of the community engagement strategy was an initial leaflet drop, which took place over the course of two days on Thursday and Friday, January 11-12, 2024. The leaflet drop was carried out by a member of MKO's Project Communications unit.

The leaflet drop involved every home within a 1.5km radius of an existing turbine receiving a hand-delivered package through their door. The package contained:

- A four-page information brochure detailing the background to the extension of life application, an overview of exactly what the application will entail, and information on the environmental, economic and community benefits that the Ballywater Wind Farm has had in its 20-year existence, and will continue to have should the extension of life be granted.
- A feedback questionnaire asking the following questions:
 1. Should the extension of life of the Ballywater Wind Farm be granted, the wind farm operators are committing to beginning a Community Benefit Fund which will start in 2025 and run annually for the remainder of the operational lifespan of the wind farm. This fund will be available to the local community for projects and/or developments of social benefit. What types of benefits do you feel the fund should provide to the local community?
 2. Do you have any concerns about the continued operation of the Ballywater Wind Farm and if so, what are they?
 3. Ballywater Windfarm Ltd is committed to keeping the local community informed about this extension of life application. Please help us identify any other local groups which you feel should be consulted with.
 4. Have you any further comments in relation to the Ballywater Wind Farm?
 5. Do you support the extension of life of the Ballywater Wind Farm?

The recipients of the questionnaire were encouraged to return their completed forms to the developers of the Ballywater Wind Farm, c/o MKO. Furthermore, houses within a 1km radius of an existing turbine were also supplied with a stamped and addressed envelope to return their feedback forms. This was done to make it as straightforward as possible for those residents living closest to the wind farm to provide their feedback free of charge. The questionnaire was also uploaded to the project website.

Over the course of the two days, approximately 180 homes in the vicinity of Ballywater Wind Farm received these project information packages.

2.2

Project website

A dedicated project website (www.ballywaterwindfarm.com) was designed and launched in tandem with the initial door-knock. The website address was included on the project brochure delivered to every home within a 1.5km radius of the wind turbine sites. The website featured more background information on the Ballywater Wind Farm and the reasons for the extension of life application. It also featured a platform for feedback from the general public.

A dedicated project email address (info@ballywaterwindfarm.com) was also established and included in the project brochure and website.

3.

PUBLIC INFORMATION EVENT

The next phase of the community engagement process involved hosting an in-person Public Information Event (PIE) to allow members of the community to meet with and speak directly to representatives of the project team. This event was held between 4pm and 8pm on Tuesday, March 5th, 2024. The venue chosen for the event was Ballygarrett Realt na Mara GAA Club, which was identified by the project team as the most suitable hall in the locality of the wind farm in which to host an event of this kind.

3.1

Event advertising

A strategic advertising campaign was designed and implemented to ensure that the Public Information event was brought to the attention of as many members of the local community as possible. This campaign had two primary strands:

- An advertisement placed in the local newspaper (the *Gorey Guardian*) in the edition of Wednesday, February 28th, six days out from the event (appx 2).
- A leaflet drop to every house within 1.5km of the turbine locations. The leaflets dropped contained the same information as appeared in the newspaper advert. It was deemed appropriate to provide every house within the 1.5km radius with a leaflet to ensure that the residents most likely to have an interest in the extension of life application were made aware of the event. This leaflet drop was carried out by a member of MKO's Project Communications team over the course of two days on Tuesday and Wednesday, February 27th – 28th.
- An email invitation to the Public Information Event was also circulated to the elected members of Wexford County Council representing both the Gorey and Kilmuckridge electoral areas, as well as to the five Teachtaí Dála for the Wexford constituency, a week prior to the event.

3.2

Event format

The Public Information Event was designed as a drop-in, exhibition-type event, to run over the course for four hours from 4pm to 8pm. The exhibition-type format was deemed the most suitable option for the event by the members of the project team, because it would allow attendees to come and view the display materials at their own time and pace, and to speak directly to representatives of the project team.

The display materials were collated and designed in the week prior to the event and printed on large A1 posters, which were erected on boards on either side of the venue. These materials included:

- Maps of the existing Ballywater Wind Farm showing the turbine layout, the turbines' proximity to homes, and the ecological and environmental constraints within which the wind farm operates

- Details about the extension of life application, including what exactly the application will entail and the reasons behind the application
- Details about the project team – CGN Europe Energy, MKO and Blackstaff Ecology, who conducted the ecological surveys required for the Environmental Impact Assessment Report (EIAR)
- Details on the EIAR itself, including the chapter headings
- Details on the environmental, economic and community benefits of the Ballywater Wind Farm, including the newly introduced Community Benefit Fund
- Details of the biodiversity of the Ballywater site, the land upon which it is situated, and the flora and fauna species that have been observed on the site over the course of the surveys
- Details about the next steps in the planning process, including the ongoing community engagement activities and the intention to submit an application for planning permission to Wexford County Council in the coming months

3.3

Event team

The Public Information Event team included representatives from the developers, CGN Europe Energy, and the planning and environmental consultants on the project, MKO. Present on the day were:

- Niall Monk, CGN Europe Energy
- Dylan Moore, CGN Europe Energy
- Robert Kennedy, MKO
- Keelin Bourke, MKO
- Toni Bourke, MKO
- Mark Higgins, MKO

Representatives of CGN Europe Energy and MKO pictured at the Public Information Event for the Ballywater Wind Farm Extension of Life application, held at Ballygarrett GAA Club on Tuesday, March 5th, 2024. From left: Mark Higgins (MKO), Toni Bourke (MKO), Dylan Moore (CGNEE), Niall Monk (CGNEE), Keelin Bourke (MKO) and Robert Kennedy (MKO).

Members of the MKO Project Communications unit had responsibility for welcoming attendees to the event and explaining the format of the exhibition. Upon arrival, attendees were invited to sign-in with their names and, if they so wished, a contact email and/or phone number. They were then given the option of viewing the exhibition materials on their own, or to be brought through the exhibition by a member of the project team.

Attendees were encouraged to ask any questions or raise any concerns they may have had about the project with a member of the project team, who would endeavour to answer these questions or concerns as thoroughly as possible. Attendees also had the option of filling out feedback forms before they left the exhibition.

The Public Information Event was reasonably well-attended, with approximately 35 members of the local community visiting the exhibition over the course of the four hours, including several near neighbours of the wind farm and some members of the local authority. The prevailing mood amongst attendees was one of broad support for the extension of life application; multiple members of the community expressed the view that because the turbines have already been in place for almost 20 years and are still producing energy efficiently, it is a logical decision to extend their operational lifespans.

4.

PUBLIC FEEDBACK

The project team sought as much public feedback as possible over the course of the community engagement process. Various channels were established to allow the members of the community to provide their thoughts, opinions, questions and comments on the extension of life application as easily as possible. These channels included:

- the feedback questionnaires attached with the initial project information pack (and the stamped and addressed envelopes provided to homes within 1km of a turbine location)
- the project website, which hosted an online version of the feedback form
- the dedicated project email address
- the in-person Public Information Event

Members of the community made use of the various channels to communicate their feelings towards the Ballywater Wind Farm to the project team. Broadly speaking, the feeling amongst the local community toward the wind farm, and the extension of life application, was supportive. The consensus emerging from the feedback received was that Ballywater Wind Farm is a long-established and well-settled development which has been largely accepted by the members of the community, most of whom had no concerns over its lifespan being extended by another ten years.

Several members of the community went so far as to say that the disruption that could be caused by decommissioning the turbines at this time would far outweigh any potential concerns over leaving them as they are, especially given that the turbines are still producing energy.

It would not be accurate to say that there was unanimous community support for the extension of life application, however. Over the course of the community engagement process, some members of the community did raise concerns over particular issues. These issues are summarised below, along with the steps taken by the project team to address them.

4.1

Issues raised

4.1.1

Proximity and changes to infrastructure

A small number of local residents raised concerns about the proximity of the wind turbines to their homes on visual amenity grounds. In certain locations, the existing turbines are within 500m of homes, most notably along the Cullentra/Ballinoulart Road to the south of the site, and in the townland of Oldtown, directly to the west of the smaller four-turbine cluster to the north of the site.

Some of these residents attended the Public Information Event to present these concerns directly to the project team, and to ensure that the proposed development would not involve increasing the height of the existing turbines, or the number of turbines in the wind farm. These fears were allayed by the

project team who reiterated that there are no material changes to the existing site being proposed as part of the extension of life development.

4.1.2 Noise concerns

Some residents, particularly those living along the Cullentra/Ballinoulart Road to the south of the site, expressed concerns about the noise outputs from the turbines while in motion.

These residents were informed that noise monitoring surveys will form part of the extension of life application and that all noise emissions will fall within accepted guideline levels.

4.1.3 Traffic

Some residents expressed concerns over a potential increase in traffic flow as a consequence of the extension of life application. These concerns were addressed by the project team, who assured residents that there would be no increase in traffic flow to or from the wind farm site as a result of the extension of life being granted, and that traffic flow arising from maintenance, surveying, etc, would remain unchanged from its current levels should the extension be granted.

4.1.4 Decommissioning

Several members of the local community queried what would become of the turbines and the associated infrastructure at the end of the ten-year extension of life being sought in this application. Some residents expressed concerns over the potential environmental and ecological damage that could be done to the adjacent SAC by the removal of the turbines and/or the excavation of their foundations.

In response, the project team explained that a decommissioning plan will be included as part of the planning application, which will outline how the turbine components will be safely deconstructed and removed with minimal disturbance to the surrounding environments at their end of their lifespan. It was further explained that any conditions included in the planning decision regarding decommissioning will be followed.

Additionally, it was clarified that modern decommissioning plans and conditions note that leaving the subterranean elements of wind turbines (i.e. foundations) in-situ is the preference to reduce the environmental impact from decommissioning. This is the decommissioning approach proposed for Ballywater Wind Farm, as outlined in the decommissioning plan appended to the Environmental Impact Assessment Report.

4.2 Support for the extension of life

Each of the feedback questionnaires distributed to homes within 1.5km of the turbine locations finished with a direct yes/no question asking residents if they supported the extension of life of the Ballywater Wind Farm. Approximately 180 of these questionnaires were distributed in hard copy, while residents also had the option of filling in the form online and submitting it via email.

15 feedback questionnaires were received in the post over the following number of weeks, while a further three questionnaires were submitted via email. From a total of 18 responses, 14 answered 'yes' to the question of whether they supported the extension of life. One response answered 'no' and three left the question unanswered.

5.

COMMUNITY BENEFIT FUND

The Ballywater Wind Farm does not currently contribute to a Community Benefit Fund of any kind. An informal fund was established early in the project's development circa 2005 but that fund was discontinued soon after.

Newly built wind energy developments which operate under the Renewable Energy Support Scheme (RESS) structures are now obliged to establish a Community Fund for the area in which they are situated. The developer allocates a minimum of €2 per MWh from the revenues generated by the wind energy development towards the fund, which is available for local community groups, sports clubs, etc.

Ballywater Wind Farm does not operate under RESS and is therefore not obliged to provide a Community Benefit Fund. However, CGNEE made the decision, as part of the application for an extension of life, to establish a fund to demonstrate their commitment to the local area and their desire to support the local community. This fund will be to the minimum value of €30,000 per annum for the remaining lifespan of the Ballywater Wind Farm.

If the extension of life is granted, the Community Benefit Fund will begin in 2025 and run annually for the remainder of the operational lifespan of the wind farm. The fund will be made available for the local community for projects and/or developments of social and environmental benefit.

The developers have partnered with the Community Foundation Ireland (CFI) in order to operate the fund. CFI are a team of professional advisors, strategists and activators with over 20 years of experience providing the expertise to enable donors to positively impact Irish communities through strategic giving.

The Community Benefit Fund would be administered and controlled entirely by CFI in partnership with the local community. Ballywater Wind Farm Ltd and CGNEE will have no say or involvement in how the funds are used.

5.1

Funding suggestions

The establishment of the Community Benefit Fund was announced to the residents via the initial leaflet-drop in January 2024. Along with being provided with background information on the fund, its intended function and the involvement of CFI, residents were asked, via the feedback questionnaires, what types of benefits they felt the fund should provide to the local community, and whether there were any specific groups, associations, clubs, etc, that they felt should benefit from the fund.

Residents were enthusiastic in their suggestions, both via the questionnaires and at the in-person Public Information Event. Some of the suggested bodies that may benefit from the fund included:

- The churches in the parish
- Local national schools
- Local Tidy Towns committee
- The Ballygarrett village Christmas lights committee
- The Cahore lifeboat and inshore rescue
- Local hedge-cutting
- The playground in Ballygarrett village
- The restoration of the Cahore canal and improvements to the Cahore trail
- Ballygarrett GAA Club
- Killenagh Wanderers AFC
- The 1914 Club
- Local charities

6.

CONCLUSION

The various issues raised by the residents over the course of the consultation process have been considered at all stages of the extension of life application. At all stages of the engagement process, the developers were fully conscious of the need for members of the local community to be properly consulted with and listened to, and their questions and concerns suitably addressed.

The developers have been especially conscious of the concerns held by some residents over issues such as proximity and visual impact, and the noise impact of the wind farm, and have made all efforts to address these concerns as comprehensively as possible.

Ballywater Windfarm Ltd and CGNEE have sought to make the interests of the local community a primary consideration of the extension of life application. This has been demonstrated not only through the extensive programme of door-to-door engagement, in-person consultation and ongoing liaisons with residents via the project website, email and phone, but also through the voluntary establishment of the Community Benefit Fund, which it is hoped will provide meaningful economic benefit to the residents of the communities surrounding the Ballywater Wind Farm for the next decade.

The developers are committed to maintaining the strong community engagement approach throughout the post-application stage and, if the extension of life is granted, will continue to consult with and be available to residents through the remaining operational lifespan of the Ballywater Wind Farm.

APPENDIX 2-3

CUMULATIVE IMPACT ASSESSMENT

Local Authority Planning Applications

Planning Authority	Application Number	Development Description	Development Address	Application Status	Application Type	Decision	Received Date	Grant Date	Appeal Ref Number	Appeal Decision	Dist to Turbine (km)	Dist to EIR Boundary (km)
Wexford County Council	20140443	PERMISSION FOR THE ERECTION OF AN EXTENSION TO THE SIDE OF AN EXISTING DWELLING	GLEBE, ARDCAVAN	APPLICATION FINALISED	PERMISSION	CONDITIONAL	18/06/2014	01/10/2014		n/a	22.13	17.25

Wicklow County Council	2488	alterations to the development permitted under Reg. Ref. 20/1088, as amended by Reg. Ref. 23/62, and will supersede the permitted information and communications technology (ICT) facility buildings permitted on site. In summary, the development comprises the replacement of the 3 no. part one and part two storey ICT facility buildings permitted on site, with 5 no. part two and part three storey ICT facility buildings with a reduced building footprint, along with an energy centre compound. The Battery Energy Storage System permitted under Reg. Ref. 23/62 and the substation and transmission line connections permitted under ABP Ref. 315200-22 will be unaffected by the proposed alterations. An Environmental Impact Assessment Report (EIA) has been prepared and will be submitted to the planning Authority with the planning application. An EPA-Industrial Emissions Directive (IE) licence will be applied for to facilitate the operation of the proposed development	Site located to the north and northeast of the existing Kish Business Park, Arklow, Co. The proposed development is located within the townlands of Bogland, Kish, Cooladangan, Ballincomary, Ballyroonaun, and Ballynattin, Co. Wicklow	Provision of a new 110kV Gas Insulated Switchgear substation and associated underground transmission line connections to an existing overhead line, via two new dropdown masts.	23/11/2022	24.97
2022234	Wexford County Council	20221776	Sanrose Limited	Site of approx. 4.9 hectares located in the townlands of Ballykelly, Ballymurn Upper, and Ballynabrigade, County Wexford.	Proposed extension to an existing permitted (WCC Ref. 20161081) sand pit into adjoining greenfield land (approx 1.97 ha) and continued use of approx. 2.93 ha of the permitted site to facilitate existing vehicular access and ancillary activities.	08/12/2022	17.85
2023052	Wexford County Council	20230372	Roadstone Limited	13.95 ha of land within the Brownwood Quarry Complex, Brownwood, Eniscorthy, County Wexford ITM 697850 637205	Restoration of a quarry void through the importation of inert soil and stone material (either by-product or waste) to agricultural land and the provision of ancillary items.	30/03/2023	22.46
2023074	Wexford County Council	20230557	Rathdrinagh Land Unlimited Company T/A Irish Recycling Ltd	Townland of Clevass, Eniscorthy, County Wexford.	Materials Recovery Facility (MRF) and an Office and ancillaries. The MRF will recycle and recover waste materials. The annual processing capacity will be 99,000 tonnes.	09/05/2023	20.78
2023132	Wexford County Council		Roadstone Limited	13.95 ha of land within the Brownwood Quarry Complex, Brownwood, Eniscorthy, County Wexford ITM 697850 637205	Restoration of a quarry void through the importation of inert soil and stone material (either by-product or waste) to agricultural land and the provision of ancillary items.	26/07/2023	22.48
2023146	Wexford County Council	20230978	Roadstone Limited	13.95 ha of land within the Brownwood Quarry Complex, Brownwood, Eniscorthy, County Wexford ITM 697850 637205	Restoration of a quarry void through the importation of inert soil and stone material (either by-product or waste) to agricultural land and the provision of ancillary items.	21/08/2023	22.48
2024027	Wexford County Council	20240205	Anthony D'Arcy Ltd.	Ballyconinger Lower Blackwater Co. Wexford	Continued use and extension of existing sand pit; sand extraction and processing (screening & washing) using existing semi mobile plant located on pit floor; screening berms; restoration; and all ancillary works within an application area of 22.9 hectares.	19/02/2024	11.68
2024040	Wexford County Council		Sanrose Limited	lands located within the townlands of Ballyhucas and Ballynabrigade at Ballymurn, Co. Wexford.	Permission is sought for a new sand pit on a site of c. 22 ha including upgrades to an existing access road & junction with L2040. Installation of washing plant, mobile screening, wheel wash, screening berms and all ancillary site works incl. landscaping.	05/03/2024	17.82
2024049	Wexford County Council	20240307	Sanrose Limited	lands located within the townlands of Ballyhucas and Ballynabrigade at Ballymurn, Co. Wexford.	Permission is sought for a new sand pit on a site of c. 22 ha including upgrades to an existing access road & junction with L2040. Installation of washing plant, mobile screening, wheel wash, screening berms and all ancillary site works incl. landscaping.	19/03/2024	17.78
2024095	An Bord Pleanála	ABP-315864-24	Sure Partners Limited	The Proposed Development is located off the coast of Co. Wicklow and Co. Wexford, on the east coast of Ireland.	The Proposed Development is an offshore wind farm consisting of wind turbine generators, offshore substation platforms, subsea cabling and associated infrastructure.	27/05/2024	23.37

APPENDIX 4-1

LIFETIME OF WIND TURBINES

To whom it might concern,

Ballywater Windfarm Ltd, which is a subsidiary of CGNEE, is located on the southeast coast of Ireland, between the villages of Kilmuckridge and Ballygarrett, in County Wexford. Ballywater Windfarm consists of 21 x ENERCON E-70 turbines. The original windfarm planning permission was granted by Wexford County Council in July 2002 for a period of 20-years (PI. Ref. 2001/0458). The commissioning of Ballywater Windfarm was completed in 2005, with a proposed decommissioning date of June 2025.

Ballywater Windfarm Ltd is applying to Wexford County Council to extend the current planning permission of Ballywater Windfarm by an additional 10 years. The current performance of the site and its assets indicate that the site can successfully operate for the proposed timeframe.

The decision to extend the operational life of Ballywater Windfarm was taken after detailed safety, environmental and technical integrity considerations including:

- The assets at Ballywater Wind Farm have been maintained to the highest standards by the turbine manufacturer for the duration of the wind farm's operational life.
- In 2012, the blades of all 21 turbines were replaced. This was carried out as a defect in the original blades was discovered on several windfarms across Europe and the decision was made to update all blades ensuring the ongoing reliability and efficiency of the wind turbines. By completing these works in 2012, this extends the life of the blades by an additional 7 years.
- Blade inspections are conducted annually on all turbines, and the blade conditions are of a high standard.
- End-of-Warranty inspections for Ballywater Windfarm were completed between 2020 and 2021, independent from the turbine manufacturer, ENERCON. Additionally, ENERCON have confirmed they have similar projects across Europe with the same characteristics to that of Ballywater Windfarm which are currently beyond their initial 20-year operation period and are

continuing to offer full-service maintenance contracts for such facilities beyond the 20 years.

- Ballywater Windfarm, in conjunction with ENERCON, the turbine manufacturer, have exchanged 8 turbine generators across the site since 2016 as part of ongoing upgrade works that will ensure the continued operation of the windfarm beyond the initial 20-year operating period.
- The outcome of the Life Extension program has been carefully evaluated, and necessary actions are implemented to ensure the continued safe and efficient operation of the wind farm. This includes maintaining safety standards, addressing environmental considerations, preserving asset integrity, conducting targeted maintenance, and ensuring consistency in managing aging infrastructure.
- Extending the operational life of Ballywater Windfarm will ensure the continued production of clean, renewable energy, which is vital for powering approximately 20,000 Irish households annually and reducing reliance on imported fossil fuels.

CGNEE is satisfied based on internal performance reviews, that Ballywater Windfarm is capable of operating for the proposed extended 10 years till 2035.

Kind Regards

Bin He

Director of Ballywater Windfarm Ltd

APPENDIX 4-3

OPERATION AND
ENVIRONMENTAL
MANAGEMENT PLAN

1.

INTRODUCTION

This Operation and Environmental Management Plan (OEMP) has been prepared by MKO on behalf of Ballywater Windfarm Ltd (the Applicant) who intend to apply to Wexford County Council (WCC) for planning permission to extend the operational period of the existing Ballywater Wind Farm (as permitted under Wexford County Council Planning Ref. 2001/0458) and the existing onsite Ballywater 110kV Substation (as permitted under Wexford County Council Planning Ref. 2004/2901) for an additional 10 years to 2035 after the expiry of their current planning permissions in 2025. The proposed lifetime extension of the existing wind farm and substation is hereafter referred to as the Proposed Development.

This report provides the environmental management framework to be adhered to during the extended operational phase of the Proposed Development and it incorporates the mitigating and monitoring principles that minimises the potential for any environmental impacts to occur.

This document has been prepared to accompany the Environmental Impact Assessment Report (EIAR) prepared as part of the planning application for the Proposed Development.

1.1

Scope of the Operation and Environmental Management Plan

This report is presented as a guidance document for the operation of the Proposed Development and is intended to replace the environmental management plan currently in place up to expiry of the existing permission in June 2025. The OEMP is intended to provide a more concise document targeted specifically at the continued operation of the Proposed Development.

Where the term 'site' is used in this OEMP it refers to all works associated with the operation of the Proposed Development. The OEMP clearly outlines the mitigation measures and monitoring proposals that are required to be adhered to in order to operate the site in an appropriate manner.

The report is divided into six sections, as outlined below:

- **Section 1** provides a brief introduction as to the scope of the report.
- **Section 2** outlines the Site and Project details, detailing the targets and objectives of this plan along with providing an overview of methodologies for works that will be carried out during the operational phase of the Proposed Development.
- **Section 3** sets out details of the environmental controls to be implemented on site including the mechanisms for implementation.
- **Section 4** consists of a summary table of all mitigation proposals to be adhered to during the operational phase of the Proposed development.
- **Section 5** consists of a summary table of all monitoring proposals to be adhered to during the operational phase of the Proposed development.
- **Section 6** outlines the proposals for reviewing compliance with the provisions of this report.

2. SITE AND PROJECT DETAILS

2.1 Site Location and Description

The existing Ballywater Wind Farm and Ballywater 110kV Substation are located on the coast of Co. Wexford, approximately 4km northeast of Kilmuckridge village.

The turbines are currently grouped into two clusters, with the smaller of this cluster located to the northeast of the site and comprising of 4 no. turbines. The larger cluster in the south of the site, comprises of 17 no. turbines, as well as the onsite substation, which is located to the west of this cluster. Access to the southern section of the site for general traffic, such as maintenance vehicles, is via the current existing entrance at the R742 Regional Road, which runs along the western side of the site boundary. Access to the northern section of the site is via the Cahore Local Road, which runs along the northern side of the site boundary.

No construction activities or alterations to the existing Ballywater Wind Farm and Ballywater 110kV Substation are proposed beyond routine maintenance of the turbines and electrical infrastructure during the operational phase of the Proposed Development.

2.2 Description of the Proposed Development

Planning permission is sought for the continued operation of the existing Ballywater Wind Farm as permitted under the provisions of WCC Pl. Ref 2001/0458. All 21 no. turbines were granted by Wexford County Council (WCC) under this planning permission. The turbines are currently grouped into two clusters, with the smaller of this cluster located to the northeast of the site and comprising of 4 no. turbines. The larger cluster in the southwest of the site is comprised of 17 no. turbines, as well as the onsite substation, which is located to the west of this cluster, as indicated in Figure 4-2 of Chapter 4 of the EIAR. Planning permission is also sought for the continued operation of the existing onsite Ballywater 110kV Substation, which was permitted under the provisions of WCC Pl. Ref. 2004/2901.

The Proposed Development does not comprise any alterations or modifications to the existing operational wind farm and substation. The Proposed Development encompasses the continued operation of the wind farm and substation, which comprises:

- (i) 21 no. existing Enercon E70 wind turbines with a maximum overall blade tip height of 99 metres (m), including hardstands;
- (ii) Existing 1 no. onsite 110 kilovolt (kV) electrical substation which includes 1 no. control building, security fencing, external lighting, underground cabling, and all associated infrastructure and associated electrical plant and apparatus;
- (iii) All existing associated electrical and communications cabling connecting the turbines to the onsite Ballywater 110kV Substation;
- (iv) Existing gated site entrances from the R742 and an unnamed local road;
- (v) Existing internal access tracks; and,
- (vi) All existing ancillary infrastructure.

All elements of the existing wind farm and substation are pre-existing, and it is not proposed to make any alterations to the current site layout, wind turbines, substation, or associated infrastructure as part of this application.

As described above, it is proposed to continue the operation of the existing wind farm and substation for a further period of 10 years, from its currently required date of decommissioning in 2025, to 2035. All elements of the Proposed Development are pre-existing and it is not proposed to make any alterations to the current site layout, wind turbines, substation or associated infrastructure.

The site layout showing the existing wind farm and substation layout is shown in Figure 2-1 below.

As construction has been completed, elements of the project that were developed as a temporary facilitator have either been removed, restored to their original condition or will have naturally revegetated. All access roads and hardstanding areas form part of a site roadway network which will be required by the ongoing agricultural activities at the site, and therefore will be left in situ for future use. It is intended that decommissioning will remove the existing turbines and reinstate areas where infrastructure is removed. The following elements are included:

- > Wind turbines dismantling and removal off site;
- > Electrical Cabling remaining in-situ;
- > Turbine foundation covering (underground reinforced concrete remaining in-situ).

A Decommissioning Plan has been prepared for the Proposed Development and is presented as Appendix 4-4 of this Environmental Impact Assessment Report (EIAR).

2.3 Targets and Objectives

The existing Ballywater Wind Farm and Ballywater 110kV Substation will continue to be operated to an approved standard and codes of practice. This OEMP considers environmental issues, and this is enhanced by the works proposals during operation, as set out in the ELAR.

The key site targets are as follows;

- Ensure works and activities are completed in accordance with mitigation and best practice approach presented in the planning documentation prepared for the site;
- Ensure operational phase works and activities have minimal impact/disturbance to local landowners and the local community;
- Ensure operation and works have minimal impact on the natural environment;
- Adopt a sustainable approach to site operation; and,
- Provide adequate environmental training and awareness for all project personnel.

The key site objectives are as follows;

- Using recycled materials if possible;
- Ensure sustainable sources for materials supply where possible;
- Avoidance of any pollution incident or near miss as a result of working around or close to existing watercourses and having emergency measures in place;
- Avoidance of vandalism;
- Keeping all watercourses free from obstruction and debris;
- Correct implementation of the sustainable drainage system (SuDS) drainage design principles;
- Keep impact of operation to a minimum on the local environment, watercourses, and wildlife;
- Correct fuel storage and refuelling procedures to be followed;
- Good waste management and house-keeping to be implemented;
- Air and noise pollution prevention to be implemented;
- Monitoring of the works and any adverse effects that it may have on the environment. Working methods will be altered where it is found there is the potential to have an adverse effect on the environment;

2.4 Wind Farm Operation Overview

An appointed Operators Controller will install a Site Manager to manage the day-to-day operation of the existing wind farm and substation. The Site Manager will be responsible for ensuring compliance with this OEMP and any revisions made to this document throughout the operation. An overview of the anticipated operational phase activities is provided below.

2.4.1 Turbine Maintenance

The existing Ballywater Wind Farm and Ballywater 110kV Substation will continue to be the subject of ongoing maintenance throughout the operational life of the site. This will be undertaken by turbine suppliers and site personnel who will manage and operate the site from the onsite control building at Ballywater Wind Farm. The turbine maintenance will not require significant plant or equipment, with all works localised in nature with operatives using vans to access the site and transport their equipment.

2.4.2 Shadow Flicker Monitoring

An assessment of the potential effects associated with shadow flicker was undertaken using the WindPRO computer software to model the predicted daily and annual shadow flicker levels (the results and associated mitigation measures of which are presented in Chapter 5 of the EIAR). As part of this assessment, it was determined that exceedances of the 2006 DoEHLG guidelines ('Wind Energy Development Guidelines for Planning Authorities', Department of the Environment, Heritage and Local Government, 2006) daily threshold for shadow flicker would be experienced at 26 no. properties. Of the 26 no. properties, 1 no. is derelict, and 1 no. owned by the participating landowners, and no mitigation is required.

2.4.3 Turbine Noise Modelling

An operational noise assessment was undertaken for the Proposed Development to compare predictions from the proposed extension of the lifetime against existing consented noise limits to demonstrate compliance with noise conditions of attached to the previous grant of permission for the site (Wexford County Council Planning Reference Ref. 2001/0458) and the existing onsite Ballywater 110kV Substation (Wexford County Council Planning Ref. 2004/2901). Details of same can be found in Chapter 10 of the EIAR.

The assessment was undertaken to determine whether the Proposed Development could operate within the existing consented noise limits. To inform this assessment existing noise levels have been measured at a set of locations, representative of the nearest NSLs in the vicinity of the site to assess the potential impacts associated with the operation of the Proposed Development and it was concluded that the wind turbine noise emissions on all noise receptors were below the consented noise limits.

It should be further noted that there have been no operational noise complaints from the site and compliance monitoring undertaken at the site previously have demonstrated that the wind farm was operating within its noise conditions. The future operation of the Proposed Development will adhere to any noise compliance requirements that may be conditioned subject to the outcome of the planning application.

In the event of a complaint regarding noise during the operational phase of the Proposed Development, including a complaint that indicates potential amplitude modulation (AM) the operator will employ a qualified acoustic consultant for assessment. If required, the acoustic consultant will assess the level of AM in accordance with the methods outlined in the Institute of Acoustics IOA Noise Working Group (Wind Turbine Noise) *Amplitude Modulation Working Group Final Report: A Method for Rating Amplitude Modulation in Wind Turbine Noise* (9 August 2016) or subsequent revisions. If considered necessary by that investigation, measures to mitigate will be implemented, consisting of the implementation of operational controls for the relevant turbine type, which will include turbine curtailment under specific operational conditions.

3.

ENVIRONMENTAL MANAGEMENT

The following sections give an overview of the drainage design, dust and noise control measures, a waste management plan for the site and implementation of the environmental management procedures for the site.

3.1

Site Drainage

During the operational phase, various combinations/adaptations of the runoff control and drainage management measures will be employed at the site, depending on the local conditions and topography. These best practice measures include:

- Natural vegetation filters are used regularly across the site where the local drainage and topography allowed attenuation of surface water runoff.
- Where possible, interceptor drains are installed up-gradient of infrastructure to collect clean surface runoff, in order to minimise the level of runoff reaching areas where suspended sediment could become entrained. It is now directed to areas where it can be re-distributed onto natural vegetation.
- Swales/roadside drains are used to collect runoff from access roads and turbine hardstanding areas of the site, likely to have entrained suspended sediment, and channel it onto natural vegetation filters.

With regards to the existing wind farm infrastructure, there are no constructed drainage outfalls associated with the wind farm infrastructure, with runoff instead flowing off hardstands and onto the adjacent ground in an 'over the edge' drainage approach across most of the site. No drainage issues were noted at the site (i.e. erosion, concentrated runoff, channelling of flow etc) during any of the site walkovers. Additionally, there are no wind farm drainage outfalls that preferentially channel runoff towards the SAC/SPA, as drainage is "over the edge" onto the adjacent grassland.

During the operational phase, occasionally construction vehicles or plant may be necessary for maintenance of access roads and hardstand areas. Upgrades to underground electrical cabling might require some minor ground works. Small amounts of clean granular material may be imported to maintain the surfaces of access tracks and hardstands during operation. During these routine maintenance works, application of temporary drainage control measures (i.e. silt fencing) and standard protection measures with regard oils/fuel usage will be sufficient to prevent any significant hydrological/hydrogeological effects in the nearby SAC/SPA. These measures will primarily be required at the northern turbine cluster.

Mitigation measures which are already operational on the Proposed Development site, will be maintained during the proposed lifetime extension. Further mitigation measures may need to be put in place during the decommissioning phase, as discussed in Appendix 4-4 Decommissioning Plan.

The Environmental Impact Statement prepared as part of the original planning application (Wexford County Council Pl. Ref: 2001/0458 and Pl. Ref:2004/2901) indicated that the construction phase of the existing Ballywater Wind Farm and Ballywater 110kV Substation, after following the proposed mitigation measures for the management of soils and water at the site, had no significant or adverse impacts to ground or surface waters.

3.2

Refuelling, Fuel and Hazardous Materials Storage

Any plant and equipment used during the operational phase will require refuelling during the works. Appropriate management of fuels will be required to ensure that incidents relating to refuelling are avoided. The following mitigation measures are proposed to avoid release of hydrocarbons at the site:

- All plant and machinery to be serviced before being mobilised to site
- Road-going vehicles will be refuelled off site wherever possible;
- Onsite refuelling will be carried out at designated refuelling areas at various locations throughout the site. Machinery will be refuelled directly by a fuel truck that will come to site as required, irrespective of the buffer distance and location of refuelling, interceptor drip trays will be available in accordance with standard good practice. Interceptor drip trays will be positioned under any stationary mobile plant to prevent oil contamination of the ground surface or water;
- Only designated trained and competent operatives will be authorised to refuel plant on site.
- Fuel pipes on plant outlets at fuel tanks etc. will be regularly checked and maintained to ensure that no drips or leaks to ground occur;
- During maintenance and service visits, some waste (lubricating and cooling oils, packaging from spare parts or equipment, unused paint, etc.) will arise. This will be recorded and removed from the Wind Farm Site and reused, recycled or disposed of in accordance with the relevant legislation in an authorised facility. Oils for the purposes of cooling the turbine transformers are stored in bunded tanks within the turbine foundations, within a bund able to contain at least 110% of the volume stored. Any leaks would be contained within the turbine transformer units and hydrocarbons would not be able to permeate to ground. Fuel will not be stored onsite on an ongoing basis. Fuel will only be brought onto site on a temporary basis during times of site outages, used on a temporary basis, to ensure containment and prevent spillages of fuel. During such instances, fuel will only be contained within a bunded electrical generator. No fuels, chemicals or solvents will be stored outside the confines of the site;
- During maintenance and service visits, some waste (lubricating and cooling oils, packaging from spare parts or equipment, unused paint, etc.) will arise. This will be recorded and removed from the Wind Farm Site and reused, recycled or disposed of in accordance with the relevant legislation in an authorised facility. Oils for the purposes of cooling the turbine transformers are stored in bunded tanks within the turbine foundations, within a bund able to contain at least 110% of the volume stored.
- No burning of any materials shall be permitted;
- The plant used will be regularly inspected for leaks and fitness for purpose; and,
- An emergency plan for the operational phase to deal with accidental spillages will be developed. Spill kits will be available to deal with and accidental spillage in and outside the refuelling area.
- A programme for the regular inspection of plant and equipment for leaks and fitness for purpose is currently in place and will continue throughout the operational phase.

3.2.1

Spill Control Measures

Every effort will be made to prevent an environmental incident during the operational phase of the Proposed Development. Oil/fuel spillages are one of the main environmental risks that will exist on the site which will require an emergency response procedure. The importance of a swift and effective response in the event of such an incident occurring cannot be over emphasised. The following steps provide the procedure to be followed in the event of such an incident:

- Stop the source of the spill and raise the alarm to alert people working in the vicinity of any potential dangers.
- If applicable, eliminate any sources of ignition in the immediate vicinity of the incident.
- Contain the spill using the spill control materials, track mats or other material as required. Do not spread or flush away the spill.
- If possible, cover or bund off any vulnerable areas where appropriate such as drains, watercourses or sensitive habitats.
- If possible, clean up as much as possible using the spill control materials.
- Contain any used spill control material and dispose of used materials appropriately using a fully licensed waste contractor with the appropriate permits so that further contamination is limited.
- Notify the Site Manager immediately giving information on the location, type and extent of the spill so that they can take appropriate action.
- The Site Manager will inspect the site and ensure the necessary measures are in place to contain and clean up the spill and where necessary appoint a specialist contractor to undertake the clean-up and prevent further spillage from occurring.
- The Site Manager will notify the appropriate regulatory body such as Wexford County Council, and the Environmental Protection Agency (EPA), if deemed necessary.

The importance of a swift and effective response in the event of such an incident occurring cannot be over emphasised. Environmental incidents are not limited to just fuel spillages. Therefore, any environmental incident must be investigated in accordance with the following steps.

- The Site Manager must be immediately notified.
- If necessary, the Site Manager will inform the appropriate regulatory authority. The appropriate regulatory authority will depend on the nature of the incident.
- The details of the incident will be recorded on an Environmental Incident Form which will provide information such as the cause, extent, actions and remedial measures used following the incident. The form will also include any recommendations made to avoid reoccurrence of the incident.
- If the incident has impacted on a sensitive receptor such as an archaeological feature the Site Manager will liaise with the Project Archaeologist.
- A record of all environmental incidents will be kept on file by the Site Manager and the Main Contractor. These records will be made available to the relevant authorities such as Wexford County Council, EPA if required.

The Site Manager will be responsible for any corrective actions required as a result of the incident e.g. an investigative report, formulation of alternative works methodologies or environmental sampling, and will advise the Operators Controller as appropriate.

3.3

Noise Control

The operation of plant and machinery, including site vehicles, is a source of potential impact that will require mitigation at all locations within the site. Proposed measures to control noise include:

- Limiting the hours during which site activities likely to create noticeable levels of noise or vibration are permitted;
- Establishing channels of communication between the Applicant or contractor, Local Authorities and residents;
- Selection of plant with low inherent potential for generation of noise and/or vibration;
- No plant or machinery will be permitted to cause a public nuisance due to noise;
- The best means practicable, including proper maintenance of plant, will be employed to minimise the noise produced by on site operations.

- All vehicles and mechanical plant will be fitted with effective exhaust silencers and maintained in good working order for the duration of works;
- Compressors models fitted with properly lined and sealed acoustic covers which will be kept closed whenever the machines are in use and all ancillary pneumatic tools shall be fitted with suitable silencers;
- Machinery that is used intermittently will be shut down or throttled back to a minimum during periods when not in use; and
- The hours of maintenance works (and associated traffic movements) will, insofar as possible, be limited to avoid unsociable hours. Activities shall generally be restricted to between 07:00hrs and 19:00hrs Monday to Friday and between 07:00hrs and 13:00hrs on Saturdays, with no activities on Sundays or public holidays unless in the event of an emergency.

Given the reduced scale of plant and equipment that will be used during operations in comparison to the construction phase, it is not anticipated that impacts associated with noise from plant and equipment will be experienced during operation when considering no significant impact was experienced during construction. However, the appropriate mitigation has been provided above for implementation as required.

The findings of the noise monitoring campaigns confirm that operational phase noise levels are below the limits set out in the planning consent for the existing development. Other than the continuation of a rigorous turbine maintenance programme in accordance with the manufacturer's specifications, no specific noise mitigation measures are required or proposed.

3.4 Traffic Management

The ongoing turbine and general site maintenance will be completed by personnel. Typically, maintenance traffic will consist of four-wheel drive vehicles or vans. It is estimated that 1-2 daily visits will be made to the wind farm site for authorised persons and vehicles to undertake minor routine maintenance and inspection, if and when required. The small volumes of traffic and intermittent nature of the works will not require any specific traffic management.

3.5 Environmental Management Implementation

3.5.1 Roles and Responsibilities

The Site Manager will be the project focal point relating to operation-related environmental issues.

In general, the Site Manager will maintain responsibility for monitoring site operations and Contractors/Sub-contractors from an environmental perspective. The Site Manager will act as the regulatory interface on environmental matters. The Site Manager will be responsible for reporting to and liaising with Wexford County Council and other statutory bodies as required.

The Operation Controller will be responsible for employing the services of suitably qualified professionals as required throughout the operational phase.

3.5.2 Environmental Induction

The Environmental Induction will be integrated into the general site induction on a case-by-case basis for each member of staff employed onsite depending on their assigned roles and responsibilities on site. Where necessary, the Environmental Induction will as a minimum include:

- A copy of the OEMP and discussion of the key environmental risks and constraints;
- A discussion of the applicable Works Method Statement;

- The roles and responsibilities of staff, including contractors, in relation to environmental management; and,
- An outline of the Environmental Incident Management Procedure.

3.5.3 **Toolbox Talks**

Toolbox talks will be held by the Site Manager at the commencement of each day, or at the commencement of new activities where required. The aims of the toolbox talks are to identify the specific work activities that are scheduled for that day or phase of work. In addition, the necessary work method statements and sub plans would be identified and discussed prior to the commencement of the day's activities.

Site meetings would be held on a regular basis involving all site personnel. The objectives of site meetings are to discuss the coming weeks activities and identify the relevant work method statements and sub plans that will be relevant to that week's activities. Additionally, any non-compliance identified during the previous week would also be discussed with the aim to reduce the potential of the same non-compliance reoccurring.

4.

MITIGATION PROPOSALS

All mitigation measures relating to the operational phase of the Proposed Development were set out in the various sections of the Environmental Impact Assessment Report (EIAR) which accompanies this planning application.

This section of the OEMP groups together all of the mitigation measures presented in the planning documentation. The mitigation measures are presented in Table 4-1 below.

By presenting the mitigation proposals in the below format, it is intended to provide an easy to audit list that can be reviewed and reported on during the operational phase of the Proposed Development. The tabular format in which the below information is presented, can be further expanded upon during the course of operation and provides a reporting template for site compliance audits.

Table 4-1 Operational Phase Mitigation Measures

Ref No.	Reference Location	Mitigation Measures	Audit Result	Action Required
Operational Phase				
MM1	ELAR Chapter 5	Regarding Health and Safety during the operational phase: ➤ Mitigation measures that are currently in place will continue during the extended operation of the Proposed Development to ensure that the risks posed to staff, landowners and the general public will remain negligible throughout the extended operational life of the wind farm. ➤ Access to the turbines is through a door at the base of the structure, which will be locked at all times outside maintenance visits. ➤ Signs have been erected at suitable locations across the site as required for the ease and safety of operating the various components of the Project. These signs include: ➤ Buried cable route markers at regular intervals and change of cable route direction; ➤ Directions to relevant turbines at junctions; ➤ "No access to Unauthorised Personnel" at appropriate locations; ➤ Speed limits signs at site entrance and junctions; ➤ "Warning these Premises are alarmed" at appropriate locations; ➤ "Danger Overhead HV" at appropriate locations; ➤ "Warning – Keep clear of structures during electrical storms, high winds or ice conditions" at site entrance; ➤ "No unauthorised vehicles beyond this point" at specific site entrances; and ➤ Other operational signage required as per site-specific hazards. Other operational health and safety measures which are currently in operation at the site include: ➤ All site visitors must complete a site-specific health and safety induction prior to entering the site		

Ref No.	Reference Location	Mitigation Measures	Audit Result	Action Required
		- Visitors must log onto the site on entry and log the site on exit by contacting a 24-hourly monitored control room - Minimum site Personal Protective Equipment (PPE) is necessary in order to enter the site, including a hard hat, safety boots and hi-visibility clothing - Along the Underground Grid Connection, on the public roadway, underground marker posts are present During the operation of the wind farm regular maintenance of the turbines is carried out by the turbine manufacturer or appointed service company. A project or task specific Health and Safety Plan has been developed for these works in accordance with the site's health and safety requirements.		
MM2	EIAR Chapter 5	Regarding <u>Residential Amenity</u> during the operational phase: All mitigation as outlined under noise and vibration, visual amenity and shadow flicker in the EIAR, will be implemented in order to reduce insofar as possible impacts on residential amenity at properties located in the vicinity of the Existing Ballywater Wind Farm and Ballywater 110kV Substation Where daily or annual shadow flicker exceedances are predicted at any inhabitable or 3rd party dwelling of the identified 24 no. sensitive properties, a site visit will be undertaken firstly to determine the presence of existing screening and window orientation at each potentially affected property. This will determine if the receptor has an actual line of sight to any turbine and actual potential for shadow flicker to occur. Once this exercise is completed and all of the potentially affected properties identified, the following measures will be employed:		

Ref No.	Reference Location	Mitigation Measures	Audit Result	Action Required
		Screening Measures In the event of an occurrence of shadow flicker exceeding guideline threshold values of 30 minutes per day at residential receptor locations, mitigation options will be discussed with the affected homeowner, including: ➤ Installation of appropriate window blinds in the affected rooms of the residence; ➤ Planting of screening vegetation; ➤ Other site-specific measures which might be agreeable to the affected party and may lead to the desired mitigation. If agreement can be reached with the homeowner, then it would be arranged for the required mitigation to be implemented in cooperation with the affected party as soon as practically possible and for the full costs to be borne by the wind farm operator. Wind Turbine Control Measures If it is not possible to mitigate any identified shadow flicker limit exceedance locally using the measures detailed above, wind turbine control measures will be implemented. Wind turbines can be fitted with shadow flicker control units to allow the turbines to be controlled to prevent the occurrence of shadow flicker at properties surrounding the wind farm. The shadow flicker control units will be added to any required turbines. A shadow flicker control unit allows a wind turbine to be programmed and controlled using the wind farm's Supervisory Control and Data Acquisition (SCADA) system to change a particular turbine's operating mode during certain conditions or times, or even turn the turbine off if necessary.		

Ref No.	Reference Location	Mitigation Measures	Audit Result	Action Required
		In order to ensure that the model and SCADA system is accurate and working well a site visit will be carried out to verify the system. The shadow flicker prediction data will be used to select dates on which a shadow flicker event could be observed at one or multiple affected properties and the following process will be adhered to. 1. Recording the weather conditions at the time of the site visit, including wind speeds and direction (i.e. blue sky, intermittent clouds, overcast, moderate breeze, light breeze, still etc.). 2. Recording the house number, time and duration of site visit and the observation point GPS coordinates. 3. Recording the nature of the sensitive receptor, its orientation, windows, landscaping in the vicinity, any elements of the built environment in the vicinity, vegetation. 4. In the event of shadow flicker being noted as occurring the details of the duration (times) of the occurrence will be recorded. 5. The data will then be sent to the wind farm operational team to confirm that the model and SCADA system are working. 6. Following 12 months of full operation of the Proposed Project a report can be prepared for the Local Authority describing the shadow flicker mitigation measures used at the wind farm and confirming the implementation and successful operation of the system. Where a shadow flicker mitigation strategy is to be implemented, it is likely that the control mechanisms would only have to be applied to a turbine to bring the duration of shadow flicker down to the 28-minute post-mitigation shadow flicker target.		
MM3	EIAR Chapter 6, Appendix 6-5	Regarding Biodiversity Mitigation Measures during the operational phase, the following mitigation measures are proposed:		

Ref No.	Reference Location	Mitigation Measures	Audit Result	Action Required
		Mitigation for Birds With regard to birds, management of the wind farm shall continue to maintain the current habitats that support breeding and wintering birds. ➤ In recognition of the relatively high mortality associated with T11, 15, 16 and 24 it is proposed that these turbines will be stopped for an hour at dawn and dusk, periods of high flight activity when many birds are actively commuting from and to roost in low light conditions and when turbines are consequently likely to be least visible. Mitigation for Bats With regard to bats, a precautionary approach suggests the implementation of an adaptive monitoring and mitigation strategy (NatureScot 2021). Elements of this strategy include: ➤ Automatic 'feathering' of idling blades will be implemented (through SCADA) to reduce rotation speed of blades to below 2 RPM while idling. Feathering blades has been shown to be effective in reducing fatality rates of bats by up to 50% and does not result in a significant loss of energy output (NatureScot 2021). ➤ Bat activity will be monitored for 3 years (by deployment of passive detectors) after the implementation of the 'feathering' of turbine blades. ➤ Dog-based fatality monitoring will be carried out on a monthly basis between 15 April and 15 October each year of the LTE. Annual reports will be prepared and submitted for the attention of the local authority and NPWS. ➤ Systematic searches will be conducted within a 125m x 125m grid centred on the turbine. ➤ A minimum of 5 turbines will be searched at random during each visit. ➤ Search effort will follow NatureScot 2021 and is further detailed in Chapter 6 Biodiversity		

Ref No.	Reference Location	Mitigation Measures	Audit Result	Action Required
		➤ In the event that a bat collision is recorded, curtailment will be immediately implemented at the particular turbine (15 April to 15 October annually). ➤ Following NatureScot guidance (where 90% of all bat activity can occur on sites when temperature exceeded 11.5°C and windspeed was below 5m/s; and where bat activity was generally recorded 30 minutes after sunset and 40 minutes prior to sunrise. These conditions are largely consistent with the high seasonal activity peaks recorded at the proposed development site. Therefore, these parameters will be used at the windfarm during the LTE when designing the curtailment programme. ➤ Searcher efficiency trials will also be conducted alongside Scavenger Removal Rates. ➤ The Bat Monitoring & Mitigation Strategy is designed to be iterative and should be amended as conditions or results dictate. These will be outlined in the annual monitoring reports to The Council. The proposed mitigation methodology is detailed further in Appendix 6-5: 2023 Bat Survey Report.		
MM4	EIAR Chapter 7, Appendix 6-5	Regarding Land, Soils and Geology during the operational phase, the following mitigation measures are proposed: Oil used in transformers (at each turbine and at the substation) and any storage of oils or hydrocarbons within the control building compound could potentially leak during the operational phase and impact on soils and subsoils. During maintenance and service visits, some waste (lubricating and cooling oils, packaging from spare parts or equipment, unused paint, etc.) will arise. This will be recorded and removed from the Wind Farm Site and reused, recycled or disposed of in accordance with the relevant legislation in an authorised facility. Turbine transformers are located within the basement of each turbine (i.e. within the turbine hardstands), with dedicated concrete foundations. Oils for the purposes of cooling the turbine transformers are stored in bunded tanks within the turbine		

Ref No.	Reference Location	Mitigation Measures	Audit Result	Action Required
		foundations, within a bund able to contain at least 110% of the volume stored. Any leaks would be contained within the turbine transformer units, and hydrocarbons would not be able to permeate to ground. Each transformer is also housed within bunds to prevent any unintended leaks or spillages. In addition: ➤ All plant and machinery to be serviced before being mobilised to site; ➤ Road-going vehicles will be refuelled off site wherever possible; ➤ On-site refuelling will be carried out at designated refuelling areas at various locations throughout the site. Machinery will be refuelled directly by a fuel truck that will come to site as required. Irrespective of the buffer distance and location of refuelling, interceptor drip trays will be available in accordance with standard good practice. Interceptor drip trays will be positioned under any stationary mobile plant to prevent oil contamination of the ground surface or water; ➤ Only designated trained and competent operatives will be authorised to refuel plant on site. Mobile measures such as drip trays and fuel absorbent mats will be used during all refuelling operations. ➤ Fuel pipes on plant outlets at fuel tanks etc. will be regularly checked and maintained to ensure that no drips or leaks to ground occur;		
MM5	EIAR Chapter 8	Regarding Hydrology and Hydrogeology at the site, the following mitigation measures are proposed during the operational phase: ➤ All plant and machinery to be serviced before being mobilised to site; ➤ Road-going vehicles will be refuelled off site wherever possible; ➤ Onsite refuelling will be carried out at designated refuelling areas at various locations throughout the site. Machinery will be refuelled directly by a fuel truck that will come to site as required. Irrespective of the buffer distance and location of refuelling, interceptor drip trays will be available in accordance with standard good practice. Interceptor drip trays will be positioned under any stationary mobile plant to prevent oil contamination of the ground surface or water;		

Ref No.	Reference Location	Mitigation Measures	Audit Result	Action Required
		➤ Only designated trained and competent operatives will be authorised to refuel plant on site. Mobile measures such as drip trays and fuel absorbent mats will be used during all refuelling operations; and ➤ Fuel pipes on plant outlets at fuel tanks etc. will be regularly checked and maintained to ensure that no drips or leaks to ground occur. These mitigation measures are considered sufficient to reduce risk to ground/peat/soils and subsoils, and to groundwater and surface water quality.		
MM6	EIAR Chapter 9	The following mitigation measures have been proposed during the extended operational phase of the Project, with regards to Air and Climate: ➤ Any vehicles or plant brought onsite during the operational phase will be maintained in good operational order that comply with the Road Traffic Acts 1961 as amended, thereby minimising any emissions that arise.		
MM7	EIAR Chapter 10	The following mitigation measures have been proposed during the extended operational phase of the Project, with regards to Noise: Wind Turbines An assessment of the operational wind turbine noise levels has been undertaken in accordance with best practice guidelines and procedures as outlined in Section 10.3 of Chapter 10. The findings of the assessment as presented in Chapter 10 have confirmed that the predicted operational noise levels will be within the relevant best practice noise criteria curves at all locations with the exception of locations H012, H013 and H031 where potential exceedances of 0.1 dB and 0.3 dB at wind speeds of 8 m/s respectively during night-time periods, in north and northeast wind directions only.		

Ref No.	Reference Location	Mitigation Measures	Audit Result	Action Required
		It is re-iterated that the predicted noise levels include an allowance for uncertainty as required by the IOA GPG, in this instance of 1 dB, which is greater than the exceedances noted in the predicted noise levels. If the Project is granted permission to continue operating, a commissioning noise survey will be carried out at these dwellings (H006, H012, H013 and H031) or at other locations with the prior agreement with the local authority. Should the exceedances predicted above be confirmed through the commissioning exercise, these exceedances will be mitigated through curtailment of turbine(s) in the relevant wind speed and wind directions. The curtailment strategy will be developed for the E70-E4 turbine installed on the site in order to achieve the relevant noise criteria at all NSLs. The E70-E4 can be programmed to run in reduced modes of operation (or low noise modes) to achieve the attenuation required in the specific wind conditions (i.e. wind speed and direction). Operating the turbines in reduced noise modes is referred to as curtailment, which typically results in a corresponding reduction in energy generation capacity for the turbine(s). To demonstrate the principle of curtailment, the example is taken of location H013, where exceedances of the night-time noise criterion of 0.3 dB L_{A90} and 0.1 dB are predicted in north and northeast wind directions, respectively. The following outline curtailment strategy would apply during night-time periods at 8 m/s windspeeds: ➤ Turbine T18 operating in at -1 dB in North wind directions; and ➤ Turbine T19 operating in at -1 dB in North and Northeast wind directions.		

Ref No.	Reference Location	Mitigation Measures	Audit Result	Action Required
		Amplitude Modulation In the event that a complaint which indicates potential amplitude modulation (AM) associated with Project, the operator will employ a qualified acoustic consultant to assess the level of AM in accordance with the methods outlined in the Institute of Acoustics IOA Noise Working Group (Wind Turbine Noise) <i>Amplitude Modulation Working Group Final Report: A Method for Rating Amplitude Modulation in Wind Turbine Noise</i> (9 August 2016) or subsequent revisions. The measurement method outlined in the IOA AMWG document, known as the 'Reference Method', will provide a robust and reliable indicator of AM and yield important information on the frequency and duration of occurrence, which can be used to evaluate different operational conditions including mitigation. These mitigation measures, if required, will consist of the implementation of operational controls for the relevant turbine type, which will include turbine curtailment under specific operational conditions. Low-frequency Noise In the unlikely event that a complaint which indicates potential low-frequency noise (LFN) associated with the Project, the operator will employ a qualified acoustic consultant an assessment in accordance with guidance in Appendix VI of the EPA document entitled <i>Guidance Note for Noise: Licence Applications, Surveys and Assessments in Relation to Scheduled Activities</i> (NG4) (EPA, 2016). This guidance is based on the threshold values outlined in the Salford University document <i>Procedure for the assessment of low frequency noise complaints, DEFRA Contract no. NANR45 Revision 1, December 2011</i>. If an exceedance of the threshold values associated with the wind farm operations is confirmed, then further investigation of the LFN will be carried out. If considered necessary by that investigation, measures to mitigate LFN at noise-sensitive locations will be implemented		

Ref No.	Reference Location	Mitigation Measures	Audit Result	Action Required
		through operational controls for the relevant turbine type, which may include turbine curtailment under specific operational conditions.		
MM8	EIAR Chapter 11	No significant operational phase activities are proposed which would require further assessment. The continuation of the operational phase of the Project will not result in any further effects on setting to the Cultural Heritage resource. No significant effects have been predicted for the proposed extended operational phase in relation to Cultural Heritage, therefore no mitigation measures have been proposed.		
MM9	EIAR Chapter 12	No significant effects have been predicted for the proposed extended operational phase in relation to Landscape and Visual Impacts, therefore no additional mitigation measures have been proposed.		
MM10	EIAR Chapter 13	In relation to Material Assets, the following mitigation measures have been proposed for the extended operational phase of the Project: Telecommunications In the event of further scoping responses being received from the EIA consultees or from other telecommunication service providers, the comments of the consultees and any proposed mitigation measures will be considered in the continued operation of the wind farm, subject to a grant of planning permission. Aviation The Applicant will coordinate with the IAA directly should a grant of planning permission be issued, to ensure that the development remains in compliance with all IAA requirements including lighting requirements. Any further details will be agreed with the Department of Defence, Air Corps and the IAA. The coordinates and elevations for the existing turbines has been supplied to the IAA, as is standard practice for wind farm developments.		

5.

MONITORING PROPOSALS

All monitoring proposals relating to the operational phase of the Proposed Development were set out in the various sections of the Environmental Impact Assessment Report (EIAR) which accompanies this planning application.

This section of the OEMP groups together all of the monitoring proposals presented in the planning documentation. The monitoring proposals are presented in Table 5-1 below.

By presenting the monitoring proposals in the below format, it is intended to provide an easy to audit list that can be reviewed and reported on during the operational phase of the Proposed Development. The tabular format in which the below information is presented, can be further expanded upon during the course of operation to provide a reporting template for site compliance audits.

Table 5-1 Schedule of Operational Phase Monitoring Proposals

Ref. No.	Reference Location	Monitoring Measure	Frequency	Reporting Period	Responsibility
Operational Phase					
MX1	Mitigation section of Chapter 6 Biodiversity	Dog-based fatality monitoring will be carried out on a monthly basis between 15 April and 15 October each year of the LTE. Annual reports will be prepared and submitted for the attention of the local authority and NPWS.			
MX2	Section 7.1.5 of Appendix 6-6 Ballywater Wind Farm Bat Report	To continually assess the effects of the ongoing Wind Farm site activities on bat activity, at least 3 years of post-consent monitoring is proposed. Post-consent monitoring will include static detector surveys, manual activity surveys and corpse searching to record any bat fatalities resulting from collision. Monitoring Year 1 Bat activity surveys Static monitoring at turbine bases and nacelle shall take place at each turbine during the bat activity season (between April and October) (NatureScot, 2021). Full spectrum recording detectors will be utilised for the same duration as during pre-application surveys and at the same density (NatureScot, 2021). As described in Section 3.5 above, the assessment of bat activity levels will include the use of 'Ecobat', a web-based interface, allowing uploaded activity data to be contrasted with a comparable reference range, allowing objective and robust interpretation. Key weather parameters and other factors that are known to influence collision risk will be monitored and will include: ➤ Windspeed in m/s (measured at nacelle height) ➤ Temperature (°C)			

Ref. No.	Reference Location	Monitoring Measure	Frequency	Reporting Period	Responsibility
		➤ Precipitation (mm/hr) Carcass searches Carcass searches, to monitor and record potential bat fatalities, will be conducted at each turbine in accordance with NIEA Guidance. This will include searcher efficiency trials and an assessment of scavenger removal rates to determine the appropriate correction factor to be applied in relation to determining an accurate estimate of collision mortality. Surveys will cover all activity seasons, and the use of a trained dog detection team will be carried out to ensure maximum efficiency. Should no bat fatalities be recorded in Year 1, curtailment in Year 2 could be reduced/re-evaluated or removed with monitoring continuing to inform this strategy. The curtailment programme for Year 2 will then be devised/alterd as necessary around key activity periods and weather parameters recorded in Year 1. Monitoring Years 2 & 3 Monitoring surveys shall continue in Year 2 and 3 and the success of the curtailment strategy will be assessed in line with the baseline data collected in the preceding year(s). The performance of the curtailment programme in terms of its ability to respond to the changes in bat abundance based on temperature and wind speed will be analysed to confirm it is neither significantly over- nor under-curtailing during different periods of bat activity. At the end of each year, the efficacy of the mitigation/curtailment programme will be reviewed, and any identified efficiencies incorporated into the programme. The requirement for continued post-consent monitoring will also be considered.			

Ref. No.	Reference Location	Monitoring Measure	Frequency	Reporting Period	Responsibility
		Should no bat fatalities be recorded in Year 1, curtailment (where applicable) in Year 2 and Year 3 could be reduced/re-evaluated or removed with monitoring continuing to inform this strategy. A monitoring programme will be submitted to, and agreed with, the relevant planning authority. Any subsequent changes will be agreed with Wexford County Council.			
MX3	Chapter 10 Noise and Vibration -Section 10.5.4.1.3	Commissioning noise surveys will be undertaken to ensure compliance with any noise conditions applied to the development. It is common practice to commence surveys within six months of a wind farm being commissioned – in this instance, continuing its operation. If an exceedance of the noise criteria is identified as part of the commissioning assessment, the guidance outlined in the IOA GPG and Supplementary Guidance Note 5: Post Completion Measurements (July 2014) will be followed, and relevant corrective actions taken. The commissioning survey will include a review for the presence of audible tones associated with the operation of the wind turbine farm in accordance with Annex C of ISO 1996-2:2017 <i>Acoustics – Description, measurement and assessment of environmental noise Part 2: Determination of sound pressure levels</i> .			

6. COMPLIANCE AND REVIEW

6.1 Site Inspections and Environmental Audits

Routine inspections of site operations will be carried out on a regular basis by the Wind Farm (in recent years this has averaged at approximately 8 no. visits per year) Manager to ensure all controls to prevent environmental impacts, relevant to the operational activities taking place at the time, are in place.

A maintenance contractor will be responsible for ensuring each turbine is well maintained. Each turbine will be subject to a routine maintenance programme, which includes monthly inspections and intermittent changing of consumables. Each turbine is also subject to a yearly master maintenance and visual blade inspections. In addition, there will be a requirement for unscheduled maintenance, which could vary between resetting alarms to major component repairs/changes. All site roads and public roads are suitable for this access if required and no modifications are required. Typically, maintenance traffic will consist of four-wheel drive LGVs.

The onsite substation and site tracks will also require periodic maintenance. The existing Ballywater 110kV Substation will continue to be operational 24 hours per day, 7 days a week throughout the year. Substations can be operated remotely and manually. Supervisory operational and monitoring activities will be carried out remotely using a SCADA system, with the aid of computers connected via a telephone modem link.

The following maintenance procedures will also be adhered to:

- Periodic service and maintenance works which include some vehicle movement.
- For operational and inspection purposes, substation access is required.
- Servicing of the substation equipment will be carried out in accordance with the manufacturer's specifications, which would be expected to entail the following:
 - Yearly service – three-day visit
 - 4-year master maintenance – 1 week visit

Occasional technical problems may require maintenance visits by technical staff. During the six-month and annual service visits, some waste (lubricating and cooling oils, packaging from spare parts or equipment, unused paint, etc.) will arise. This will be recorded and removed from the Wind Farm Site and reused, recycled or disposed of in accordance with the relevant legislation in an authorised facility.

It is estimated that 1-2 daily visits will be made to the Site for authorised persons and vehicles to undertake minor routine maintenance and inspection, if and when required. Although the level of activity required for the maintenance of the both the existing Ballywater Wind Farm and existing Ballywater 110kV Substation infrastructure is minimal.

Environmental inspections will ensure that the works are undertaken in compliance with this OEMP and all other planning application documents. The Site Manager will be suitably trained to undertake environmental site inspections.

6.2 Auditing

An Environmental audit will first be carried out monthly during the operational phase of the Proposed Development to ensure the operational phase mitigation measures that are still in place as required are adequate.

In contrast to monitoring and inspection activities, audits are designed to shed light on the underlying causes of non-compliance, and not merely detect the non-compliance itself. In addition, audits are the main means by which system and performance improvement opportunities may be identified. Environmental audits will be carried out by the Site Manager on behalf of the Operation Controller. It is important that an impartial and objective approach is adopted. Environmental audits will be conducted at planned intervals to determine whether the OEMP is being properly implemented and maintained. The results of environmental audits will be provided to project management personnel.

6.3 Environmental Compliance

The following definitions shall apply in relation to the classification of Environmental Occurrences during the operation of the proposed extension of the existing Ballywater Wind Farm and Ballywater 110kV Substation:

Environmental Near Miss: An occurrence which if not controlled or due to its nature could lead to an Environmental Incident.

Environmental Incident: Any occurrence which has potential, due to its scale and nature, to migrate from source and have an environmental impact beyond the site boundary.

Environmental Exceedance Event: An environmental exceedance event occurs when monitoring results indicate that limits for a particular environmental parameter (as indicated in the Environmental Monitoring Programme) has been exceeded.

An exceedance will immediately trigger an investigation into the reason for the exceedance occurring and the application of suitable mitigation where necessary.

Exceedance events can be closed out on achieving a monitoring result below the assigned limit for a particular environmental parameter.

Environmental Non-Compliance: Non-fulfilment of a requirement and includes any deviations from established procedures, programs and other arrangements related to the OEMP.

6.4 Corrective Action Procedure

A corrective action is implemented to rectify an environmental problem onsite. Corrective actions will be implemented by the Site Manager. Corrective actions may be required as a result of the following;

- > Environmental Audits;
- > Environmental Inspections and Reviews;
- > Environmental Monitoring;
- > Environmental Incidents; and,
- > Environmental Complaints.

A Corrective Action Notice will be used to communicate the details of the action required to the main contractor. A Corrective Action Notice is a form that describes the cause and effect of an environmental problem on site and the recommended corrective action that is required. The Corrective Action Notice, when completed, will include details of close out and follow up actions.

If an environmental problem occurs on site that requires immediate attention direct communications between the Site Manager will be conducted. This in turn will be passed down to the site staff involved. A Corrective Action Notice will be completed at a later date.

6.5

Operation and Environmental Management Plan Review

This OEMP will be reviewed after every 6 months of operation and may also require updating after the planning application process to comply with any conditions should planning permission be granted.

APPENDIX 4-4

DECOMMISSIONING PLAN

1.

INTRODUCTION

This Decommissioning Plan has been prepared by MKO on behalf of Ballywater Windfarm Ltd for the decommissioning of the existing Ballywater Wind Farm and associated infrastructure, and the existing onsite Ballywater 110kV Substation, hereafter referred to as the Proposed Development. This document has been prepared as part of an Environmental Impact Assessment Report (EIAR) and planning application to Wexford County Council, to extend the operational life of the existing Ballywater Wind Farm (Wexford County Council Planning Ref. 2001/0458) and the existing onsite Ballywater 110kV Substation (Wexford County Council Planning Ref. 2004/2901) for a further period of 10 years beyond the expiry of their current permissions in June 2025. Under the Proposed Development, decommissioning of the existing wind farm and substation is instead intended to take place after the proposed additional 10 year period (in 2035), subject to planning permission.

Decommissioning activities have evolved since the original planning application was submitted and this Decommissioning Plan has been prepared to account for such updates. This Decommissioning Plan is based upon current technologies, methods and best practice.

Prior to decommissioning, the applicant will engage with the Planning Authority to agree a specific Decommissioning Plan to ensure the appropriate decommissioning and reinstatement of the site having regard to prevailing environmental conditions and to ensure the use of best available recycling technology and techniques available at the time. This document should, therefore, be considered to be a 'live' document which will be further developed by the appointed decommissioning contractor who will prepare and insert detailed method statements relative to each individual work stream.

This report provides the environmental management framework to be adhered to during the decommissioning phase of the Proposed Development and it incorporates the mitigating principles to ensure that the work is carried out in a way that minimises the potential for any environmental impacts to occur.

1.1

Scope of the Decommissioning Plan

This report is presented as a guidance document for the decommissioning of the Proposed Development. Where the term 'site' is used in the Decommissioning Plan it refers to all works associated with the Proposed Development, including enabling works. The Decommissioning Plan clearly outlines the mitigation measures and monitoring proposals that are required to be adhered to in order to complete the works in an appropriate manner. The decommissioning plan does not consider decommissioning of the Underground Grid Connection, which forms part of the overall Project, as it is not proposed to decommission the grid connection after the proposed 10 year extension of life.

The report is divided into six sections, as outlined below:

- **Section 1** provides a brief introduction as to the scope of the report.
- **Section 2** outlines the site and Proposed Development details, detailing the targets and objectives of this plan along with providing an overview of works methodologies that will be adopted throughout decommissioning.
- **Section 3** sets out details of the environmental controls to be implemented on site including the mechanisms for implementation. A waste management plan is also included in this section.
- **Section 4** outlines the Emergency Response Procedure to be adopted in the event of an emergency in terms of site health and safety and environmental protection.
- **Section 5** sets out a programme for the timing of the works.
- **Section 6** outlines the proposals for reviewing compliance with the provisions of this report.

2. SITE AND PROJECT DETAILS

2.1 Site Location and Description

The existing Ballywater Wind Farm and Ballywater 110kV Substation are located on the coast of Co. Wexford, approximately 4km northeast of Kilmuckridge village.

The turbines are currently grouped into two clusters, with the smaller of the clusters located to the northeast of the site and comprising of 4 no. turbines. The larger cluster in the southwest of the site, comprises of 17 no. turbines, as well as the existing onsite substation, which is located to the west of this cluster. Access to the southern section of the site for general traffic, such as maintenance vehicles, is via the current existing entrance at the R742 Regional Road, which runs along the western side of the site boundary. Access to the northern section of the site is via the Cahore Local Road which runs along the northern side of the site boundary.

No construction activities or alterations to the existing wind farm or substation are proposed beyond routine maintenance of the turbines and electrical infrastructure during the operational phase of the Proposed Development.

2.2 Description of the Proposed Development

Planning permission is sought for the continued operation of the existing Ballywater Wind Farm as permitted under the provisions of WCC Pl. Ref 2001/0458. All 21 no. turbines were granted by Wexford County Council (WCC) under this planning permission. The turbines are currently grouped into two clusters, with the smaller of this cluster located to the northeast of the site and comprising of 4 no. turbines. The larger cluster in the southwest of the site is comprised of 17 no. turbines, as well as the onsite substation, which is located to the west of this cluster, as indicated in Figure 4-1. Planning permission is also sought for the continued operation of the existing onsite Ballywater 110kV Substation, which was permitted under the provisions of WCC Pl. Ref. 2004/2901. The Proposed Development encompasses the continued operation of the wind farm and substation, which comprises:

- (i) 21 no. existing Enercon E70 wind turbines with a maximum overall blade tip height of 99 metres (m), including hardstands;
- (ii) Existing 1 no. onsite 110 kilovolt (kV) electrical substation which includes 1 no. control building, security fencing, external lighting, underground cabling, and all associated infrastructure and associated electrical plant and apparatus;
- (iii) All existing associated electrical and communications cabling connecting the turbines to the onsite Ballywater 110kV Substation;
- (iv) Existing gated site entrances from the R742 and an unnamed local road;
- (v) Existing internal access tracks; and,
- (vi) All existing ancillary infrastructure.

All elements of the existing wind farm and substation are pre-existing, and it is not proposed to make any alterations to the current site layout, wind turbines, substation, or associated infrastructure as part of this application. The Applicant has made a commitment not to send turbine blades to a landfill or incineration facility. Instead, the Applicant is committed to recycling the wind turbine components, insofar as possible. The exact approach for recycling the turbines has yet to be determined as it will be 10 years from now, however recycling will be carried out in accordance with best practice at that time.

It is proposed to leave the turbine and substation foundations and site cabling (connecting the turbines to the onsite substation) in place underground and to cover them with earth and reseed as appropriate. Leaving the turbine foundations in-situ is considered a more environmentally prudent option, as to remove that volume of reinforced concrete from the ground could result in significant environmental nuisance such as noise, dust and/or vibration. The site cabling is direct-buried and not within any

ducting which would allow the cables to be pulled through and removed with only limited groundworks. Leaving the cables in-situ will avoid any unnecessary ground disturbance and excavations which could result in direct or indirect discharges to natural watercourses.

As construction has been completed, elements of the Proposed Development that were developed as a temporary facilitator have either been removed, restored to their original condition or will have naturally revegetated. All access roads and hardstanding areas form part of a site roadway network which will be required by the ongoing agricultural practices, and therefore will be left in-situ for future use. It is intended that decommissioning will remove the existing turbines and reinstate areas where infrastructure is removed.

The following elements are included:

- Wind turbines dismantling and removal offsite;
- Electrical cabling remaining in-situ;
- Removal of onsite substation components and substation
- Turbine foundation covering (underground reinforced concrete remaining in-situ).

During decommissioning, it may be possible to reverse some of the potential impacts caused during the initial construction of the wind farm by rehabilitating construction areas such as turbine bases and hard standing areas. This will be done by allowing these areas to naturally revegetate and regenerate which reduces run-off and sedimentation.

Targets and Objectives

The decommissioning phase works will be completed to approved standards, which include specified materials, standards, specifications and codes of practice. This Decommissioning Plan has considered environmental aspects, and this is enhanced by the works proposed as part of decommissioning.

The key site targets are as follows:

- Ensure decommissioning works and activities are completed in accordance with mitigation and best practice approach presented in the accompanying Environmental Impact Assessment Report (EIAR) and associated planning documentation.
- Ensure decommissioning works and activities have minimal impact/disturbance to local landowners and the local community.
- Ensure decommissioning works and activities have minimal impact on the natural environment.
- Adopt a sustainable approach to decommissioning; and,
- Provide adequate environmental training and awareness (to the approved standards at the time of decommissioning) for all project personnel.

The key site objectives are as follows:

- Using recycled materials, if possible, e.g. soil and overburden material for covering and reinstatement.
- Ensure sustainable sources for materials supply where possible.
- Avoidance of any pollution incident or near miss as a result of working around or close to existing watercourses and having emergency measures in place.
- Avoidance of vandalism.
- Keeping all watercourses free from obstruction and debris.
- Correct implementation of the sustainable drainage system (SuDS) drainage design principles.
- Keep impact of decommissioning works to a minimum on the local environment, watercourses, and wildlife.
- Correct fuel storage and refuelling procedures to be followed.
- Good waste management and housekeeping to be implemented.
- Air and noise pollution prevention to be implemented.
- Monitoring of the works and any adverse effects that it may have on the environment. Decommissioning methods will be altered where it is found there is the potential to have an adverse effect on the environment.

Decommissioning Methodologies Overview

Introduction

An experienced main contractor will be appointed to undertake the decommissioning of the Proposed Development. The main contractors will comply with the Operational Environmental Management Plan (OEMP) implemented during operation and any revisions made to those documents as they develop throughout the continued operation of the wind farm and substation. An overview of the anticipated decommissioning methodologies is provided below.

Decommissioning Methodology

The proposed anticipated decommissioning methodology is summarised under the following main headings:

- Wind turbines;
- Turbine Foundations;
- Crane Hardstanding & Access Tracks;
- Transformers and Electrical Cabling;
- Underground Cabling; and
- Electrical Control Building and 110kV Substation.

2.4.2.1 General Principles

Unlike most other forms of development, decommissioning of wind farms is typically a straightforward process. Infrastructure can readily be dismantled onsite and removed. Following the restoration of the site, there would be no significant visible evidence of prior existence, and no legacy of pollution.

The decommissioning of the Proposed Development is not expected to pose significant risks to the environment; nevertheless, effects need to be assessed in order to ensure that no, or minimal, impact on the environment occurs.

All measures described within the ELAR with regards to mitigation and protection for ecological receptors, waste management, surface water management and prevention of pollution will apply to decommissioning works, subject to review of relevant regulations and best practice at that time.

In general, all structures above ground level shall be dismantled and removed from the site for reuse or recycling where possible, however, access tracks are likely to be retained for ongoing use by landowners to access their lands. It is likely that, in order to minimise environmental disturbance, the majority of sub-surface elements of the wind farm shall remain in-situ.

Upon decommissioning of the Proposed Development, the wind turbines will be disassembled in reverse order to how they were erected. The turbines will be disassembled with a similar model of crane that was used for their erection. The turbine components will be separated and removed offsite, and the turbine materials will be transferred to a suitable recycling or recovery facility. Leaving the turbine foundations in-situ is considered a more environmentally prudent option, as to remove that volume of reinforced concrete from the ground could result in unnecessary environment emissions such as noise, dust and/or vibration. The underground electrical cabling connecting the turbines to the on-site substation will remain in-situ. This is considered the most environmentally prudent option, avoiding unnecessary excavation and soil disturbance.

The overriding principle of the decommissioning process is to minimise the extent of any ground disturbance on site. While groundworks are an inevitable consequence of the decommissioning process, they shall only be undertaken where absolutely necessary.

The following sections detail the methodologies likely to be implemented during decommissioning, however, as described above, a site-specific approach will be agreed with the Planning Authority.

2.4.2.2 Wind Turbines

Prior to any decommissioning works being undertaken, a comprehensive health and safety assessment will be carried out. In advance of works to the turbines, they will be disconnected from the onsite electrical network by an appointed electrical contractor. Turbine dismantling will be undertaken in reverse order to the methodology employed during their construction. Cranes will be brought to site and will utilise the existing crane hardstandings.

If wind turbine components are not to be reused, then they shall be recycled where possible. The tower sections and nacelle are inert steel/ferrous metal structures which are readily recyclable. These will be sent to a licensed waste facility for recycling.

The turbine blades are constructed of fibreglass. Due to the large number of turbine blades currently being decommissioned globally, extensive research is being undertaken to find an alternative use for the fibreglass. There are a number of emerging innovations for fibreglass recycling including the re-purposing of fibreglass for other civil engineering projects (e.g. as a component in concrete production, roofs for social housing and incorporation to the construction of electrical powerline masts/structures).

The Applicant has made a commitment not to send turbine blades to a landfill or incineration facility. Instead, the Applicant is committed to recycling the wind turbine components, insofar as possible. The exact approach for recycling the turbines has yet to be determined as it will be 10 years from now, however recycling will be carried out in accordance with best practice at that time.

Having been dismantled, the turbine blades will be processed on the crane hardstanding to accommodate their removal by standard HGVs. This process is likely to avoid the requirement for abnormal-sized loads, or oversized vehicles, to utilise the local road network.

2.4.2.3 Turbines and Hardstands

On the dismantling of turbines, it is not intended to remove the concrete foundation from the ground. It is considered that its removal will be the least preferred options in terms of having potential effects on the environment. Therefore, the turbine foundations will be backfilled and covered with soil material. If there is usable soil or overburden material on the site, this material will be used. Alternatively, where material is not readily available on site, soil will be sourced locally and imported to site on heavy good vehicles (HGVs). This will be done using the fewest number of deliveries as possible. The imported soil will be spread and graded over the foundation using a tracked excavator and revegetation enhanced by spreading of an appropriate seed mix to assist in revegetation and accelerate the resumption of the natural drainage management that will have existed prior to any construction. Hardstands shall be covered with soil material and regraded to match existing ground contours and profile. The area shall then be seeded out or allowed to vegetate naturally.

2.4.2.4 Transformers & Electrical Cabling

The decommissioning of transformers will depend entirely on any future use of the wind turbine. If the turbine is to be used elsewhere, the transformer will be removed from site for refurbishment and future use. If the transformer is to be recycled, it will be removed to an approved waste handling/recycling facility and stripped of any useable parts with the remainder being recycled.

The Electrical Cabling within the substation and electrical control building will be left in situ to avoid unnecessary excavation and soil disturbance, and avoid adverse environmental effects such as noise, vibration and dust. The hardstand area will be covered in a similar manner to the turbine hardstands.

2.4.2.5 Underground Cabling

The 20kV cables at the Ballywater Wind Farm were installed without ducting. The cabling will be cut at both ends and will remain in-situ to avoid unnecessary excavation and soil disturbance, and avoid adverse environmental effects such as noise, vibration and dust.

2.4.2.6 Electrical Control Building and 110kV Substation

The decommissioning of the Electrical Control Building will involve the stripping-out and removal of steel, conductors, switches and other materials and equipment. These materials will then be reconditioned and reused or recycled. A soft strip of the building shall ensure that all fixtures and fittings are removed prior demolition.

Demolition of the control building shall take place using conventional demolition methods. Foundations and building services shall be grubbed up to a depth of 1m below ground level. The

demolition waste shall comprise mainly rubble (blocks, broken concrete, and plaster etc.) and timber. Rubble can be segregated to provide an aggregate material which may be used in the reinstatement of the site while un-suitable material will be removed and disposed of at an approved licenced waste management facility. Timber and other waste shall be segregated according to material type with a view to recycling where possible or disposal. All demolition materials which cannot be reused on site shall be removed off site to a licensed waste handling facility for recycling or disposal. Excavations shall be covered with suitable material, soiled over and seeded out or allowed to vegetate naturally.

As well as the Electrical Control Building, the onsite Ballywater 110kV Substation will be decommissioned by stripping out and removing all components and electrical plant from the substation. These materials will then be reconditioned and reused or recycled where possible. The underground cabling in the substation footprint will be cut at either end and left in situ. The surrounding fencing, and any other associated materials will be demolished and recycled locally. The substation and access footprint will be covered and allowed to revegetate naturally, in a similar manner to the turbine hardstanding areas.

3. ENVIRONMENTAL MANAGEMENT

The following sections give an overview of the drainage design, dust and noise control measures, a waste management plan for the site and the implementation of the environmental management procedures for the site.

3.1 Site Drainage

The site drainage features for the existing wind farm and substation site during the proposed extension of operation are outlined in Section 8.3.3.2 in the Chapter 8 of the EIAR: Hydrology and Hydrogeology. As this Decommissioning Plan is a working document and is presented as an Appendix to the EIAR, the drainage measures are not included in this document. When the final Plan is prepared prior to decommissioning and presented as a standalone document, all drainage measures will be included in that document as required. The drainage proposals will be developed further prior to the commencement of decommissioning if deemed necessary. However, it should be noted that by the time decommissioning is undertaken, after the proposed 10 year extension of operation of the Proposed Development, the areas within the site have already or will have revegetated resulting in a resumption of the natural drainage management that will have existed prior to any construction. It is not anticipated that the decommissioning phase will interrupt this restored drainage regime in any way with the works proposed.

3.2 Refuelling, Fuel and Hazardous Materials Storage and General Pollution Prevention Measures

Pollution prevention methods will be undertaken in accordance with those measures set out in the EIAR and prevailing best practice procedures. Any material or substance which could cause pollution, including fuels/oils or silty water will be prevented from entering groundwater, surface water drains or surface waters by the appropriate use of, and appropriate placement of, temporary cut-off drains and silt traps. Any sign of ineffective water treatment measures or evidence of silted or contaminated water entering surface water on-site, will be reported immediately to the contractor.

The plant and equipment used during decommissioning works will require refuelling during the works. Appropriate management of fuels will be required to ensure that incidents relating to refuelling are avoided. The following mitigation measures are proposed to avoid release of hydrocarbons at the site:

- Road-going vehicles will be refuelled off site wherever possible;
- All refuelling will be carried out in a designated area over an impermeable surface (hardstanding / protective layer/trays) at least 50m from surface waters/surface water drains where possible. Machinery will be refuelled directly by a fuel truck that will come to site as required;
- Irrespective of the buffer distance and location of refuelling, interceptor drip trays will be available in accordance with standard good practice. Interceptor drip trays will be positioned under any stationary mobile plant to prevent oil contamination of the ground surface or water;
- Only designated trained and competent operatives will be authorised to refuel plant on site. Mobile measures such as drip trays and fuel absorbent mats will be used during all refuelling operations;
- Fuel pipes on plant outlets at fuel tanks etc. will be regularly checked and maintained to ensure that no drips or leaks to ground occur;
- Fuel volumes stored on site will be minimised. Any areas of waste oil/fuel/chemical storage and refuelling will be located 50m away from surface waters or drainage

paths. Such storage areas will be appropriately sited and bunded to prevent the downward percolation of contaminants to natural soils and groundwater. Fuel, oils and chemicals will be stored on an impervious base within a bund able to contain at least 110% of the volume stored. Rainwater will not be allowed to accumulate within the bund and in any way compromise the required 110% volume capacity. No tanks or containers may be perforated or dismantled on-site. A competent operator shall empty all contents and residues for safe disposal off-site in accordance with current waste regulations;

- No burning of any materials shall be permitted;
- The use of herbicides will also be prohibited;
- Plant and site vehicles are to be well maintained and any vehicles leaking fluids must be repaired or removed from site immediately. Any servicing operations shall take place over drip trays; and,
- An emergency plan for the decommissioning phase to deal with accidental spillages will be developed (refer to Section 4) Spill kits will be available to deal with and accidental spillage in and outside the refuelling area.
- A programme for the regular inspection of plant and equipment for leaks and fitness for purpose will be developed at the outset of the decommissioning phase.

3.3

Dust Control

Dust can be generated from on-site activities during decommissioning such as covering of foundations and travelling on site roads during prolonged periods of dry weather. The extent of dust generation will depend on the type of activity undertaken, the location, the nature of the dust, i.e. soil, and the weather. In addition, dust dispersion is influenced by external factors such as wind speed and direction and/or, periods of dry weather. Site traffic movements also have the potential to generate dust as they travel along the haul route.

Proposed measures to control dust include:

- Any site roads with the potential to give rise to dust will be regularly watered, as appropriate, during dry and/or windy conditions;
- The designated public roads outside the site and along the main transport routes to the site will be regularly inspected by the Site Manager for cleanliness, and cleaned as necessary;
- Material handling systems and material storage areas will be designed and laid out to minimise exposure to wind;
- Water misting or sprays will be used as required if particularly dusty activities are necessary during dry or windy periods;
- The transport of soils or other material, which has significant potential to generate dust, will be undertaken in tarpaulin-covered vehicles where necessary;
- All site related traffic will have speed restrictions on un-surfaced roads to 15 kph;
- Daily inspection of the site to examine dust measures and their effectiveness.
- When necessary, sections of the haul route will be swept using a truck mounted vacuum sweeper;

3.4

Noise Control

The operation of plant and machinery, including site vehicles, is a source of potential impact that will require mitigation at all locations within the site. Proposed best practice mitigation measures to control noise include:

- Limiting the hours during which site activities likely to create noticeable levels of noise or vibration are permitted;

- Establishing channels of communication between the Applicant or contractor, Local Authorities and residents;
- Selection of plant with low inherent potential for generation of noise and/or vibration;
- No plant or machinery will be permitted to cause a public nuisance due to noise;
- The best means practicable, including proper maintenance of plant, will be employed to minimise the noise produced by on site operations.
- All vehicles and mechanical plant will be fitted with effective exhaust silencers and maintained in good working order for the duration of works;
- Compressors models fitted with properly lined and sealed acoustic covers which will be kept closed whenever the machines are in use and all ancillary pneumatic tools shall be fitted with suitable silencers;
- Machinery that is used intermittently will be shut down or throttled back to a minimum during periods when not in use; and
- The hours of decommissioning works (and associated traffic movements) will, insofar as possible, be limited to avoid unsociable hours. Activities shall generally be restricted to between 07:00hrs and 19:00hrs Monday to Friday and between 07:00hrs and 13:00hrs on Saturdays, with no activities on Sundays or public holidays unless in the event of an emergency. However, to ensure that optimal use is made of good weather period or at critical periods within the programme (e.g., crane use) or to accommodate removal of large turbine component along public routes it could be necessary on occasion to work outside of these hours. Any such out of hours working will be notified in advance to the Local Authority.

3.5

Ground Disturbance, Material Excavation & Reinstatement

During decommissioning, all plant and machinery will keep to existing infrastructure (e.g. tracks and hardstanding) and will not encroach upon adjacent habitats unless this is essential in order to progress the decommissioning works. In the event of any necessary encroachment into adjoining habitats; appropriate trackway or matting shall be placed to avoid any loss of the adjoining habitat.

The reinstatement of any areas disturbed during the decommissioning works will be undertaken. The contractor will record excavated volumes and storage areas, and volumes and type of material utilised for reinstatement of relevant areas. This information will be updated for the duration of the decommissioning works.

Reinstatement will be completed using site-won materials wherever possible without compromising or damaging established/existing habitats. Natural vegetation will be preferred; however, native seed mixes may also be selected to complement surrounding species. The seed mix and method of application will be agreed with a suitably qualified ecologist to ensure that the reinstated habitats are compatible with those existing and surrounding the reinstated areas at the time of decommissioning.

All temporarily stockpiled materials will be stored in designated areas and isolated from any surface drains and a minimum of 50m away from surface water where possible. Aggregate or fine materials storage will be enclosed and screened/sheeted. No storage of materials within sensitive habitats will be permitted.

Soil and vegetation must be stored separately from subsoil and shall be retained and reinstated on all areas of stripped ground as soon as possible to prevent erosion and leaching/loss of nutrients.

3.6

Biodiversity

Regarding Biodiversity at the site, the decommissioning phase will involve the following best practice mitigation measures:

- All measures to mitigate the risks of contamination of watercourses as highlighted in Chapters 7 & 10 will be fully implemented.
- The areas within 50m of the hard-stand and turbine foundations will be subject to a pre-works terrestrial ecology walkover to highlight any constraints that may be present (e.g. breeding or resting places of protected species, presence of Invasive Plant Species). If any significant constraints are identified appropriate controls will be developed and integrated into the live decommissioning plan ahead of the commencement of the work.
- If any Third Schedule Invasive species are present in or adjacent to the works footprint, an Invasive Species Management Plan (ISMP) will be developed, and all recommendations implemented in accordance with the contemporary best practice measures.
- Speed limits will be enforced on internal roads.
- A detailed traffic management plan will be incorporated into the decommissioning plan which will ensure that areas of intact blanket bog are unaffected by traffic or storage of plant and materials.
- All edible wastes will be stored in covered segregated containers and disposed of at licensed facilities.
- No refuelling or other hydrocarbon related usage will be undertaken within 50m of any watercourse in relation to maintenance vehicles, plant or machinery.
- Any import of soil or fill necessary in the decommissioning process shall be from approved sources and appropriately tested or inspected to minimise the risk of import of invasive species. Only soil appropriate to the site (pH, soil type) will be used. The re-seeding or natural revegetation of reinstated areas will proceed on the advice of a suitably qualified ecologist. Any seed mix used will be on the approval of the ecologist.

3.7

Ornithology

Regarding Ornithology and Avian Populations, the decommissioning plan will include industry best practice measures to mitigation the impact of works on a bird, which may include the following:

- No removal of woody vegetation or scrub will be carried out within the bird breeding season (March 1st to August 31st)
- Vantage Point surveys will be carried out for the season before and during the decommissioning process. No decommissioning work will be allowed to commence in areas within 500m of an active Hen Harrier nest.
- All edible wastes will be stored in covered segregated containers and disposed of at licensed facilities.
- All measures to mitigate the risks of contamination of watercourses as highlighted in Chapters 7 & 10 will be fully implemented.
- The areas within 50m of the hard-stand and turbine foundations will be subject to a pre-works ornithology walkover to highlight any constraints that may be present (e.g. breeding or resting places of protected species). If any significant constraints are identified, appropriate controls will be developed and integrated into the live decommissioning plan ahead of the commencement of the work.
- Speed limits will be enforced on internal roads.
- A detailed traffic management plan will be incorporated into the decommissioning plan which will ensure that areas of intact blanket bog are unaffected by traffic or storage of plant and materials.

3.8 Invasive Species Management

Any soil material that will be imported to site as part of the foundation covering will be free of any invasive species (listed under the Third Schedule of the European Communities (Birds and Natural Habitats) Regulations 2011 (S.I. No. 477 of 2011)). The site manager will take steps to ensure this sourcing suitably clean material and verify the quality of the material by having it inspected prior to bringing it to site by a suitably qualified ecologist. Prior to decommissioning, a suitably qualified ecologist will complete an invasive species survey.

3.9 Traffic Management

Prior to the decommissioning and after the Proposed 10 years extension of life, an updated Decommissioning Plan, including material recycling / disposal and a detailed Traffic Management Plan, will be developed to minimise impacts to the local road network. The Traffic Management Plan will be prepared in consultation with the Local Authority, and agreed with the Local Authority in advance of decommissioning.

3.10 Waste Management

This section of the Decommissioning Plan provides a waste management plan (WMP) which outlines the best practice procedures during the decommissioning of the Proposed Development. The WMP will outline the methods of waste prevention and minimisation by recycling, recovery and reuse at each stage of decommissioning. Disposal of waste will be seen as a last resort.

3.10.1 Legislation

The Waste Management Act 1996 and its subsequent amendments provide for measures to improve performance in relation to waste management, recycling and recovery. The Act also provides a regulatory framework for meeting higher environmental standards set out by other national and EU legislation.

The Act requires that any waste related activity must have all necessary licenses and authorisations. It will be the duty of the Waste Manager on the site of the Ballywater Wind Farm to ensure that all contractors hired to remove waste from the site have valid Waste Collection Permits. It will then be necessary to ensure that the waste is delivered to a licensed or permitted waste facility. The hired waste contractors and subsequent receiving facilities must adhere to the conditions set out in their respective permits and authorisations.

The Department of the Environment provides a document entitled, *'Best Practice Guidelines on the Preparation of Waste Management Plans for Construction and Demolition Projects'* (2021). It is important to emphasise that no demolition will take place at this site, however, this document was referred to throughout the process of completing this WMP.

3.10.2 Waste Management Hierarchy

The waste management hierarchy sets out the most efficient way of managing in the following order:

Prevention and Minimisation:

The primary aim of the WMP will be to prevent and thereby reduce the amount of waste generated at each stage of the project.

Reuse of Waste:

Reusing as much of the waste generated on site as possible will reduce the quantities of waste that will have to be transported off site to recovery facilities or landfill.

Recycling of Waste:

There are a number of established markets available for the beneficial use of Construction and Demolition waste such as using waste concrete as fill for new roads.

At all times during the implementation of the WMP, disposal of waste to landfill will be considered only as a last resort.

3.10.3 Waste Arising from Decommissioning

The relevant components will be removed from site for re-use, recycling or waste disposal. Any structural elements that are not suitable for recycling will be disposed of in an appropriate manner. All lubrication fluids will be drained down and put aside for appropriate collection, storage, transport and disposal. Any materials which cannot be re-used or recycled will be disposed of by an appropriately licenced contractor.

The waste types arising from the decommissioning of Proposed Development are outlined in Table 3-1 below.

Table 3-1 Expected waste types arising during the Decommissioning Phase

Material Type	Example	EW Code
Cables	Electrical wiring	17 04 11
Metals	Copper, aluminium, lead and iron	17 04 07
Fibreglass	Turbine blade component	10 11 03
Hydrocarbons	Oils and lubricants drained from the turbines	13 01 01,13 02 04

3.10.3.1 Reuse

Many construction materials can be reused a number of times before they have to be disposed of:

- Electrical wiring can be reused on similar wind energy projects
- Elements of the turbine components can be reused but this will be determined by the condition that they are as well as when decommissioning actually takes place.

3.10.3.2 Recycling

If a certain type of construction material cannot be reused onsite, then recycling is the most suitable option. The opportunity for recycling during decommissioning will be limited and restricted to components of the wind turbines.

All waste that is produced during the decommissioning phase including dry recyclables will be deposited in the on-site skip initially and sent for subsequent segregation at a remote facility. The anticipated volume of all waste material to be generated at the Proposed Development is low, which provides the justification for adopting this method of waste management.

3.10.3.3 Implementation

3.10.3.3.1 Roles and Responsibilities

Prior to the commencement of the decommissioning, a Construction Waste Manager will be appointed by the Contractor. The Construction Waste Manager will be in charge of the implementation of the objectives of the plan, ensuring that all hired waste contractors have the necessary authorisations and that the waste management hierarchy is adhered to. The person nominated must have sufficient authority so that they can ensure everyone working on the decommissioning adheres to the management plan.

3.10.3.3.2 Training

It is important for the Construction Waste Manager to communicate effectively with colleagues in relation to the aims and objectives of the waste management plan. All employees working on site during the decommissioning phase of the project will be trained in materials management and thereby, should be able to:

- Distinguish reusable materials from those suitable for recycling;
- Ensure maximum segregation at source;
- Co-operate with site manager on the best locations for stockpiling reusable materials;
- Separate materials for recovery; and
- Identify and liaise with waste contractors and waste facility operators.

3.10.3.3.3 Record Keeping

The WMP will provide systems that will enable all arisings, movements and treatments of construction waste to be recorded. This system will enable the contractor to measure and record the quantity of waste being generated. It will highlight the areas from which most waste occurs and allows the measurement of arisings against performance targets. The WMP can then be adapted with changes that are seen through record keeping.

The fully licensed waste contractors employed to remove waste from the site will be required to provide documented records for all waste dispatches leaving the site. Each record will contain the following:

- Consignment Reference Number
- Material Type(s) and EWC Code(s)
- Company Name and Address of Site of Origin
- Trade Name and Collection Permit Ref. of Waste Carrier
- Trade Name and Licence Ref. of Destination Facility
- Date and Time of Waste Dispatch
- Registration no. of Waste Carrier vehicle
- Weight of Material
- Signature of Confirmation of Dispatch detail
- Date and Time of Waste Arrival at Destination
- Site Address of Destination Facility

3.10.3.4 Waste Management Plan Conclusion

The WMP will be properly adhered to by all staff involved in the project which will be outlined within the induction process for all site personnel. The waste hierarchy should always be employed when designing the plan to ensure that the least possible amount of waste is produced during decommissioning. Reuse of certain types of construction wastes will cut down on the cost and requirement of raw materials therefore further minimising waste levels.

This WMP has been prepared to outline the main objectives that are to be adhered to and it will be updated as required prior to decommissioning.

3.11 **Environmental Management Implementation**

3.11.1 **Roles and Responsibilities**

A Contractor will be appointed to undertake the decommissioning activities. The site manager and/or Environmental Clerk of Works (ECoW) will be key members of the Contractor's team and are the points of contact relating to decommissioning-related environmental issues.

In general, the ECoW will maintain responsibility for monitoring the decommissioning works and Contractors/Sub-contractors from an environmental perspective. The ECoW will act as the regulatory interface on environmental matters. The Site Manager will be responsible for reporting to and liaising with Clare County Council and other statutory bodies as required.

The Site Manager in consultation with the ECoW will be responsible for employing the services of a suitably qualified ecologist and any other suitably qualified professionals as required throughout the decommissioning works.

3.11.2 **Timing of Works**

The most intrusive decommissioning works (e.g., excavations and ground profiling) will be carefully scheduled to avoid the coldest winter months and the main bird breeding season (the main breeding season being April to August inclusive). The precise scheduling of works will be reviewed by an ecological/ornithological consultant prior to commencement.

4.

HEALTH AND SAFETY

Decommissioning of the Proposed Development will necessitate the presence of a construction site and travel on the local public road network to and from the site. Construction sites and the machinery used on them pose a potential health and safety hazard to construction workers if site rules are not properly implemented.

The Proposed Development will be decommissioned in accordance with all relevant Health and Safety Legislation, including:

- Safety, Health and Welfare at Work Act 2005 (No. 10 of 2005);
- Safety, Health and Welfare at Work (General Application) (Amendment) Regulations 2016 (S.I. No. 36 of 2016);
- S.I. No. 528/2021 - Safety, Health and Welfare at Work (Construction) (Amendment) Regulations 2021 and
- Safety, Health and Welfare at Work (Work at Height) Regulations 2006 (S.I. No. 318 of 2006).

The following measures below are also detailed in Chapter 16 Schedule of Monitoring and Mitigation Measures.

- A Health and Safety Plan covering all aspects of the decommissioning process will address the Health and Safety requirements in detail. This will be prepared on a preliminary basis at the procurement stage and developed further at decommissioning stage.
- All hazards will be identified, and risks assessed. Where elimination of the risk is not feasible, appropriate mitigation and/or control measures will be established. The contractor will be obliged under the decommissioning contract and current health and safety legislation to adequately provide for all hazards and risks associated with the decommissioning phase of the Proposed Project. Safepass registration cards are required for all decommissioning, delivery and security staff. Decommissioning operatives will hold a valid Construction Skills Certificate Scheme card where required. The developer is required to ensure a competent contractor is appointed to carry out the decommissioning works. The contractor will be responsible for the implementation of procedures outlined in the Safety and Health Plan. Public safety will be addressed by restricting the Proposed Wind Farm site access during construction. Fencing will be erected in areas of the Proposed Wind Farm site where uncontrolled access is not permitted.
- All staff will be made aware of and adhere to the Health & Safety Authority's 'Guidelines on the Procurement, Design and Management Requirements of the Safety, Health and Welfare at Work (Construction) (Amendment) Regulations 2021'. This will encompass the use of all necessary Personal Protective Equipment and adherence to the Site Health and Safety Plan.

The scale and scope of the project necessitates that a Project Supervisor Design Process (PSDP) and Project Supervisor Construction Stage (PSCS) are required to be appointed in accordance with the provisions of the Health & Safety Authority's 'Guidelines on the Procurement, Design and Management Requirements of the Safety, Health and Welfare at Work (Construction) Regulations 2013'.

The PSDP appointed for the decommissioning stage shall be required to perform his/her duties as prescribed in the Safety, Health and Welfare at Work (Construction) Regulations. These duties include (but are not limited to):

- Identify hazards arising from the design or from the technical, organisational, planning or time related aspects of the project;

- Where possible, eliminate the hazards or reduce the risks;
- Communicate necessary control measures, design assumptions or remaining risks to the PSCS so they can be dealt with in the Safety and Health Plan;
- Ensure that the work of designers is coordinated to ensure safety;
- Organise co-operation between designers;
- Prepare a written Safety and Health Plan;
- Prepare a safety file for the completed structure and give it to the client; and
- Notify the Authority and the client of non-compliance with any written directions issued.

The PSCS appointed for the decommissioning stage shall be required to perform his/her duties as prescribed in the Safety, Health and Welfare at Work (Construction) Regulations. These duties include (but are not limited to):

- Development of the Safety and Health Plan for the decommissioning stage with updating where required as work progresses;
- Compile and develop safety file information.
- Reporting of accidents / incidents;
- Weekly site meeting with PSCS;
- Coordinate arrangements for checking the implementation of safe working procedures. Ensure that the following are being carried out:
- Induction of all site staff including any new staff enlisted for the project from time to time;
- Toolbox talks as necessary;
- Maintenance of a file which lists personnel on-site, their name, nationality, current Safe Pass number, current Construction Skills Certification Scheme (CSCS) card (where relevant) and induction date;
- Report on site activities to include but not limited to information on accidents and incidents, disciplinary action taken and PPE compliance;
- Monitor the compliance of contractors and others and take corrective action where necessary; and
- Notify the Authority and the client of non-compliance with any written directions issued.

5.

EMERGENCY RESPONSE PLAN

An Emergency Response Plan (ERP) is presented in this section of the Decommissioning Plan. It provides details of procedures to be adopted in the event of an emergency in terms of site health and safety and environmental protection.

5.1

Emergency Response Procedure

The site ERP includes details on the response required and the responsibilities of all personnel in the event of an emergency. The ERP will require updating and submissions from the contractor/PSCS and sub-contractors as decommissioning progresses. Where sub-contractors that are contracted on site are governed by their own emergency response procedure a bridging arrangement will be adopted to allow for inclusion of the sub-contractor's ERP within this within this document.

This is a working document that requires updating throughout the various stages of the project.

5.1.1

Roles and Responsibilities

The chain of command during an emergency response sets out who is responsible for coordinating the response. The Site Supervisor/Construction Manager will lead the emergency response which makes him responsible for activating and coordinating the emergency response procedure. The other site personnel who can be identified at this time who will be delegated responsibilities during the emergency response are presented in Figure 5-1. In a situation where the Site Supervisor/ Construction Manager is unavailable or incapable of coordinating the emergency response, the responsibility will be transferred to the next person in the chain of command outlined in Figure 5-1. This will be updated throughout the various stages of the project.

Figure 5-1 Emergency Response Procedure Chain of Command

5.1.2 Initial Steps

In order to establish the type and scale of potential emergencies that may occur, the following hazards have been identified as being potential situations that may require an emergency response in the event of an occurrence.

Table 5-1 Hazards associated with potential emergency situations

Hazard	Emergency Situation
Construction Vehicles: Dump trucks, tractors, excavators, cranes etc.	Collision or overturn which has resulted in operator or third-party injury.
Abrasive wheels/Portable Tools	Entanglement, amputation or electrical shock associated with portable tools
Contact with services	Electrical shock or gas leak associated with an accidental breach of underground services
Fire	Injury to operative through exposure to fire
Falls from heights including falls from scaffold towers, scissor lifts, ladders, roofs and turbines	Injury to operative after a fall from a height
Sickness	Illness unrelated to site activities of an operative e.g. heart attack, loss of consciousness, seizure
Turbine Specific Incident	This will be included the turbine manufacturers' emergency response plan.

In the event of an emergency situation associated with, but not restricted to, the hazards outlined in Table 5-1 the Site Supervisor/Construction Manager will carry out the following:

- Establish the scale of the emergency situation and identify the number of personnel, if any, have been injured or are at risk of injury.
- Where necessary, sound the emergency siren/fog-horn that activates an emergency evacuation on the site. The Site Supervisor/Construction Manager must proceed to the assembly point if the emergency poses any significant threat to their welfare **and if there are no injured personnel at the scene that require assistance**. The Site Supervisor/Construction Manager will be required to use their own discretion at that point. In the case of fire, the emergency evacuation of the site should proceed, without exception. The site evacuation procedure is outlined in Section 5.1.3.
- Make safe the area if possible and ensure that no identifiable risk exists with regard to dealing with the situation e.g. if a machine has turned over, ensure that it is in a safe position so as not to endanger others before assisting the injured.
- Contact the required emergency services or delegate the task to someone. If delegating the task, ensure that the procedures for contacting the emergency services as set out in Section 5.2 is followed.
- Take any further steps that are deemed necessary to make safe or contain the emergency incident e.g. cordon off an area where an incident associated with electrical issues has occurred.
- Contact any regulatory body or service provider as required e.g. ESB Networks the numbers for which as provided in Section 5.3.
- Contact the next of kin of any injured personnel where appropriate.

5.1.3 Site Evacuation/Fire Drill

A site evacuation/fire drill procedure will provide basis for carrying out the immediate evacuation of all site personnel in the event of an emergency. The following steps will be taken:

- Notification of the emergency situation. Provision of a siren or fog-horn to notify all personnel of an emergency situation.
- An assembly point will be designated in the construction compound area and will be marked with a sign. All site personnel will assemble at this point.
- A roll call will be carried out by the Site Security Officer to account for all personnel on site.
- The Site Security Officer will inform the Site Supervisor/Construction Manager when all personnel have been accounted for. The Site Supervisor/Construction Manager will decide the next course of action, which be determined by the situation that exists at that time and will advise all personnel accordingly.

All personnel will be made aware of the evacuation procedure during site induction. The Fire Services Acts of 1981 and 2003 require the holding of fire safety evacuation drills at specified intervals and the keeping of records of such drills.

5.1.4

Spill Control Measures

Every effort will be made to prevent an environmental incident during the decommissioning phase of the project. Oil/fuel spillages are one of the main environmental risks that will exist on the site which will require an emergency response procedure. The importance of a swift and effective response in the event of such an incident occurring cannot be over emphasised. The following steps provide the procedure to be followed in the event of such an incident:

- Stop the source of the spill and raise the alarm to alert people working in the vicinity of any potential dangers.
- If applicable, eliminate any sources of ignition in the immediate vicinity of the incident.
- Contain the spill using the spill control materials, track mats or other material as required. Do not spread or flush away the spill.
- If possible, cover or bund off any vulnerable areas where appropriate such as drains, watercourses or sensitive habitats.
- If possible, clean up as much as possible using the spill control materials.
- Contain any used spill control material and dispose of used materials appropriately using a fully licensed waste contractor with the appropriate permits so that further contamination is limited.
- Notify the Environmental Clerk of Works (ECoW) immediately giving information on the location, type and extent of the spill so that they can take appropriate action.
- The ECoW will inspect the site and ensure the necessary measures are in place to contain and clean up the spill and prevent further spillage from occurring.
- The ECoW will notify the appropriate regulatory body such as Wexford County Council, and the Environmental Protection Agency (EPA), if deemed necessary.

The importance of a swift and effective response in the event of such an incident occurring cannot be over emphasised. Environmental incidents are not limited to just fuel spillages. Therefore, any environmental incident must be investigated in accordance with the following steps.

- The ECoW must be immediately notified.
- If necessary, the ECoW will inform the appropriate regulatory authority. The appropriate regulatory authority will depend on the nature of the incident.
- The details of the incident will be recorded on an Environmental Incident Form which will provide information such as the cause, extent, actions and remedial measures used following the incident. The form will also include any recommendations made to avoid reoccurrence of the incident.
- If the incident has impacted on a sensitive receptor such as an archaeological feature the ECoW will liaise with the Project Archaeologist.

- A record of all environmental incidents will be kept on file by the ECoW and the Main Contractor. These records will be made available to the relevant authorities such as Wexford County Council, EPA if required.

The ECoW will be responsible for any corrective actions required as a result of the incident e.g. an investigative report, formulation of alternative works methodologies or environmental sampling, and will advise the Main Contractor as appropriate.

5.2

Contact the Emergency services

In the event of requiring the assistance of the emergency services the following steps should be taken:

- **Stay calm.** It is important to take a deep breath and not get excited. Any situation that requires 999/112 is, by definition, an emergency. The dispatcher or call-taker knows that and will try to move things along quickly, but under control.
- **Know the location of the emergency and the number you are calling from.** This may be asked and answered a couple of times but do not get frustrated. Even though many emergency call centres have enhanced capabilities meaning they are able to see your location on the computer screen they are still required to confirm the information. If for some reason you are disconnected, at least emergency crews will know where to go and how to call you back.
- **Wait for the call-taker to ask questions, then answer clearly and calmly.** If you are in danger of assault, the dispatcher or call-taker will still need you to answer quietly, mostly "yes" and "no" questions.
- **If you reach a recording, listen to what it says.** If the recording says your call cannot be completed, hang up and try again. If the recording says all call takers are busy, WAIT. When the next call-taker or dispatcher is available to take the call, it will transfer you.
- **Let the call-taker guide the conversation.** He or she is typing the information into a computer and may seem to be taking forever. There is a good chance, however, that emergency services are already being sent while you are still on the line.
- **Follow all directions.** In some cases, the call-taker will give you directions. Listen carefully, follow each step exactly, and ask for clarification if you do not understand.
- **Keep your eyes open.** You may be asked to describe victims, suspects, vehicles, or other parts of the scene.
- **Do not hang up the call** until directed to do so by the call taker.

Due to the remoteness of the site it may be necessary to liaise with the emergency services on the ground in terms of locating the site. This may involve providing an escort from a designated meeting point that may be located more easily by the emergency services. This should form part of the site induction to make new personnel and sub-contractors aware of any such arrangement or requirement if applicable.

5.3

Contact Details

A list of emergency contacts is presented in Table 5-2. A copy of these contacts will be included in the Site Safety Manual and in the site offices and the various site welfare facilities.

Table 5-2 Emergency Contacts

Contact	Telephone no.
Emergency Services – Ambulance, Fire, Gardai	999/112
Doctor – Kilmuckridge Medical Centre	053 913 0158
Hospital – Wexford General Hospital	0053 915 3000
ESB Emergency Services	1800 372 999
Gas Networks Ireland Emergency	1800 20 50 50
Gardai – Courtown Harbour Garda Station	053 942 5102
Health and Safety Co-ordinator - Health & Safety Services	TBC
Health and Safety Authority	1890 289 389
Inland Fisheries Ireland (IFI)	0818 34 74 24
Project Supervisor Construction Stage (PSCS): TBC	TBC
Project Supervisor Design Stage (PSDS): TBC	TBC
Client: Ballywater Windfarm Limited	(01) 643 0801

5.3.1

Procedure for Personnel Tracking

All operatives on site without any exception will have to undergo a site induction where they will be required to provide personal contact details which will include contact information for the next of kin.

In the event of a site operative becoming in an emergency situation where serious injury has occurred and hospitalisation has taken place, it will be the responsibility of the Site Manager or next in command if unavailable to contact the next of kin to inform them of the situation that exists.

5.4

Induction Checklist

Table 5-3 provides a list of items highlighted in this ERP which must be included or obtained during the mandatory site induction of all personnel that will work on the site. This will be updated throughout the various stages of the project.

Table 5.3 Emergency Response Plan Items Applicable to the Site Induction Process

ERP Items to be included in Site Induction	Status
All personnel will be made aware of the evacuation procedure during site induction	
Due to the remoteness of the site it may be necessary to liaise with and assist the emergency services on the ground in terms of locating the site. This may involve providing an escort from a designated meeting point that may be located more easily by the emergency services. This should form part of the site induction to make new personnel and sub-contractors aware of any such arrangement or requirement if applicable.	
All operatives on site without any exception will have undergone a site induction where they will be required to provide personal contact details which will include contact information for the next of kin.	

6.

PROGRAMME OF WORKS

6.1

Decommissioning Schedule

The decommissioning phase will take approximately 3 – 6 months to complete from commencing the removal of turbines to the final reinstatement of the site.

At this time, it is not possible to determine exactly when decommissioning will take place.

The phasing and scheduling of the main decommissioning task items are outlined in Figure 6-1 below, where 1st January has been shown as an indicative start date for decommissioning to commence.

ID	Task Name	Task Description	Month 1-3	Month 3-6
1	Site Health and Safety			
2	Turbine Decommissioning	Disconnect Power Output		
3	Turbine & Met Mast Dismantling	Disassemble Turbine Components		
4	Turbine Removal	Transport of all Turbine Components off Site		
6	Turbine & Met Mast Foundations Covering	Reinstate Foundations Areas by Covering with Soil Material		
7	Accommodation Areas Reinstatement	Reinstate Soil Berm and Boundary treatments		

Figure 6-1 Indicative Decommissioning Schedule

7.

MITIGATION PROPOSALS

All mitigation measures relating to the decommissioning phase of the Proposed Development have been set out in the various sections of the Environmental Impact Assessment Report (EIAR) which accompanies this planning application.

This section of the Decommissioning Plan groups together all of the mitigation measures presented in the planning documentation. The mitigation measures are presented in the following pages.

By presenting the mitigation proposals in the below format, it is intended to provide an easy to audit list that can be reviewed and reported on during the decommissioning phase of the project. The tabular format in which the below information is presented, can be further expanded upon during the course of operation and provides a reporting template for site compliance audits.

Table 7-1 Decommissioning Phase Mitigation Measures

Ref. No.	Reference Location	Mitigation Measure	Audit Result	Action Required
Decommissioning Phase				
MM11	ELAR Chapter 4	In the event that the Proposed Development is decommissioned after the 10 years extension of life, an updated Decommissioning Plan will be prepared for agreement with the local authority. This will be a comprehensive plan updated in line with decommissioning methodologies that may exist at the time. The Final Decommissioning Plan will therefore be agreed with the Local Authority at least three months prior to decommissioning the Proposed Development.		
MM12	Decommissioning Plan	Regarding Ornithology and Avian Populations, the decommissioning plan will include industry best practice measures to mitigation the impact of works on a bird, which may include the following: ➤ No removal of woody vegetation or scrub will be carried out within the bird breeding season (March 1st to August 31st) ➤ Vantage Point surveys will be carried out for the season before and during the decommissioning process. ➤ All edible wastes will be stored in covered segregated containers and disposed of at licensed facilities. ➤ All measures to mitigate the risks of contamination of watercourses as highlighted in Chapters 7 & 10 will be fully implemented. ➤ The areas within 50m of the hard-stand and turbine foundations will be subject to a pre-works ornithology walkover to highlight any constraints that may be present (e.g. breeding or resting places of protected species). If any significant constraints are identified, appropriate controls will be		

		developed and integrated into the live decommissioning plan ahead of the commencement of the work. ➤ Speed limits will be enforced on internal roads. ➤ A detailed traffic management plan will be incorporated into the decommissioning plan which will ensure that areas of marsh & fen are unaffected by traffic or storage of plant and materials.		
MM13	Decommissioning Plan	Regarding Biodiversity at the site, the decommissioning phase will involve the following best practice mitigation measures: ➤ All measures to mitigate the risks of contamination of watercourses as highlighted in Chapters 7 & 10 will be fully implemented. ➤ The areas within 50m of the hard-stand and turbine foundations will be subject to a pre-works terrestrial ecology walkover to highlight any constraints that may be present (e.g. breeding or resting places of protected species, presence of Invasive Plant Species). If any significant constraints are identified appropriate controls will be developed and integrated into the live decommissioning plan ahead of the commencement of the work. ➤ If any Third Schedule Invasive species are present in or adjacent to the works footprint, an Invasive Species Management Plan (ISMP) will be developed, and all recommendations implemented in accordance with the contemporary best practice measures. ➤ Speed limits will be enforced on internal roads. ➤ A detailed traffic management plan will be incorporated into the decommissioning plan which will ensure that areas of intact blanket bog are unaffected by traffic or storage of plant and materials. ➤ All edible wastes will be stored in covered segregated containers and disposed of at licensed facilities. ➤ Any import of soil or fill necessary in the decommissioning process shall be from approved sources and appropriately tested or inspected to minimise the risk of import of invasive species. Only soil appropriate to the site (pH, soil type) will be used. The re-seeding or natural revegetation of reinstated		

		areas will proceed on the advice of a suitably qualified ecologist. Any seed mix used will be on the approval of the ecologist		
MM14	Chapter 7	The key mitigation measure during the decommissioning phase is the avoidance of sensitive aquatic areas. The River Cahore runs approximately 0.8km from the nearest turbine (T11) and flows in a southeast direction until the waterbody intersects the Ballywater Wind Farm. The Bog and Warren River is sourced approximately 0.51km from the nearest turbine (T09). The Bog and Warren River is a tributary of the River Cahore. The Cahore Canal is situated approximately 0.16km from the nearest turbine (T17) and provides drainage which redirects the Cahore River from the designated sites located along the eastern periphery of Ballywater Wind Farm. Because of this proximity to surface waters, mitigation measures were put in place during the original construction phase. No in-stream works would be required during the decommissioning phase of the existing wind farm. Small amounts of clean granular material may be imported to maintain the surfaces of access tracks and hardstanding areas. During decommissioning works, application of temporary drainage control measures (i.e. silt fencing) and protection measures with regard to oils/fuel usage will be sufficient to prevent any significant hydrological effects in the nearby SAC/SPAs. Best construction practices will be adhered to throughout the decommissioning phase of the development as indicated in Chapter 4, Section 4.7. No earthworks are proposed, no effect on groundwater is anticipated, therefore no further mitigation measures are proposed.		
MM15	EIAR Chapters 4, 5, 7, 8,	Regarding dust, noise and vibration during decommissioning of subsurface infrastructure, ➤ It is proposed to leave turbine foundations in place underground and to cover them with earth and reseed as appropriate. On removal of turbines, the covering of the foundation will be completed using locally sourced material (e.g. topsoil) where possible. Leaving the turbine foundations in-		

		situ is considered a more environmentally prudent option, as to remove large volumes of reinforced concrete from the ground could result in significant environment nuisances such as noise, dust and/or vibration. ➤ Use of an appropriate native seed mix to assist in revegetation and accelerate the resumption of the natural drainage management that will have existed prior to any construction is recommended.		
MM16	ELAR Chapters 7, 8, 14	In order to limit impacts upon Soils and the Water Environment from potential leaks and spillages of hydrocarbons during the decommissioning works, the following measures are proposed: ➤ All plant and machinery to be serviced before being mobilised to site; ➤ No plant maintenance completed on-site, any broken-down plant removed from site to be fixed; ➤ Refuelling completed in a controlled manner using drip trays at all times; ➤ Mobile bowsers, tanks and drums stored in secure, impermeable bunded storage areas away from open water; ➤ Only designated trained operators authorised to refuel plant on-site; ➤ Procedures and contingency plans set up to deal with emergency accidents or spills; and, ➤ Highest standards of site management maintained, and utmost care and vigilance followed to prevent accidental contamination or unnecessary disturbance to the site and surrounding environment during works.		
MM17	ELAR Chapter 9	Regarding Air Quality during the decommissioning phase: ➤ All construction vehicles and plant used onsite during the decommissioning phase will be maintained in good operational order. If a vehicle requires repairs this work will be carried out, thereby minimising any emissions that arise. ➤ Turbines components will be transported from the Site on specified routes only, as agreed with the Planning Authority prior to decommissioning. ➤ All machinery will be switched off when not in use.		

		➤ Users of the Site will be required to ensure that all plant and vehicles are suitably maintained to ensure that emissions of engine generated pollutants are kept to a minimum. ➤ The Materials Recovery Facility (MRF) facility will be as close as possible to the Proposed Development site to reduce the amount of emissions associated with vehicle movements. ➤ All plant and materials vehicles shall be stored in dedicated areas within the Wind Farm Site. ➤ The roads adjacent to the site entrances will be checked weekly for damage/potholes and repaired as necessary.		
MM18	Decommissioning Plan	Regarding Noise and Vibration control during the decommissioning phase, the following best practice mitigation measures are proposed: ➤ Local residents will be kept informed of the proposed working schedule, where appropriate, including the times and duration of any abnormally noisy activity that may cause concern; ➤ Any extraordinary site work occurring outside of the core working hours (for example, crane operations lifting components off the tower) will be programmed, when appropriate, so that haulage vehicles would not arrive at or leave the site between 19:00 and 07:00, with the exception of abnormal loads that would be scheduled to avoid anticipated periods of high traffic flows; ➤ All vehicles and mechanical plant will be fitted with effective exhaust silencers and be subject to programmed maintenance; ➤ Inherently quiet plant will be selected where appropriate and available - all major compressors would be 'sound reduced' models fitted with properly lined and sealed acoustic covers, which would be kept closed whenever the machines are in use; ➤ Machines will be shut down between work periods (or when not in use) or throttled down to a minimum; ➤ All equipment used on site will be regularly maintained, including maintenance related to noise emissions; and		

		➤ Vehicles will be loaded carefully to ensure minimal drop heights so as to minimise noise during this operation.		
MM19	EIAR Chapter 11	Regarding Cultural Heritage during the decommissioning phase, there will be minimal works required and it is proposed that site roads be left in-site. No potential direct impacts to the archaeological, architectural or cultural heritage resources were identified and therefore no mitigation is required to be proposed.		
MM20	EIAR Chapter 15	Regarding Site Traffic related impacts during the decommissioning phase: ➤ When the Proposed Development is decommissioned after the 10 years extension of life, an updated Decommissioning Plan, including material recycling / disposal and a Traffic Management Plan, developed to minimise impacts to the local road network, will be prepared at the time for agreement with the local authority. A detailed Traffic Management Plan will be prepared in consultation with the local authority prior to any future decommissioning.		

8.

MONITORING PROPOSALS

All monitoring proposals relating to the decommissioning phase of the Proposed Development have been set out in the various sections of the Environmental Impact Assessment Report (EIAR) which accompanies this planning application.

This section of the Decommissioning Plan groups together all of the monitoring proposals presented in the planning documentation. The monitoring proposals are presented in the following pages.

By presenting the monitoring proposals in the below format, it is intended to provide an easy to audit list that can be reviewed and reported on during the operational phase of the project. The tabular format in which the below information is presented, can be further expanded upon during the course of operation to provide a reporting template for site compliance audits.

Table 8-1 Schedule of Decommissioning Phase Monitoring Proposals

Ref. No.	Reference Location	Mitigation Measure	Frequency	Reporting Period	Responsibility
Decommissioning Phase					
MX4	Decommissioning Plan Section 3.11	The Site Manager in consultation with the ECoW will be responsible for employing the services of a suitably qualified ecologist and any other suitably qualified professionals as required throughout the decommissioning works.	As required	As required	Site Manager

9. COMPLIANCE AND REVIEW

9.1 Site inspections and Environmental Audits

Routine inspections of decommissioning activities will be carried out on a daily and weekly basis by the ECoW and the Site Supervisor/Construction Manager to ensure all controls to prevent environmental impacts, relevant to the decommissioning activities taking place at the time, are in place.

Environmental inspections will ensure that the works are undertaken in compliance with this Decommissioning Plan and all other planning application documents. Only suitably trained staff will undertake environmental site inspections.

9.2 Auditing

An Environmental audit will first be carried out prior to the decommissioning phase of the Proposed Development to ensure the operational phase mitigation measures that are still in place as required are adequate. Further environmental audits will be carried out on a monthly basis during the decommissioning phase of the project and on completion of the decommissioning works.

In contrast to monitoring and inspection activities, audits are designed to shed light on the underlying causes of non-compliance, and not merely detect the non-compliance itself. In addition, audits are the main means by which system and performance improvement opportunities may be identified. Environmental audits will be carried out by the ECoW on behalf of the appointed contractor. It is important that an impartial and objective approach is adopted. Environmental audits will be conducted at planned intervals to determine whether the Decommissioning Plan is being properly implemented and maintained. The results of environmental audits will be provided to project management personnel.

9.3 Environmental Compliance

The following definitions shall apply in relation to the classification of Environmental Occurrences during the decommissioning of the Proposed Development:

- **Environmental Near Miss:** An occurrence which if not controlled or due to its nature could lead to an Environmental Incident.
- **Environmental Incident:** Any occurrence which has potential, due to its scale and nature, to migrate from source and have an environmental impact beyond the site boundary.
- **Environmental Exceedance Event:** An environmental exceedance event occurs when monitoring results indicate that limits for a particular environmental parameter (as indicated in the Environmental Monitoring Programme) has been exceeded.
- An exceedance will immediately trigger an investigation into the reason for the exceedance occurring and the application of suitable mitigation where necessary.
- Exceedance events can be closed out on achieving a monitoring result below the assigned limit for a particular environmental parameter.
- **Environmental Non-Compliance:** Non-fulfilment of a requirement and includes any deviations from established procedures, programs and other arrangements related to the Decommissioning Plan.

9.4

Corrective Action Procedure

A corrective action is implemented to rectify an environmental problem on-site. Corrective actions will be implemented by the Site Supervisor/Construction Manager, as advised by the Site Environmental Clerk of Works. Corrective actions may be required as a result of the following;

- Environmental Audits;
- Environmental Inspections and Reviews;
- Environmental Monitoring;
- Environmental Incidents; and,
- Environmental Complaints.

A Corrective Action Notice will be used to communicate the details of the action required to the main contractor. A Corrective Action Notice is a form that describes the cause and effect of an environmental problem on site and the recommended corrective action that is required. The Corrective Action Notice, when completed, will include details of close out and follow up actions.

If an environmental problem occurs on site that requires immediate attention direct communications between the Site supervisor/Construction Manager and the ECoW will be conducted. This in turn will be passed down to the site staff involved. A Corrective Action Notice will be completed at a later date.

9.5

Decommissioning Phase Plan Review

This Decommissioning Plan will be updated and reviewed prior to commencement of decommissioning.

APPENDIX 5-3

**IMPACT OF WIND TURBINES ON
HOUSE PRICES IN SCOTLAND -
CLIMATE EXCHANGE (2016)**

Impact of wind turbines on house prices in Scotland

Dr Stephan Heblich,¹ Dr Dan Olnert,² Prof Gwilym Pryce² and Prof Chris Timmins³

With research assistance from Dr Ellie Bates⁴ and Dr Tim Birab²

October 2016

¹ Department of Economics, University of Bristol, member of the ESRC AQMeN project.

² Sheffield Methods Institute, University of Sheffield, member of the ESRC AQMeN project.

³ Department of Economics, Duke University, USA, member of the ESRC AQMeN project.

⁴ School of Law, University of Edinburgh, member of the ESRC AQMeN project.

Summary

This report presents the main findings of a research project estimating the impact on house prices from wind farm developments. It is based on analysis of over 500,000 property sales in Scotland between 1990 and 2014.

The methodology builds on research on the impact from wind farms on house prices in England (Gibbons 2014). This study improves the way the impact is estimated by looking at the impact of both single turbines and whole wind farms.

To control for the normal fluctuations in house prices we used a 'control group' that closely resembles the characteristics of the dwellings in the study but without being exposed to a wind farm. This provides prices that can be used to interpret a wind farm's impact on the price of dwellings nearby. As such a result showing no effect means that the house price of the property with a wind farm close by has increased or decreased at the same rate as the properties in the control group.

The study looked at both natural landscape and built environment in relation to how exposed a dwelling is to the visual impact of the wind farm.

Key findings

1. **No evidence of a consistent negative effect on house prices:** Across a very wide range of analyses, including results that replicate and improve on the approach used by Gibbons (2014), we do not find a consistent negative effect of wind turbines or wind farms when averaging across the entire sample of Scottish wind turbines and their surrounding houses. Most results either show no significant effect on the change in price of properties within 2km or 3km, or find the effect to be positive.
2. **Results vary across areas:** The results vary across different regions of Scotland. Our data do not provide sufficient information to enable us to rigorously measure and test the underlying causes of these differences, which may be interconnected and complex.

Our results persist under a variety of assumptions:

- whether or not we account for the visibility of turbines;
- whether we base the analysis on individual turbines or entire wind farms;
- whether we account for building heights or use only the natural terrain when estimating turbine visibility; and
- whether we follow individual dwellings over time or use postcode averages.

The complexity of the findings may be due to:

- attitudes towards wind farms and their benefits potentially varying across regions and different social and economic groups;
- Scotland having a higher proportion of its turbines located in remote areas; and
- the fact that some wind farms provide economic or leisure benefits (e.g. community funds or increasing access to rural landscapes through providing tracks for cycling, walking or horse riding).

Additionally these factors are not mutually exclusive. It is likely that they affect house prices simultaneously, and to varying degrees in different locations.

Introduction and background

The Scottish Government has committed to a target for renewables to generate the equivalent of 100% of Scotland's electricity demand by 2020⁵. Onshore wind power is playing a central part in decarbonising Scotland's energy supply.

The rapid growth in onshore wind (both in Scotland and globally) has been accompanied by an interest in understanding the impacts of onshore wind development, both positive and negative. The overall economic benefits of investment and spending are relatively straightforward to measure⁶; impacts on communities less so. Survey-based approaches consistently show a majority in favour of renewable power generation in principle but paint a more mixed picture for those directly affected by nearby wind farm development⁷.

There is now a substantial body of research on the local impacts of wind farms. Some of this research has looked at measurable effects on house price in order to understand the objective effects on communities, beyond stated views. Have properties near to, or in sight of, new wind farm developments seen price changes that differ from other houses? Until recently, all extant studies had consistently found no robust evidence of any such price impact. One of the most recent studies, by RenewableUK and the Centre for Economics and Business Research, used seven wind farm case studies across England and Wales, and came to the same conclusion: either no impact or even a slight positive one⁸.

Very shortly after that study, however, Steve Gibbons looked again at English and Welsh wind farms using a larger dataset and property prices between 2000 and 2012, and found evidence for negative price impacts⁹. In Gibbons' analysis previous house price studies¹⁰, the key problem he identifies is sample size: while some studies contain many properties, the number of observations actually used to estimate the price impact tends to be too low to be statistically reliable. Many also do not compare price changes across time. Gibbons' research design allows for comparison of much larger groups of property prices before and after wind farms became operational, allowing for more robust results.

The present study bases its price impact analysis on Gibbons' approach, including his use of a landscape analysis to determine whether properties can likely see a turbine¹¹, or whether line of sight is blocked. Line of sight analysis allows us to test whether visibility of turbines affects house prices differently to proximity alone, by separating visible and non-visible turbines into two groups. We have also explored ways of improving on Gibbons' approach, greatly increasing the resolution and precision of the data. These improvements are listed below:

1. Whilst we replicate Gibbons' approach using average house price per postcode and postcode-centre for housing location, we also repeat the analysis using individual property prices based on full address locations.
2. We use a dataset of wind turbines that includes their exact location and tip height, rather than the centre-point of wind farms. Relying on the centre-point of wind farms might be particularly problematic in a Scottish context where some wind farms are very spread out. When turbines are dispersed in this way, it is possible for a house to be a very long way from the centre of the wind farm, but very close to a peripheral turbine.
3. Our landscape analysis uses 5 metre grid squares (versus 200 metre in Gibbons). Combined with the exact property locations and turbine locations, this gives much more accurate lines of sight.

¹¹ Why 'likely'? - The real landscape may differ in ways the model has not captured - for example, vegetation may be blocking a view.

- 4 Taking advantage of this higher resolution, we have also added building height data (where available) to test whether buildings may block a property's view.

The following section describes the data used in more detail, and then explains the two key steps in producing the analysis: the line of sight analysis and the econometric house price analysis. The full results are then presented, before concluding with some possible explanations for the findings.

Details of the house price impact analysis

Overview of the data and method

In this section, we outline the data sources for the project and explain how they were used to produce the house price impact analysis. The following four sub-sections describe the **four sources of data** used:

1. House price data for Scotland from January 1990 to March 2014.
2. Wind turbines that became operational between November 1995 and December 2014.
3. Digital Elevation Model (DEM) data for the Scottish landscape, giving height above sea-level for 5-metre grid squares covering the whole of Scotland.
4. Building height data, added to the DEM data.

We shall then detail the two steps of data preparation and analysis. The first step was to carry out a line of sight analysis identifying which houses could most likely see at least one turbine. This provided full details for each house of the number of visible turbines and their distance. The second step was to use this information, along with property price change over time (and a number of other control variables; see below), to produce the final house price impact analysis.

House price data

Data for property prices in Scotland comes from two previously unlinked versions of price data from Registers of Scotland (RoS). By linking these, the house price record covers just over 23 years (1990 to March 2014). While RoS record every Scottish sale, the analysis here drops any sales that, for a number of reasons, were not suitable. For example, not all properties could be exactly geocoded because the RoS record contained insufficient address information to obtain a location match and had to be excluded.

Only repeat sales (properties that sold more than once within the time period of the data) were used in the house price analysis. Following properties over time in this way helps us to compare like with like when estimating the house price impact of turbines being constructed. One limitation of this repeat sales approach is that we do not know whether there have been major changes to the dwelling over time. However, provided changes to dwellings are fairly randomly distributed across all dwellings in the data, this should not have a big effect on the results. In total, the RoS data provided 637,000 repeat-sale properties, accounting for just over 1.7 million sales.

Following Gibbons, we restricted the properties used in the analysis to those within 15km of at least one turbine (i.e. within the green circles in Figure 2). This is done, as Gibbons says, because "as the distance to the wind farm increases, the number of other potential coincident and confounding factors increases, making any attempt to identify wind farm impacts less credible"¹². This reduces the total number of properties in the analysis to 509,275.

Wind turbines

Three sources have been combined to produce the wind turbine dataset:

1. Precise wind turbine locations were acquired from Ordnance Survey's "Points of interest" (POI) data, freely available through an academic license¹³. Its latest incarnation (as of late 2015) is much more comprehensive than previous versions. This data is collated for Ordnance Survey by PointX (www.pointx.co.uk). The POI turbine data itself is mainly supplied to Ordnance Survey by RenewableUK.
2. Dates that wind farms became operational were 'scraped' from RenewableUK's website (www.renewableuk.com) and then matched to turbines.

¹² Gibbons, 'Gone with the Wind'. p.180

¹³ Code and guidance for extracting specific types of POI data are accessible at the Sheffield Methods Institute github page: github.com/SheffieldMethodsInstitute/windfarmsHousePrices

7. Turbine tip height information was collated through direct research of planning applications and other publicly available sources¹⁴.

Figure 1 shows the cumulative rise in the number of turbines becoming operational in Scotland from 1995 onwards; the total reaches just over 2,500 turbines by the end of 2014.

Figure 1: Number of operational wind turbines in Scotland, cumulative from 1995 to 2014

Landscape and building height data

To determine whether a turbine is likely to be viewable from a particular property, we need to know if any landscape features intervene to block the view. This requires using a 3D 'Digital Elevation Model' (DEM) of the Scottish terrain, onto which houses and turbines can be added. We use Ordnance Survey's "OS Terrain 5" DEM, which provides height above sea level for every 5-by-5 metre grid point.

The OS Terrain 5 data can be used to identify which houses have their lines of sight blocked by the physical landscape, but this does not account for the effect of other buildings. To correct for this, we also use building height data for the majority of properties in Scotland, combining Ordnance Survey's Mastermap with LIDAR data from the Centre for Environmental Data Analysis (CEDA). The OS Terrain 5 DEM data's 5 metre resolution is fine enough to allow addition of building footprints and heights derived from the Mastermap and CEDA data.

On the map of Scotland in Figure 2, areas for which we used building data are shown with the yellow (Mastermap) and red (CEDA) grid areas. Where both sources covered the same area, we used the slightly better quality Mastermap data. These two sources do not cover all buildings in Scotland, but because data exists for all the larger conurbations, 84% percent of properties have a line of sight that crosses building height data and so could potentially have that view blocked. Calculations are run both with and without building heights for comparison, with the latter using the 84% subset of houses that may have had a line of sight blocked by a building.

¹⁴ The majority of the work tracking down tip heights was done by Dr Ellie Bates, University of Edinburgh.

Figure 2: Scotland - housing data location (dark blue), turbine 15km radii and building height data location

Analysis step 1: Which houses can likely see turbines? 'Line of sight' analysis

The econometric analysis requires the following information for each repeat-sale property:

- Which turbines, if any, are within 15km?
- How close is each of them to the property?
- Of those turbines within this 15km range, which are visible to this property and which likely cannot be seen?

Used Pythagoras' Theorem to compute distances between each dwelling and turbine. To estimate turbine visibility, we used 'line of sight' analysis (also known as "intervisibility" analysis)¹⁵. Figure 3 and Figure 4 illustrate how this process is carried out using the example of a particular property in Glasgow that has its line of sight blocked by another building. 136 batches of housing, turbine and landscape data are processed - these figures use a batch covering the Cathkin Braes wind turbine, installed in 2013¹⁶. (Other batches process larger groups of turbines together, e.g. the Whitelee wind farm to south of Glasgow in Figure 3 is processed in one batch.)

The dotted line on the map of Glasgow in Figure 3 marks an 8.7km line of sight between this example property and the Cathkin Braes turbine. Figure 4 gives the landscape cross-section for this same line (with horizontal distance at 1/8th scale, relative to height), showing how the DEM landscape data - both with and without building heights - is used. The line starts two metres above ground level on the site of the house¹⁷ and 'looks' towards the turbine blade tip height. If the highest point of the tip is visible above landscape and buildings, the line of sight is clear. In this example, for landscape alone, the house (left-hand side of graph) has a clear line of sight. If building heights are used, however (green in Figure 4), line of sight is blocked.

This process was repeated for all properties. The addition of building height data blocked a great many more from view of a turbine. Without building heights, 80% of properties within 15km of a turbine are identified as having a line of sight to at least one. This drops to 32% when building heights are used - an unsurprising result given how many properties are located in conurbations. Note that this binary visibility result says nothing about a turbine's actual visual impact which will depend on proximity. For example, a visible turbine will presumably have a much bigger visual impact when viewed from nearby properties compared with the view from houses 15km away. As Gibbons says:

"Existing literature based on fieldwork suggests that large turbines are potentially perceptible up to 20km or more in good visibility conditions, but 10 to 15km is more typical for a casual observer and details of individual turbines are lost by 8km."¹⁸

¹⁵ Code and guidance for this is available at the Sheffield Methods Institute github page: github.com/SheffieldMethodsInstitute/windfarmsHousePrices

¹⁶ See e.g. "£5m city turbine will be visible around world (From Evening Times)." 2013. www.eveningtimes.co.uk/news/13256714.5m_city_turbine_will_be_visible_around_world

¹⁷ The building data for the house is discounted: for the building height check, line of sight is only checked once the line has got past the building's edge.

¹⁸ Gibbons p.180

Figure 3: Digital Elevation Model for Glasgow area. Repeat-sales properties in green. Wind turbines are yellow triangles. Dotted line is an example line of sight (matches figure below) for a sample Glasgow property to Cathkin Braes turbine tip.

Figure 4: example line of sight blocked by buildings that would not be blocked by landscape alone. Matches dotted line in above figure. Property on left, Cathkin Braes turbine tip on right. Note horizontal distance is 1/8 of actual scale, relative to height.

Analysis step 2: house price impact using 'difference in differences'

The aim of the econometric analysis described in this section is to assess the house price impact as distance increases, both for visible and non-visible turbines and wind farms.

We use a "difference in differences" approach to identify the causal effect of wind turbine proximity and visibility. This approach seeks to estimate how rates of change in house prices differ between properties "exposed" to wind turbines (through proximity and/or visibility) compared with those that are not exposed. We use only 'repeat sale' properties, as described above. We label properties exposed to wind turbines - those we want to identify any price impact for - as the "treatment group".

To measure the causal effect of wind turbine exposure, we would ideally like to know how the same dwelling's change in price over time is affected by the presence or absence of a wind farm. Clearly, observing both states at the same time is not possible. Instead, we construct a "control group" that closely resembles the characteristics of the treatment group but has not been exposed to a wind farm. The control group thus provides us with a counterfactual dwelling price, which we interpret as what the price would have been if the treatment group had not been in proximity to, or in sight of, wind turbines. This setup allows us to compare the average change in 'exposed' dwellings' house price to the average change in 'unexposed' dwellings' house price before and after turbines become operational - a so called *difference-in-differences* framework.

The first difference is how much the treatment and control groups change price between the chosen time periods. The second difference is how these two changes compare. This second difference is labelled the "treatment effect", i.e. the causal impact of wind farm developments on house price growth. If we were to produce the same findings as Gibbons, with the treatment group's price increasing less than the control group, then the impact of wind turbines on house price growth would be negative. For example, if we find a house price impact of -10%, this means that prices in the treatment group went up by 10% less than they did in the control group. On the other hand, if we find a positive effect, say 10%, this means that prices in the treatment group went up by 10% more than in the control group.

Note that a key assumption in the difference-in-differences framework is that the treatment and control groups show the same trends in house price growth in the pre-treatment period (the 'common trends assumption'), which means that they are subject to the same influences on price before the turbine is installed.

For all results, we repeated our difference-in-differences analysis using a large variety of additional controls that control for possible unobserved factors. This is the same as the "fixed effects" approach used by Gibbons (2014). The essential principle of a fixed effects approach is to allow fixed (i.e. constant over time) differences in subsets of the data to be accounted for. Including fixed effects allows the analysis to control for factors that we cannot easily measure (such as cultural differences or unknown economic, political or physical factors) but are likely to be fairly constant over time and may cause different price trends. The most intuitive fixed effects are regional. For example, there might be different house price trends across NUTS2 regions because of differences in the fixed characteristics across regions, such as their physical geography. These differences can be controlled for using fixed effects even if we do not have detailed data on the different underlying characteristics. This may be important if wind farms are sited taking these features into account.

All of the results presented in this report include basic fixed effects that control for variations in overall house price trends and differences in property characteristics. We use annual and quarterly fixed-effect controls to flexibly account for house price trends. Since we are looking at repeat sales, our estimations further include a set of house fixed effects - allowing each property its own trend line - that absorb any time-invariant house characteristics such as its footprint size or number of bedrooms. These are the "basic" controls used in all the results reported here.

We then add a number of additional controls to the models in order to test sensitivity. First, a number of geographic controls are added, allowing different house price effects over time by including fixed effects for slope (for each individual property), elevation (height above sea level for each property) and aspect (which compass direction the property's slope is facing, indicating which direction their predominant view is likely to be). Second, we add controls for different price effects across distance rings. These controls are in line with the ones used by Gibbons (2014). In addition, we allow house prices to differ between Scotland's four NUTS2 regions and include a set of region-by-year interactions. These additional fixed effects results are provided in the appendices.

Results

We present three sets of results. We start with the Gibbons (2014) approach, which is based on postcode averages for house prices and computes proximity and visibility using the centre point of entire wind farms (rather than individual turbines). We then compare these baseline results with outputs based on more fine-grained analysis that follows individual dwellings over time and calculates turbine proximity and visibility based on individual wind turbines. This is done both for visibility based just on terrain, and also visibility that also accounts for any buildings that may block the view.

Result #1: Analysis based on Postcode Averages & Wind Farm Centre Points ('centroids') (Gibbons)

Figure 5 shows the percentage impact on house price growth of a dwelling close to a wind farm being able to see the wind farm (blue line) compared with not being able to see the wind farm (red line). The approach used to derive this first set of results is similar to Gibbons (2014). They are based on:

- the change in average house prices in a given postcode before and after a wind farm became operational (rather than individual dwellings); and
- the effect of entire wind farms (rather than individual turbines).

Compared to the individual-property-level repeat sales analysis, one may think of this as a repeat sales estimation at the postcode level. However, instead of looking at the same house selling multiple times, we now look at multiple transactions in the same postcode. The implicit assumption is that houses within the same postcode unit are very similar and could be used interchangeably.

Figure 5: Result #1: Percent difference in the change of house price

(Postcode/wind farm centroids¹⁹, **whole wind farm** visible/not visible.)

The horizontal axis shows the distance between the postcode of dwellings and the centre of the wind farm. These distances are grouped into 6 bands: (i) 0-2km, (ii) 2-3km, (iii) 3-4km, (iv) 4-5km, (v) 5-8km, and (vi) 8-14km. The vertical bars show the confidence intervals for each estimate. If the confidence interval is narrow, depicted by a short vertical bar, it means the estimate is precise. The longer the bar, the wider the confidence interval,²⁰ and the less precise the estimate is. If this vertical bar is entirely above zero, it means the result suggests a significant²¹ positive effect on house price change caused by the construction of the wind farm. If the vertical bar lies entirely below zero, it means that the effect is significantly negative. If the vertical bar extends above and below zero, as is the case for most of the estimates in Figure 5, it means that there is no significant effect, either positive or negative. In other words, we cannot rule out a zero effect at the 95% confidence level.

A zero effect does not mean that house price growth has flat-lined. Rather it means that the treatment group (those properties that are in close proximity to a wind turbine) have a similar house price growth trajectory as the control group (those properties that are not in close proximity to a wind turbine).

The results in Figure 5 suggest that visible turbines have a positive effect on house prices (the blue line is above zero for the first four distance bands). However, the majority of confidence intervals extend above and below zero. This suggests that there is no significant house price effect in the first three distance bands, but a possible slight positive effect for visible turbines in the 4-5km band, dropping to a negative effect in the 8-14km band.

As discussed above, we repeated our analysis using a large variety of different specifications that control for a variety of possible unobserved factors using the same “fixed effects” approach used by Gibbons (2014). The results of the key variations from this exercise are presented in Figure A1 in the appendix, where Figure 5 is replicated in Figure A1(A) for comparison. We can see that the results are broadly consistent with Figure 5 in that none of the graphs show significant negative impacts of wind turbines on house price growth in the first three distance bands. Some graphs do, however, suggest a significant **positive** impact on house price growth, particularly in the second distance band (2-3 km), and particularly for visible turbines (see graphs (B), (C), (D), (F), and (H) of Figure A1). A more detailed description of the results in Figure A1 is presented in the Appendix.

Result #2: Analysis based on Repeat Sales & Individual Turbines

Figure 6 shows results based on the repeat sales of individual properties and the impact on house price growth after individual turbines become operational²². Here we see a significant positive impact on house price growth in the first distance band (1-2km) for properties that cannot see any turbines, but this effect is much smaller and statistically insignificant for properties in the same distance band that can see turbines. Note that the positive effect on properties for which turbines are visible, becomes statistically significant in the second, third and fourth distance bands. The two furthest distance bands, however, do indicate negative price impacts. Though these results are mixed, as confidence intervals for visible/not visible turbines cross or touch the zero line.

Results of the sensitivity analysis—comparison with a variety of different fixed effects—are presented in Figure A2 in the appendix. Again, these different versions of the results tell a similar story with the positive impact on house price growth

¹⁹ Centroid means centre point of an aerial unit (e.g. postcode) or multiple points.

²⁰ Based on the 95% level of confidence, which is the standard threshold used in statistical studies.

²¹ Statistical “significance”, in this context, means that there is less than a 5% chance that an estimated negative or positive house price impact is purely due to random variation in the data.

²² Again, this is replicated in the appendix, figure A2(A).

tending to diminish with distance for properties that cannot see turbines, but rising then falling with distance for properties that can see turbines.

Crucially, there are no consistent signs of negative impacts on house price growth in the first three distance bands. In these results, the negative signal in the furthest two bands is again mixed, with no completely consistent pattern either side of zero.

Note that at shorter distances, confidence intervals tend to be larger. This is unsurprising, as sample sizes at shorter distances are smaller (there are not many houses very close to turbines) and so there will necessarily be more uncertainty in our estimates at close distances.

Figure 6: Result #2: Percent difference in the change of house price
(All repeat sales, turbine visible / not visible)

Results for individual repeat sales properties (Figure A2, appendix) show much the same pattern, but with larger percentage effects. The larger non-visible turbine effects at very close distance do, again, have large confidence intervals - but these do not cross the zero line. For both the centroid and repeat-sales results, any impact on house price growth tends to drop off as distances increase, though there is a great deal of variability in this response.

Repeat-sales results take advantage of having individual turbine data to distinguish between responses to turbines over and under 100 metres to tip height (appendix, figures A2(E) and A2(F); A3(E) and A3(F)). Sub-100 metre turbines are associated with consistent negative house price impacts, if they can be seen - but, again, confidence intervals cross the zero line. This is not the case for those out of sight, however.

Turbines over 100 metres in height are very similar to the main results - with perhaps a more clear decay of positive effect over distance for non-visible turbines. It is worth noting that: (a) Aberdeenshire has a large proportion of the sub-100 metre turbines and (b) most of the above 100 metre turbines were built after 2006, so this difference in response could be rooted in these different times and places.

Result #3: Analysis based on Repeat Sales & Individual Turbines, Taking into Account Building Heights

One disadvantage with both Result #1 (the Gibbons approach) and Result #2 (the individual houses/turbines approach) is that the visibility estimates do not take into account the possibility of buildings (as opposed to natural features) blocking the line of sight to turbines and wind farms.

Figure 7 shows the results of an analysis based on the repeat sales of individual properties and the impact on house price change after individual turbines become operational taking into account the height of buildings that might block the view of turbines. (Again, the appendix shows the results of the sensitivity analysis for these results in Figure A3). While the main findings remain similar to Results #1 and #2 in that there are no consistent signs of negative house price effects in the first three distance bands, it is clear that the estimates of impacts of visible and non-visible turbines on house price changes appear to be much closer in Result #3. Looking across all the results in Appendix figure A3, for both visible and non-visible turbines, the impact on house price growth seems to be more positive in the second distance band (2-3km) than in the closest distance band (0-2km), but then declines in distance bands three and four. As with the previous result, there appear to be negative price impacts in the last two distance bands, particularly for visible turbines, but these results are less consistent in the sensitivity analysis.

Figure 7: Result #3 Percent difference in the change of house price

(All repeat sales, turbine visible / not visible, using building height data for line-of-sight)

While results using building height data in Figure 7 are broadly similar to those relying on terrain-based line of sight, for some of these regressions there are quite different results even for properties that cannot "see" a turbine. This is because it uses a different sample of houses - only those that have lines of sight that cross areas that have available building height data. If this is not done, it is impossible to know whether a property has a clear line of sight due to no

buildings blocking it, or just that no building height data was available. As mentioned above, this still accounts for 84% of properties - but these are all in the larger conurbations. The properties that "can see" and "cannot see" are, of course, also different. The building height results, then, say more about the impact of wind turbines in urban areas than the non-building height sample.

The main difference in the building height result is in the nearest distance band where the effects on house price growth for properties whose line of sight is blocked by a building are noticeably smaller in comparison to those with line of sight blocked by terrain. With terrain only, visible and non-visible appeared to show a quite different response (Figure 6), but when the building height data are included (Figure 7), the impact of visible and non-visible turbines both have the same direction of change as distance is increased (though again, the wide confidence intervals mean there is considerable uncertainty surrounding the estimates).

The pattern of difference between sub-100-metre turbines (Figure A3(E)) and those over (Figure A3(F)) is similar to the terrain-based results once the uncertainty surrounding estimates is taken into account. For turbines less than 100 metres that can be seen despite building height, there appear to be large impacts on the price growth of properties in close proximity, and these impacts diminish at further distances, but the confidence intervals are so wide, we cannot be sure that the effects are different to zero for any of the distance bands, visible or non-visible. Much more precise results are available for turbines over 100m with statistically significant positive effects for the second distance band (2-3km) in Figure A3(F).

Summary and possible explanations for the results

In summary, we have not found any consistent evidence of a negative impact of wind turbines on house price growth. Generally speaking the effect is either positive at particular distance bands (2-3km) or not distinguishable from zero.

Note again that a zero effect does not mean that house price growth has flat-lined. Rather, it means that there is no significant difference between the house price growth of the treatment group (properties close to turbines) and that of the control group (properties far away from turbines).

A positive effect means that the treatment group has a higher rate of house price growth than the control group. The repeat sales analysis, for example, finds a positive effect of 2% for houses in the 2-3km distance band that can see a turbine (Figure 6). This means that the value of those houses went up by 2% more than the increase in value of dwellings in the control group.

We also find some evidence that the impact of wind turbines on house price growth appears to vary across different regions of Scotland. This finding has not, as far as we are aware, been systematically tested in previous UK studies using the rigorous methods applied here.

There is some evidence from the results that property prices respond differently to wind turbines in different parts of Scotland. It must be emphasised, this finding is somewhat tentative. Using the current method, sample sizes are too small to be fully reliable. However, it does suggest that while some areas see the positive impacts described above, others may see negative impacts.

Results for Angus/Dundee and Clackmannanshire/Fife regions, all clustered north of the Firth of Forth, appear to see some negative impacts for visible turbines, though most of these have confidence intervals crossing or just touching zero. In contrast, North and South Lanarkshire show the most positive price impacts at close distances. Other regions either produce no geographical results due to data limitations, or are very mixed.

Our data do not provide sufficient information to enable us to rigorously measure and test the underlying causes of these differences which may be interconnected and complex. Differential impacts may arise, for example, from interactions between variations in physical terrain, urban social structures, local approaches to turbine development policy and community engagement.

We now conclude the report by offering a number of possible explanations for our findings.

Heterogeneous and changing preferences

The reason our results are consistently different to those reported by Gibbons (2014) might be because attitudes towards wind farms may be different in Scotland than in other parts of the UK, and may also vary significantly within Scotland, and between individuals. Attitudes may also have varied over time – e.g. in response to public debates about energy futures or rural economic development. So our complex findings may reflect genuine complexity and fluidity in the preferences and attitudes of homeowners across Scotland over the time period considered.

Location of turbines

In Scotland, a much higher proportion of turbines are likely to be located on moors and mountains, and in much more remote areas than in England and Wales. These differences in terrain might be another important reason for the discrepancies between our results and those of Gibbons (2014), as might the potential alternative uses of the land on which turbines are constructed. For example, in remote mountain locations, there may be fewer alternative commercially viable uses for the land and so the opportunity cost in terms of foregone alternative revenue streams from the land may be smaller. In contrast, high quality farmland locations in England and Wales may well have more valuable

alternative uses that have to be foregone, both now and in the future, if turbines are constructed. This may itself affect the attitudes of, and financial impact on, local residents and businesses.

Amenity and economic benefits

The positive house price impacts presented above may also reflect the fact that some wind farms provide economic and leisure benefits to the surrounding areas.

- E.g.1: The Whitelee wind farm had 25,000 visitors in the first two years of opening²³ and provides 130kms of tracks for walkers, cyclists, horse riders and dog walkers. These benefits may be substantial and may offset any negative aesthetic or noise effects. The positive effect of such amenities might be particularly strong if the previous land use was essentially barren and of little aesthetic merit. The effects, positive and negative, are likely to vary geographically but not necessarily in the same way.
- E.g.2: Some renewable energy companies provide community and development funds to fund a range of projects that benefit the locality and potentially generate employment. The SSE Clyde wind farm fund²⁴, for example, is expected to provide a total of £17.5 million for local projects that boost local investment and employment, offer training, prevent poverty, or benefit the local or social environment in some way. Such initiatives may improve the quality of life of local residents and increase house prices accordingly.

Patterns of social stratification

Attitudes towards wind turbines and the economic benefits may vary across different social and economic groups. If the location of these groups relative to the location of wind farms varies (e.g. because affluent households are more concentrated in the outskirts in some cities than in others) then the house price responses might vary depending on location.

For example, Kavanagh, Lee and Pryce (2016)²⁵ find that poverty is much more concentrated in the inner city in Dundee than it is in Edinburgh. The maps in Figure 11 below make the same point using the Scottish Index of Multiple Deprivation. Note also that Kavanagh, Lee and Pryce (2016) identify significant change in the geographic patterns of poverty between 2001 and 2010. Since wind turbines tend to be located in rural areas, households living near the edge of the city are most likely to be affected, either positively or negatively, and variations in the pattern of wealth over time and between cities might affect the pattern of house price impact.

Figure 11: 2011 Scottish Index of Multiple Deprivation in Edinburgh and Dundee. Lower values (darker blue) are more deprived areas, higher values are less deprived.

Overall, those who are likely to be able to see a wind turbine typically live in lower value houses (and presumably have lower incomes) than those who cannot (Figure 12). It may be that those on lower incomes are less averse to wind turbines, perhaps because the marginal benefit of any community fund or other positive spillover from wind farm projects is larger relative to their disposable income.

Figure 12: Average annual house prices (plotted on log scale) for houses that will have a turbine in sight at some point within the timeframe of the study vs. those that do not

Interactions between multiple causes

These explanations are not mutually exclusive. It is likely that they affect house prices simultaneously, and to varying degrees in different locations.

These forces may also reinforce or negate each other. They may each wax and wane over time and have different effects at different spatial scales leading to a complex and fluid set of potential outcomes at each point in time.

Further research would be needed to identify which of these effects is most prevalent and persistent. However, it should be noted that the data we collated for this project are unlikely to be sufficient to disentangle these effects in a robust way.

Appendix: Sensitivity analysis

Introduction

We noted above that we use a "fixed effect" methodology to control for a wide range of factors that we cannot observe or measure directly. Provided these factors remain fairly constant over time, we can control for their impact on price trends by introducing additional categorical variables into the analysis. All of the results presented in this report include basic fixed effects that control for differences in dwelling attributes, such as number of bedrooms, which we assume remain constant over time.

We also experimented with a wide number of additional controls. This allows us to test whether our results are robust to changes in how the analysis is set up. For example, we included fixed effects that allow different house price effects to occur over time for: the land gradient (for each individual property); elevation (height above sea level for each property); and aspect (which compass direction the property's slope is facing, indicating which direction their predominant view is likely to be). We also included controls for different price effects across distance rings and we allowed house prices to differ between Scotland's four NUTS2 regions and include a set of region-by-year interactions.

The impacts of these different specifications are presented in the graphs below for each of main categories of results presented under the labels A1, A2, and A3 which relate to the headings used in the main body of the report:

- Figure A1 reports sensitivity analysis for Result #1: Analysis based on Postcode Averages & Wind Farm Centre-Points ('centroids') (Gibbons),
- Figure A2 reports sensitivity analysis for Result #2: Analysis based on Repeat Sales & Individual Turbines
- Figure A3 reports sensitivity analysis for Result #3: Analysis based on Repeat Sales & Individual Turbines, Taking into Account Building Heights

You will see that each of the three figures contains eight sub-graphs, labelled (A) to (H) which give results for each type of fixed effects analysis. The labels for each are explained below:

The first sub-figure, labelled (A), is the "basic" fixed effects used in all analyses:

- **(A) "properties"**: includes fixed effects for time and properties. Note that these results are the same as the results used in the main sections above: they include the same time fixed effects and the property-level fixed effects as those used in Figures 5, 6 and 7 and follow the method described in the "Analysis Step 2" section above. We reproduce them below for ease of comparison with the additional results.

Sub-figures (B) to (D) in Figures A1, A2 and A3 below each add an extra fixed effect on top of the last. In order, these are:

- **(B) "geography"**: fixed effects for slope, elevation and aspect;
- **(C) "rings"**: fixed effects for properties in each distance ring from turbines (or wind farms for figure A1);
- **(D) "NUTS2"**: fixed effects for Scotland's four NUTS2 regions.

Each sensitivity analysis includes a further four sub-figures. These run separate analyses on a particular subset of the data, with each of them using the full set of fixed effects. All three break down properties by their distance from the Scottish coast:

- **(G) "Coast < 2km"**: contains only coastal properties – i.e. those within 2km of the coast;
- **(H) "Coast > 2km"**: contains only inland properties – i.e. those located 2km or more beyond any coastal point.

Sub-figures (E) and (F) vary depending on whether the analysis is based on postcodes/wind farm centre-points or individual dwellings/turbines:

In **Figure A1** the analysis is based on postcode and wind farm centre-points and the results are broken down by wind farm size:

- **A1(E) "Single turbines"**: looks just at single turbine sites;
- **A1(F) "More than one turbine"**: looks at sites with more than one turbine.

In **Figures A2 and A3**, the analysis is based on individual turbines (rather than entire wind farms), and so we can estimate the impact of turbine height:

- **A2(E) and A3(E) "Turbines < 100m"**: plots the impact of turbines that are less than 100m tall;
- **A2(F) and A3(F) "Turbines > 100m"**: plots the impact of turbines over 100m tall.

Note that all graphs in the appendix have the same scale for the vertical axis, which is limited to the plus/minus 15% price change interval. This was done to make each sub-figure directly comparable. Any confidence intervals (i.e. the vertical bars plotted for each estimate) beyond this range are cut off at the 15% limit.

Sensitivity analysis for result #1: based on Postcode Averages & Wind Farm Centre-Points ('centroids') (Gibbons)

The results in the graphs (E) and (F) of Figure A1 allow us to compare the effects of "wind farms" consisting of single turbines (graph A1(E)) and those with two turbines or more (graph A1(F)). Single-turbine effects have wider confidence intervals making the estimates less precise and not statistically different from zero. The estimates are also noticeably less precise for coastal locations (A1(G)) than for inland properties (A1(H)). Controlling for "geography" using fixed effects for slope, elevation and aspect (A1(B)), distance rings (A1(C)) and NUTS2 region (A1(D)) yields relatively precise positive house price effects particularly for the 2-3km distance band.

Figure A1: Percent difference in the change of house price
(Postcode/wind farm centroids, whole wind farm visible / not visible)

Sensitivity analysis for result #2: based on Repeat Sales & Individual Turbines

Figure A2: Percent difference in the change of house price

(All repeat sales, turbine visible / not visible)

Sensitivity analysis for result #3: based on Repeat Sales & Individual Turbines and Taking into Account Building Heights

Figure A3: Percent difference in the change of house price
(All repeat sales, turbine visible / not visible accounting for building heights)

<http://www.naturvardsverket.se/Documents/publikationer/620-5308-6.pdf>
- "None of the... evidence reviewed suggests an association between noise from wind turbines and pain and stiffness, diabetes, high blood pressure, tinnitus, hearing

impairment, cardiovascular disease, and headache/migraine." *Source: Massachusetts review* http://www.mass.gov/dep/energy/wind/turbine_impact_study.pdf

"...there are no evidences that noise from wind turbines could cause cardiovascular and psycho-physiological effects." *Source: Eja Pedersen 2003 Review* <http://www.naturvardsverket.se/Documents/publikationer/620-5308-6.pdf>

"...there was no evidence that environmental noise was related to raised blood pressure..." *Source: Ad Hoc Expert Group on Noise and Health* http://www.hpa.org.uk/webc/HPAwebFile/HPAweb_C/1279888026747

- "The health impact of the noise created by wind turbines has been studied and debated for decades with no definitive evidence supporting harm to the human ear." *Source: Chatham-Kent Public Health Unit* <http://www.harvestingwindsupport.com/blog/wp-content/uploads/2011/03/Chatham-KentHealth-and-Wind-.pdf>
- "The electromagnetic fields produced by the generation and export of electricity from a wind farm do not pose a threat to public health..." *Source: NHMRC 2010* http://www.nhmrc.gov.au/files/nhmrc/publications/attachments/new0048_evidence_review_wind_turbines_and_health.pdf
- "... no consistent associations were found between wind turbine noise exposure and symptom reporting, e.g. chronic disease, headaches, tinnitus and undue tiredness." *Source: Bolin et al 2011 Review* [http://iopscience.iop.org/1748-9326_6_3_035103.pdf](http://iopscience.iop.org/1748-9326/6/3/035103/pdf/1748-9326_6_3_035103.pdf)
- "... low level frequency noise or infrasound emitted by wind turbines is minimal and of no consequence... Further, numerous reports have concluded that there is no evidence of health effects arising from infrasound or low frequency noise generated by wind turbines." *Source: NHMRC 2010* http://www.nhmrc.gov.au/files/nhmrc/publications/attachments/new0048_evidence_review_wind_turbines_and_health.pdf
- "... renewable energy generation is associated with few adverse health effects compared with the well documented health burdens of polluting forms of electricity generation..." *Source: NHMRC 2010* http://www.nhmrc.gov.au/files/nhmrc/publications/attachments/new0048_evidence_review_wind_turbines_and_health.pdf
- "Although opposition to wind farms on aesthetic grounds is a legitimate point of view, opposition to wind farms on the basis of potential adverse health consequences is not justified by the evidence." *Source: Chatham-Kent Public Health Unit* <http://www.harvestingwindsupport.com/blog/wp-content/uploads/2011/03/Chatham-KentHealth-and-Wind-.pdf>
- "What is apparent is that numerous websites have been constructed by individuals or groups to support or oppose the development of wind turbine projects, or media sites

reporting on the debate. Often these websites state the perceived impacts on, or benefits to, human health to support the position of the individual or group hosting the website. The majority of information posted on these websites cannot be traced back to a scientific, peer-reviewed source and is typically anecdotal in nature. In some cases, the information contained on and propagated by internet websites and the media is not supported, or is even refuted, by scientific research. This serves to spread misconceptions about the potential impacts of wind energy on human health..." Source: Knopper&Ollson review <http://www.ehjournal.net/content/pdf/1476-069X-10-78.pdf>

- Afsset was mandated by the Ministries responsible for health and the environment to conduct a critical analysis of a report issued by the *Académie nationale de médecine* that advocated the use of a minimum 1,500 metre setback distance for 2.5 MW wind turbines or more. The Affset report concluded that "It appears that the noise emitted by wind turbines is not sufficient to result in direct health consequences as far as auditory effects are concerned. [...] A review of the data on noise measured in proximity to wind turbines, sound propagation simulations and field surveys demonstrates that a permanent definition of a minimum 1,500 m setback distance from homes, even when limited to windmills of more than 2.5 MW, does not reflect the reality of exposure to noise and does not seem relevant."

Annoyance

- "... wind turbine noise is comparatively lower than road traffic, trains, construction activities, and industrial noise." Source: Chatham-Kent Public Health Unit <http://www.harvestingwindsupport.com/blog/wp-content/uploads/2011/03/Chatham-KentHealth-and-Wind-.pdf>
- "There is consistent evidence that noise from wind turbines—whether estimated in models or using distance as a proxy—is associated with annoyance, and reasonable consistency that it is associated with sleep disturbance and poorer sleep quality and quality of life. However, it is unclear whether the observed associations are due to wind turbine noise or plausible confounders" NHMRC (2014) [full report](#)
- "The perception of noise depends in part on the individual - on a person's hearing acuity and upon his or her subjective tolerance for or dislike of a particular type of noise. For example, a persistent "whoosh" might be a soothing sound to some people even as it annoys others." Source: NRC 2007 http://www.vawind.org/assets/nrc/nrc_wind_report_050307.pdf
- "... some people might find [wind turbine noise annoying. It has been suggested that annoyance may be a reaction to the characteristic "swishing" or fluctuating nature of wind turbine sound rather than to the intensity of sound." Source: Ontario CMOH Report

http://www.health.gov.on.ca/en/public/publications/ministry_reports/wind_turbine/wind_turbine.pdf

- "... being annoyed can lead to increasing feelings of powerlessness and frustration, which is widely believed to be at least potentially associated with adverse health effects over the longer term." *Source: Ad Hoc Expert Group on Noise and Health*
http://www.hpa.org.uk/webc/HPAwebFile/HPAweb_C/1279888026747
- "Wind turbine annoyance has been statistically associated with wind turbine noise, but found to be more strongly related to visual impact, attitude to wind turbines and sensitivity to noise." *Source: Knopper&Ollson review*
<http://www.ehjournal.net/content/pdf/1476-069X-10-78.pdf>
- "... self reported health effects like feeling tense, stressed, and irritable, were associated with noise annoyance and not to noise itself..." *Source: Knopper&Ollson review*
<http://www.ehjournal.net/content/pdf/1476-069X-10-78.pdf>
- "... many of the self reported health effects are associated with numerous issues, many of which can be attributed to anxiety and annoyance." *Source: Knopper&Ollson review*
<http://www.ehjournal.net/content/pdf/1476-069X-10-78.pdf>
- "To date, no peer reviewed articles demonstrate a direct causal link between people living in proximity to modern wind turbines, the noise they emit and resulting physiological health effects. If anything, reported health effects are likely attributed to a number of environmental stressors that result in an annoyed/stressed state in a segment of the population." *Source: Knopper&Ollson review*
<http://www.ehjournal.net/content/pdf/1476-069X-10-78.pdf>
- "... some community studies are biased towards over-reporting of symptoms because of an explicit link between...noise and symptoms in the questions inviting people to remember and report more symptoms because of concern about noise." *Source: Ad Hoc Expert Group on Noise and Health*
http://www.hpa.org.uk/webc/HPAwebFile/HPAweb_C/1279888026747
- "... it is probable that some persons will inevitably exhibit negative responses to turbine noise wherever and whenever it is audible, no matter what the noise level." *Source: Fiumicelli review abstract*
- "The major source of uncertainty in our assessment is related to the subjective nature of response to sound, and variability in how people perceive, respond to, and cope with sound." *Source: Oregon review*
<http://public.health.oregon.gov/HealthyEnvironments/TrackingAssessment/HealthImpactAssessment/Documents/Oregon%20Wind%20Energy%20HIA%20Public%20comment.pdf>
- "... sleep difficulties, as well as feelings of uneasiness, associated with noise annoyance could be an effect of the exposure to noise, although it could just as well be that

respondents with sleeping difficulties more easily appraised the noise as annoying."

Source: NHMRC 2010

http://www.nhmrc.gov.au/files/nhmrc/publications/attachments/new0048_evidence_review_wind_turbines_and_health.pdf

- "Even noise that falls within known safety limits is subjective to the recipient and will be received and subsequently perceived positively or negatively." *Source: Chatham-Kent Public Health Unit* <http://www.harvestingwindsupport.com/blog/wp-content/uploads/2011/03/Chatham-KentHealth-and-Wind-.pdf>
- "... annoyance was strongly correlated with a negative attitude toward the visual impact of wind turbines on the landscape..." *Source: NHMRC 2010*
http://www.nhmrc.gov.au/files/nhmrc/publications/attachments/new0048_evidence_review_wind_turbines_and_health.pdf
- "Respondents tended to report more annoyance when they also noted a negative effect on landscape, and ability to see the turbines was strongly related to the probability of annoyance." *Source: Minnesota Health Dept 2009*
<http://www.health.state.mn.us/divs/eh/hazardous/topics/windturbines.pdf>
- "[It is proposed that annoyance is not a direct health effect but an indication that a person's capacity to cope is under threat. The person has to resolve the threat or their coping capacity is undermined, leading to stress related health effects... Some people are very annoyed at quite low levels of noise, whilst others are not annoyed by high levels." *Source: NHMRC 2010*
http://www.nhmrc.gov.au/files/nhmrc/publications/attachments/new0048_evidence_review_wind_turbines_and_health.pdf
- "Further, sounds, such as repetitive but low intensity noise, can evoke different responses from individuals... Some people can dismiss and ignore the signal, while for others, the signal will grow and become more apparent and unpleasant over time... These reactions may have little relationship to will or intent, and more to do with previous exposure history and personality." *Source: Minnesota Health Dept 2009*
<http://www.health.state.mn.us/divs/eh/hazardous/topics/windturbines.pdf>
- "Stress and annoyance from noise often do not correlate with loudness. This may suggest [that other factors impact an individual's reaction to noise... individuals with an interest in a project and individuals who have some control over an environmental noise are less likely to find a noise annoying or stressful." *Source: Minnesota Health Dept 2009* <http://www.health.state.mn.us/divs/eh/hazardous/topics/windturbines.pdf>
- "There is a possibility of learned aversion to low frequency noise, leading to annoyance and stress..." *Source: Leventhall 2005 review*
<http://www.noiseandhealth.org/article.asp?issn=1463-1741;year=2004;volume=6;issue=23;spage=59;epage=72;aulast=Leventhall>

- "Noise produced by wind turbines generally is not a major concern for humans beyond a half mile or so because various measures to reduce noise have been implemented in the design of modern turbines." *Source: NRC 2007*
http://www.vawind.org/assets/nrc/nrc_wind_report_050307.pdf
- "Noise... levels from an onshore wind project are typically in the 35-45 dB(A) range at a distance of about 300 meters... These are relatively low noise or sound-pressure levels compared with other common sources such as a busy office (~60 dB(A)), and with nighttime ambient noise levels in the countryside (~20-40 dB(A))." *Source: NRC 2007*
http://www.vawind.org/assets/nrc/nrc_wind_report_050307.pdf
- "Complaints about low frequency noise come from a small number of people but the degree of distress can be quite high. There is no firm evidence that exposure to this type of sound causes damage to health, in the physical sense, but some people are certainly very sensitive to it." *Source: Ad Hoc Expert Group on Noise and Health*
http://www.hpa.org.uk/webc/HPAwebFile/HPAweb_C/1279888026747
- "... there is the theoretical possibility that annoyance may lead to stress responses and then to illness. If there is no annoyance then there can be no mechanism for any increase in stress hormones by this pathway... if stress-related adverse health effects are mediated solely through annoyance then any mitigation plan which reduces annoyance would be equally effective in reducing any consequent adverse health effects. It would make no difference whether annoyance reduction was achieved through actual reductions in sound levels, or by changes in attitude brought about by some other means." *Source: Ad Hoc Expert Group on Noise and Health*
http://www.hpa.org.uk/webc/HPAwebFile/HPAweb_C/1279888026747

Infrasound

- "Infrasound is audible when the sound levels are high enough. The hearing threshold for infrasound is much higher than other frequencies. Infrasound from wind farms is at levels well below the hearing threshold and is therefore inaudible to neighbouring residents. There is no evidence that sound which is at inaudible levels can have a physiological effect on the human body. This is the case for sound at any frequency, including infrasound."

Summary of 2013 VTA Finnish report

VTT Technical Research Centre of Finland has published a new study with a conclusion that wind turbines do not cause any adverse health effects. The study consisted of a review of nearly 50 scientific research articles conducted in Europe, USA, Australia and New Zealand over the past 10 years.

Due to the increased number of wind power projects in Finland, a growing concern has arisen among the public regarding the possible negative impacts wind energy production may have on human health. VTT Technical Research Centre of Finland conducted a comprehensive literature review covering nearly 50 scientific research articles. The review concluded that in the light of current scientific research, there is no evidence to show that the infrasound produced by modern wind turbines is anything but harmless.

The sound of a nearby wind farm does not possess such qualities or volume that it would cause physical symptoms to humans. The study also concluded that the infrasounds below the auditory threshold does not constitute a health hazard. Additionally, most of the infrasound caused by a wind farm is mixed with other infrasound from the environment and

does therefore not cause any additional exposure. According to the research articles reviewed, the low frequency sound with potential hazardous health impacts would have to be of a higher volume than that caused by wind farms, in order to have an impact on our health. Also, concern that shadow flicker may cause epileptic seizures are overruled in the research material. Such seizures cannot be caused by the type of flicker the slow rotation speed of the wind turbine blades produce.

Commentary: Major problems with recent systematic review on wind farms and distress.

Simon Chapman AO PhD FASSA

Professor of Public Health

University of Sydney

simon.chapman@sydney.edu.au

At least 20 reviews of the evidence on whether wind turbines cause health problems including stress have been published since 2003 (1). Cureus recently published another (2) where the authors referenced none of these.

Highlights of the findings of these reviews may be found here (1). The most recent (2014) review by Australia's peak health and medical agency, The National Health and Medical Research Council (3) concluded:

"There is no consistent evidence that noise from wind turbines... is associated with self reported human health effects. Isolated associations may be due to confounding, bias or chance. There is consistent evidence that noise from wind turbines—whether estimated in models or using distance as a proxy—is associated with annoyance, and reasonable consistency that it is associated with sleep disturbance and poorer sleep quality and quality of life. However, it is unclear whether the observed associations are due to wind turbine noise or plausible confounders."

and

"The association between estimated noise level and annoyance was significantly affected by the visual attitude of the individual (i.e. whether they found wind farms beautiful, or ugly and unnatural) in the three studies that assessed this as a potential confounding factor. Residents in [one] study with a negative attitude to the visual impact of wind farms on the landscape had over 14 times the odds of being annoyed compared with those people without a negative visual attitude. ...This means that factors other than the noise produced by wind turbines contribute to the annoyance experienced by survey respondents."

Against this background, I was curious to see what a new systematic review would conclude. According to the Cureus website, the new paper was peer reviewed. This is difficult to understand because of the sheer volume of major and minor problems it contains. Together, these make its contribution valueless to scholarly understanding of the

phenomenon of noise and health complaints about wind farms. The paper shows many signs of poor understanding of the subject matter of their review, of critical appraisal methods, of some basic conventions in systematic reviewing, of structuring in scientific writing, and much more besides.

The problems commence in the first line of the abstract where the confusing statement is made that "the proximity of wind turbines to residential areas has been associated with a higher level of complaints compared to the general population." I assume here that they are trying to say that those living near turbines have a higher prevalence of health complaints like sleep disturbance and general "human distress" than in the wider population. The prevalence of sleeping problems in general populations is as high as 33% (4) and reference material exists that quantifies the prevalence of many health problems in general populations (5, 6). Instead, the authors support their statement with a reference to a small qualitative study of 15 people both affected and unaffected by turbines (7). No conclusions about the prevalence of health problems in communities near turbines or in matched comparison populations can be drawn from that paper. I know of no published evidence that would allow such a statement to be made.

The authors state that their search strategy located 18 eligible papers but that these were based on six original studies. They explain that the 12 non-original "studies" (several of which were reviews or commentaries) were then excluded. Yet in their "key results" they proceed to describe the characteristics of all 18 papers and thus act as if these were not excluded ("All 18 peer-reviewed studies captured in our review found an association...").

The authors do not appear to understand what an "outcome" is. The abstract lists "outcome" variables that are not outcomes at all (such as study quality and journal name). These are independent variables, not dependent ones.

Their eligibility criteria for study selection are perplexing. What for example, is the difference between "peer-reviewed studies" and "studies published in peer-reviewed journals"? So too, is their noting that they searched the Cochrane Library for relevant studies. The Cochrane Library is a repository of reviews of evidence for health interventions, not for data on the prevalence of health complaints.

The authors seem not to understand the difference between studies and trials. For obvious reasons, there have been no trials conducted in this area.

Their main conclusions are that:

An association exists between wind turbines and distress in humans.

The existence of a dose-response relationship (between distance from wind turbines and distress) and the consistency of the association across studies .. argues for the credibility of this association.

The first conclusion is very imprecise and sweeping and ripe for being megaphoned by anti-wind farm interest groups as if it actually meant something. One of the six original studies reviewed (Salt & Hullar) (8) should have never been included in this review – see below. The Nissenbaum et al study (9) is listed as of moderate quality with a low risk of bias. Yet all three authors and two out of three reviewers of that paper are members of Society for Wind Vigilance, an anti-wind organization. Nissenbaum has been raising health concerns in study areas for several years, potentially biasing collected data. Neither of these problems is mentioned in this review. Two critiques of this study were published in Noise and Health pointing out the very poor quality of the results, analysis and the overstatements of conclusions (10, 11).

The Shepherd et al study (12) which the authors rate as of “high” quality, failed to make any mention that the small wind farm community involved had for years been subjected to a local wind farm opposition group fomenting anxiety about health issues (13). Indeed, with one exception (14), the five studies referenced were performed in areas where complaints of annoyance were being raised. But such farms are unlikely to be representative of all wind farms. As our work shows, over nearly 65% of wind farms in Australia have never received a single complaint (15), and 73% of complainants in Australia are concentrated around just 6/51 farms. The failure of the authors to note this fundamental problem of study sample selection bias is another major problem.

Among the five “original” studies they considered satisfied their selection criteria was a paper by Salt & Hullar (8). This paper is not in any way a “study” of “the association between wind turbines and human distress.” It reports no original empirical data and is essentially a backgrounder on infrasound and the “possibility” that wind turbine might create auditory distress. It is unfathomable why this paper was included in the data set.

Table 2 purports to be a meaningful summary of the findings of these six studies on the association between turbine exposure and “distress”. I would defy anyone to make any sense of the Table, particularly the column headed “does [sic] response”.

By way of comparison to the lack of detail provided by the authors of this review, it is instructive to look at the results from the Dutch study which formed the basis of the

Pedersen 2009 paper(14) which were further analysed by Bakker et al (16) who noted that sleep disturbance was assessed by a question dealing with the frequency of sleep disturbance by environmental sound ("how often are you disturbed by sound?"). Two thirds of all respondents reported not being disturbed by any sound at all. Disturbance by traffic noise or other mechanical sound was reported by 15.2% of the respondents. Disturbance by the sound of people and of animals was reported by 13.4% of the respondents. Relevantly, disturbance by the sound of wind turbines was reported by only 4.7% of the respondents (6% in areas deemed to be quiet and 4% in areas deemed to be noisy). Bakker and colleagues (16) note that it was not clear from the study if there was a primary source causing sleep disturbance and how respondents attributed being awakened by different environmental sound sources. What was clear was that wind turbines were less frequently reported as a sleep disturbing sound source, than other environmental sounds irrespective of the area type (quiet versus noisy). Analysis showed that among respondents who could hear wind turbine sound, annoyance was the only factor that predicted sleep disturbance. The authors speculated that being annoyed might contribute to a person's sensitivity for any environmental sound, and the reaction might be caused by the combination of all sounds present. It might also be the case that people annoyed by wind turbine noise attribute their experience of sleep disturbance to wind turbine noise, even if that was not the source of their awakening.

Swathes of the paper are given over to descriptions of their efforts to rate the levels of evidence in the four reviewed studies. But they never ever describe their approach in any way that might permit replication of how they went about such rating. How was level of evidence actually determined? It should have been explicitly defined in the text. Their discussion of the risk of bias across studies is bizarre. "The quality of the study could be confounded by journal name and author". Surely the authors mean here that the evaluation of the quality of the study could be biased by this knowledge. The term "confounded" has another meaning.

Their "key results" consist of no more than five bullet points. These read like draft notes-to-self (eg: None of these studies captured in our review found any association (potential publication bias)").

The authors chose to use the term "distress" instead of "annoyance". The American Medical Dictionary defines distress as 1. Mental or physical suffering or anguish or 2. Severe strain resulting from exhaustion or trauma. Annoyance on the other hand is defined as 1. The act of annoying or the state of being annoyed or 2. A cause of irritation or vexation; a nuisance. (The American Heritage Dictionary of the English Language, Fourth Edition copyright 2000) and is generally identified as a highly subjective state in medical literature. It is clear that the authors chose a stronger term than was used by the majority of studies. Most literature refers to annoyance, while the referenced alternative of "Wind Turbine Syndrome" was coined in a vanity press published case study with extraordinary weaknesses of selection bias, methodology and analysis (17). Similarly, "extreme annoyance" is rarely used in the

literature. Annoyance is by far the most commonly used term in the material referenced, so it is unclear why "distress" was chosen.

The paper is riddled with imprecise, mangled and contradictory language. For example: key finding 1: "All 18 peer-reviewed studies captured in our review found an association..." and key finding 2: "None of these studies captured in our review found any association (potential publication bias)"; infelicitous prose: "these complaints are coined in research"; "There might be a theoretical incline to give studies in high impact journals higher quality..."; basic grammatical errors: "the study's principle outcome"; "there was no missing data." It is unconventionally structured with extremely scant results and methods sections providing no adequate explanations of how key decisions on quality or bias were made.

The publication of this very poor paper is regrettable.

**ADVICE ON WIND TURBINES AND
HORSES – GUIDANCE FOR
PLANNERS AND DEVELOPERS
(BRITISH HORSE SOCIETY, 2015)**

ADVICE ON
Wind Turbines and Horses –
Guidance for Planners
and Developers

The
British
Horse
Society

The UK is committed to producing 15 percent of energy from renewable sources by 2020 and government strategies incorporate the use of wind energy towards this target. The BHS does not express an opinion on the use of wind energy as its concern is for equestrian safety, however:

The potential effect of turbines on horses should be considered on any route used by them – this includes bridleways, byways, roads and permissive routes – and on businesses where horses are kept or trained.

Horses are most likely to react to the noise made by wind turbines, the movement of the blades, or movement of shadows cast by the blades. Placement of turbines must take account of existing equestrian access in minimising these effects of turbines close to routes used by horses or businesses where horses are kept.

Even though some horses are untroubled by turbines – photographs and film of horses grazing or being ridden near turbines are easily available – there are plenty of reports of horses whose reaction to a turbine has been adverse. There will be many unreported incidents and records of them are much harder to find because they were unexpected.

It cannot be assumed that it is safe to introduce turbines near equestrian routes because there are fewer reports of adverse reactions than of horses accepting turbines.

Most wind farms until recently have been in less populated areas with alternative equestrian routes and many riders have been able to choose to avoid going near turbines if they wish.

Proposals for wind energy projects are now increasing in more populated areas where there is a much higher density of traffic and urbanisation, and a much lower number of off-road routes and quiet roads. Riders may not have a choice of routes, commonly only one off-road route is available – none at all in many areas – so many riders and most carriage-drivers are reliant on quiet roads.

Wind farms can have a very severe and wide-reaching effect on the continued rights of equestrians to use off-road routes, pushing them onto busy roads or causing them to transport horses to less hostile environments for daily exercise, or to give up. All of these responses affect other traffic, the environment and the economy. It is estimated that an owner contributes more than £3,000¹ to the local economy for every horse, and horse riding

¹ British Equestrian Trade Association Survey 2011 found that direct expenditure on upkeep and care was £3,105 per horse per annum

is an activity and sport undertaken by mature women, for whom exercise opportunities should not be reduced.

There have been no formal trials to establish horses' responses to turbines so there is no evidence as such, only anecdotal reports. Funding for such a trial would be difficult to acquire, even if it was considered humane to put animals into a situation that was known to be potentially unsafe or distressing. Reliance has to be on reported experience, which demonstrates, even in a very limited survey², that more than 20 percent of riders had experienced an adverse reaction from horses to wind turbines. It is important to note that the horses affected included placid, experienced and well-trained horses accustomed to all sorts of situations, and such as would often be partnered by a particularly vulnerable rider (young, inexperienced or with limited ability to cope) who may be reliant on off-road routes. A high proportion of riders would not risk taking their horses near turbines due to the bad experience of others or their own caution.

It may be argued that the evidence of the survey is poor because of the many variables such as other things the horse could be reacting to and that people's perceptions cannot be taken into account. However, in the absence of trials or surveys to the contrary, it remains that some horses and riders will be affected and the fewer alternatives there are for those people to continue to ride in safety, the less appropriate it is that their right of use of

² British Horse Society survey of Wind Turbine Experiences 2012

any route should be jeopardised.

BHS guidance in the 1990s recommended a minimum of 200m separation distance from bridleways, when the maximum height of turbines was around 65m. The distance was soon revised to three times tip height as turbines quickly became larger, although this was too late to include in government planning guidance.

BHS Policy Statement

The BHS strongly recommends that the views and concerns of local equestrians should be recognised and taken into account when determining separation distances and that normally a

minimum separation distance of 200m³ or three times blade tip height (whichever is greater) will be required between a turbine and any route used by horses or a business with horses.

This minimum separation distance may not be appropriate in all situations. Every site should be considered independently because there are likely to be many interdependent factors involved. A holistic approach is required that considers all of those factors, common ones of which are listed below, although less usual ones may occur in any location and require individual consideration.

The BHS is aware that every site is different and a blanket policy to cover all situations may be excessively restrictive for some sites. Emphasis is therefore placed on consideration of all factors with consultation and negotiation with local riders and carriage-drivers.

A single microgeneration unit, for which three times tip height is less than 200m, will be accepted at the lesser distance provided that there are no other factors that increase the separation distance required.

Factors which affect the separation distance required are:

- Availability of alternative routes and their desirability compared with the affected route. An assessment of routes and use patterns in the location may be needed. The fewer alternatives available, the more the impact on the affected route should be mitigated by increasing separation distances.
- The number of turbines and their location relative to the route:

³ Includes all classes of highway available to horses – bridleway, restricted byway, byway open to all traffic, general purpose road (surfaced or unsurfaced) – and permissive routes

- o One turbine is much easier to cope with than many; the more machines, the greater the threat.
- o Turbines to one side only may create an easier situation than to both sides.
- o Several turbines to both sides of a route; the longer the corridor, the greater the risk.
- o Clear ahead or clear behind is better than turbines visible both in front and behind at the same time. A horse has nearly 350° vision and may react to a threat from behind that a rider cannot see.
- o Location north of a route is better than south as it will not cast shadows across the route – turbines east and west of a north-south route is the worst scenario for incidence of shadow cast at any time of day. However, on some sites this instance may be occasional and it may be feasible for a turbine to be turned off in such circumstances but able to generate at all other times.
- Other hazards on the route so that the addition of turbines to existing

hazards creates an unreasonable situation, examples would be a deep ditch, reduced width, barbed wire fence, gate, blind bend or ruts. This is also true for turbines near a road, where an equestrian on the road already has motor vehicular traffic to consider and a horse's reactions may have immediate impact on other road users.

- Undulating ground which alters the height at which moving blades are in view is different from flat ground where all movement is well above eye level from any approach.
- Encountering a moving turbine at close quarters because it was obscured on approach by a hill, wood or building is a greater risk than approaching a turbine clearly in view from several hundred metres.

Depending on local variation caused by prevailing wind and day length, the separation distance to avoid shadow cast will be greater where a route lies north of a turbine between west south west and east south east. Figure 1 roughly shows the area which will be affected by shadows and where the separation distance between route and turbine should be greater. The shaded area also reflects where noise is likely to be more of a problem because the route is downwind of prevailing wind in much of England and Wales.

Figure 1: Separation distance between the turbine and route should be greater for routes in the blue area

Provision of alternative routes or improvement of existing facilities may reduce the impact of a wind farm, for example if a path can be provided off-road so that riders are not coping with traffic and tarmac as well as the wind turbines. Even if the separation distance between the turbines and the alternative route is less than to the road, it may be a preferable and safer option for some users.

Anemometers should be located at a distance greater than their overall height from an equestrian route. Cables must not cross an equestrian route,

including during erection of the mast. Their ground points should be at least 3m from an unfenced equestrian route and cables should be wrapped or sleeved to a height of 2m to increase their visibility.

Some anemometers have been found to produce a high pitched bleeping which is evidently distressing to horses. Models emitting noises should be avoided.

Access for construction purposes should avoid bridleways or byways as it is incompatible with equestrian use and routes should not be closed to equestrians so as to facilitate construction. Alternative construction traffic routes may be required.

Why horse riders are concerned

There are reports of horses being frightened by turbines, and equally there are reports of horses being undisturbed by them or quickly becoming accustomed to them. Horse owners are naturally concerned about the possible effect of turbines on their horses and may view them as a very high risk to their safety. Horses are flight animals and if frightened, they may make abrupt unexpected movements or bolt (run out of control), both of which may cause a rider to fall at speed and risk injury to him or herself, the horse, and to anyone in the horse's path.

Equestrians have very few off-road riding opportunities – less than a quarter of paths available to walkers and even fewer to carriage-drivers – so the potential loss of any route is understandably of grave concern. Any route that was previously available to all should not be rendered unsafe for some. In the majority of cases where riders and carriage-drivers are displaced from off-road routes their only alternative will be greater use of roads, with an increased risk to themselves and other road users.

How horses react to turbines

Some horses appear very fearful of wind turbines, others are unconcerned. This does not seem to be related to the ability of the rider or handler, or to the temperament of the horse – bomb-proof veterans have been known to react badly and spooky thoroughbreds to appear oblivious. There are also reports of horses that have previously encountered turbines calmly but on another occasion, with no apparent difference in conditions, have reacted adversely.

From reports of experiences, horses are most likely to be reacting to noise, movement of the blades or movement of shadows cast by the blades.

During the design stage, a wind energy project developer should

communicate with the authority's access officers to ensure that equestrian routes are taken into account and turbines located with maximum separation from horses to reduce the effect of noise, movement or shadows. This applies equally to a microgeneration system as a large commercial wind farm. Businesses with horses should be considered in the same way.

Movement is most likely to have an adverse effect on horses if it starts or changes direction suddenly, or if it is seen suddenly at close quarters, rather than having

been visible from several hundred metres. Although sudden movement is very unlikely with commercial turbines, microgeneration units⁴ can react quite abruptly to gusts and changes in wind direction and the movement and noise seem much greater because they are closer to the horse. They should be of a design that minimises 'yawing' of the head with changing wind direction.

A turbine's blades sailing over a right of way is found threatening by many people, but may be agreed with the planning authority if it reduces impact on another part of the site. It should be avoided on an equestrian route.

The BHS has received reports of turbines subject to annual testing producing sudden unusual high noise levels, which may be very frightening to horses. This should be avoided and, if it is required, then notification at least five days in advance should be clearly signed on approaches to the site at a distance that will be out of range of the noise. Websites for wind farms should also show the information prominently.

Moving shadows cast by blades are likely to be found more threatening by some horses when they fall on a hard surface than on vegetation. Shadow

⁴ Microgeneration is the small-scale generation of heat and electric power by individuals, small businesses and communities to meet their own needs

cast can be predicted and turbines must be sited to avoid casting shadows on equestrian routes. Strategic hedge or tree planting or hedge management may shield an equestrian route from the effect.

Local horses may become accustomed to turbines, but this may not be feasible for businesses which horses visit for short periods. Some horses away from their home environment and accustomed handler may be more sensitive than in a familiar environment. Several planning authorities have taken account of the effect on horses and business in turning down applications for turbines in close proximity to stud farms dealing mainly with highly strung blood horses and other equestrian related businesses dependent on visiting horses. However, many horses do not react to turbines at all and the number of microgeneration projects for rural businesses or at competition venues⁵ is rising, which over time is likely to help horses habituate to turbines.

Inclusion of information about turbine locations along with other potential hazards in promotional material for riding routes will help riders consider the risks in advance. Where possible, it may be pragmatic to suggest alternative routes.

Developers, local authority planning officers and the Planning Inspectorate (hearing public inquiries on wind projects) are dependent on evidence for their decisions on whether turbines are appropriate in a certain location. To date, relatively few dangerous incidents involving horses have been reported. As the number of turbines in the country increases and more riders encounter them, there may be more incidents but as turbines become commonplace and people accept them, so too will horses. If the number of incidents reported to the BHS increases and indicates that the safety of horses and riders or carriage-drivers is at risk, then the situation and policies will be reviewed.

Mitigation

There are a number of actions which may benefit riders and carriage-drivers or reduce the effect of turbines on them. They include:

- Provision of new definitive or permissive routes or improvement of existing routes in the locality to provide alternatives for those at risk for the life of the wind energy project.
- Diversion of routes to a greater distance or with increased sightlines to

⁵ A demonstration turbine close to the equestrian area at the Pembrokeshire County Show in 2012 caused at least four incidents of horses reacting out of control, presumably to the turbine, and on investigation the Show decided not to permit demonstration turbines near equestrian areas at future events

avoid suddenly coming upon turbines within 500m.

- Consideration of potential impact on riders and/or carriage drivers should they be unable to continue using a route because of turbines, such as availability of alternative routes in the immediate vicinity.
- On many developments it can be identified that a limited number of turbines will affect an equestrian route with over-sail or shadow cast only under certain conditions. It is possible to model those conditions and to programme specific turbines to switch off as required to abate the nuisance.
- Consideration of the nature of the route in terms of space for a horse to shy, spin, jump or be manoeuvred on firm level ground; proximity of and access to roads if a horse was to bolt out of control.
- Notification to equestrians of certain days during construction most likely to be a hazard; for instance, concrete pouring creates many vehicle movements during a short period of time.
- Restriction of construction and construction traffic to 8am-6pm week days only so that routes can still be used during the construction period at the times of highest demand for equestrians.
- Restriction of construction traffic to roads or new tracks. Bridleways or byways must not become access roads. If this is unavoidable, alternative equestrian routes should be provided and the surface of the bridleway or byway restored to one suitable for horses.
- Notification of when turbine blades will be static, prior to commissioning, so that riders can familiarise horses by degrees.
- Notification after commissioning of test days throughout the life of the turbine(s) which may produce increased or unusual noise or speed.
- Familiarisation days organised on site.
- Using microgeneration machines of a design that minimises 'yawing' of the head with the changing wind direction as sudden movements are those most likely to frighten horses and risk an accident.
- Strategic hedge or tree planting or hedge management to shield an equestrian route from the effect of moving shadows on a path or blades at eye level.

This guidance does not apply in Scotland, for which the BHS produces separate guidance. Variation in the two documents arises from very different law relating to access and to patterns of land use between the countries.

Annex 1 - Figures 1 -20	18

Introduction

1. The existing wind farm at Ballywater, located between the villages of Kilmuckridge and Ballygarrett, County Wexford, commenced operation in 2005, with a permitted operational life of 20 years. Blackstaff Ecology Ltd was appointed by Ballywater Windfarm Ltd to provide ornithological input to this environmental Impact assessment as part of an application to extend the operational life of the wind farm by a further 10 years.
2. The wind farm consists of 21 no turbines with a total output of 42MW, an electrical substation, met mast and associated access tracks and occupies agricultural fields of low conservation interest. It is anticipated that the wind farm will continue to operate with a similar degree of intensity and disturbance for maintenance and repair as at present. Agricultural operations within the wind farm will continue as at present but are independent of the wind farm.
3. Effects on avian receptors arising from an extension of the proposed life time of a wind farm are likely to be similar to those arising from re-powering of facility, in that effects relate to an existing development. Ornithological surveys therefore follow the recommendations outlined in SNH (2014)¹ and guidance in Nature Scot (2023)².
4. This report was prepared and undertaken by Dr Brian Sutton BSc PhD CEnv MCIEEM and was reviewed by Mr Cormac Loughran (MSc CEnv MCIEEM) of Blackstaff Ecology Ltd. Ornithological surveys that contributed to the report were carried out by Karl Hamilton, Catriona Porter, Jazmin Creaney and Brian Sutton.

Statement of Authority

5. Dr Sutton was awarded a PhD in Environmental Science by the University of Ulster. Prior to working at Blackstaff Ecology, he worked as a member of the Habitat Survey Team of the Environment and Heritage Service (now the Northern Ireland Environment Agency) for 2 years. Following this, he worked as a consultant ecologist for AECOM Ltd for 15 years, carrying out habitat, bird and mammal surveys for a wide range of governmental and private clients. Projects undertaken were at a range of scales, from small private developments to major infrastructure projects. He has been a Principal Ecologist at Blackstaff Ecology for the past eight years. Dr Sutton has carried out breeding and wintering bird surveys over the past 50 years, and has held a British Trust for Ornithology bird ringing licence throughout that period.
6. Cormac Loughran, a Chartered Environmentalist (CEnv), and a full member of the Chartered Institute of Ecology and Environmental Management (MCIEEM). Cormac has worked professionally as a Consultant Ecologist for the past eleven years. He holds an MSc (Distinction) in Environmental Management from the University of Ulster, and has extensive experience in a broad range of flora and fauna surveys. He has undertaken and coordinated the EclAs for numerous infrastructure developments. Cormac is also an experienced field naturalist and prior to his consultancy work, he worked as a warden/ranger for The National Trust on a number of important nature reserves between 1995 and 2004. These included Crom Estate in County Fermanagh and Murlough NNR and Slieve Donard in County Down. Cormac therefore also has a wide range of habitat management experience including; broadleaved woodland, wetland, dune grassland, wet and dry heathland and blanket bog.
7. Karl Hamilton has a BSc (Hons) in Environmental Biology from the Queen's University of Belfast, after which he took up the post of Senior Reserve Warden and Biodiversity Officer for the

¹ Scottish Natural Heritage (2014): Repowering onshore wind farms: bird survey requirements

² NatureScot (2023): NatureScot pre-application guidance for onshore wind farms.

Wildfowl Wetlands Trust within Northern Ireland. This role included hands-on management of a variety of terrestrial and aquatic habitats, surveying and monitoring of flora and fauna, managing volunteers and work placements, and surveying. In 2010 Karl commenced his career in ecological consultancy as a freelance ecologist, engaging in contract and sub-contract work throughout Northern Ireland and the Republic of Ireland, undertaking primarily Preliminary Ecological Assessments, Protected Species Surveys, Invasive Species Surveys and Ecological Impact Assessments. In 2020 Karl joined Blackstaff Ecology as Senior Ecologist and specialises in ornithological, botanical and habitat surveys. Karl also regularly provides training courses in these and other ecological subjects for environmental NGOs, statutory organisations and other ecologists. To date Karl has completed habitat surveys and active peat assessments on a dozen wind farm developments.

8. Jazmin Creaney has a BSc in Zoology and is a member of CIEEM. She has undertaken further courses including Animal Conservation, GIS and Environmental Management. She has a range of experience in conducting field surveys both locally, with organisations including BTO, The National Trust and TetraTech, and abroad, through her time monitoring elephant behaviour and habitat damage in South Africa. Since joining Blackstaff Ecology in 2021, Jazmin has been involved in projects throughout NI and the ROI and has gained significant ecological experience, including ornithological surveys of wind farm sites.
9. Catriona Porter has an MSc in Animal Behaviour and Welfare (Distinction) from Queen's University, Belfast. She has several years of experience within the nature conservation sector through extensive volunteering including organisations such as UK Overseas Territories Conservation Forum, Ulster Wildlife and the RSPB. Catriona has 8 months experience within the ecological consultancy sector, beginning in April 2021 where she assisted with carcass trials on a windfarm with Allen & Mellon Environmental. Since joining Blackstaff in May 2021 she has been involved in projects in Northern Ireland and the ROI and has gained experience in both survey techniques and ecological report writing specific to bats and birds

Methodology

10. The following bird surveys were carried out:
 - 1) Vantage Point Surveys - to identify the use made of the site by target and secondary species (SNH, 2014³).
 - 2) Modified breeding bird survey (Gregory & Baillie 1994)⁴ – to identify the location of birds likely to be breeding on the site.
 - 3) Searches within 2km of the site to establish the potential for presence of protected species within the likely zone of influence of the wind farm.
11. Carcass searches were carried out between April 2022 and October 2022 as part of a bat monitoring study. Any bird carcasses found during these searches were also recorded.
12. Selected species were assigned 'target species' status due to their higher conservation designation and consequent legislative protection such as inclusion in Annex I of the Birds

³ SNH (2014): Recommended bird survey methods to inform impact assessment of onshore wind farms..

⁴ Gregory R.D. and Baillie S.R.(1994: .Evaluation of sampling strategies for 1 km squares for inclusion in the Breeding Bird Survey, B.T.O Research Report No. 139. Thetford (BTO).

Directive⁵ or are on the Red List of birds of conservation concern (BoCCI)⁶. Potential examples of target species relevant to this site are goose species. Other species, considered of local conservation importance, were assigned as 'secondary species' and include species such as buzzard and sparrowhawk.

Vantage Point Watch

13. A Vantage Point (VP) method was used to record bird species flying through the study area (i.e. the area in which the wind turbines are sited to a distance of 500m from each turbine). Two vantage points were selected from which, in combination, an unobstructed view of the entire area could be obtained. A total of 33 hours of VP watches was carried out from VP South and 39 hours from VP North between April and August 2023. A minimum of 36 hours of VP watch is required when risk of collision with turbine rotors is to be estimated. However collision risk monitoring (CRM) is carried out prior to wind farm construction and is not appropriate for operational wind farms. The intensity of watches carried out for this study is therefore sufficient to assess the occurrence, behaviour and likely impacts on target species during the survey period. Watches were carried out at various times of day (Table 1), to account for potential diurnal variations in bird behaviour.

Table 1: Weather conditions during VP watches

Date	VP	Time	Weather
24.04.23	S	13.10-16:10	Cloud 7/10-8/10, 8°C, wind F4, dry, good visibility
17.05.23	S	16:30-19:30	Cloud 5/10, wind F3, 17°C dry, good visibility
	N	11:40-14:40	Cloud 5/10, wind F3, 19°C dry, good visibility

12.06.23	S	19:05-22:05	Cloud 8/10, wind F1, 17°C, dry, good visibility
13.06.24	N	16:00-19:00	Cloud 8/10, wind F3, 18°C, dry, good visibility
26.06.23	N	18:15-21:15	Cloud 8/10, wind F1-2, 18°C, dry, moderate visibility
	S	18:10-21:10	Cloud 8/10, wind F1-2, 18°C, dry, moderate visibility
27.06.23	N	10:30-14:30	Cloud 10/10, wind F3-4, 19°C, dry, poor visibility (1km)
30.06.23	N	16:25-19:25	Cloud 8/10-10/10, wind F3-4, 18°C, spots of rain, moderate visibility
01.07.23	S	09:30-12:30	Cloud 15/10-9/10, wind F3-4, 17°C, dry, moderate visibility
11.07.23	N	18:40-20:40	Cloud 8/10, wind F3, 16°C, dry, moderate visibility
	S	18:40-21:40	Cloud 8/10, wind F3, 16°C, dry, moderate visibility
24.07.23	N	19:30-21:30	Cloud 8/10, wind F1-2, 18°C, dry, good visibility
	S	19:15-22:15	Cloud 8/10, wind F1-2, 18°C, dry, good visibility
25.07.23	S	09:35-13:35	Cloud 0/10, wind F1-2, 17°C, dry, good visibility
	N	10:00-13:00	Cloud 0/10, wind F1-2, 17°C, dry, good visibility
07.08.23	N	16:50-19:50	Cloud 8/10, wind F3, 17°C, dry, good visibility
	S	16:50-19:50	Cloud 8/10, wind F3, 17°C, dry, good visibility
08.08.23	S	10:45-14:45	Cloud 10/10, wind F2, 17°C, light rain, good visibility
	N	12:00-15:00	Cloud 10/10, wind F2, 19°C, light rain, good visibility

14. VP watches were carried out during spells of weather that were considered to be acceptable for vantage point surveying (Table1). Acceptable conditions were defined as winds not exceeding force 5 on the Beaufort Scale in strength and good visibility of at least 1.5 to 2

⁵ Directive 2009/147/EC

⁶ Gilbert G, Stanbury A and Lewis L (2021). Birds of Conservation Concern Ireland 2020-2026. Irish Birds 43: 1–22

kilometres from the vantage point. Heavy and persistent precipitation (i.e. heavy enough to discourage bird activity) was considered to render conditions unsuitable for surveying, although light-moderate passing showers or short periods of fine drizzle were considered acceptable as long as they did not have significant negative effects on visibility. Weather conditions during VP watches are summarised in Table 1.

15. Watches could be suspended and restarted where weather conditions were changeable between acceptable and unacceptable for surveying (e.g. a watch could be suspended during a sudden downpour, or where a mist rose and cleared again); the period of suspension would not count towards the total required watch time. In the event, weather conditions during all VP watches allowed uninterrupted observation.
16. The time, flight direction, height and duration for all observed target or secondary species were recorded during the VP watches. The height estimates separated observations into broad altitude groups, i.e. observations of birds flying at heights lower than the swept range (<10m), within the swept range (1-150m) and above the swept range (>150m).

Breeding Bird Survey

17. Breeding bird survey (BBS) site transects were walked on 25.04.23, 17.05.23, 13.06.23 and 12.07.23 to record evidence of breeding bird activity across the whole site. Transects were designed to pass within sight and hearing distance of birds using all habitats on the site. Locations of records of birds in suitable habitat and showing likely breeding behaviour were marked on a base map of the site. As the breeding season progressed, the number of fledged young increased; it is often difficult to determine the age class of many species at this time of year, and all records were mapped. This potential bias was taken into account when assessing the number of territories present at the site.
18. Evidence of breeding activity included presence of nests, courtship behaviour, distraction behaviour, birds carrying food and adults accompanied by fledglings.

2km Protected Species Survey

19. Surveys from public roads within 2km of the wind farm boundary were carried out on four occasions, on 25.04.23, 17.05.23, 13.06.23 and 27.06.23. The survey entailed vantage point watches and listening stops over adjacent lands of up to 15 minutes duration in order to determine whether local habitats were used by protected species that have the potential to be affected by the continuing operation of the Ballywater wind farm. Species were accorded target species or secondary species status as defined above.

NBDC records

20. The National Biodiversity Data Centre database was interrogated for breeding season (April – August inclusive) records of birds within 1km of the wind farm.

Results

Vantage Point Watch

21. NatureScot guidance (SNH 2017)⁷ is that establishment of the ornithological baseline should focus on those species which are afforded a higher level of legislative protection, or those which, as a result of their behaviour, may be more likely to be subject to impact from wind farms. Following these criteria, eleven target species were sighted during the 63 hours of VP

⁷ SNH (2017). Recommended bird survey methods to inform impact assessment of onshore wind farms. Scottish Natural Heritage, Battleby.

watches. A further 18 secondary species were recorded, dominated by waterbird species that frequented the adjacent wetlands to the east of the wind farm. Tables 2 and 3 provide lists of target and secondary species respectively that were observed during VP watches. .

Breeding Bird Survey

22. The northern and southern sections of the windfarm were recorded separately. A total of 34 bird species was recorded during the surveys. Tables 4 and 5 list these species and provide an estimate of the number of breeding pairs. The colour coding refers to the species' BoCCI status.

Table 4 - Species recorded during the BBS – Northern Section

2km Protected Species Survey

23. Two records of kestrel and a single record of little egret were the only target species noted during the searches of the immediate site hinterland. Nine secondary species were recorded. Records for the 27.06.23 have been lost but it is known that no target species were recorded. Results of 2km searches are tabulated in Table 6.

Table 6 – Target and Secondary Species recorded during 2km search

Date	Species	No	Comments
25.04.23	Mallard	3	Foraging within Ballyteigue Marsh
	Moorhen	1	Foraging within marsh
	Kestrel	1	Female hover-hunting over fields to NW of Ballyteigue Bay beach
17.05.23	Teal	2	Flying over Chore Marsh
	Mallard	4	Flew into marsh from SSW
	Wigeon	1	Flew from marsh to NNE
	Teal	2	Flew from marsh to S
	Mallard	4	Flew over marsh
	Grey heron	1	Flew into marsh from NNE
	Mute swan	2	Foraging in marsh, flew to SSW

	Grey heron	1	Flew from marsh to N
	Little egret	1	Flew from marsh to NNW
	Black-headed gull	2	Flew over marsh
	Grey heron	1	Flew from marsh to NE
	Greylag goose	2	Foraging in marsh, flew into field to SW
	Kestrel	1	Hover-hunting over dunes, landed briefly on beach, flying to NNE
	Black-headed gull	1	Flew over marsh
	Greylag goose	2	Flew over marsh landed in field to SW
17.05.23	Buzzard	1	Circled over field beside Dundrum plantation
	Black-headed gull	3	Flying to N over beach
13.06.23	Black-headed gull	2	Flying to S over beach and out to sea
	Black-headed gull	1	Flying along coast toSSW
	Grey heron	1	Flying over fields and beach to S
	Mallard	3	Flew into Cahore Marsh

Discussion

24. The habitats at Ballywater are dominated by agricultural grassland and arable fields, often separated by hedgerows of variable structure and conservation value. Habitats along the eastern margin of the site are more variable and of greater conservation interest. Habitats here include open water, reedbeds, scrub and treelines. Breeding bird population diversity and abundance reflect the nest site opportunities that these habitats provide. Bird species recorded reflect this diversity of habitats, with birds of open habitats, including meadow pipit and skylark,

occurring within the windfarm and a more diverse community, including wildfowl and heron species, present in the diverse habitats in the east of the site. Proximity to the coast is also likely to influence the species composition of the site as well as the behaviour of individuals of some species.

25. Searches on 25.04.23, 17.05.23, 13.06.23 and 27.06.23, extending to 2km beyond the wind farm surveyed the mainly agricultural grassland habitats of the wider countryside. Bird records were of common species similar to those found in the agricultural grassland habitats in the vicinity of the wind farm. Birds of conservation concern were generally restricted to wetland species in the vicinity of the coast and coastal marshes.
26. The northern and southern sections of the windfarm are discussed separately.

Northern Section

Vantage Point Watch

27. Nine species of primary conservation concern were recorded during vantage point watches. Of these, four species (kestrel, golden plover, curlew and redshank) are red-listed in BOCCI, while five species (night heron, little egret, marsh harrier, golden plover and common tern) are included in Annex I of the Birds Directive. Great white egret is included as a rare potential breeder that has recently established a breeding population in Britain.
28. Fourteen species of birds of secondary conservation concern were recorded during VP watches. These comprise seven wildfowl species, grey heron, buzzard, four gull species and raven.
29. Observations were generally of birds passing through airspace outside the windfarm, dominantly over wetter habitats between the windfarm and the coast. The recorded species are dominated by wetland birds, which use this peripheral area for foraging and, in some cases, potentially for nesting, while many birds pass over during commuting flights. Few birds were seen to approach the turbines. Single buzzards overflew the wind farm on two occasions, an apparent pair of buzzards on a single occasion, and flocks of six (27.06.23) and three (24.07.23) curlew passed through the windfarm. Commuting little egrets, including a group of three (30.06.23) and single grey herons occasionally passed to the west and east of the windfarm, on occasion approaching turbines to within 100m. Gull species were generally seen passing the site parallel to the coast and rarely approached the vicinity of the turbines.

Breeding Bird Survey

30. The breeding bird survey (BBS) was confined to an area within around 100m of the operational turbines and access tracks. Habitats within this area are dominated by agricultural grassland fields, with associated hedgerows as field boundaries. Thirty-seven species were recorded during the BBS, comprising a single re-listed BOCCI species (meadow pipit), ten amber-listed species and 26 green-listed species (Table 4). The majority of these were recorded as foraging or passing over.
31. The low conservation value of the agricultural habitats is reflected in the low population densities and diversity of breeding birds present on the site. Eleven common passerine species were likely to have nested within the survey area, with an estimated 14 nesting territories. Persistent records of meadow pipit suggested that the species nested and it is likely that the amber-listed skylark also occupied two territories.

Carcass search

32. A total of 25 carcass searches were carried out in the vicinity of the four turbines in the northern section of the windfarm, over 12 dates between 13.04.22 and 14.10.22, as part of a programme to monitor effects on bats at the site. A further 9 searches were made over six dates between 15.03.22 and 06.04.22 and 13 over six dates between 31.10.22 and 23.01.23, exclusively for birds. No dead birds were found during this exercise. It is possible for dead birds to be removed by scavengers, particularly red fox, but the absence of evidence of strikes suggests that mortality of larger, easily detectable birds is an uncommon occurrence. Detectability of small passerine carcasses is likely to be low, but these species generally occupy the airspace below rotor blade height during the breeding season and it is generally considered that farmland passerine species are not significantly impacted by wind farms (SNH 2017).

Southern Section

Vantage Point Watch

33. Seven species of primary conservation concern were recorded during vantage point watches. Of these, three species (kestrel, dunlin and curlew) are red-listed in BOCCI, while three species (little egret, marsh harrier and common tern) are included in Annex I of the Birds Directive. Great white egret is included as a rare potential breeder that has recently established a breeding population in Britain.
34. Seventeen species of birds of secondary conservation concern were recorded during VP watches. These comprise seven wildfowl species, cormorant, grey heron, two raptor species, five gull species and raven.
35. Flights of both target and secondary species were largely confined to the wetter grassland and semi-natural habitats between the wind farm and the coast. Apart from buzzard, sparrowhawk and raven, all target and secondary species recorded are generally associated with wetland habitats.
36. A limited number of flights occurred of birds entering the windfarm at rotor height. Two greylags passed close to T 20 on 24.04.23, four mallard approached T15 and T16 on 17.05.23. Three little egrets and a great white egret passed through the windfarm on 31.05.23 and a single Brent goose entered the windfarm on 11.07.23. The presence of turbines appeared to deter flocks of 30 greylags on 24.07.23 and five Brent geese on 25.07.23: birds appeared to change direction when approaching turbines and then left the windfarm airspace.
37. Curlew were seen to fly over the marginal wetland and change direction to fly inland between the northern and southern sections of the windfarm on four occasions, thereby avoiding entering the windfarm airspace.

Breeding Bird Survey

38. The BBS covered the entire landholding to the west of the farm track along the eastern edge of the site. Habitats within the windfarm are dominated by agricultural grassland fields, often separated by trimmed hedgerows. Limited areas of scrub and woodland are also present. Farm buildings form a cluster within the site. The wetland areas along the eastern side of the site, but outside the windfarm limits, were included in the survey.
39. The breeding bird community within the windfarm reflects its overall low habitat diversity and comprises a range of common species that are typical of farmland. The majority of breeding birds occurred in the hedgerow, scrub and woodland habitats, and it is likely that breeding bird density did not differ significantly from similar habitats elsewhere in the wider countryside. An

estimated 15 species of birds used hedgerows as nest sites, although a record of long-tailed tit on a single date may not refer to locally breeding birds. At least one pair of swallows nested in the farm buildings. Birds of open grassland, principally meadow pipit and skylark, were sparsely represented and estimated territories may include grassland outside the site red line.

40. The birds present in the wetland areas to the east of the site were more diverse and records from this area may include many birds that use the site for foraging, and commute to nest sites elsewhere. Passerine species associated with these habitats include reed warbler, a recent coloniser in Ireland.

Carcass search

41. A total of 114 carcass searches were carried out in the vicinity of the four turbines in the northern section of the windfarm, between 12.05.23 and 14.06.23, as part of a programme to monitor effects on bats at the site. A further 37 searches were made over six dates between 15.03.22 and 06.04.22, and 53 over six dates between 31.10.22 and 23.01.23, exclusively for birds. A single dead jackdaw was found during this exercise. See above for comments regarding removal by scavengers. Again, the absence of small passerines is largely accounted for by their low susceptibility to collision with turbine rotors.
42. It is assumed that the two carcasses found in the windfarm are the result of collisions with turbine rotors, but there was no clear indication that this was the case. After taking into account the detectability and scavenger removal issues involved in carcass searches, it seems likely that bird collisions with turbine rotors at Ballywater are rare.

NBDC records

43. The NBDC returned four breeding season bird records from within 1km of the wind farm. These comprised rare visitors (glossy ibis, Montague's harrier, hobby and blue-headed wagtail) and are not relevant to this discussion.

Conclusions

44. The wind farm habitats continue to support passerine species of a diversity and apparent abundance that are similar to those characteristic of the habitats of the local wider countryside. The presence of the wind farm does not appear to have had a significant impact on this breeding bird community.
45. Larger birds (particularly corvid species) which may be at greater risk from collision with turbine rotors were recorded within the wind farm during BBS and appear to routinely pass through the wind farm. This suggests a degree of habituation, with birds generally avoiding turbines. Two bird corpses (jackdaw and herring gull) found within the wind farm may have been the result of collisions, but, from numerous searches, the incidence of collisions appears to be very low.
46. Active avoidance of turbines was apparent, with greylag geese and brent geese rapidly leaving the wind farm as a likely result of a flight that initially headed towards a turbine. Curlew appeared to preferentially head inland through the gap between the northern and southern sections of the wind farm.
47. Both primary and secondary species recorded during VP watches were dominated by wetland bird species which in the main used the airspace above the wetland habitats to the east of the wind farm. These species rarely entered the wind farm airspace. It is likely that the majority

of these birds were of local provenance and there was thus also an element of habituation in their behaviour with regard to the turbines. It may be significant the only records of curlew entering the windfarm airspace (27.06.23 and 24.07.23) were of small flocks which were likely returning unsuccessful breeders and therefore not habituated to the site.

48. Observations of bird behaviour, determination of the breeding bird community and absence of evidence of significant collision risk to birds suggest that the wind farm currently does not have a significant effect on the breeding bird population of the site.

APPENDIX 6-2

WINTERING BIRD REPORT
2023-2024

1. EXECUTIVE SUMMARY

Ornithological surveys have been conducted at the site of Ballywater Wind Farm, New Road, Co. Wexford, from October 2023 to March 2024. This report outlines the findings from surveys completed during the 2023-2024 winter season. The following surveys were undertaken:

- > Vantage Point Survey
- > Winter Walkover Survey
- > Waterbird Distribution and Abundance Survey
- > Hen Harrier Roost Survey

The key observations during surveys include regular use of the site by golden plover, dunlin, hen harrier, merlin, little egret, ruff, whooper swan, lapwing, wigeon, black-tailed godwit, curlew, redshank, shoveler and snipe. The marsh habitat within the site, which partially comprises of the Cahore Marshes SPA, is an area of high usage by birds, with large numbers of waterbirds using this area throughout the winter. Furthermore, this marsh habitat was used by hen harrier for roosting on two occasions during surveys. Additionally, there is a resident population of kestrel, meadow pipit, buzzard and sparrowhawk at the site.

2. INTRODUCTION

2.1 Background

MKO was appointed to carry out ornithological surveys at Ballywater Wind Farm, Co. Wexford (hereafter "the site") for the 2023-2024 winter season. This report describes the survey methods and findings for the period October 2023 to March 2024 inclusive. It is supported by Appendix 1 which contains the survey effort, including details of details on survey times, weather conditions, surveyors, survey results and other additional information. Appendix 2 contains raw data and maps.

2.2 Site Description

The site is located south of Courtown (Grid Ref: SG 12144 01882). The dominant habitat onsite is agricultural grassland with accompanying smaller areas of inland marshes, dunes and tree lines. The wider surroundings are predominantly coastal beaches and improved agricultural grassland. The total area of the site is approximately 355 hectares.

3. METHODS

3.1 Field Surveys

Field surveys were undertaken from October 2023 to March 2024 inclusive. This section of the report describes the various field survey methods employed. Based on the results of a desk study and reconnaissance site visits, the likely importance of the site for bird species was determined and, adopting a precautionary approach, a site-specific scope for the ornithological field surveys was developed.

3.1.1 Vantage Point Surveys

Vantage point surveys were undertaken in accordance with NatureScot, formerly SNH (2017) to monitor flight activity within the site and to a 500m radius of the proposed turbines. Surveys were conducted from two fixed point vantage points with comprehensive coverage of the site (Appendix 2, Figure 1). Survey methodology followed NatureScot (2017) guidance. The surveyor collected data on bird observations and flight activity from a scanning arc of 180° to a 2km radius at the fixed vantage point locations for two 3-hour watches separated by a minimum 30-minute break (i.e., 6 hours total) per month. Surveys were conducted from October to March inclusive and were scheduled to provide a minimum of 36 hours for the winter season and spread over the full daylight period, including dawn and dusk watches, to coincide with the highest periods of bird activity. Flight activity of target species was mapped and recorded as per defined flight bands which were chosen in relation to the dimensions of turbine models at the site. Bands were split into 0-39m, 39-69m, 69-99m and >99m. All flight activity within height bands 39-99m are within the potential collision height (PCH) with regard to the turbine swept area. In addition, the presence of any non-target species was recorded to inform the evaluation of supporting habitat.

3.1.2 Winter Walkover Surveys

Winter walkover surveys were undertaken to record the presence of bird species within the site and to a 500m radius. The methodology was adapted from the breeding walkover methodology outlined in O'Brien and Smith (1992) and Gilbert *et al.* (1998), combined with Common Bird Census methods (British Trust for Ornithology, 2021). Transect routes were walked across different habitat complexes within the site where access allowed. All target species were recorded and mapped. In addition, the presence of any non-target species was recorded to inform the evaluation of supporting habitat.

Winter walkover surveys were conducted in daylight hours over four visits between October and March. Appendix 2, Figure 2 shows the transect routes.

3.1.3 Waterbird Distribution and Abundance Surveys

Waterbirds include: swans, geese and ducks; cormorant, shag, divers and grebes; auks and seabirds; gulls, terns and skuas; herons, egrets and crane; rails and crakes; waders; and kingfisher. Significant wetlands and waterbodies within 8km of the site were surveyed for waterbirds during the winter season to provide information on their distribution in relation to the site.

Survey methodology follows Gilbert *et al.* (1998) and the Irish Wetland Bird Survey (BirdWatch Ireland, 2021). Surveys were undertaken during daylight hours from suitable vantage points at wetlands and waterbodies. All target waterbird species were recorded and mapped. Appendix 2, Figure 3 shows the surveyed area.

3.1.4 Hen Harrier Roost Surveys

Hen harrier roost surveys were undertaken within and adjacent to the site. These surveys aimed to identify active winter hen harrier roosts within or near the site. Survey methodology followed Gilbert *et al.* (1998) and O'Donoghue (2019). Roost watches of 2-3 hours were conducted at two hen harrier vantage point

locations from dusk until last visible light during which all hen harrier observations were recorded and mapped.

Each hen harrier vantage point was surveyed once per month during the winter season between October and March inclusive. Figure 4 shows the hen harrier vantage point locations.

3.2 **Statement of Authority**

This report has been prepared by Susan Doran (B.Sc.), Ornithologist of MKO, and reviewed by Patrick Manley (B.Sc.), Senior Ornithologist. Both are suitably qualified ornithologists with experience in completing avifaunal assessments and competent experts for the purposes of the preparation of this report, following SNH (2017) and CIEEM (2017) ecological reporting guidelines. Field surveys were undertaken by Cian Cardiff. Cian is a suitably qualified competent expert in field ornithology.

3.3 **Survey Limitations**

A comprehensive suite of bird surveys was undertaken at the site between October 2023 and March 2024. Results from winter season 2023-2024 are derived from a continuous six months of surveying undertaken in accordance with best practice guidance, SNH (2017). The survey duration and scope are considered entirely satisfactory.

4. RESULTS

4.1 Field Surveys

The following bird species were recorded during the survey period. These include species listed on **Annex I** of the EU Birds Directive (2009/147/EC), and species that are a Special Conservation Interest (**SCI**) of a Special Protection Area (SPA) designated under the EU Birds and Habitats (92/43/EEC) Directives Natura 2000 network within 15km of the site¹, species listed on the **Red List** of Birds of Conservation Concern in Ireland (Gilbert *et al.*, 2021), and species considered sensitive to this type of development (i.e., raptor species). The list is ordered in accordance with conservation significance: Annex I species, SCIs of designated sites, Red listed species and raptors:

- > Golden Plover (Annex I & SCI & BoCCI Red Listed)
- > Greenland White-fronted Goose (Annex I & SCI)
- > Red-throated Diver (Annex I & SCI)
- > Bar-tailed Godwit (Annex I & BoCCI Red Listed)
- > Dunlin (Annex I & BoCCI Red Listed)
- > Hen Harrier (Annex I & Raptor)
- > Marsh Harrier (Annex I & Raptor)
- > Merlin (Annex I & Raptor)
- > Peregrine Falcon (Annex I & Raptor)
- > Short-eared Owl (Annex I & Raptor)
- > Glossy Ibis (Annex I)
- > Great White Egret (Annex I)
- > Kingfisher (Annex I)
- > Little Egret (Annex I)
- > Little Gull (Annex I)
- > Mediterranean Gull (Annex I)
- > Ruff (Annex I)
- > Whooper Swan (Annex I)
- > Common Scoter (SCI & BoCCI Red Listed)
- > Lapwing (SCI & BoCCI Red Listed)
- > Cormorant (SCI)
- > Sanderling (SCI)
- > Wigeon (SCI)
- > Kestrel (BoCCI Red Listed & Raptor)
- > Black-tailed Godwit (BoCCI Red Listed)
- > Curlew (BoCCI Red Listed)
- > Curlew Sandpiper (BoCCI Red Listed)
- > Kittiwake (BoCCI Red Listed)
- > Knot (BoCCI Red Listed)
- > Meadow Pipit (BoCCI Red Listed)
- > Oystercatcher (BoCCI Red Listed)
- > Pochard (BoCCI Red Listed)
- > Razorbill (BoCCI Red Listed)
- > Redshank (BoCCI Red Listed)
- > Redwing (BoCCI Red Listed)
- > Scaup (BoCCI Red Listed)
- > Shoveler (BoCCI Red Listed)
- > Snipe (BoCCI Red Listed)

¹ It is noted that a determination will be made on whether there is connectivity between the SPAs and the site at the appropriate assessment stage

- > Buzzard (Raptor)
- > Long-eared Owl (Raptor)
- > Sparrowhawk (Raptor)

The following sections describe the species observed during surveys. Raw data and maps are provided in Appendix 2. Incidental records of birds of conservation concern are also presented.

4.1.1 Vantage Point Surveys

Summary results from vantage point surveys are presented below in Table 4-1.

Table 4-1 Vantage Point Survey Summary

Species	Total number of records	Total number of Bird Seconds* at PCH	Activity of note
Golden plover	20	512,500	Flocks ranged from 6 to 600 birds. Most observations were of birds commuting. Additionally, there were six observations of flocks foraging on site and within 500m of the site. The majority of observations were within, or partially within, the site.
Greenland White-fronted Goose	2	1,480	Observations were of flocks of 2 and 12 birds commuting over the site at the potential collision height. All observations were within, or partially within, the site.
Bar-tailed Godwit	1	0	This observation was of two birds flying across the site.
Dunlin	12	2,130	Flocks ranged from 1 to 40 birds. Five observations were of birds commuting and five observations were of birds foraging on the marsh. All observations were within the site.
Hen Harrier	10	1,325	All observations were of individuals commuting or hunting within, or partially within, the site.
Marsh Harrier	1	55	This observation was of an individual commuting over the site.
Merlin	9	240	Observations were of between one and two birds commuting or hunting. Most observations were within, or partially within, the site.
Peregrine Falcon	2	33	Observations were of individual birds hunting or drinking.
Short-eared Owl	1	180	This observation was of an individual commuting at the potential collision height.
Glossy Ibis	3	355	Observations were of between two and three birds commuting at the potential collision height over the site.
Great White Egret	1	100	This observation was of an individual commuting at potential collision height over the site.
Little Egret	19	1,220	Flocks ranged from one to six birds foraging or commuting. All observations were within, or partially within, the site.
Little Gull	1	0	Observation was of an individual flying within the site.

* Bird Seconds are the number of birds observed multiplied by the number of seconds the flock was observed for.

Species	Total number of records	Total number of Bird Seconds' at PCH	Activity of note
Mediterranean Gull	2	0	Observations were of between one and three birds commuting or washing within the site.
Ruff	13	680	Observations of between one and eight commuting and foraging. There were two observations at the potential collision height. All observations were within, or partially within, the site.
Whooper Swan	15	5,970	Flocks ranged from 3 to 22 birds. Most observations were of birds commuting at the potential collision height. Additionally, there were six observations of flocks foraging on, or within 500m of, the site. All observations were within, or partially within, the site.
Lapwing	12	99,640	Flocks ranged from 11 to 290 birds. Most observations were of birds commuting. There were, two observations of 79 and 110 birds foraging on, or within 500m of, the site. All observations were within, or partially within, the site.
Cormorant	2	45	There was one observation of an individual commuting and one observation of seven birds roosting adjacent to the site.
Wigeon	21	4,100	Flocks ranged from 6 to 170 birds. Nine observations were of birds foraging on, or within 500m of, the site. There were eight observations of birds commuting, three of which were at the potential collision height. Most observations were within, or partially within, the site.
Kestrel	8	385	All observations were of between one and two birds commuting or hunting. Most observations were within, or partially within, the site.
Black-tailed Godwit	17	14,320	Flocks ranged from 17 to 200 birds. Six observations were of birds foraging on, or within 500m of, the site. There were ten observations of birds commuting, two of which were within the potential collision height. All observations were within, or partially within, the site.
Curlew	13	5,655	Flocks ranged from 8 to 86 birds. Most observations were of birds commuting, with six observations at the potential collision height. Additionally, there were two observations of birds foraging. All observations were within, or partially within, the site.
Curlew Sandpiper	1	0	This observation was of two birds commuting over the site.
Kittiwake	1	0	This observation was of an individual commuting over the site.
Meadow Pipit	6	185	Observations were of between one and four birds commuting. All observations were within, or partially within, the site.
Pochard	1	0	This observation was of an individual foraging within the site.

Species	Total number of records	Total number of Bird Seconds ¹ at PCH	Activity of note
Redshank	13	580	Flocks ranged from 3 to 41 birds, most observations were of birds commuting. There were six observations of birds foraging on, or within 500m of, the site. All observations were within, or partially within, the site.
Redwing	2	0	Observations were of one or two birds foraging on, or within 500m of, the site.
Shoveler	13	1,230	Flocks ranged from 3 to 66 birds. Seven observations were of birds foraging on, or within 500m of, the site and six observations were of birds commuting, two of which were within the potential collision height. All observations were within, or partially within, the site.
Snipe	16	1,445	Flocks ranged from 1 to 16 birds. Most observation were of birds commuting. There were five observations of birds foraging or rooting on, or within 500m of, the site. Most observations were within, or partially within, the site.
Buzzard	6	285	Observations were of between one and four birds commuting, hunting or soaring. All observations were within, or partially within, the site.
Sparrowhawk	6	180	All observations were of individuals commuting, hunting or soaring. All observations were within, or partially within, the site.

4.1.2

Winter Walkover Surveys

Summary results from winter walkover surveys are presented below in Table 4-2.

Table 4-2 Winter Walkover Survey Summary

Species	Total number of records	Activity of note
Golden plover	4	Flocks were of between 200 and 530 birds foraging within the site.
Greenland White-fronted Goose	1	There was one observation of 14 birds commuting over the site.
Bar-tailed Godwit	1	There was one observation of two birds foraging within the site.
Dunlin	4	Flocks ranged from 6 to 44 birds foraging within the site.
Hen Harrier	3	All observations were of individuals hunting within the site.
Merlin	1	There was one observation of two birds hunting adjacent to the site along the coast.
Little Egret	9	Flocks were of between one and nine birds foraging. Six observations were within the site.
Mediterranean Gull	2	Observations were of one and two birds foraging within the site.
Ruff	4	All observations were of between five and six birds foraging within the site.
Whooper Swan	3	Observations were of between 3 and 64 birds foraging on, or within 500m of, the site.
Lapwing	3	Observations were of between 7 and 350 birds commuting over or foraging on and adjacent to the site.
Wigeon	4	All observations were of between 45 and 220 birds foraging within the site.
Kestrel	1	This observation was of two birds hunting within the site.
Black-tailed Godwit	4	Observations were of between 9 and 200 birds commuting or feeding on, or within 500m of, the site.
Curlew	3	Observations were of between 9 and 86 birds commuting or foraging on, or within 500m of, the site.
Curlew Sandpiper	1	This observation was of an individual foraging within the site.
Meadow Pipit	2	Observations were of between one and three birds foraging and commuting within the site.
Redshank	4	Observations were of between 2 and 41 birds foraging within the site.
Redwing	1	This observation was of an individual bird.
Scaup	1	There was one observation of three scaup foraging within the site.
Shoveler	5	Observations were of between 22 and 80 birds foraging within the site.
Snipe	3	Observations were of between three and six birds foraging within the site.

Species	Total number of records	Activity of note
Sparrowhawk	3	All observations were of between one and two birds hunting, within, or partially within, the site.

Waterbird Distribution and Abundance Surveys

Summary results from waterbird distribution and abundance surveys are presented below in Table 4-3. These are discussed in more detail in Section 5 of this report.

Table 4-3 Waterbird Distribution and Abundance Survey Summary

Species	Total number of records	Flock size Range	Number of records within 500m of site	Activity of note
Golden plover	14	9-600	14	Four of the observations were of birds flying with all other observations being of birds feeding and roosting. All observations were on, or within 500m of, the site.
Red-throated Diver	34	1-6	1	All observations were of birds foraging. There was one observation within 500m of site. The remaining observations were between 1.2km and 7.8km from the site.
Bar-tailed Godwit	2	1	2	Both observations were of birds foraging within the site.
Dunlin	12	2-55	9	Nine observations were of birds foraging on, or within 500m of, the site. There was one observation of three birds foraging at Morriscastle Beach (1.2km from the site) with the two remaining observations being of birds commuting at Roney Point (3.6km from the site)
Little Egret	13	1-6	12	Most observations were of birds foraging on, or within 500m of, the site. Additionally, there was one observation of four birds foraging approximately 1km from the site at Old Bawn Beach.
Mediterranean Gull	11	1-4	5	Five observations were of birds foraging on, or within 500 of, the site. All other observations were of birds foraging or commuting off the coast between 2.2km and 5.7km from the site.
Ruff	11	1-4	11	All observations were of birds Foraging, roosting or commuting within the site.
Whooper Swan	10	3-16	10	All observations were of birds foraging within the site.
Common Scoter	3	1-9	0	Observations were between approximately 3.6km to 6.4km north of the site. All observations were of birds foraging or commuting.
Lapwing	9	3-350	9	All observations were of birds foraging within, or adjacent to, the site.
Cormorant	36	1-6	3	All observations were of birds foraging off the coast, three of which were within 500m of the site. All other observations were between approximately 500m and 7km from the site.
Sanderling	1	7	0	This observation was of seven birds foraging at Ballyvaldon Beach, approximately 7.3km south of the site.

Species	Total number of records	Flock size Range	Number of records within 500m of site	Activity of note
Wigeon	20	3-250	18	Most observations were of birds foraging on, or within 500m of, the site. There were two observations of birds commuting off Cahore (approximately 1.8km from the site) and Glasscarrig Point (approximately 2.6km from the site)
Black-tailed Godwit	11	9-300	11	All observations are of birds foraging on, or within 500m of, the site.
Curlew	10	5-88	10	All observations were of birds foraging, commuting or roosting within the site.
Kittiwake	1	11	0	There was one observation of a flock of 11 birds foraging off Roney Point.
Knot	1	1	1	This observation was of one bird foraging within the site.
Oystercatcher	5	3-12	0	Two observations were of birds foraging on Old Bawn Beach, approximately 600m from site. The remaining observations were of birds foraging or commuting at Cahore point, Glenbeg Head (approximately 7km from the site) and Tinnaberna (approximately 3.7km from the site).
Razorbill	3	1-6	1	There was one observation of two birds foraging within 500m of the site. The other two observations were of birds foraging at Glasscarrig Point and Pollshone Head (approximately 6.3km from the site)
Redshank	13	2-70	11	Most observations were of birds foraging or commuting on, or within 500m of, the site. There was one observation of two birds foraging off Glenbeg Head and one of six birds commuting off Roney Point.
Scaup	1	1	1	There was one observation of an individual foraging within the site.
Shoveler	12	6-68	12	All observations are of bird feeding within the site.
Snipe	4	2-11	4	All observations are of birds foraging or commuting within the site.

4.1.4 Hen Harrier Roost Surveys

Summary results from hen harrier roost surveys are presented below in Table 4-4 and discussed in more detail in Section 5 of this report.

Table 4-4 Hen Harrier Roost Survey Summary

Species	Total number of records	Number of records within 500m of site	Activity of note	Roosting Status
Hen Harrier	20	20	All observations were of individuals, with the majority of observations being of birds hunting. All observations were within, or partially within, the site. There were two observations of birds landing close to dusk, it is considered that these birds were going to roost. Both observations were of birds roosting within the marsh on site.	Two observations of birds going to roost within the marsh on site.

4.1.5 Incidental Records

Incidental records of target species during the survey period are detailed in Table 4-5. These are discussed in further detail in Section 5 of this report.

Table 4-5 Incidental Records

Species	Survey Type(s)	Number of records	Activity of note
Golden plover	Vantage Point Survey and Hen Harrier Roost Survey	6	Flocks ranged from 9 to 300 birds. All observations were of birds commuting or foraging within the site.
Dunlin	Vantage Point Survey and Hen Harrier Roost Survey	7	All observations were of between 16 and 50 birds commuting or foraging on, or within 500m of, the site.
Hen Harrier	Waterbird Distribution and Abundance Survey	1	This observation was of an individual hunting within the site.
Marsh Harrier	Hen Harrier Roost Survey	1	This observation was of an individual hunting within the site.
Merlin	Hen Harrier Roost Survey and Waterbird Distribution and Abundance Survey	5	All observations were of between one and two birds hunting on, or within 500m of, the site.
Short-eared Owl	Hen Harrier Roost Survey	2	Observations were of between one and three birds hunting within the site.
Kingfisher	Hen Harrier Roost Survey	1	This observation was of an individual calling on site.
Little Egret	Hen Harrier Roost Survey	10	All observations were of between two and six birds foraging within the site.
Little Gull	Hen Harrier Roost Survey	1	This observation was of an individual foraging within the site.
Mediterranean Gull	Hen Harrier Roost Survey	2	Observations were of between two and five birds roosting within the site.
Ruff	Hen Harrier Roost Survey	8	Observations were of between 5 and 10 birds foraging or commuting within the site.
Whooper Swan	Hen Harrier Roost Survey	5	Observations were of between 3 and 44 birds foraging, commuting or roosting on, or within 500 of, the site
Lapwing	Vantage Point Survey and Hen Harrier Roost Survey	4	All observations were of between 30 and 250 birds foraging on, or within 500 of, the site.
Wigeon	Vantage Point Survey and Hen Harrier Roost Survey	12	Observations were of between 6 and 400 birds foraging within the site.
Kestrel	Hen Harrier Roost Survey and Waterbird Distribution and Abundance Survey	7	All observations were of between one and three birds hunting on, or within 500 of, the site.
Black-tailed Godwit	Hen Harrier Roost Survey	6	Observations were of between 9 and 250 birds foraging within the site.

Species	Survey Type(s)	Number of records	Activity of note
Curlew	Hen Harrier Roost Survey	4	Observations were of between 11 and 92 birds foraging on, or within 500 of, the site.
Knot	Hen Harrier Roost Survey	1	This observation was of two birds foraging on site.
Meadow Pipit	Hen Harrier Roost Survey and Waterbird Distribution and Abundance Survey	2	Observations were of between six and nine birds foraging on, or within 500 of, the site.
Redshank	Hen Harrier Roost Survey	7	Observations were of between 9 and 46 birds foraging within the site.
Shoveler	Hen Harrier Roost Survey	9	Observations were of between 20 and 150 birds foraging or roosting within the site.
Snipe	Vantage Point Survey and Hen Harrier Roost Survey	6	Observations were of between 2 and 100 birds foraging within the site.
Buzzard	Hen Harrier Roost Survey and Waterbird Distribution and Abundance Survey	7	Observations were of between one and six birds hunting, displaying or perched on, or within 500 of, the site. There was one observation 1.3km from the site. There was one observation of six birds displaying together in February. This indicated a probable territory being establish for the breeding season.
Long-eared Owl	Hen Harrier Roost Survey	1	This observation was of an individual bird calling on site.
Sparrowhawk	Hen Harrier Roost Survey and Waterbird Distribution and Abundance Survey	3	Observations were of between one and four birds hunting within, or partially within, the site.

5. Discussion

Ornithological surveys were conducted at the site during the 2023-2024 winter season.

There were two irregularly used hen harrier roosts identified, both of which were within the marsh habitat within the site. Both roost sites were only used on one occasion during surveys, despite multiple visits being conducted at both locations.

Golden plover, dunlin, hen harrier, merlin, little egret, ruff, whooper swan, lapwing, wigeon, black-tailed godwit, curlew, redshank, shoveler and snipe were regularly observed at, or within 500m of, the site. These species were observed both commuting over or using habitats within the site, and to 500m, for foraging or roosting. There were less frequent observations of kestrel, meadow pipit, buzzard and sparrowhawk, however these species are likely to be resident at the site throughout the winter season and were using the site for hunting/foraging. Twenty additional target species were observed at, or within 500m of, the site, however these species were observed irregularly, and generally, in low numbers. Common scoter, sanderling and kittiwake were observed during waterbird distribution and abundance surveys; however, they were not observed within 500m of the site.

The primary habitat use for most species, particularly the waterbird species, was the salt marshes within the eastern section of the site. The majority of observations of waterbirds and harriers were associated with this area which partially comprises the Cahore Marshes SPA.

Within 8km of the site, large numbers of red-throated diver, ruff and cormorants were observed flying and foraging off the coast. Additionally, mediterranean gull, oystercatcher, razorbill and redshank were regularly observed commuting and foraging within 8km of site.

Table 2.4 Hen Harrier Roost Survey data

Ref.	HHVP	Date	Time	Species	Number	Habitat and activity	Surveyor
HH001	HHVP1	22/10/2023	17:15	Hen Harrier	1	freshwater marsh and reed and large sedge swamps, hunting, juvenile	CC
HH002	HHVP1	22/10/2023	17:30	Hen Harrier	1	freshwater marsh, dune scrub and woodland and reed and large sedge swamps, hunting, hunting marsh and dune area, same individual	CC
HH003	HHVP1	22/10/2023	17:42	Hen Harrier	1	freshwater marsh and reed and large sedge swamps, hunting, same individual	CC
HH004	HHVP1	22/10/2023	18:05	Hen Harrier	1	freshwater marsh and reed and large sedge swamps, hunting, same individual, highly likely to have roosted nearby.	CC
HH005	HHVP1	31/10/2023	16:25	Hen Harrier	1	freshwater marsh and reed and large sedge swamps, hunting, juvenile	CC
HH006	HHVP1	31/10/2023	16:38	Hen Harrier	2	freshwater marsh and reed and large sedge swamps, hunting, juveniles	CC
HH007	HHVP1	31/10/2023	16:50	Hen Harrier	1	freshwater marsh and reed and large sedge swamps, hunting, juvenile	CC
HH008	HHVP1	08/11/2023	14:30	Hen Harrier	1	freshwater marsh, hunting, juvenile	CC
HH009	HHVP1	04/12/2023	15:03	Hen Harrier	1	freshwater marsh, hunting, juvenile	CC
HH010	HHVP1	26/12/2023	14:40	Hen Harrier	1	freshwater marsh, hunting	CC
HH011	HHVP1	26/12/2023	15:20	Hen Harrier	1	freshwater marsh, hunting	CC
HH012	HHVP	08/01/2024	14:45	Hen Harrier	1	freshwater marsh, hunting	CC
HH013	HHVP	08/01/2024	15:05	Hen Harrier	1	freshwater marsh, hunting	CC
HH014	HHVP	28/01/2024	15:00	Hen Harrier	1	freshwater marsh, hunting	CC
HH015	HHVP	28/01/2024	15:55	Hen Harrier	1	freshwater marsh, hunting	CC
HH016	HHVP	28/01/2024	17:07	Hen Harrier	1	freshwater marsh, hunting	CC
HH017	Ballinoulart	27/02/2024	16:22	Hen Harrier	1	freshwater marsh, hunting	CC
HH018	Ballinoulart	27/02/2024	17:09	Hen Harrier	1	freshwater marsh, hunting, landing	CC
HH019	Templederry	15/03/2024	16:35	Hen Harrier	1	freshwater marsh, hunting, wintering bird	CC
HH020	Templederry	15/03/2024	17:50	Hen Harrier	1	freshwater marsh, landed, same bird as above, in reeds nearing dusk.	CC

Appropriate Assessment Screening

1. In accordance with Regulation 27 (1) of the European Communities (Natural Habitats) Regulations 1997, the proposal by CGNEE Ltd to extend the approved period of operation of the currently active Ballywater Wind Farm, Co Wexford, must be considered for its potential to have significant effects, either alone or in combination, (the development being neither directly connected with nor necessary to the management of the site(s)) on any Natura 2000 sites.
2. The Ballywater Wind Farm is within 15km of four Special Areas of Conservation and two Special Protection Areas. These Natura 2000 sites are listed in Table 1. Although there is no formal requirement for this 15 km radius zone, it is recommended for plans and projects in guidance for planning authorities provided by NPWS in 2010 (DEHLG, 2010), and has become the norm across other land use sectors in Ireland.
3. The Wexford Harbour and Slobs SPA is approximately 19km to the south of the Ballywater Wind Farm. This SPA is the principal wintering site in Ireland of Greenland white-fronted goose *Anser albifrons flavirostris* and birds that use Cahore Marshes and The Slobs are regarded as comprising a single wintering population (Crowe 2005)¹ Movement of the species between the two SPAs is known to occur, with birds commuting to Wexford Harbour to roost. The designation features of Wexford Harbour and Slobs SPA are therefore also included in Table 1.
4. The nature of the scheme, and lack of hydrological or ecological connectivity, indicates that there are no likely pathways for effects on other Natura 2000 sites at greater distances.

Table 1: Designation features of Wexford Harbour and Slobs SPA and Natura 2000 sites with 15km of the Ballywater Wind Farm.

Designated Site	Distance from proposed development	Reason for designation
Special Area of Conservation (SAC)		
Cahore Polders and Dunes	<50m E	Annual vegetation of drift lines [1210] Embryonic shifting dunes [2110] Shifting dunes along the shoreline with <i>Ammophila arenaria</i> (white dunes) [2120] Fixed coastal dunes with herbaceous vegetation (grey dunes) [2130] Humid dune slacks [2190]
Kilmuckridge-Tinnaberna Sandhills	3km S	Embryonic shifting dunes [2110]

¹ Crowe (2005): Ireland's Wetlands and their Waterbirds: Status and Distribution. BirdWatch Ireland, Newcastle, Co. Wicklow.

Designated Site	Distance from proposed development	Reason for designation
		Shifting dunes along the shoreline with <i>Ammophila arenaria</i> (white dunes) [2120] Fixed coastal dunes with herbaceous vegetation (grey dunes) [2130]
Blackwater Bank	4km E	Sandbanks which are slightly covered by sea water all the time [1110]
Slaney River Valley	14.5km W	Estuaries [1130] Mudflats and sandflats not covered by seawater at low tide [1140] Atlantic salt meadows (<i>Glaucopuccinellietalia maritima</i>) [1330] Mediterranean salt meadows (<i>Juncetalia maritimi</i>) [1410] Water courses of plain to montane levels with the <i>Ranunculon fluitantis</i> and <i>Callitricho-Batrachion</i> vegetation [3260] Old sessile oak woods with <i>Ilex</i> and <i>Blechnum</i> in the British Isles [91A0] Alluvial forests with <i>Alnus glutinosa</i> and <i>Fraxinus excelsior</i> (<i>Alno-Padion</i> , <i>Alnion incanae</i> , <i>Salicion albae</i>) [91E0] <i>Margaritifera margaritifera</i> (Freshwater Pearl Mussel) [1029] <i>Petromyzon marinus</i> (Sea Lamprey) [1095] <i>Lampetra planeri</i> (Brook Lamprey) [1096] <i>Lampetra fluviatilis</i> (River Lamprey) [1099] <i>Alosa fallax fallax</i> (Twait Shad) [1103] <i>Salmo salar</i> (Salmon) [1106] <i>Lutra lutra</i> (Otter) [1355] <i>Phoca vitulina</i> (Harbour Seal) [1365]
Special Protection Area (SPA)		
Cahore Marshes	<50mE	Wigeon (<i>Anas penelope</i>) [A050] Golden Plover (<i>Pluvialis apricaria</i>) [A140] Lapwing (<i>Vanellus vanellus</i>) [A142]

Designated Site	Distance from proposed development	Reason for designation
		Greenland White-fronted Goose (<i>Anser albifrons flavirostris</i>) [A395] Wetland and Waterbirds [A999]
The Raven	12.5km SW	Red-throated Diver (<i>Gavia stellata</i>) [A001] Cormorant (<i>Phalacrocorax carbo</i>) [A017] Common Scoter (<i>Melanitta nigra</i>) [A065] Grey Plover (<i>Pluvialis squatarola</i>) [A141] Sanderling (<i>Calidris alba</i>) [A144] Greenland White-fronted Goose (<i>Anser albifrons flavirostris</i>) [A395] Wetland and Waterbirds [A999]
Wexford Harbour and Slobs	19km S	Little Grebe (<i>Tachybaptus ruficollis</i>) [A004] Great Crested Grebe (<i>Podiceps cristatus</i>) [A005] Cormorant (<i>Phalacrocorax carbo</i>) [A017] Grey Heron (<i>Ardea cinerea</i>) [A028] Bewick's Swan (<i>Cygnus columbianus bewickii</i>) [A037] Whooper Swan (<i>Cygnus cygnus</i>) [A038] Light-bellied Brent Goose (<i>Branta bernicla hrota</i>) [A046] Shelduck (<i>Tadorna tadorna</i>) [A048] Wigeon (<i>Anas penelope</i>) [A050] Teal (<i>Anas crecca</i>) [A052] Mallard (<i>Anas platyrhynchos</i>) [A053] Pintail (<i>Anas acuta</i>) [A054] Scaup (<i>Aythya marila</i>) [A062] Goldeneye (<i>Bucephala clangula</i>) [A067] Red-breasted Merganser (<i>Mergus serrator</i>) [A069] Hen Harrier (<i>Circus cyaneus</i>) [A082] Coot (<i>Fulica atra</i>) [A125] Oystercatcher (<i>Haematopus ostralegus</i>) [A130] Golden Plover (<i>Pluvialis apricaria</i>) [A140]

Designated Site	Distance from proposed development	Reason for designation
		Grey Plover (<i>Pluvialis squatarola</i>) [A141] Lapwing (<i>Vanellus vanellus</i>) [A142] Knot (<i>Calidris canutus</i>) [A143] Sanderling (<i>Calidris alba</i>) [A144] Dunlin (<i>Calidris alpina</i>) [A149] Black-tailed Godwit (<i>Limosa limosa</i>) [A156] Bar-tailed Godwit (<i>Limosa lapponica</i>) [A157] Curlew (<i>Numenius arquata</i>) [A160] Redshank (<i>Tringa totanus</i>) [A162] Black-headed Gull (<i>Chroicocephalus ridibundus</i>) [A179] Lesser Black-backed Gull (<i>Larus fuscus</i>) [A183] Little Tern (<i>Sterna albifrons</i>) [A195] Greenland White-fronted Goose (<i>Anser albifrons flavirostris</i>) [A395] Wetland and Waterbirds [A999]

5. There are no likely effects on the designation features of the SACs listed in Table 1 arising from the proposed extended operational period of the wind farm. There are no likely pathways for effects on site hydrology or physical effects on any of the SAC designation features. The nature and scale of the proposal, and lack of hydrological connectivity, indicate that there are no likely pathways for effects on Natura 2000 sites at greater distances.
6. The distance of the Ballywater Wind Farm from The Raven SPA, and the inland location of the wind farm, indicate that there are unlikely to be effects on the marine and littoral species that are designation features of the Natura 2000 site. Greenland white-fronted geese that use the SPA are part of the population that winter in a number of sites in south-east Ireland. The site is particularly important as a roost for this species, attracting birds from the Wexford Harbour complex of wintering sites, which includes the Wexford Harbour and Slobbs SPA (approximately 19km to the south of Cahore Marshes). Cahore Marshes are within this complex, and birds are known to commute on a daily basis between the site and Wexford Harbour. The wind farm is not on the direct route between the two sites and commuting birds that use Cahore Marshes as a foraging site are unlikely to overfly the wind farm. There is therefore limited likelihood of collision risk for birds commuting between Cahore Marshes and alternative sites. Goose species are also known to actively avoid flights in close proximity to wind turbines and high avoidance rates indicate that collisions with turbines during routine commuting flights and consequent population-level effects are unlikely. The Raven SPA and Wexford Harbour SPA are not considered further.

7. The Ballywater Wind Farm is adjacent to the Cahore Marshes SPA; the nearest turbine to the SPA boundary (Turbine 22) is <50m from the SPA boundary. There is therefore potential for birds that use the SPA to either use adjacent land as alternative foraging areas or for them to overfly the wind farm. A site synopsis of Cahore Marshes SPA is provided in Annex 1. Maps and site layout are provided in Annex 2.
8. The likely significance of effects of a proposed project on Natura 2000 sites and their conservation objectives are assessed taking into account the source-pathway-receptor model. The source is defined as the individual elements of the proposed project that have the potential to impact on a Natura 2000 site, its qualifying features and its conservation objectives. The pathway is defined as the means or route by which a source can migrate to the receptor. The receptor is defined as the Natura 2000 site and its qualifying features. Each element can exist independently; however, a potential impact is created where there is a linkage between the source, pathway and receptor.
9. The proposal is subject to the European Communities (Natural Habitats) Regulations 1997 (Regulation 27(1)), as consolidated in Irish law in the European Communities (Birds and Natural Habitats) Regulations 2011. Therefore, the precautionary approach should be applied, as set out in Commission Guidance: Managing Natura 2000 Sites and as required by the European Court of Justice in C-127/02 (Waddenzee). As such a Habitats Regulations Screening Assessment is required to be completed for the proposed development. This process follows the recommendations provided by DEHLG (2009, revised 2010)². Regulation 27(2) of the Natural Habitats Regulations outlines the type of assessment that would be accepted as appropriate. Designated site descriptions and site conservation objectives are to be found in Annex 1.
10. The Appropriate Assessment Screening will be required to investigate potential effects of the continued operation of the wind farm on the designation features and conservation objectives of the Natura 2000 site. Effects on all designation features will be considered. For the Cahore Marshes SPA, features of concern may be summarised as the populations of four waterfowl species and the wetland habitats that sustain them.
11. Depending on the outcome of the Screening exercise, and following the precautionary principle, if significant effects are likely, uncertain or unknown, a further stage of Appropriate Assessment (Stage 2) will be required that will take account of any mitigation measures that have been identified arising from the screening process. A Natura Impact Statement (NIS) will then be produced, which will record and analyse potential effects on the conservation objectives of the SPA. Assuming that no significant effects will be anticipated, works will be carried out in accordance with the mitigation measures produced in the AA (Stage 2).
12. This Screening Assessment refers to the proposal to continue the operation of an existing wind farm. The land holding associated with the wind farm extends into the SPA, but the leased area that defines the wind farm consists of the turbine bases, adjacent hardstanding and necessary infrastructure, which lie outside the SPA boundary. In addition, hard access tracks connect the various elements of the wind farm. Lands adjacent to the wind farm elements are under conventional agricultural management – cereals and improved grassland at the time of a reconnaissance site visit (01.07.23).

² DEHLG (2009, revised 2010): Appropriate Assessment of Plans and Projects in Ireland – Guidance for Planning Authorities

13. Location maps relating to the Site are included in Annex 2.

Timing of operations

14. This assessment refers to an operational wind farm. It is anticipated that operation will continue as at present for the period of the application, after which the wind farm will be decommissioned and all above ground infrastructure removed from the site.

Summary of site designations

Cahore Marshes SPA

15. Cahore Marshes has been designated as a SPA for the following features:
- Wigeon (*Anas penelope*) [A050]
 - Golden Plover (*Pluvialis apricaria*) [A140]
 - Lapwing (*Vanellus vanellus*) [A142]
 - Greenland White-fronted Goose (*Anser albifrons flavirostris*) [A395]
 - Wetland and Waterbirds [A999]
16. The Cahore Marshes SPA is of considerable ornithological importance as it provided a feeding area for an internationally important population of Greenland white-fronted goose at the time of designation. It also holds nationally important populations of three other species. The regular occurrence of Greenland white-fronted goose, Bewick's swan, whooper swan and golden plover is of particular note as these species are all listed on Annex I of the E.U. Birds Directive.
17. Five year mean peak counts of Greenland white-fronted goose for the period 1994/95 to 1998/99 (the period which provided the quantitative validation for the designation of the site) averaged 634 birds. At designation peak average for wigeon was 1,661, golden plover 6,038, and lapwing 3,455. The golden plover population is of particular note as it represents almost 4% of the all-Ireland population. The site also holds other wintering waterbirds, in smaller numbers, including shelduck (28), teal (417), mallard (244), shoveler (40), curlew (635) and black-headed gull (326). The site provides excellent feeding for these species, as well as good roost/rest areas. Peak annual counts for the Irish Wetland Birds Survey were requested from BirdWatch Ireland for the period winter 2003/04 (two years prior to operation of the wind farm) to winter 2021/22 (the most recent counts available).

Site Visit

18. A reconnaissance site visit to the wind farm site was carried out on 01.07.23 by Dr Brian Sutton to inform this assessment.

Current Management

19. There are currently no management plans that are designed specifically to take account of the designated conservation interests of the Cahore Marshes SPA. Parts of the site are signed as a Wildlife Reserve, with shooting prohibited. Conservation objectives have been produced that in general aim to maintain or improve the populations of the designation species, within the limits imposed by natural processes. Specific conservation objectives include:
- population dynamics data on the species concerned indicate that it is maintaining itself on a long-term basis as a viable component of its natural habitats; and

- the natural range of the species is neither being reduced nor is likely to be reduced for the foreseeable future.
20. The SPA includes a coastal sand dune complex that is open to public access, while parts of the site extend onto agricultural grassland. Agricultural activities and human activities, including recreational access, are considered to be the greatest risks to the conservation interest of the SPA.

Appropriate Assessment Screening

21. The proposed project is not directly connected with or necessary to the management of the Natura 2000 sites. Principal potential impacts on Greenland white-fronted goose are fatality due to collision with turbine rotors and displacement from apparently suitable feeding areas.

Ballywater Wind Farm

22. The existing wind farm occupies agricultural fields of low conservation interest. The wind farm is adjacent to agricultural fields that are used as feeding areas for Greenland white-fronted geese. Apparently suitable foraging is also available within the wind farm. However, in the absence of current data, it is not known whether birds from the SPA population use these areas.
23. The wind farm consists of 21 no turbines, an electrical substation, met mast and associated access tracks. The wind farm came on-stream in 2005.
24. It is anticipated that the wind farm will continue to operate with a similar degree of intensity and disturbance for maintenance and repair as at present. Agricultural operations within the wind farm will continue as at present, but are independent of the wind farm.
25. It is anticipated that the site will continue to operate for the extended licenced period. Under current regulations, any extension to that operational period will require a further planning application. Decommissioning of the site will include many operations that are similar to those of the construction phase. However, greater amounts of demolition debris are likely to be produced. This will be removed and disposed of to licensed sites. The distance of the various elements of the scheme from any watercourses indicates that there will be no significant discharge of demolition-derived pollutants to water bodies within the SPA.

Stage 1: Test of Likely Significance – Cahore Marshes SPA

Name of Project or Plan.	Extension of operation of Ballywater Wind Farm
Project reference (Planning ref. etc.):	
Name and location of Natura 2000 site.	Cahore Marshes SPA, Co Wexford
Natura 2000 site features:	The SPA supports an internationally important population of Greenland White-fronted Goose (<i>Anser albifrons flavirostris</i>) [A395] as part of the flock that is based at Wexford Harbour. The site supports nationally important populations of a further three species – Wigeon (<i>Anas penelope</i>) [A050], Golden Plover (<i>Pluvialis apricaria</i>) [A140] and Lapwing (<i>Vanellus vanellus</i>) [A142]. The Golden Plover population is of particular note as it represents almost 4% of the all-Ireland population (at the time of designation). The regular occurrence of Greenland White-fronted Goose, Bewick's Swan (absent in recent winters),

	Whooper Swan and Golden Plover is of particular note as these species are all listed on Annex I of the E.U. Birds Directive. Wetland and Waterbirds [A999] refers to the habitats necessary for the maintenance of the avian designation features
Description of the Project or Plan Size and scale; Land-take; Distance from Natura 2000 site or key features of the site; Resource requirements (water abstraction etc); Emission (disposal to land, water or air); Excavation requirements; Transportation requirements; Duration of construction, operation, de-commissioning etc; Other.	<u>Description of Project</u> The proposal refers to an extension of the operational lifetime of an existing wind farm that comprises the following elements: • 21 number wind turbines of 70m rotor diameter, generating 42MW, • Met mast; • Substation: and • All associated, completed, site development, landscaping and reinstatement works. <u>Size and scale</u> The windfarm comprises two phases. The southern unit (17 turbines) lies within a land ownership unit of approximately 2.83km² and the northern phase (4 turbines) lies within an ownership unit of approximately 55ha. <u>Land-take</u> None <u>Distance from Natura 2000 site or key features of the site</u> The SPA boundary approaches 3 no turbines (T15-17) at approximately 80m and T24 at approximately 40m. <u>Resource requirements (water abstraction etc)</u> None <u>Emission (disposal to land, water or air)</u> The extension will not result in any additional emissions compared to the current situation. <u>Excavation requirements</u> None <u>Transportation requirements</u> Transportation will be limited to the current use of site tracks for turbine maintenance. <u>Duration of construction, operation, de-commissioning etc</u> The proposed extension period of operation is 10 years.
Is the proposal directly connected with or necessary to management of the site for conservation of Natura 2000 features? If yes proceed no further.	No
Describe the individual elements of the project (either alone or in combination with other plans or projects) likely to give rise to impacts on the Natura 2000 site.	Continuing operation of the wind farm has the potential to reduce the area available to designation species for feeding and to increase mortality of designation species as a result of collision with turbine rotors. There are no likely effects on the Wetlands and Waterbirds designation feature, as there will be no loss of supporting habitats arising from the proposed extension.

Natura 2000 Feature: Mention all features	Describe any likely direct or indirect effects to the Natura 2000 features arising as a result of: loss; reduction of habitat area; disturbance; habitat or species fragmentation; reduction in species density; changes in key indicators of conservation value (e.g. water quality, climate change).	*Effect Significant/Not Significant? Why?
Wigeon (<i>Anas penelope</i>) [A050]	Displacement from feeding areas.	Not Significant The numbers of wigeon using the site have increased during the period of operation, contrary to the national trend, which shows a decline in the Irish wintering population of 18.2% between 1994/95 and 2019/20.
Golden Plover (<i>Pluvialis apricaria</i>) [A140]		Not Significant The numbers of golden plover using the site have been variable during the period of wind farm operation with a reduction in numbers since designation. The IWeBS maximum count for 2004/05 was 4000 and for 2021/22 was 3050. This equates to a reduction of 24% compared to a 58% reduction nationally between 2007/08 and 2019/20. The decline in numbers of birds using the site is broadly in line with the national trend and this situation is likely to continue.
Lapwing (<i>Vanellus vanellus</i>) [A142]		Not Significant The numbers of lapwing using the site have been variable during the period of wind farm operation, with a reduction in numbers since designation, including an exceptionally low IWeBS count in 2021/22. If that winter is treated as an outlier the decline in numbers of birds using the site is broadly in line with the national trend and this situation is likely to continue. A crude measure of the local trend shows a reduction of 62% from 3455 (designation period 1994/95-1998/99) to 1316 (2020/21) compared with a national reduction of 64% between 1997/98 and 2019/20.
Greenland White-fronted Goose (<i>Anser albifrons flavirostris</i>) [A395]		Not Significant It is likely that displacement of the designation species from feeding areas has occurred as a result of the construction of the wind farm. The IWeBS peak mean count between 1995 and 1999 was 329, in 2005/06 was 120, compared with a maximum in 2020/21 of 18. This reduction exceeds the national trend. Any

		displacement effects are likely to be already in place; an operational extension is unlikely to produce additional significant displacement effects.
• Wigeon (<i>Anas penelope</i>) [A050] • Golden Plover (<i>Pluvialis apricaria</i>) [A140] • Lapwing (<i>Vanellus vanellus</i>) [A142]	Disturbance arising from required access to turbines during maintenance.	Not Significant Disturbance arising from maintenance of turbines is likely to continue at current levels. There will be no additional disturbance arising from the proposed operational extension. Populations of wigeon, golden plover and lapwing have been maintained in line with national trends – wind farm related disturbance has had no apparent effect on the use of the site by these species.
• Greenland White-fronted Goose (<i>Anser albifrons flavirostris</i>) [A395]		Not Significant Greenland whitefronts are likely to be more susceptible to disturbance than the other designation species, with a suggested buffer zone between the source of disturbance and feeding birds of 500-1000m, within the distance likely to be relevant to maintenance visits. However, disturbance due to agricultural activities is likely to be more frequent and intensive. Additive disturbance from wind farm activities is likely to be short-term and intermittent.
• Wigeon (<i>Anas penelope</i>) [A050] • Golden Plover (<i>Pluvialis apricaria</i>) [A140] • Lapwing (<i>Vanellus vanellus</i>) [A142] • Greenland White-fronted Goose (<i>Anser albifrons flavirostris</i>) [A395]	Increased mortality due to collision with turbine rotors	Not Significant Accepted avoidance rates for birds at onshore wind farms are high (98% for duck and wader species, 99.8% for goose species); there is low risk to wader and duck species at the site at the population level. <u>Relatively high numbers of bird casualties have been found during a year-long programme of carcass searches; collision mortality was dominated by gulls and corvids and no designation species were found.</u> Reduced use of the site by Greenland whitefront (maximum IWebs count, 2021/22, was 18 birds) further indicates that there is minimal risk at the population level to the internationally important Wexford wintering population. Populations of three designation species have increased or have been maintained during the current operational period at levels ~proportional to national population trends (see discussion below). Searches for cadavers over winters 2022/23 and 2023/24 did not produce any definitive casualties of the designation species, although feather residues were not always identified to species. Mortality due to operation of the wind farm does not appear

		therefore to be a limiting factor at the population level for designation species using the SPA.
--	--	--

Describe any potential effects on the Natura 2000 site as a whole in terms of: interference with the key relationships that define the structure or function of the site	Effect considered significant/non-significant: Finding of No significant effects Matrix	
There is a potential for interception and displacement of Greenland whitefronts during commuting flights between Cahore Marshes SPA and roost sites in/near Wexford Harbour.	Not significant Direct routes between foraging and roosting sites avoid the wind farm; high avoidance rates also mitigate against interception of commuting birds.	
Provide details of any other projects or plans that together with the project or plan being assessed could (directly or indirectly) affect the site.	Provide details of any likely in-combination effects and quantify their significance -	
There are no known projects or plans that, in combination with the proposed development, are likely to affect the designated site.	Not significant There are no likely in combination effects on the SPA.	
Is the potential scale or magnitude of any effect likely to be significant?		
Alone?		Yes ☐ No ☒
In-combination with other projects of plans?		Yes ☐ No ☒
Conclusion: Is the proposal likely to have a significant effect on a Natura 2000 site?	Yes ☐ No ☒	
IF IT HAS BEEN DETERMINED THAT THE PROPOSAL WILL NOT HAVE A SIGNIFICANT EFFECT THEN ASSESSMENT IS COMPLETED. IF ANY PART OF THE PROPOSAL IS LIKELY TO HAVE A SIGNIFICANT EFFECT AN APPROPRIATE ASSESSMENT WILL BE REQUIRED – STAGE 2 AA.		

Data collected to carry out the assessment

Who carried out the assessment?	Dr Brian Sutton BSc PhD CEnv MCIEEM
Sources of data	Provided with application, client's drawings, NPWS website and aerial photography. Consultation with NPWS, but no response to date.
Level of assessment completed	Stage 1 – Screening

Assessment

26. The existing wind farm approaches the SPA boundary locally to around 40m; it is likely that any effects on designation species distribution and behaviour have been long-established and an extension of the wind farm operational lifetime is unlikely to exert additional pressures on these populations compared to the current situation.
27. The populations of three of the designation species have declined during the current operational period of the wind farm. Peak annual counts for the Irish Wetland Birds Survey of the Cahore sector, which includes part of the SPA, were requested from BirdWatch Ireland for the period immediately preceding construction of the wind farm to the most recent count. However, counts have been sporadic and were only available between winter 2003/04-2008/09 and 2020/21-2021/22. IWebs data are provided in Annex 3. The boundaries of the SPA and the IWebs count sectors are not coincident but the latter area includes those areas that are of importance for the designation species.

Greenland white-fronted goose

28. During this period, the maximum Greenland whitefront count of 120 birds was in 2005/06. There has been a considerable decline in use of the SPA and the maximum count in 2021/22 was of 18 birds. The Wexford wintering flock, of which birds using Cahore Marshes SPA are a part, has declined in numbers from around 10,000 birds in the 1990s to a maximum spring count in 2021 of 6262 birds. However, the population trend in Wexford does not match the steeper global population decline of the taxon; by 2015 the global population stood at ca.19,000 individuals, representing a decline of 47% in 16 years (Griffin *et al* 2020)³. Smaller flocks within Ireland have become extinct or appear in danger of extinction, and the decline of the sub-population that uses Cahore Marshes SPA may be related to this pattern of extinction, with the Wexford Harbour/Slobs functioning as the core of the Irish wintering population. However, it should be noted that the Cahore population was itself of international importance and the subsequent near extinction is therefore significant at the population level. Population decline generally is the result of low reproductive success in Greenland, together with an apparent low reproductive capability – ringing studies suggest that, even when the population was increasing into the 1990s, a remarkable 85% of Wexford Greenland white-fronted geese never survived to successfully reproduce (Stroud *et al* 2012)⁴.
29. Displacement effects resulting from the construction and operation of the Ballywater Wind Farm may be superimposed on this pattern of general population decline. The population trend for Greenland whitefronts at Cahore Marshes shows a trend that is significantly steeper than that for the totality of the Wexford flock. The five year mean peak counts of Greenland white-fronted goose for the period 1994/95 to 1998/99 (the period which provided the quantitative validation for the designation of the site) averaged 634 birds. The IWeBS peak mean count between 1995 and 1999 was 329 birds. Differences between these counts may reflect differences in time of day as well as the greater area of the SPA compared with the IWeBS sector; numbers are in each case of international importance. The most recent available IWeBS winter maximum count for the site was of 18 birds (2021/22).
30. A review of studies of effects of wind farms on wintering birds indicates that displacement distances of feeding geese at wintering sites generally ranged from 100–600 m, but evidence also suggests that large-scale displacement occurs, with fewer swans and geese returning to areas after wind farms were installed (Rees 2012).⁵ Recent guidance from NatureScot suggests that Greenland whitefronts are highly susceptible to disturbance, with a suggested buffer of 500-1000m between wintering birds and activities likely to cause disturbance (Goodship *et al* 2022). The close proximity of the Cahore Marshes SPA to the Ballywater Wind Farm therefore suggests that the decline in the local wintering sub-population may in part be ascribed to the presence of the wind farm. These potential effects are now well-established and the extension of the proposed operational period is unlikely to have a significant effect on the current distribution or numbers of the species at this site. It is likely that the decline in the number of birds using the site had begun before operation of the wind farm if the site followed the trend exhibited for the Wexford Slobs main site.

⁵ Rees, E.C., (2012): Impacts of wind farms on swans and geese: a review. *Wildfowl* (2012) 62: 37–72

31. Greenland whitefronts are intensely site-faithful and the loss of the species from a particular site therefore suggests that the loss is due either to death of the individual birds or their adoption of an alternative wintering site due to factors operating at the site level. The high level of site-faithfulness exhibited by the species, with birds often returning to the same field in successive winters, suggests that individual birds/sub-populations establish a tradition of site exploitation over a number of years. The absence of birds at Cahore Marshes in recent years suggests that this tradition has been disrupted. In the hypothetical future absence of a wind farm there may be insufficient birds with an attachment to the site for the population to recover to its designation level. In the light of the decline in the numbers using the Wexford Slobs site, it is likely that the main site is at below carrying capacity for the species, assuming that site habitat quality and area have been maintained, and is capable of absorbing the displaced population from Cahore Marshes. The past large-scale relocation of the Irish wintering Greenland whitefronts from dominantly bog habitats to coastal sites indicates that birds are able to adopt and maintain new traditions with reference to feeding grounds.
32. Collisions of geese with turbine rotors are unlikely to have had a significant effect on the Greenland whitefront population. Accepted avoidance rates (98%) for birds at onshore wind farms are high, and when considered together with likely displacement distances for foraging birds and the likely flightlines between foraging areas and roost sites, there appears to be low risk to local birds from collision. Nine searches for bird cadavers were made over six dates between 15.03.22 and 06.04.22 and 13 over six dates between 31.10.22 and 23.01.23, covering the vicinity of all turbines. A single dead jackdaw was found, which may have been a casualty arising from collision. No designation species were found. It is recognised that removal of dead birds by scavengers is possible, reducing perceived mortality risk arising from collisions. However, it is likely that some evidence of the past presence of a large cadaver would generally remain in the form of loose feathers. The absence of bird cadavers is viewed as confirmation of low collision rates for the designation species.

Lapwing

33. The numbers of lapwing using the site have been variable during the period of wind farm operation, with a reduction in numbers since designation, including an exceptionally low IWeBS count of 555 birds in 2021/22. Lapwing numbers during the IWeBS count winters reached 3500 in 2005/06, the winter immediately following the wind farm inauguration and numbers have been significantly lower in succeeding winters. If the 2021/22 winter is treated as an outlier the decline in numbers of birds using the site is broadly in line with the national trend and this situation is likely to continue. A crude measure of the local trend shows a reduction of 62% from 3455 (designation period 1994/95-1998/99) to 1316 (2020/21) compared with a national reduction of 64% between 1997/98 and 2019/20. Lapwing numbers at sites throughout the British Isles can be highly variable, often reflecting the relative harshness of the winter elsewhere (Britain, western Europe). There has been a significant decline in the species throughout its range, largely a response to breeding habitat loss arising from agricultural intensification. Changes in weather patterns, particularly resulting in a succession of recent milder winters in Britain, are a further potential reason for reduced numbers wintering at Cahore. It is therefore difficult to establish to what extent displacement from the site as a result of operation of the wind farm is a factor in the reduced numbers of lapwings using the site during winter. Any potential displacement effects are likely to be well-established and the proposed extension is unlikely to have a significant effect on the distribution or numbers of the species at this site. Significant numbers of lapwings use the agricultural fields within the turbine field for foraging, resting and, potentially, roosting, and were frequently observed using the air space within the wind farm at rotor height. No casualties of this species were found during a year-long programme of carcass searches. It is likely that birds using wind farm sites become habituated to turbine operation and are generally able to avoid operating turbines.

Golden plover

34. At designation the peak average for golden plover was 6,038. The reduced population of golden plover, when compared with the designation-era, at Cahore is largely in line with the global decline of the species. IWeBS data suggest a decline in the Irish wintering population between 1884/95 and 2019/20 of 54.1%. As an example, the IWeBS maximum count for 2021/22 was 3050, or 50.5% of the designation population. There is therefore no evidence that the presence of the wind farm has had an adverse effect on the local golden plover population, conforming closely to the national trend. Significant numbers of golden plover use the agricultural fields within the turbine field for foraging, resting and, potentially, roosting, and were frequently observed using the air space within the wind farm at rotor height. No casualties of this species were found during carcass searches and the lack of evidence of casualties and the readiness of birds to use the ground between turbines suggests that collision events are infrequent. A review of 29 studies suggests golden plover will only approach wind turbines to an average distance of 175m in the non-breeding season (Hötter et al. 2006)⁶. There is therefore likely to be some localised displacement of birds within the wind farm but the site remains able to support significant numbers of the species. Golden plover are reported to avoid turbines in the landscape and it is therefore likely that the absence of recorded casualties of this species reflects the actual low collision susceptibility of this species. It is likely that birds using wind farm sites become habituated to turbine operation and are generally able to avoid operating turbines.

Wigeon

35. The designation peak average for wigeon was 1,661. The significant increase in the species at the site indicated in the IWeBS data, with a recent peak (2021/22) of 2152 birds, is against the national trend, which shows a decline in the Irish wintering population of 18.2% between 1994/95 and 2019/20. This local increase may reflect the absence of shooting pressure at the site. Both this species and Greenland whitefronts feed largely by grazing on grassland; additionally, therefore, the reduced grazing competition from Greenland whitefronts resulting from that species' decline in numbers may have been a factor in the increase in wigeon at the site. There is therefore no evidence that the presence of the wind farm has had an adverse effect on the local wigeon population.

Conclusions

36. The decline in the numbers of Greenland whitefronts at Cahore Marshes coincides with the operation of the Ballywater Wind Farm. Although the species showed a global decline in numbers prior to wind farm operation, the greater rate of decline at Cahore suggests that site-dependent factors are involved. When the known responses of goose species generally to wind farm presence are taken into account, it is considered that it is likely that the presence of the Ballywater Wind Farm has been a factor in this rapid decline at this site. The proposed extension

⁶Hötter, H, Thomsen, K-M, and Jeromin, H (2006). Impacts on biodiversity of exploitation of renewable energy sources: the example of birds and bats—facts, gaps in knowledge, demands for further research, and ornithological guidelines for the development of renewable energy exploitation. NABU 1–65

of the wind farm operational period is unlikely to have a significant additional effect at a population level on the species.

37. While wind farm operation has had a likely effect on Greenland whitefront numbers at the site, it is unclear whether absence of the wind farm would have a beneficial effect on the species at this site. The decline in the species at the site means that the traditional use of the site has been disrupted and newly adopted feeding grounds may be preferred.
38. The presence of the wind farm does not appear to have had an adverse effect on golden plover and lapwing, which have declined at the site in line with national trends. Wigeon have increased at the site during the lifetime of the operational wind farm, contrary to the national trend, and there has thus not been an adverse effect on this species.
39. This Appropriate Assessment Screening, based on the best available scientific information, finds that the proposed operational extension does not pose a further risk of significant effects on Natura 2000 sites and that the proposal does not require progression to a Stage 2 appropriate assessment. Therefore, it is concluded that it will not have a significant effect on the conservation objectives or integrity of any Natura 2000 sites.

Annex 1

SITE NAME: CAHORE MARSHES SPA

SITE CODE: 004143

Cahore Marshes SPA is located just south of Cahore Point on the north Co. Wexford coast. It comprises an area of polder grassland and some arable land interspersed by canals and drainage channels. The drainage canals and sluices were installed in the mid 19th century to reclaim wetlands and land that flooded regularly behind the sand dunes. Seawater may occasionally enter the channels and create brackish conditions. The area is underlain by rocks of Cambrian age. The site is a Special Protection Area (SPA) under the E.U. Birds Directive, of special conservation interest for the following species: Greenland White-fronted Goose, Wigeon, Golden Plover and Lapwing. The E.U. Birds Directive pays particular attention to wetlands and, as these form part of this SPA, the site and its associated waterbirds are of special conservation interest for Wetland & Waterbirds. The Cahore Marshes SPA is of ornithological importance as a site for wintering waterfowl. An internationally important population of Greenland White-fronted Goose (634 - five year mean peak counts for the period 1994/95 to 1998/99), which is part of the flock that is based at Wexford Harbour, utilises this site during the winter. Both Whooper Swan (23) and Bewick's Swan (12) also occur, but in relatively low numbers - all figures are mean peak counts for four of the five winters between 1995/96 and 1999/2000. Bewick's Swan had been more numerous in the 1980s, especially in spring, but numbers have declined in line with a national decrease. The site supports nationally important populations of a further three species - Wigeon (1,661), Golden Plover (6,038) and Lapwing (3,455). The Golden Plover population is of particular note as it represents almost 4% of the all-Ireland population. The site also holds other wintering waterbirds, in smaller numbers, including Shelduck (28), Teal (417), Mallard (244), Shoveler (40), Curlew (635) and Black-headed Gull (326). The site provides excellent feeding for these species, as well as good roost/rest areas. The Cahore Marshes SPA is of considerable ornithological importance as it provides a feeding area for an internationally important population of Greenland White-fronted Goose. It also holds nationally important populations of three other species. The regular occurrence of Greenland White-fronted Goose, Bewick's Swan, Whooper Swan and Golden Plover is of particular note as these species are all listed on Annex I of the E.U. Birds Directive.

Executive Summary

This is a brief summary of results. For full details please read the report in its entirety.

- A comprehensive suite of bat surveys was undertaken in 2022 to assess activity at Ballywater Windfarm. The surveys aimed to identify any potential impacts a 5 year life extension of the windfarm could have upon the local bat population. Static detector monitoring recorded bat activity across spring, summer and autumn with 13 deployments each season. A significant number of bat casualty searches were undertaken in spring, summer and autumn – searches covered every turbine, with each turbine receiving at least 1 search per season (each turbine receiving a minimum of 2 searches in summer as this is typically recognised as being a higher risk period).
- No bat carcasses were found. This result indicates that the windfarm is not currently causing bat fatalities. Extension of the windfarm lifetime is not anticipated to result in any significant mortality rate among the local bat population.
- Seven species of bat were recorded. Levels of bat activity varied between turbines, ranging from Negligible – High. Elevated levels of bat activity were recorded for Leisler's bat, Common pipistrelle and Soprano pipistrelle which are species considered most at-risk from turbine associated mortality.

- Wexford County Council Planning Applications was accessed to view previous supporting ecological information however Blackstaff Ecology was unable to locate any previous bat survey effort undertaken for the windfarm which commenced operation in 2005. BCI note that the majority of operational windfarms in Ireland have had no baseline bat surveys conducted either as part of the planning process or for post-construction monitoring of potential operational impacts. BCI state that where an extension or alteration to a windfarm is proposed, any associated bat activity must first be identified and a decision made whether further assessment is needed.
- These 2022 bat surveys are considered the sole existing baseline bat data for this site. A Bat Monitoring and Mitigation Plan (BMMP) is recommended - details of this are provided in Appendix 3. With this mitigation, operational extension of the windfarm for an additional 5 years is not anticipated to have any significant effect upon the local bat population.

Introduction

1. Blackstaff Ecology Ltd. was commissioned by CGN to assess bat activity at Ballywater Windfarm, County Wexford. This windfarm commenced operation in 2005 with a permitted lifespan of twenty years. The current proposal seeks to extend the operational lifetime of the windfarm by an additional 5 years. A comprehensive suite of bat surveys was undertaken in 2022 which assessed bat activity across the windfarm and which will be used to anticipate potential impacts (if any) upon the local bat population. This report details the survey results in addition to methodology and mitigation.
2. The windfarm is located between Kilmuckridge and Ballygarrett villages. It consists of 21 turbines (the existing numbering system for the windfarm excepts T1, T2, T4 which do not exist: present turbines are numbered T3, T5 – T24).
3. The development does not seek to alter existing turbine specifications or install new turbines, but to extend the life of the existing 21 turbines. A comprehensive static detector survey was undertaken to record bat activity levels across the existing windfarm. This survey was enhanced by a substantial amount of bat casualty searches which focused on every turbine at least once per season. The resulting dataset has been used to inform current impacts of the windfarm regarding bats and anticipate continuing impacts (if any) should the lifetime extension be granted.
4. A robust dataset has therefore been accumulated which should allow adequate assessment of any potential the project may hold to impact upon on local bat populations.

Statement of Authority

5. Static detector and bat casualty surveys were planned and implemented by Cormac Loughran CEnv MCIEEM MSc. Static detector data was subsequently analysed using Kaleidoscope Pro and verified manually by Mr. Philip Leathem. Final results were then prepared in this report by Catriona Porter MSc. This report has been reviewed and approved by Cormac Loughran.
6. Catriona has an MSc in Animal Behaviour and Welfare (Distinction) from Queen's University, Belfast. Prior to entering consultancy she has several years of experience within the nature conservation sector through involvement with various NGOs. Catriona has over 3 years of experience within the ecological consultancy sector beginning in April 2021 with Allen & Mellon Environmental. She has been involved in projects in the north and south of Ireland and has gained varied experience in survey techniques and the associated ecological reports. Catriona has conducted approximately thirty-five emergence/re-entry bat surveys, twenty bat roost potential assessments on buildings and trees, two Ecological Clerk of Works (ECow) supervised demolitions and over one hundred bat carcass searches for single wind turbines. She is a Qualifying CIEEM member.
7. Cormac is a Chartered Environmentalist (CEnv), and a full member of the Chartered Institute of Ecology and Environmental Management (MCIEEM). He holds an MSc (Distinction) in Environmental Management from the University of Ulster, and has extensive experience in bat surveys; having undertaken and coordinated full bat surveys and associated impact assessments for numerous major infrastructure developments, and small-scale projects. Cormac has also previously held a Natural England Disturbance Licence (20121610) for Bats (all species, (all counties of England)). He has attended numerous courses and conferences, specifically relating to bats, for the purposes of CPD (Continuing Professional Development). These have included the Natural England approved 'Bat Licence Training Course' run by Wildwood Ecology (Cardiff). Cormac has also attended the BCT (Bat Conservation Trust) approved course 'Bats and Trees', and has attended three BCI (Bat Conservation Ireland) biannual conferences (2010 Kilkenny, 2012 Sligo & Cork 2014). He also attended the Nathusius' Pipistrelle Workshop in Enniskillen (2009).
8. Philip has worked as an Environmental Technician with Blackstaff Ecology Ltd for over six years. In this role he is responsible (among other things) for the upkeep and deployment of a suite of 30 static detectors

(used on a wide variety of sites in any given year). To date he has deployed and gathered data on over 20 windfarms as well as 200 individual turbine installations. In addition, he has completed 5 years of carcass searches at two major windfarms. He is also currently working towards a degree in Environmental Science.

Legislation

9. There are eleven recorded bat species in Ireland and nine are considered resident. All bat species found in Ireland are listed under Annex IV of the EC Habitats Directive which requires protection for bats and their habitats. The lesser horseshoe bat *Rhinolophus hipposideros* is further listed under Annex II of the Directive, requiring designation of conservation areas for this species. Ireland is legally obliged to maintain the favourable conservation status of Annex-listed species. Irish bat species are also protected by national legislation (Wildlife Acts 1976 – 2012).
10. Bats are protected across Europe by the Convention on the Conservation of European Wildlife and Natural Habitats (Bern Convention 1982). Migrant bat species are further protected across all European boundaries by the Convention on the Conservation of Migratory Species of Wild Animals (Bonn Convention 1979, enacted 1983). There is therefore an obligation to protect the habitat of bats, including links to important feeding areas.
11. In relation to the above legislation, it is an offence if:
 - *They are deliberately captured, injured or killed*
 - *These animals are disturbed in such a way as to significantly affect their ability to survive, breed, or rear / nurture their young, or in a way that affects the local distribution or abundance of that species*
 - *A breeding site or resting place of these species is damaged or destroyed, even if this is unintentional and / or when the animal is not present*
 - *Access to a structure or place used by these species for protection or shelter is intentionally or recklessly obstructed*
 - *This legislation applies to all life stages of these species*
12. The protected species legislation applies independently of planning permission, so licences are likely to be necessary for operations that affect bats but do not require planning permission. A grant of planning permission does not constitute a licence or permit to disturb bats or interfere with their breeding or resting places. The destruction, alteration or evacuation of a roost site must be carried out under licence obtained from the National Parks and Wildlife Service (NWPS) – however, NWPS advise that if the proposed activity can be timed, organised and carried out so as to avoid committing offences then a licence may not be required.
13. Every six years, Member States of the European Union are required to report on the conservation status of all habitats and species listed on the annexes of the Habitats Directive. The NWPS monitors the conservation status of European protected habitats and species: an assessment is presented every six years to the European Commission. The most recent report for the R.O.I. is dated 2019; conservation status and identified threats are summarised in the table below.

Table 2 - Conservation status and identified threats to Irish bats (NWPS 2019)

Species	Status	Threats
Common pipistrelle <i>Pipistrellus pipistrellus</i>	Favourable	A05 Removal of small landscape features for agricultural land parcel consolidation (M)
Soprano pipistrelle <i>Pipistrellus pygmaeus</i>	Favourable	A14 Livestock farming (without grazing) [impact of anti-helminthic dosing on dung fauna] (M)
Nathusius' pipistrelle <i>Pipistrellus nathusii</i>	Unknown	B09 Clear---cutting, removal of all trees (M)
Leisler's bat <i>Nyctalus leisleri</i>	Favourable	F01 Conversion from other land uses to housing, settlement or recreational areas (M)

Daubenton's bat <i>Myotis daubentonii</i>	Favourable	F02 Construction or modification (e.g. of housing and settlements) in existing urban or recreational areas (M)
Natterer's bat <i>Myotis nattereri</i>	Favourable	F24 Residential or recreational activities and structures generating noise, light, heat or other forms of pollution (M)
Whiskered bat <i>Myotis mystacinus</i>	Favourable	H08 Other human intrusions and disturbance not mentioned above (Dumping, accidental and deliberate disturbance of bat roosts (e.g. caving) (M)
Brown long-eared <i>Plecotus auritus</i>	Favourable	L06 Interspecific relations (competition, predation, parasitism, pathogens) (M)
Lesser horseshoe bat <i>Rhinolophus hipposideros</i>	Inadequate	M08 Flooding (natural processes) D01 Wind, wave and tidal power, including infrastructure (M)

Bats & Wind Turbines

14. There is evidence from the USA and mainland Europe to suggest that single wind turbines can impact upon bats as dead bats have been found beneath some turbines. Such deaths may have been caused by direct collision with the turbine blades or by damage to the bat's lungs as they pass close to the rotating turbine blades.
15. Such damage is called 'pulmonary barotrauma' and is thought to occur as bats fly into areas of low air pressure, which are created as the turbine blades are rotating; the resulting sudden change in air pressure is thought to cause the bat's lungs to expand at a rate which causes soft tissues within the lungs to rupture.
16. A European Union Advisory Committee called EUROBATs (which was initiated in 1994 and is concerned with the conservation of European bat populations) has produced guidance on how any potential impacts of wind turbines on bats can be assessed.
17. The guidance, 'EUROBATs Publication Series No. 3: Guidelines for consideration of bats in windfarm projects (Rodrigues et al. 2008)' identifies a need to conduct pre-construction bat activity surveys as well as assessing any habitat feature(s) which may be used by bats within the local landscape. Such a survey should particularly aim to identify situations which would pose a high level of risk to bats e.g. active bat roost, commuting corridor or foraging habitat in close proximity to a proposed turbine location.
18. Various bat species are at varying degrees of risk from wind turbines as each species has a different flight style, foraging method and echolocation call. Using these parameters, it has been determined that four Irish bat species - common, soprano and Nathusius' pipistrelles, and Leisler's bat; are at a high level of risk from turbines with the latter two species also having a high population vulnerability. The remaining Irish bat species (*Myotis* spp., long-eared bats and horseshoe bats) were regarded as being at a low level of risk collision with turbines, and having low population vulnerability. The SNH 2021 guidelines summarise the risk of impact and factors involved, shown in Table 3.

Table 3 - Factors that influence risk of turbine impact in Irish bats¹

Factor	Risk of turbine impact	
	Low Risk	High Risk
Habitat preference	Bats preferring cluttered habitat	Bats preferring to use open habitat
Echolocation characteristics	Short range High frequency Low intensity Detection distance ~15m	Long range Low frequency High intensity Detection distance ~80m (except <i>Pipistrellus</i> spp.)
Wing shape	Low wing loading Low aspect ratio Broadest wings	High wing loading High aspect ratio Narrow wings
Flight speed	Slow	Fast
Flight behaviour and use of landscape	Manoeuvre well Will travel in cluttered habitat Keeps close to vegetation Gaps may be avoided	Less able to manoeuvre May avoid cluttered habitat Can get away from unsuitable habitat quickly Commute across open landscape
Hunting techniques	Hunt close to vegetation Exploit richer food sources in cluttered habitat Gleaners	Less able to exploit insect abundance in cluttered habitat Aerial hawker Feed in open
Migration	Local or regional movements	Long-range migrant in some parts of range
Conclusion	<i>Myotis</i> spp. Long eared bats Horseshoe bats	Common pipistrelle Soprano pipistrelle Leisler's bat Nathusius' pipistrelle

Bat Call Analysis

19. Kaleidoscope Pro was used to undertake analysis of data collected during automated passive monitoring, although noise files were also manually checked using AnalookW in order to double check the bat classifiers were accurate. Bat activity was measured using the number of files containing a bat call or bat call sequence irrespective of length, for a complete night of recording. This method of passive monitoring enables determination of species composition, temporal activity patterns (between different times of year and different times of night) at a fixed location.
20. All detectors used during surveys are broadband detectors however, the frequencies of ultrasonic calls (from the static detectors) were divided by a factor of 8 and the data produced were then viewed as ZC (zero-crossed) files.
21. All the various software programmes used represent the recorded calls as sonograms (graphs of call frequency along the Y axis against time (duration) of the call along the X axis). All sonograms were then analysed to determine bat species. Echolocation calls are reliably distinguishable from other sounds (e.g. wind, mechanical sounds, birds or insects), but the ability to distinguish species of bats varies with taxon, location, type of equipment & quality of recording, and can be difficult. Some bats are relatively easy to speciate from viewing sonograms and very little additional analysis of the sonograms may be required. Some species, such as those within the genus *Myotis*, can be extremely difficult, if not impossible to separate into species.

¹ Information taken from Appendix 3 - Scottish Natural Heritage. (2021). Bats and Onshore Wind Turbines: Survey, Assessment and Mitigation.

22. Bat echolocation calls consist of repetitive patterns commonly referred to as pulses or calls. Here, a singularly produced sound is defined as a pulse and the consecutive repetition (sequence) of pulses is defined as a call. Calls which were difficult to identify from viewing the sonogram alone were analysed in more detail by determining the mathematical parameters of the pulses that could be defined. Any noise distorting the clear definition of a pulse was excluded from analysis. The mathematical parameters measured included:
- *Time between each pulse known as Inter Pulse Interval (IPI);*
 - *Duration of call (Dur);*
 - *Maximum frequency of call (Fmax);*
 - *Minimum frequency of call (Fmin); and,*
 - *Peak frequency of the call (Fpeak).*
23. There are inherent limitations when surveying bats using ultrasonic detectors. Ultrasound, unlike audible sound, is attenuated rapidly in air. Many echolocation calls are in the 40KHz to 60KHz region, where air attenuation is over 1dB per metre. Sound absorption increases exponentially with frequency and a bat echolocating at 30kHz is unlikely to have a range exceeding 30m, with the range decreasing to 10m at 100KHz. Some bats call louder than others, notably Leisler's bat, which calls at the lowest frequency of any Irish at <25KHz where excess attenuation is around 0.5 dB per metre. It is frequently audible at around 80m (Altringham, 2003).
24. In practice this means that bat detectors do not detect most bats calling from 30kHz and upwards at distances over 30m. Some species, such as brown long-eared bat, make very directional and quiet calls and can only easily be detected when the detector is facing the source of call (i.e. the bat) and at close range.
25. Therefore, there may be some bias in the recording of bat species, caused by variations in the detectability of different species.
26. Data from automated/static systems is limited because there is no observational context. Fifty bat passes could represent one bat passing 50 times (e.g. while foraging along a riparian corridor) or 50 bats each passing once (e.g. when commuting between a roost and a favoured foraging location). Reality is likely to be somewhere between these two extremes.
27. Therefore, the ability to estimate abundance of bats by carrying out detector surveys is limited as it requires differentiation between multiple passes of a single bat and multiple bats making single passes, and is not usually possible through echolocation monitoring. However, the results can be used to indicate relative activity of bats in different habitats based on number of bat passes over time.
28. There are also some limitations on identification of some bats to species level, particularly those of the genera *Myotis*. This is due to similarities in calls of the different species and they can be difficult to identify to species level in cases where the bat pass was; brief, distant, faint or if the bat was not seen. Due to the similarities in call parameters, species of the genera *Myotis* can often not be identified to species level using analysis of recorded bat calls.

Survey Constraints

29. Ballywater Windfarm is located within the context of a working farm therefore numerous unavoidable access constraints were encountered for varying turbines throughout the surveys such as: cattle, slurry spreading, presence of farming machinery et cetera. Such access constraints influenced to some degree the survey design, i.e. turbines which could be accessed for static detector rotation and casualty search

² John D. Altringham (2003) British Bats

schedules. Despite such constraints, the dataset collected across spring, summer and autumn 2022 is considered sound and sufficient to allow for a robust assessment to be made.

Methodology

30. Survey methodology was informed by the BCT's 2012 and 2023 Good Practice Guidelines, 2021 SNH guidance, NWPS 2022 guidance and BCI 2012 guidance.

Desk Study

Satellite Imagery with Ground-truthing

31. Habitats and features present in and around the windfarm were assessed for their likelihood to support foraging and / or commuting bats. Presence and quality of such habitats was confirmed in ground-truthing exercises completed by Blackstaff Ecology when traversing the site and its surroundings.

Subterranean Bat Sites

32. The University of Bristol Spelaeological Society (UBSS) Cave Database for the Republic of Ireland was consulted for information on caves within 10km of the windfarm site.
33. The Geological Society Ireland was also consulted, specifically the National Karst Database via QGIS, to identify any subterranean features which may be utilised by bats such as caves and enclosed depressions.

National Biodiversity Data Centre – Bat Landscape Map

34. Lundy et. al (2011) used Maximum Entropy Models to examine relative importance of bat landscape and habitat associations in Ireland. The National Biodiversity Data Centre (NBDC) map viewer features bat landscape maps tailored for each bat species present in Ireland. The landscape maps categorise areas of Ireland into a 5-point colour-coded scale ranging from highest habitat suitability index in red to lowest in green. It should be noted areas highlighted as less favourable may feature localised areas of abundance; it should also be noted that such results are based upon a modelling exercise and are not informed by bat records. The indices may yet provide insight as to favourable bat associations in the vicinity: the windfarm location was therefore reviewed with regards to the bat landscape maps for each species.

Wind Energy in the Surrounding Landscape

35. Wind Energy Ireland's (WEI) interactive map was reviewed in conjunction with accessible wind farm planning applications from Wexford County Council, in a search for wind energy developments within 10km of Ballywater Windfarm.

Field Surveys

Automated Monitoring

36. Blackstaff Ecology undertook automated monitoring at the existing windfarm for ten consecutive nights at individual recording locations during spring, summer and autumn each. Multiple recording periods were utilised in spring and summer in order to facilitate static detector rotation between turbines (for which there is not yet any standardised methodology).
37. 2021 SNH guidelines recommend for windfarms of greater than 10 turbines, 10 turbines plus then 1/3 of additional turbines should receive static monitoring effort. Ballywater Windfarm consists of 21 turbines

therefore this equates to 14 turbines to monitor each season. The design of the static detector survey was influenced to a degree by the aforementioned constraints (see Survey Constraints section). A robust and comprehensive dataset was nonetheless collected: static detectors were deployed 13 times per season (12 different turbine locations covered in spring, with T7 receiving two rounds, then 13 different turbine locations in summer and autumn each). The design of static detector rotation therefore closely followed where possible 2021 SNH guidelines. This shortfall of 2 turbine locations in spring and 1 location in summer / autumn is not considered to significantly impact survey results, particularly when considering the nature of the proposal (lifetime extension without alterations) in conjunction with mitigation recommendations (see Appendix 3).

38. A total of 4 Song Metre Mini static detectors were used for deployment each season. The detectors were programmed to record from 30 minutes prior to sunset until 30 minutes after sunrise each night, equating to one extra hour of monitoring per night. They remained in-situ at the chosen turbine for 10 nights before rotation, totalling 10 extra hours of recording per turbine in each deployment period. In order to collect bat data for a sufficient proportion of turbines each season, the detectors were rotated after each 10 day deployment period. Results tables may be viewed in Appendix 1. Turbines for which 0 bat passes were recorded on every night of the deployment period are not included in this appendix nor elsewhere in this report – these turbines are clearly specified within Section 5, Results.
39. The spring period is considered from mid-April – mid-June; summer from mid-June – mid-August; autumn from mid-August – mid-October.
40. These surveys have provided a significant volume of data on the site under investigation. The results of these surveys are considered sufficient for assessment of any potential impacts a lifetime extension could have on the local bat population.

Table 4 - Turbines which received static detector monitoring each season, with deployment periods

Deployment Period	Spring	Summer	Autumn
17.05.22 – 26.05.22	T3, T7, T19, T20		
23.05.22 – 01.06.22	T5, T8, T9, T14, T17		
30.05.22 – 08.06.22	T6, T7, T13, T18		
17.06.22 – 26.06.22		T3, T5, T7, T10, T11	
29.06.22 – 08.07.22		T8, T13, T15, T16	
10.07.22 – 19.07.22		T12, T17, T21, T23	
15.09.22 – 24.09.22			T3, T5, T6, T8, T9, T10, T13, T14, T15, T17, T19, T21, T22

Casualty Searches

41. The windfarm was subjected to bat carcass searches across spring, summer and autumn 2022. A total of 145 searches were conducted and focused on all 21 turbines. A total of 49 searches were conducted in spring, 60 searches in summer and 36 searches in autumn.
42. Searches lasted a minimum of 45minutes and a maximum of 60minutes. The monitoring of carcasses entailed the systematic search for bat casualties within a 50m x 50m grid centred on a turbine. Bat carcass searches were undertaken using a trained specialist, as detailed in the Statement of Authority section, and where possible took place the morning after optimal conditions for bats had occurred. These are defined as;
 - i. <5m/s ground wind speed,
 - ii. >10°C of temperature (1 hour after dusk),
 - iii. no rain, and
 - iv. after a warm day of similar settled conditions

43. This approach has been selected to maximise the likelihood of finding bat carcasses, which is essential in enabling predicted bat mortality to be accurately estimated. Bat carcasses would be collected (if found) to enable accurate species identification using DNA where required.
44. In order to undertake carcass searches beneath all turbines, the search schedule was varied with turbines receiving between 1 – 3 searches each season. Each turbine received at least 1 carcass search each season. Summer is recognised as being typically a higher risk period therefore the search effort was expanded in this season, with each turbine receiving a minimum of 2 searches (the majority of turbines receiving 3 searches).

Table 5 - Turbines which received casualty searches each season, with search dates

Search Date	Spring	Summer	Autumn

Results

Desk Study

Satellite Imagery with Ground-truthing

45. The windfarm is located on Cahore Marshes SPA and comprises several different habitat types. The turbines are situated within agricultural fields utilised either for cattle grazing, horse pasture or crop growth. The

marsh stretches north to south, along the east of the windfarm beyond all turbines which are contained to agricultural land; between this marsh and the Irish Sea lay several more agricultural fields (lacking turbines), areas of scrub and also sand dunes. The agricultural grassland is bordered by hedgerows, most of which are species poor, being predominantly hawthorn and / or gorse. These hedgerows provide flightlines for bats which connect the site to the surrounding landscape. They also provide some foraging opportunity, as do pockets of scrub present across the wider site. Bats were observed foraging along the marsh and scrub parallel to dunes during the separate ornithological surveys, when survey timings extended close to dusk. It is therefore evident that the windfarm site and its immediate surroundings contains habitat suitable for commuting and / or foraging bats.

Subterranean Bat Sites

46. 0 caves were returned from the BSS database for County Wexford.
47. Karst features have been recorded by the geological society Ireland for all counties excepting Wexford and Carlow, both of which have small areas of limestone bedrock. GSI states that the majority of karst landforms are found in the west of Ireland. No subterranean features including caves were returned by the accessed dataset.

National Biodiversity Data Centre – Bat Landscape Map

48. A review of the NBDC bat landscape map provided a habitat suitability index of between 0.0 (green) – 52 (red). This indicates that different areas of the site possess mixed suitability for different bat species.

Wind Energy in the Surrounding Landscape

49. WEI did not return any other windfarms within 10km of Ballywater Windfarm.

Field Surveys

Automated Monitoring

50. Levels of bat activity recorded at the turbines varied from negligible – high. On occasion no bat passes were recorded for the duration of the 10 day deployment period. Elevated levels of bat activity were recorded for Leisler's bat, Common pipistrelle and Soprano pipistrelle, species considered most at-risk from turbine associated mortality. Appendix 1 contains the static detector results tables for each turbine monitored in spring, summer and autumn.
51. Below is a breakdown of results for each covered turbine per season.

Spring

52. Six turbines (T3, T5, T7 on two deployments, T8, T13, T17) featured 0 bat passes on every night.
53. Two turbines (T14, T19) did not surpass negligible and / or low activity levels. 8/10 nights featured 0 bat passes at T14: the remaining two nights had low levels of bat activity. T19 had one night of negligible and nine nights of low bat activity.
54. Four turbines (T6, T9, T18, T20) featured elevated levels of bat activity in this season. When broken down on a per night basis:

Table 7 – Summary breakdown of spring bat activity levels

T3	T5	T6	T7
10 nights = negligible (0 bat passes)	10 nights = negligible (0 bat passes)	2 nights = low 2 nights = moderate 6 nights = high	10 nights = negligible (0 bat passes)
T8	T9	T13	T14
10 nights = negligible (0 bat passes)	3 nights = low 5 nights = moderate 2 nights = high	10 nights = negligible (0 bat passes)	8 nights = negligible 2 nights = low
T17	T18	T20	
10 nights = negligible (0 bat passes)	2 nights = negligible 4 nights = low 1 night = moderate 3 nights = high	1 night = negligible 6 nights = low 3 nights = moderate	

Summer

55. Seven turbines (T8, T10, T11, T12, T15, T21, T23) featured 0 bat passes on every night.
56. Two turbines (T5, T13) did not surpass negligible and / or low bat activity levels. Four nights at T5 featured negligible levels of bat activity, the remaining six nights had low levels. T13 featured three negligible nights and seven low nights.
57. Four turbines (T3, T7, T16, T17) featured elevated levels of bat activity in this season. When broken down on a per night basis:

Table 8 – Summary breakdown of summer bat activity levels

T3	T5	T7	T8
8 nights = negligible 1 night = low 1 night = high	4 nights = negligible 6 nights = low	4 nights = negligible 4 nights = low 2 nights = moderate	10 nights = negligible (0 bat passes)
T10	T11	T12	T13
10 nights = negligible (0 bat passes)	10 nights = negligible (0 bat passes)	10 nights = negligible (0 bat passes)	3 nights = negligible 7 nights = low

10 nights = negligible (0 bat passes)	1 night = negligible 3 nights = low 5 nights = moderate 1 night = high	8 nights = negligible 1 night = low 1 night = moderate	10 nights = negligible (0 bat passes)
T23			
10 nights = negligible (0 bat passes)			

Autumn

58. Three turbines (T8, T9, T14) recorded 0 bat passes on every night. One further turbine (T10) did not record any bat data for 5/10 nights.
59. Five turbines (T5, T6, T10, T13, T17) did not surpass negligible and / or low levels of bat activity.
60. Five turbines featured elevated levels of bat activity in this season: T3, T15, T19, T21, T22. When broken down on a per night basis:

Table 9 – Summary breakdown of spring bat activity levels

T3	T5	T6	T8
6 nights = low 3 nights = moderate 1 night = high	2 nights = negligible 8 nights = low	8 night = negligible 2 nights = low	10 nights = negligible (0 bat passes)
T9	T10	T13	T14
10 nights = negligible (0 bat passes)	8 nights = negligible 2 nights = low	9 nights = negligible 1 night = low	10 nights = negligible (0 bat passes)
T15	T17	T19	T21
3 nights = negligible 6 nights = low 1 night = moderate	8 nights = negligible 2 nights = low	3 nights = negligible 5 nights = low 2 nights = moderate	3 nights = negligible 6 nights = low 1 night = moderate
T22			
9 nights = low 1 night = moderate			

Casualty Searches

61. No bat carcasses were found.
62. One bird carcass was found (juvenile herring gull) during the bat carcass searches. This carcass was found at T14 during the spring search conducted on 12.05.22. Another bird carcass (jackdaw) was found during the bird carcass search conducted 09.01.23. Further details on bird casualty searches are presented in a separate ornithology report.

Discussion

63. The proposal of lifetime extension will not result in any loss, alteration or degradation of landscape features currently being utilised by bats to commute and/or forage; as such, displacement of individuals or populations is not anticipated. The habitats present on site will continue to remain available to bats.
64. The results from the bat casualty survey indicate that Ballywater Windfarm is not currently causing bat fatalities and its operation thus not causing any significant impact upon the local bat population in this regard. It must be acknowledged that this survey was not calibrated to take account of corpse finding difficulty, habitat visibility and removal of corpses by scavengers as is recommended by BCI for assessments of existing wind turbine development surveys - i.e., predation / searcher efficiency trials were not incorporated. In the absence of such integrated trials >100 bat casualty searches were undertaken (145 total) across spring, summer and autumn 2022. This is a significant number of searches and is considered sufficient to give confidence in the negative result. The application seeks to extend the windfarm lifetime and does not include any additional plans to alter existing turbine specifications or install additional turbines: therefore the application is not anticipated to result in any significant change to the windfarm's current level of impact upon bats.
65. The results from the 2022 static detector monitoring survey have provided a robust dataset showing the assemblage of bat species present across the windfarm. This dataset has also highlighted which areas of the site featured either elevated or insignificant levels of bat activity. 12/21 turbines featured at least one night where bat activity levels surpassed low. Contrastingly 13/21 turbines recorded 0 bat passes on every night in at least one recording period.

Table 1 – Turbines identified with elevated (Moderate or higher) levels of bat activity in each season, therefore considered most at risk of potentially causing bat casualties

Spring	Summer	Autumn
T6	T3	T3
T9	T7	T15
T18	T16	T19
T20	T17	T21
		T22

T3	T8	T8
T5	T10	T9
T7	T11	T14
T8	T12	
T13	T15	
T14	T21	
	T23	

66. Results indicate bat activity levels are varied across the site. Current guidance does not recommend each turbine receive static detector recording across all three seasons. As this did not occur, results are therefore not comparable across seasons; seasonal differences in bat activity levels will not inform mitigation.
67. Casualty search results were negative for each turbine with elevated bat activity levels. Survey results indicate that whilst bats are commuting and / or foraging across the site, the windfarm is not causing bat casualties. A lifetime extension without alteration to existing turbines / installation of new turbines is not anticipated to induce any new threats to local bat populations.
68. Due to recorded bat activity levels surpassing low, under the precautionary principle a Bat Monitoring and Mitigation Plan (BMMP) is however recommended. Further data collection is also considered desirable given the lack of existing baseline bat data prior to these 2022 surveys. The information collected as part of the static detector and bat casualty surveys will be used to inform the BMMP: such as specific turbines which should receive focused mitigation(s) and / or monitoring. Seven bat species were recorded across the site including those which are considered most at risk from turbine associated mortality. The BMMP is therefore recommended to include further bat casualty search efforts in conjunction with further static detector monitoring. Such casualty searches are initially only considered necessary for turbines with moderate or above levels of bat activity.

Conclusion

69. Bat casualty searches indicate the windfarm is not causing bat fatalities therefore curtailment is not initially considered necessary. Static detector monitoring however revealed a varied species assemblage across the site including presence of those species considered high risk from turbine associated mortality, with bat activity surpassing non-significant levels at several turbines. The 2022 data appears to be the only bat data collected for the site. Under the precautionary principle a Bat Monitoring and Mitigation Plan (BMMP) is therefore recommended in order to support the lifetime extension of this windfarm. This BMMP should be targeted and informed by the bat survey data collected in 2022 and presented in the above report.

APPENDIX 6-5

**BALLYWATER WIND FARM BAT
REPORT, 2023**

Table of Contents

1.	INTRODUCTION	1
1.1	Background	1
1.2	Bat Survey and Assessment Guidance	2
1.3	Irish Bats: Legislation, Policy and Status	3
1.4	Statement of Authority	4
2.	PROJECT DESCRIPTION	6
3.	METHODS	8
3.1	Consultation	8
3.2	Desk Study	8
3.2.1	Bat Records	8
3.2.2	Bat Species' Range	8
3.2.3	Designated Sites	8
3.2.4	Landscape Features	9
3.2.4.1	Ordnance Survey Mapping	9
3.2.4.2	Geological Survey Ireland	9
3.2.4.3	National Biodiversity Data Centre Bat Landscape Mapping	9
3.2.4.4	Additional EIAR Projects in the Wider Landscape	9
3.3	Field Surveys	10
3.3.1	Bat Habitat Suitability Appraisal	10
3.3.2	Roost Surveys	10
3.3.3	Manual Activity Surveys	11
3.3.4	Ground-level Static Surveys	12
3.3.5	Dog-led Collision Monitoring	13
3.4	Bat Call Analysis	16
3.4.1	Assessment of Bat Activity Levels	17
3.5	Assessment of Collision Risk	18
3.5.1	Population Risk	18
3.5.2	Site Risk	18
3.5.3	Overall Risk Assessment	19
3.5.4	Survey Limitations	19
4.	RESULTS	21
4.1	Consultation	21
4.1.1	Bat Conservation Ireland	21
4.1.2	Development Applications Unit - NPWS	21
4.2	Desk Study	21
4.2.1	Bat Records	21
4.2.2	Bat Species Range	23
4.2.3	Designated Sites	23
4.2.4	Landscape Features	23
4.2.5	Other EIAR Developments	24
4.3	Field Surveys	24
4.3.1	Bat Habitat Suitability Appraisal	24
4.3.2	Roost Surveys	25
4.3.2.1	Daytime Roost Inspections	25
4.3.2.2	Potential Roosting Features - Trees	30
4.3.3	Manual Activity Surveys	32
4.3.4	Ground-level Static Surveys	38
5.	DISCUSSION	47
5.1	Assessment of Bat Activity Levels	47
5.1.1	Adapted Site-specific Ranges	47
5.2	Importance of Bat Population Recorded at the Site	50

6.	RISK AND IMPACT ASSESSMENT	51
6.1	Collision Mortality	51
6.1.1	Assessment of Site-Risk.....	51
6.1.2	Assessment of Collision Risk	51
6.1.2.1	Leisler's bat	52
6.1.2.2	Soprano pipistrelle	53
6.1.2.3	Common pipistrelle	53
6.1.3	Collision Risk Summary	54
6.1.3.1	Dog-led Collision Monitoring Results	55

- Appendix 2 – Site Risk Assessment**
- Appendix 3 – Overall Site Risk Assessment**

1.

INTRODUCTION

MKO was commissioned to complete a comprehensive assessment of the potential effects on bats, as part of an application for planning permission to extend the operational period of the existing Ballywater Wind Farm. Ballywater Wind Farm is located on the coast of Co. Wexford, approximately 4km northeast of Kilmuckridge village. This report provides details of the bat surveys undertaken, including survey design, methods and results, and the assessment of potential effects of the Proposed Development on bats. Where necessary, mitigation is prescribed to minimise any identified significant effects.

Bat surveys undertaken throughout 2023 were carried out in accordance with the methodologies described in NatureScot 2021¹. Bat surveys employed a combination of methods, including desktop study, habitat and landscape assessments, roost inspections, manual activity surveys and static detector surveys at ground level. Surveys were based on the existing layout of 21 no. turbines.

Planning permission is being sought for the continued operation of 21 no. existing turbines which make up the existing Ballywater Wind Farm. The assessment and mitigation provided in this report has been designed in accordance with NatureScot 2021. Consideration was also given to the Northern Ireland Environment Agency (NIEA) Natural Environment Division (NED) Guidance², which was produced in August 2021 (amended May 2022), following the completion of the bat surveys at the Proposed Development site.

For the purposes of this EIAR:

- Where the 'Proposed Development' is referred to, this relates to all of the project components described in detail in Chapter 4 of this EIAR.
- Where 'the Site' is referred to, this relates to the primary study area for the EIAR, as delineated by the EIAR Site Boundary for the Project in green, as shown in Chapter 1, Figure 1-1. The Site encompasses an area of approximately 472 hectares.

1.1

Background

Wind energy provides a clean, sustainable alternative to fossil fuels in generating electricity. However, wind energy development can impact wildlife, directly through mortality and indirectly through disturbance and habitat loss. Bat fatalities have been reported at wind energy facilities around the world, raising concern about the cumulative impacts of such developments on bat populations (Arnett *et al.* 2016). No large-scale studies have been undertaken in Ireland to date. However, a study from the UK estimated bat fatalities at 0 – 5.25 bats per turbine per month (Mathews *et al.* 2016). While these results are not directly applicable to Ireland due to differences in bat species and behaviour, Ireland shares more similarities with bat assemblages of Great Britain, when compared to those of mainland Europe.

Investigative research in North America and mainland Europe have revealed the mechanisms for bat mortality at wind turbines. Fatalities arise from direct collision with moving turbine blades (Horn *et al.* 2008, Cryand *et al.* 2014) and barotrauma (Baer Wald *et al.* 2008), i.e., internal injuries caused by air pressure changes. Why bats fly in the vicinity of wind turbines has been attributed to several different behavioural and environmental factors, e.g. habitat associations, weather conditions and, species ecology.

¹ NatureScot published *Bats and Onshore Wind Turbines: Survey, Assessment and Mitigation*. Version: August 2021 (NatureScot, 2021).

² Northern Ireland Environment Agency Natural Environment Division (NED) published *Guidance on Bat Surveys, Assessment and Mitigation for Onshore Wind Turbine Developments in Northern Ireland* (NIEA, 2021).

Bat surveys are undertaken to gain an insight into bat activity in the presence of turbines and to predict and mitigate against any future risks identified. Survey design and analyses of results at the Site was undertaken with reference to the latest policy and legislation, scientific literature and industry guidelines. Any spatial, temporal or behavioural factors that may put bats at risk were fully considered.

1.2

Bat Survey and Assessment Guidance

Several guidelines for surveying bats at wind energy developments have been produced in Europe, the UK and Ireland.

At a European level, the Advisory Committee to the EUROBATS Agreement, to which Ireland is a signatory, have produced *Guidelines for Consideration of Bats in Wind Farm Projects* which outlines an approach for assessing the potential impacts of wind turbines on bats during planning, construction and operation phases (Rodrigues, 2015). However, these guidelines are based on continental scenarios and include more diverse species and behaviours than those typical of Ireland. As such, EUROBATS guidance may recommend a level of survey that may prove inappropriate in Irish scenarios. Nevertheless, the guidance is evidence-based and provides a useful European context, within which Member States are encouraged to produce specific national guidance, focusing on local circumstances.

Bat Conservation Ireland produced *Wind Turbine/Wind Farm Development Bat Survey Guidelines* (BCI, 2012a). This document provides advice to practitioners and decision makers in Ireland on necessary qualifications for surveyors, health and safety considerations, pre-construction and post-construction survey methodologies and information to be included in a report. In the absence of comprehensive Irish research, these guidelines provide generalised methodology rather than detailed technical advice.

The second edition of the UK Bat Conservation Trust *Bat Survey Good Practice Guidelines* (Hundt, 2012) includes a chapter (Chapter 10) on survey methodologies for assessing the potential impacts of wind turbines on bats. The document provides technical guidance for consultants carrying out impact assessments. However, the recommendations are not based on any research findings specific to the UK. A third edition to the guidelines, published in early 2016, removed the chapter on surveying wind turbine developments. This change has been maintained within the fourth edition to the guidelines, published in September 2023 (Collins, 2023). Prior to the publication of the BCT guidelines, Natural England's *Bat and Onshore Wind Turbines: Interim Guidance* provided an interpretation of the EUROBATS recommendations, as applied to onshore wind energy facilities in the UK (Natural England, 2014). In addition, the Chartered Institute of Ecology and Environmental Management (CIEEM) publishes advice on best practice as well as updates on the current state of knowledge in the *Technical Guidance Series* and in the quarterly publication *In Practice*.

In August 2021, NatureScot (formerly Scottish Natural Heritage), published *Bats and Onshore Wind Turbines: Survey, Assessment and Mitigation* (NatureScot, 2021). The 2021 version supersedes the 2019 version of the guidance. The purpose of the guidance is to help planners, developers and ecological consultants to consider the potential effects of onshore wind energy developments on bats. The emphasis is on direct impacts such as collision mortality, but there is reference throughout to the need for a full impact assessment requiring wider consideration of other (indirect) effects. The Guidance replaces previous guidance on the subject; notably that published by Natural England and Chapter 10 of the Bat Conservation Trust publication, *Bat Surveys: Good Practice Guidelines (2nd edition)*, (Hundt, 2012) and tailors the generic EUROBATS guidance on assessing the impact of wind turbines on European bats (Rodrigues *et al.* (2014)). The document guides the user through the key elements of survey, impact assessment and mitigation.

The NIEA (NED) recently published *Guidance on Bat Surveys, Assessment and Mitigation for Onshore Wind Turbine Developments in Northern Ireland*. This new guidance follows and builds upon the recently updated NatureScot 2021 guidance. The latter guidance has set the industry standard

since its publication in 2019. The NED guidance does not aim to replace the NatureScot guidance, but it does provide additional clarifications and recommendations regarding survey requirements and impact assessment in an Irish context.

The survey scope, assessment and mitigation provided in this report are in accordance with NatureScot 2021 Guidance.

1.3

Irish Bats: Legislation, Policy and Status

Ireland has nine resident bat species, comprising more than half of Ireland's native terrestrial mammals (Montgomery *et al.*, 2014).

All Irish bats are protected under European legislation, namely the Habitats Directive (92/43/EEC) (as amended). All Irish species are listed under Annex IV of the Directive, requiring strict protection for individuals, their breeding sites and resting places. The lesser horseshoe bat (*Rhinolophus hipposideros*) is further listed under Annex II of the Directive, requiring the designation of conservation areas for the species. Under this Directive, Ireland is obliged to maintain the favourable conservation status of Annex-listed species. This Directive has been transposed into Irish law through the European Communities (Birds and Natural Habitats) Regulations 2011 (S.I. No. 477/2011, as amended).

In addition, Irish species are further protected by national legislation (Wildlife Acts 1976, as amended). Under this legislation, it is an offence to intentionally disturb, injure or kill a bat, or disturb its roost. Any work at a roost site must be carried out with the agreement of the National Parks and Wildlife Service (NPWS).

The NPWS monitors the conservation status of European protected habitats and species and reports their findings to the European Commission every 6 years in the form of an Article 17 Report. The most recent report for the Republic of Ireland was submitted in 2019. Table 1-1 summarises the current conservation status of Irish bat species and identified threats to Irish bat populations.

Table 1-1 Irish Bat Species Conservation Status and Threats (NPWS, 2019)

Bat Species	Conservation Status	Principal Threats
Common pipistrelle <i>Pipistrellus pipistrellus</i>	Favourable	A05 Removal of small landscape features for agricultural land parcel consolidation (M)
Soprano pipistrelle <i>Pipistrellus pygmaeus</i>	Favourable	A14 Livestock farming (without grazing) [impact of anti-helminthic dosing on dung fauna] (M)
Nathusius' pipistrelle <i>Pipistrellus nathusii</i>	Unknown	B09 Clear-cutting, removal of all trees (M)
Leisler's bat <i>Nyctalus leisleri</i>	Favourable	F01 Conversion from other land uses to housing, settlement or recreational areas (M)
Daubenton's bat <i>Myotis daubentonii</i>	Favourable	F02 Construction or modification (e.g. of housing and settlements) in existing urban or recreational areas (M)
Natterer's bat <i>Myotis nattereri</i>	Favourable	F24 Residential or recreational activities and structures generating noise, light, heat or other forms of pollution (M)
Whiskered bat <i>Myotis mystacinus</i>	Favourable	H08 Other human intrusions and disturbance not mentioned above (Dumping, accidental and deliberate disturbance of bat roosts (e.g. caving) (M)
Brown long-eared bat <i>Plecotus auritus</i>	Favourable	L06 Interspecific relations (competition, predation, parasitism, pathogens) (M)
Lesser horseshoe bat <i>Rhinolophus hipposideros</i>	Inadequate	M08 Flooding (natural processes) D01 Wind, wave and tidal power, including infrastructure (M) L06 Interspecific relations (competition, predation, parasitism, pathogens) (M) M08 Flooding (natural processes) D01 Wind, wave and tidal power, including infrastructure (M)

Statement of Authority

MKO employs a dedicated bat unit who specialise in bat survey techniques and impact assessments. MKO ecologists have relevant academic qualifications and are qualified in undertaking surveys to the levels required. The Ecology team holds current relevant bat derogation licence(s) from NPWS. The licences are intended for professionals carrying out surveys with the potential to disturb roosting bats (i.e. roost inspections). Graduate and seasonal ecologist staff are included under the conditional licence where they are accompanied by more experienced colleagues.

Scope development and project management was overseen by Aoife Joyce (BSc., MSc.) and John Hynes (BSc., MSc., MCIEEM).

Bat surveys were conducted by MKO ecologists Nathan Finn (B.Sc., M.Sc.), Laura McEntegart (B.Sc.), Neil Campbell (B.Sc., M.Sc.), David Culleton (B.Sc., M.Sc.), Laura Gránicz (B.Sc., M.Sc.), and Kate Greaney (B.Sc., M.Sc.). Data analysis was undertaken, and results were compiled by Nathan Finn. Impact assessment, the design of mitigation and final reporting was completed by Nathan Finn and Laura McEntegart, under the supervision of Sara Fissolo (B.Sc.), Aoife Joyce and John Hynes, who reviewed and approved the final document.

Laura McEntegart has over 3 years' experience in ecological assessment specialising in bat ecology and has completed training courses with Bat Mitigation and Enhancement (CIEEM), and Kaleidoscope Pro Analysis. Sara has over 4 years' experience in undertaking bat surveys and impact assessments and has completed courses in Bat Impacts and Mitigation (CIEEM) and Kaleidoscope Pro Analysis. Aoife has 5 years' experience in ecological assessments and has completed CIEEM and BCI courses in Bat Impacts and Mitigation, Bat Tree Roost Identification and Endoscope training, Bat ID, Trapping and Handling and Kaleidoscope Pro Analysis. John is a full member of the Chartered Institute of Ecology and Environmental Management (CIEEM) and has over 10 years' professional ecological consultancy experience. He is also a former member of the Bat Conservation Ireland management council. Staff's roles and relevant training are presented in Table 1-2 below.

Table 1-2 Project team qualifications and training

Staff	Role	Training
John Hynes (B.Sc., M.Sc., MCIEEM)	Ecology Director	BSc. Environmental Science, University of Galway, Ireland. MSc. Applied Ecology, University College Cork, Ireland. Advanced Bat Survey Techniques – Trapping, biometrics, handling (BCI).
Aoife Joyce (B.Sc., M.Sc.)	Project Director	BSc. (Hons) Environmental Science, University of Galway, Ireland. MSc. (Hons) Agribioscience, University of Galway, Ireland. Advanced Bat Survey Techniques – Trapping, biometrics, handling (BCI), Bat Impacts and Mitigation (CIEEM), Bat Tree Roost Identification and Endoscope Training (BCI), Bats in Heritage Structures (BCI), Bats and Lighting (BCI), Kaleidoscope Pro Analysis (Wildlife Acoustics).
Sara Fissolo (B.Sc.)	Project Ecologist	BSc. (Hons) Ecology and Environmental Biology, University College Cork, Ireland. Advanced Bat Survey Techniques (BCI), Bat Impacts and Mitigation (CIEEM), Bats in Heritage Structures (BCI), Bat Care (BCT), Bats and Lighting (BCI), Kaleidoscope Pro Analysis (Wildlife Acoustics).
Laura McEntegart (B.Sc.)	Bat Ecologist	BSc. (Hons) Botany and Plant Science, National University of Ireland, Galway.

		Bat Handling Training Course (BCI), Bats: Assessing the Impact of Development on Bats, Mitigation & Enhancement – (CIEEM), Kaleidoscope Pro Analysis (Wildlife Acoustics), Endoscope Training (Internal), Emergence and Re-Entry Surveys (Internal) Structure & Tree Inspection (Internal), Manual Transect Survey (Internal), Bat Habitat Appraisal (Internal)

2.

PROJECT DESCRIPTION

The existing Ballywater Wind Farm is located on the coast of Co. Wexford, approximately 4km northeast Kilmuckridge village (IG Ref.: T 19698 44430). There are two main site entrances. The southern part of the site is accessed via the entrance located on the R742 regional road to the west of the Site. Access to the northern section of the site is via the Cahore Local Road which runs along the northern side of the site boundary.

Land use within the Site comprises a mix of improved agricultural grassland (GA1) and arable crops (BC1), with marshes and sand dunes along the eastern boundary of the site. The land use within the surrounding areas is predominantly agricultural grasslands and crops, and one-off rural housing. A location map of the site is provided in Figure 2-1.

The Proposed Development does not comprise any alterations or modifications to the existing operational wind farm. The Proposed Development encompasses the continued operation of the wind farm, which comprises:

- i. 21 no. existing Enercon E70 wind turbines with a maximum overall blade tip height of 99 metres (m), including hardstands;
- ii. Existing 1 no. onsite 110 kilovolt (kV) electrical substation which includes 1 no. control building, security fencing, external lighting, underground cabling, and all associated infrastructure and associated electrical plant and apparatus;
- iii. All existing associated electrical and communications cabling connecting the turbines to the onsite Ballywater 110kV Substation;
- iv. Existing gated site entrances from the R742 and an unnamed local road;
- v. Existing internal access tracks; and,
- vi. All existing ancillary infrastructure.

All elements of the Proposed Development are pre-existing and it is not proposed to make any alterations to the current site layout, wind turbines or associated infrastructure as part of this application.

The full description of the Wind Farm is provided in Chapter 4 of this EIAR. Further details on the planning history of the site are presented in Chapter 2: Background to the Proposed Development, of this EIAR.

3. METHODS

3.1 Consultation

A scoping exercise was undertaken as part of the EIAR for the Proposed Development. A Scoping Document, providing details of the application site and the Proposed Development, was prepared by MKO and circulated to consultees in September 2023. As part of this exercise, prominent Irish conservation groups were contacted, and Bat Conservation Ireland (BCI) were specifically invited to comment on the potential of the Proposed Development to affect bats.

3.2 Desk Study

A desk study of published material was undertaken prior to conducting field surveys. The aim was to provide context to the site in order to assist bat survey planning and assessment. This included the identification of designated sites, species of interest or any other potential risk factors within the Site and the surrounding region. The results of the desk study including sources of information utilised are provided below.

3.2.1 Bat Records

The National Bat Database of Ireland holds records of bat observations received and maintained by BCI. These records include results of national monitoring schemes, roost records as well as ad-hoc observations. A search of the National Bat Database of Ireland was last carried out on the 4th June 2024 and examined bat presence and roost records within a 10 km radius of the EIAR Study Area (IG Reference: T 19426 44401) (BCI 2012, Hundt 2012, NatureScot 2021). Available bat records were provided by Bat Conservation Ireland on 4th July 2024. Results from the National Biodiversity Data Centre were also reviewed for bat species present within the relevant 10km grid squares of the Site (Grid squares T14 and T24).

3.2.2 Bat Species' Range

EU member states are obliged to monitor the conservation status of natural habitats and species listed in the Annexes of the Habitats Directive. Under Article 17, they are required to report to the European Commission every six years. In April 2019, Ireland submitted the third assessment of conservation status for Annex-listed habitats and species, including all species of bats (NPWS, 2019).

The 2019 Article 17 Reports were reviewed for information on bat species' range and distribution in relation to the location of the Site. The aim was to identify any high-risk species at the edge of their range (NatureScot, 2021).

3.2.3 Designated Sites

The National Parks and Wildlife Service (NPWS) map viewer and website provides information on rare and protected species, sites designated for nature conservation and their conservation objectives. A search was undertaken of sites designated for the conservation of bats within a 10km radius of the EIAR Site Boundary (BCI 2012, Hundt, 2012, NatureScot 2021). This included European designated sites, i.e. SACs, and nationally designated sites, i.e. NHAs and pNHAs.

3.2.4 Landscape Features

3.2.4.1 Ordnance Survey Mapping

Ordnance survey maps (OSI 1:5,000 and 1:50,000) and aerial photographs were reviewed to identify any habitats and features likely to be used by bats. Maps and images of the EIAR Site Boundary and general landscape were examined for suitable foraging or commuting habitats including woodlands and forestry, hedgerows, treelines and watercourses. In addition, any potential roost sites, such as buildings and bridges, were noted for further investigation.

3.2.4.2 Geological Survey Ireland

The Geological Survey Ireland (GSI) online mapping tool and University of Bristol Speleological Society (UBSS) Cave Database for the Republic of Ireland was consulted for any indication of natural subterranean bat sites, such as caves, within 10km of the Site (BCI, 2012) (last searched on the 9th February 2024). Furthermore, the archaeological database of national monuments was reviewed for any evidence of manmade underground structures, e.g. souterrains, that may be used by bats (last searched on the 9th February 2024).

3.2.4.3 National Biodiversity Data Centre Bat Landscape Mapping

The National Biodiversity Data Centre (NBDC) map viewer presents “Bat Landscape” maps for individual species and for all species combined. Lundy *et al.* (2011) used Maximum Entropy Models to examine the relative importance of bat landscape and habitat associations in Ireland. The resulting map provides a 5-point scale, ranging from highest habitat suitability index (presented in red) to lowest suitability index (presented in green). However, squares highlighted as less favourable may still have local areas of abundance.

The location of the Site was reviewed in relation to bat habitat suitability indices. The aim of this was to assess habitat suitability for all bat species within the EIAR Site Boundary. It is worth noting that these results are based on a modelling exercise and not confirmed bat species records. Regardless, they may provide a useful indication of potential favourable bat associations within the Site.

3.2.4.4 Additional EIAR Projects in the Wider Landscape

A search for proposed, existing and permitted wind energy developments within 10 km of the Proposed Development was undertaken (NatureScot, 2021) in conjunction with reviewing the Wind Energy Ireland interactive wind farm map (windenergyireland.com). Other large infrastructure developments and proposals (e.g. roads) were also noted. Information on the location and scale of these developments was gathered to inform the potential for cumulative effects. Further details on infrastructure developments within the vicinity of the Site can be found in Chapter 2 of the main EIAR.

3.3 Field Surveys

3.3.1 Bat Habitat Suitability Appraisal

Bat walkover surveys were carried out throughout 2023. During these surveys, habitats within the EIAR Site Boundary were assessed for their suitability to support roosting, foraging and commuting bats. Connectivity with the wider landscape was considered. Suitability was assessed according to Collins (2016) which provides a grading protocol for roosting habitats and for commuting and foraging areas. Suitability categories, divided into *High*, *Moderate*, *Low* and *Negligible*, are described fully in **Appendix 1**.

3.3.2 Roost Surveys

Daytime Roost Inspections

A search for roosts was undertaken within 200m plus the rotor radius (i.e. 235m) of the existing turbines (NatureScot, 2021). The aim of these searches was to determine the presence of Potential Roost Features (PRFs) for bats and the need for further survey work or mitigation. The site was visited in Spring, Summer and Autumn 2023. Walkover surveys were carried out in combination with deployment and collection of static detectors, and all structures identified within the search area were assessed for their potential to support roosting bats (see **Appendix 1** for criteria in assessing roosting habitats). This comprised a detailed inspection of the interior, if accessible, and exterior to look for evidence of bat use, including live and dead specimens, droppings, feeding remains, urine splashes, fur oil staining and noises.

Nine structures, and their associated outbuildings, were identified as potential roost features within the Site. These were subject to a roost assessment which comprised a detailed inspection of the interiors and exteriors to look for evidence of bat use, including live and dead specimens, droppings, feeding remains, urine splashes, fur oil staining and noises. Details of these PRFs are shown in Table 3-1.

Table 3-1 Potential Roost Features Identified within the Site.

Structure	IG Reference	Nearest Turbine	Approximate Distance to Nearest Turbine
A) Dairy shed	T 19601 44476	T12	40 m
B) Storage shed	T 19621 44391	T12 and T13	130 m
C) Storage shed	T 19690 44396	T12	65 m
D) Storage shed	T 19608 44512	T12	105 m
E) Derelict farmhouse	T 19536 44411	T8	70 m
F) Red brick ruin	T 18230 44113	T3	775 m
G) Stables	T 20505 46096	T21	330 m
H) Hay shed	T 20522 46051	T21	310 m
I) Horse walker	T 20509 46053	T21	315 m

Any potential tree roosts were examined for the presence of rot holes, hazard beams, cracks and splits, partially detached bark, knot holes, gaps between overlapping branches and any other PRFs identified by Andrews (2018).

3.3.3 Manual Activity Surveys

Manual activity surveys were undertaken in Spring, Summer and Autumn 2023 and included driven transects and emergence surveys at identified PRFs, in accordance with best practice guidance. Surveyors were equipped with active full spectrum bat detectors, the Batlogger M bat detector (Elekon AG, Lucerne, Switzerland) and all bat activity was recorded for subsequent analysis to confirm species identifications.

Individual bats of the same species cannot be identified using this method: the number of bat passes recorded is used as a measure of activity within the area, although it might not reflect the number of individual bats present, as the same bat can be recorded multiple times.

All surveys were carried out during weather conditions suitable for bat surveying and were within the suitable survey period for bat activity surveys. Details of the surveys are presented in Table 3-2 and described below.

Table 3-2 2023 Survey Effort – Manual Surveys

Date	Surveyors	Survey Type	Sunset	Start-End	Weather	Transect (km)
3 rd May 2023	Neil Campbell, David Culleton	Dusk Emergence Transect	20:55	20:35 – 23:46	13 - 16 °C; dry; light breeze	4
13 th June 2023	Laura McEntegart, Nathan Finn	Dusk Emergence and Transect	21:48	21:18 – 00:38	20 - 21 °C; dry; calm – moderate breeze	7
6 th September 2023	Laura McEntegart, Nathan Finn	Dusk Transect	20:02	19:45 – 22:53	15-17 °C; dry; calm	10.9
Total Survey Effort						21.9

Dusk Emergence Surveys

Structures with PRFs were assessed for their suitability for carrying out an emergence. Eight structures with PRFs were identified within the site, and another structure with a PRF was identified within 260 metres of the site boundary. Seven of these structures presented *Negligible* roosting suitability, while another presented *Low* roosting suitability, thus, these eight structures were not subject to dusk emergence surveys. One building, assigned *High* roosting suitability was subject to two dusk emergence surveys, undertaken on 3rd May 2023 and 13th June 2023. Emergence surveys commenced 20 and 30 minutes before sunset and concluded approximately 1.5 hours after sunset.

Surveys carried out in May and June can detect maternity colonies, and male/non-breeding female summer roosts. Day, night, feeding and satellite roosts can also be found during these months (Collins, 2016).

Manual Transect Surveys

Manual transect surveys were undertaken on the evenings of 3rd May 2023, 13th June 2023 and 6th September 2023. Transects were driven by two surveyors, recording bats in real time. Two of the three transect surveys followed dusk emergence surveys. Manual transect surveys were completed within 3 hours after sunset.

Surveyors were equipped with active full spectrum bat detectors, the Batlogger M bat detector (Elekon AG, Lucerne, Switzerland), and all bat activity was recorded for subsequent analysis to confirm species identifications. The driven transect(s) followed the methodology described by Roche *et al.* (2012) and was conducted along the roads inside the site.

The aim of these surveys was to identify the bat species using the site and gather any information on bat behaviour and important features used by bats. Transect routes were prepared with reference to the proposed layout, desktop, and walkover survey results as well as any health and safety considerations and access limitations. As such, transect routes followed existing roads and tracks. Survey effort is outlined in Table 3-2 above and transect routes are presented in Figure 3-1 below.

3.3.4 Ground-level Static Surveys

Where developments have more than 10 turbines, NatureScot (2021) requires one detector per turbine up to 10, plus one detector for every three additional turbines. The scope of bat work was designed considering a 21-turbine Proposed Development layout. Given that 21 turbines are present on site, 13 static bat detectors were deployed to ensure compliance with NatureScot guidance. Detectors were deployed in the proximity of each existing turbine base.

Automated bat detectors were deployed at 13 no. locations for at least 10 nights of suitable weather in Spring (April - May), at least 20 nights of suitable weather in Summer (June - July), and at least 10 nights of suitable weather in Autumn (September). Upon collecting D06 in Spring we realised the detector had stopped recording so we redeployed the detector. Upon arriving to collect the detectors in September, D02 was discovered lying open, and only had two nights of data recorded, so this detector was redeployed for another 14 nights to give it at least 10 nights of suitable weather. Static detector locations are described in Table 3-3 and presented in Figure 3-2.

Table 3-3 Ground-level Static Detector Locations

ID	Location	Habitat	Linear Feature within 50 m	Corresponding Turbine
D01	T 20990 45694	Hedgerow surrounded by improved agricultural grassland.	Fence. Scattered bushes approx. 50m to the north.	T22
D02	T 20784 45292	Earthbank surrounded by improved agricultural grassland.	Hedgerow just under 50m away. Fence.	T24
D03	T 19775 43731	Earthbank near improved agricultural grassland.	Fence.	T18
D04	T 20293 43588	Earthbank surrounded by improved agricultural grassland.	Fence.	T20
D05	T 19636 43948	Earthbank near arable crops and improved agricultural grassland.	Thick treeline approximately 50m away. Fence.	T14
D06	T 20063 44271	Improved agricultural grassland.	Small woodland approx. 40m to NE. Fence.	T16
D07	T 19896 44803	Earthbank near arable crops and improved agricultural grassland.	Treeline approximately 50m away.	T11
D08	T 19367 44729	Earthbank near improved agricultural grassland	Two long hedgerows. Fence.	T7
D09	T 19740 44498	Earthbank surrounded by buildings and artificial surfaces near improved agricultural grassland and arable crops.	Long building (dairy farm). Short hedgerow.	T12
D10	T 19476 44466	Earthbank surrounded by improved agricultural grassland.	Very short hedegrow. Long building (dairy farm) approx. 50m away. Fence.	T8
D11	T 19391 44062	Earthbank near arable crops and improved agricultural grassland.	Two long hedgerows, one thick and one smaller.	T9

ID	Location	Habitat	Linear Feature within 50 m	Corresponding Turbine
D12	T 18995 44366	Earthbank near buildings and artificial surfaces, arable crops and improved agricultural grassland.	Fence.	T3
D13	T 19836 44201	Earthbank surrounded by improved agricultural grassland.	Fence and long hedgerow.	T17

Full spectrum bat detectors, Song Meter SM4BAT (Wildlife Acoustics, Maynard, MA, USA), were employed using settings recommended for bats, with minor adjustments in gain settings and band pass filters to reduce background noise when recording. Detectors were set to record from 30 minutes before sunset until 30 minutes after sunrise. The Song Meter automatically adjusts sunset and sunrise times using the Solar Calculation Method when provided with GPS coordinates.

Onsite weather monitoring was undertaken concurrently with static detector deployments. One Vantage Pro 2 (Davis Instruments, CA, UCS) was deployed each season and night-time hourly data was tracked remotely to ensure a sufficient number of nights (i.e. minimum 10 no. for Spring and Autumn, and 20 no. for Summer) with appropriate weather conditions were captured (i.e. dusk temperatures above 8°C, wind speeds less than 5 m/s and no or only very light rainfall). Table 3-4 summarises survey effort achieved for each of the detector locations in 2023.

Table 3-4 2023 Survey Effort - Ground-level Static Surveys

Season	Survey Period	Total Survey Nights per detector location	Nights with Appropriate Weather
Spring	13 th April – 3 rd May 2023	20	10
Spring Redeployment (just D06)	3 rd May – 24 th May	22	19 (+6 nights in original deployment)
Summer	13 th June – 11 th July 2023	28	20
Autumn	6 th September – 19 th September 2023	13	12
Autumn Redeployment (just D02)	19 th September – 3 rd October 2023	14	9 (+2 from original deployment)
Total Survey Effort		97	78

3.3.5 Dog-led Collision Monitoring

Dog-led collision monitoring surveys were also carried out from October 2023 to September 2024. These surveys use conservation detection dogs to locate bird and bat carcasses on the Site. More details of these surveys can be found in Appendix 6-7, Carcass Search Report.

Bat Call Analysis

All recordings were later analysed using bat call analysis software Kaleidoscope Pro v.5.4.8 (Wildlife Acoustics, MA, USA). The aim of this was to identify, to a species or genus level, what bats were present at the Site. Bat species were identified using established call parameters, to create site-specific custom classifiers. All identified calls were also manually verified. Where recordings' parameters matched certain criteria (echolocation pulses > 10; match ratio > 0.95; auto ID = PIPPIP or PIPPYG), a bulk ID was applied to manually match the software's auto ID.

Echolocation signal characteristics (including signal shape, peak frequency of maximum energy, signal slope, pulse duration, start frequency, end frequency, pulse bandwidth, inter-pulse interval and power spectra) were compared to published signal characteristics for local bat species (Russ, 1999). *Myotis* species (potentially Daubenton's bat (*M. daubentonii*), Whiskered bat (*M. mystacinus*), Natterer's bat (*M. nattereri*)) were considered as a single group, due to the difficulty in distinguishing them based on echolocation parameters alone (Russ, 1999). The echolocation of Soprano pipistrelle (*P. pygmaeus*) and Common pipistrelle (*P. pipistrellus*) are distinguished by having distinct (peak frequency of maximum energy in search flight) peak frequencies of ~55 kHz and ~46 kHz respectively (Jones & van Parijs, 1993). Some overlapping is possible between these species.

Individual bats of the same species cannot be distinguished by their echolocation alone. Thus, 'bat passes' was used as a measure of activity (Collins, 2023). A bat pass was defined as a recording of an individual species/species group's echolocation containing at least two echolocation pulses and of maximum 15s duration. All bat passes recorded in the course of this study follow these criteria, allowing comparison. Due to the volume of bat activity data recorded, where multiple bat passes were recorded within the same registration, rarer or harder to record species were identified. Underreporting of common species is possible using this method and is accounted for within the assessment.

Echolocation calls by brown long-eared bats (*Plecotus auritus*) are intrinsically quiet and hard to record by static equipment. All data collected (besides the calls which a bulk ID was applied to as mentioned previously), including 'Noise' files and 'No ID' files are checked to ensure all calls for this species have been captured. However, a level of underrepresentation is expected for this species and is accounted for in the assessment of activity levels.

Plate 3-1 Sonogram of Echolocation Pulses of Common pipistrelle (Peak Frequency 45kHz)

3.4.1

Assessment of Bat Activity Levels

The online database tool Ecobat (mammal.org.uk) is recommended by NatureScot 2021 to assess bat activity levels within a proposed wind-farm site. This web-based interface, launched in August 2016, allows users to upload activity data and to contrast results with a comparable reference range, allowing objective interpretation. Uploaded data then contributes to the overall dataset to provide increasingly robust outputs. Ecobat generates a percentile rank for each night of activity and provides a numerical way of interpreting levels of bat activity in order to provide objective and consistent assessments. Table 3-5 defines bat activity levels as they relate to Ecobat percentile values (NatureScot, 2021).

Table 3-5 Ecobat Percentile Score and Categorised Level of Activity (NatureScot, 2021).

Ecobat Percentile	Bat Activity Level
81 to 100	High
61 to 80	Moderate to High
41 to 60	Moderate
21 to 40	Low to Moderate
0 to 20	Low

Ecobat was unavailable for a cross-site analysis of 2023 data as the platform has been undergoing maintenance since late 2022 with no proposed timeline of a relaunch. Therefore, data was assessed on a site-specific basis.

Following preliminary analysis and manual verification using Kaleidoscope Pro, statistical analysis and visualisation was performed using RStudio (version 2023.12.1+402.) and R (version 4.3.3). RStudio, an integrated development environment for the R programming language³, was employed for data cleaning, exploration, and data visualisation. The 'ggplot2' R package was particularly instrumental in creating the data visualisations shown in the results section. Data was standardised into bat pass rates, calculated as bat passes per hour (total bat passes / night length) to account for seasonal changes in night length (Matthews et al. 2016). Activity is often variable between survey nights. Therefore, the median Nightly Pass Rate was used as the most appropriate measure of bat activity (Lintott & Mathews, 2018). During all calculations, data was rounded to at least three decimal places. When visualising the bat pass rates per season, survey effort was defined as detector hours (sum of recorded hours across all detectors). This was defined to circumvent any issues arising from differences in survey effort between detectors in a season.

The methodology used to assess activity levels across the Site was adapted from Mathews *et al.* (2016), where activity ranges of pipistrelle species were defined using an average of maximum nightly pass rates (in total passes during the survey period) across all detectors, divided into tertiles. In this methodology section, widespread species (*Pipistrellus pipistrellus*, *Pipistrellus pygmaeus*, *Nyctalus leisleri*) activity ranges were determined using an average of maximum nightly pass rates (total passes / survey effort) across all detectors, divided into quartiles. For all other species groups, maximum nightly pass rate (bp/h) recorded across all detectors, divided into quartiles was used.

Activity levels were assessed separately for widespread pipistrelle species (*Pipistrellus pipistrellus*, *Pipistrellus pygmaeus*), noctules (*Nyctalus leisleri*), *Myotis* spp. and rare or hard to record species (*Plecotus auritus*, *Pipistrellus nathusii*). Median and maximum nightly activity (bp/h) at each detector location were then categorized as Low, Medium, or High for each recorded season. Any figure below 25% of the maximum/average maximum nightly pass rate was considered Low activity, while figures above 75% were classified as High. Values falling between these two quartiles were defined as Medium. To prevent skewing the activity threshold, any evident outliers recorded across the detectors were excluded.

³ R Core Team (2024). R: A Language and Environment for Statistical Computing. R Foundation for Statistical Computing, Vienna, Austria. <<https://www.R-project.org/>>.

The site-specific categories identified were deemed appropriate for the assessment, based on activity levels recorded by MKO at similar sites. Table 3-6 presents activity ranges per species group identified.

Table 3-6 Site-specific Activity Level Categories based on Maximum Bat Passes per Hour (bp/h).

Assessment Level	Activity Threshold as Bat Passes per Hour (bp/h) for Bat Species				
	<i>Pipistrellus</i> spp.	<i>Nyctalus leisleri</i>	<i>Myotis</i> spp.	<i>Pipistrellus nathusii</i>	<i>Plecotus auritus</i>
Low	< 5.5	< 3.5	< 0.9	< 0.5	< 0.4
Medium	5.5 – 16.5	3.5 – 10.4	0.9 – 2.7	0.5 – 1.4	0.4 – 1.2
High	16.5 <	10.4 <	2.7 <	1.4 <	> 1.2

3.5 Assessment of Collision Risk

3.5.1 Population Risk

NatureScot (2021) provides a generic assessment of bat collision risk for UK species, based on species behaviour and flight characteristics. In the guidelines, this measure of collision risk is used, in combination with relative abundance, to indicate the potential vulnerability of British bat populations. No such assessment is provided for Irish bat populations.

In Plate 3-2, an adapted assessment of vulnerability for Irish bat populations to collision with wind turbine blades is provided. This adaptation of NatureScot Guidance Table 2 was based on collision risk and species abundance of Irish bat populations. Species' collision risk follows those described in NatureScot (2021). Relative abundance for Irish species was determined in accordance with Wray *et al.* (2010) using population data available in the 2019 Article 17 reports (NPWS, 2019). Feeding and commuting behaviours, and habitat preferences for bat species in Ireland were also considered.

Relative Abundance	Low Collision Risk	Medium Collision Risk	High Collision Risk
Common species			Common pipistrelle Soprano pipistrelle
Rarer species	Daubenton's bat Brown long-eared bat Lesser horseshoe bat		Lesser long-eared bat
Rarest species	Natterer's bat Whiskered bat		Nyctalus noctule
	Low Population Vulnerability	Medium Population Vulnerability	High Population Vulnerability

Plate 3-2 Population Vulnerability of Irish Bat Species (Adapted from NatureScot, 2021)

3.5.2 Site Risk

The likely impact of a proposed development on bats is related to site-based risk factors, including habitat and development features. The cross-tabulation result of habitat risk and project size determines the site risk (i.e. Low, Medium or High) (Plate 3-3) i.e. Table 3a (NatureScot, 2021). Table 5-1 in the

results section describes the criteria and site-specific characteristics used to determine an indicative risk level for the Site. All site assessment levels, as per NatureScot (2021) are presented in **Appendix 2**.

		Project Size		
		Small	Medium	Large
Habitat Risk	Low	1	2	3
	Moderate	2	3	4
	High	3	4	5
		Low/Lowest Site Risk (1-2)	Medium Site Risk (3)	High/Highest Site Risk (4-5)

Plate 3-3 Site-risk Level Assessment Matrix (Table 3a, NatureScot, 2021)

3.5.3 Overall Risk Assessment

An overall assessment of risk was made by combining the site risk level (i.e. Low/Medium/High) and the population risk (i.e. Site-specific bat activity outputs), as shown in the overall risk assessment matrix table (Plate 3-4) i.e. Table 3b (NatureScot, 2021). The assessment was carried out for both median and maximum activity categories in order to provide insight into typical bat activity (i.e. median values) and activity peaks (i.e. maximum values).

Site Risk Level	Ecobat Activity Category					
	Nil (0)	Low (1)	Low-Moderate (2)	Moderate (3)	Moderate-High (4)	High (5)
Lowest (1)	0	1	2	3	4	5
Low (2)	0	2	4	6	8	10
Medium (3)	0	3	6	9	12	15
High (4)	0	4	8	12	16	20
Highest (5)	0	5	10	15	20	25
		Low Overall Risk (0-4)	Medium Overall Risk (5-12)	High Overall Risk (13-25)		

Plate 3-4 Overall Risk Assessment Matrix (Table 3b, NatureScot, 2021)

This exercise was carried out for each high collision risk species. Plate 3-2 above outlines high collision risk species. Overall risk assessments were also considered in the context of any potential impacts at the population level, particularly for species identified as having high population vulnerability (Plate 3-2).

3.5.4 Survey Limitations

A comprehensive suite of bat surveys has been undertaken at the Site in 2023. The surveys undertaken in 2023, in accordance with SNH Guidance, provide the information necessary to allow a complete, comprehensive and robust assessment of the potential impacts of the Proposed Development on bats receptors.

The information provided in this report accurately and comprehensively describes the baseline environment; provides an accurate prediction of the likely effects of the Proposed Development; prescribes mitigation as necessary; and describes the predicted residual impacts. The specialist studies, analysis and reporting have been undertaken in accordance with the appropriate guidelines.

A potential limitation included a technical fault with the onsite weather station; however, weather data was reviewed from a nearby station approximately 26.5 km away for Spring and again for a section of the Autumn deployment. Weather data for the Spring and Autumn redeployments were taken from the Visual Crossing website and continuously reviewed on Met Eireann and yr.no to ensure a sufficient number of nights with appropriate weather.

No limitations in the scope, scale or context of the assessment have been identified. Overall, a comprehensive assessment has been achieved.

4. RESULTS

4.1 Consultation

4.1.1 Bat Conservation Ireland

No response has been received from Bat Conservation Ireland as of 11th October 2024.

4.1.2 Development Applications Unit - NPWS

A detailed scoping exercise was undertaken for the Proposed Development. The Development Applications Unit were invited to provide any feedback, comments or suggestions they might have relating to the Proposed Development. A response was received from the Department of Housing, Local Government and Heritage on 11th March 2024, in which they stated that they were not in a position to make specific comments on this particular development at this time. The full details of the scoping and consultation exercise are described in the main EIAR.

4.2 Desk Study

4.2.1 Bat Records

Bat Conservation Ireland

The National Bat Database of Ireland was searched for records of bat activity and roosts within a 10km radius of the proposed site (IG Ref: T 19426 44401). Available bat records were provided by Bat Conservation Ireland on 4th June 2024. A number of observations have been recorded within 10 km; three roosts, three transects and eighteen ad-hoc observations. At least six of Ireland's nine resident bat species were recorded within 10 km of the proposed works including Common and Soprano pipistrelle, Leisler's bat, Brown long-eared bat, Daubenton's bat and Natterer's bat. The results of the database search are provided in Table 4-1.

National Biodiversity Data Centre

The National Bat Database of Ireland was searched for records of bat activity and roosts within the hectads close to the Site (IG Ref.: T 19698 44430), last search on 9th February 2024). Six of Ireland's

nine resident bat species were recorded in the hectads in the proximity of the Site. The results of the database search are provided in Table 4-2.

Table 4-2 NBDC Bat Records within the hectads near the Site.

Grid Square	Species	Record Count	Latest Record	Dataset

T24	Soprano Pipistrelle (<i>Pipistrellus pygmaeus</i>)	1	14/10/2009	National Bat Database of Ireland

4.2.2 Bat Species Range

The potential for negative impacts is likely to increase where there are high risk species at the edge of their range (NatureScot, 2021). Therefore, range maps presented in the 2019 Article 17 Reports (NWPS, 2019) were reviewed in relation to the location of the Site.

The Site is within or at the edge (coastal area) of the current known range for six of the resident bat species in Ireland, as mapped in the Article 17 reporting. The site is outside the range of three resident bat species (Lesser horseshoe bat, Nathusius' pipistrelle, and Whiskered bat).

4.2.3 Designated Sites

Within Ireland, the Lesser horseshoe bat is the only bat species requiring the designation of Special Areas of Conservation (SACs) and the Site is situated outside the current known range of this species. Natural Heritage Areas (NHAs) and proposed Natural Heritage Areas (pNHAs) may be designated for any bat species. A search of NHAs and pNHAs within a 10 km radius of the EIAR Site Boundary found no sites designated for the conservation of bats.

4.2.4 Landscape Features

A review of mapping and photographs provided insight into the habitats and landscape features present at the Site. In summary, the primary land use within the Site is agricultural lands.

A review of the GSI online mapper did not indicate the possible presence of any subterranean sites within the EIAR Site Boundary, and a search of the National Monuments Database did not reveal the presence of any manmade subterranean sites within the EIAR Site Boundary.

A search of the UBSS Cave Database for the Republic of Ireland found no caves within the Site or within 10 km of the EIAR Site Boundary.

A review of the NBDC bat landscape map provided a habitat suitability index of 28.44 (orange). This indicates that Site has moderate to high habitat suitability for bat species.

4.2.5 Other EIAR Developments

There are no other wind farms within a 10 km buffer of the Proposed Development. One other large infrastructure developments/proposal was identified within 10 km of the Proposed Development. This is in the form of a retention of a quarry (planning application number 20190228). This is not believed to have any cumulative impacts on the Proposed Development area.

4.3 Field Surveys

4.3.1 Bat Habitat Suitability Appraisal

Further details on habitats within the Site can be found in Chapter 6 of the main EIAR. The habitats within the EIAR Site Boundary are dominated by Improved agricultural grassland (GA1) with areas of Arable crops (BC1), Buildings and artificial surfaces (BL3) and Hedgerow (WL1). The site also consists of smaller areas of Earthbank (BL2), Stone walls and other stonework (BL1), Dry meadows and grassy verges (GS2) and Scrub (WS1). Marsh and sand dune habitats can be found on the periphery of the Site along the eastern coastal boundary.

Results from the desktop review and walkover surveys were used to assess habitats for their suitability to support foraging and commuting bats, and roosting bats, according to Collins (2016). Suitability categories, divided into *High*, *Moderate*, *Low* and *Negligible*, are described fully in **Appendix 1**.

With regard to foraging and commuting bats, areas of improved agricultural grassland, buildings and artificial surfaces, and earthbanks were considered to have *Negligible* suitability, i.e. negligible habitat features on site likely to be used by commuting or foraging bats (Collins, 2016).

Due to the nature of the topography of the site, it is a very open landscape with limited tall vegetation or tree coverage for safety from predators. However, hedgerows, scrub, and the small immature woodlands present on site show potential for foraging and commuting bats. The heavily maintained hedgerows within the site along field boundaries, wire fencing, roadways, agricultural grassland and areas of arable crops do not provide significant high-quality foraging or commuting habitat. As such, they were assigned a *Low* potential. Other hedgerows and bramble on the site boundary, and scrub present within the site were assigned *Moderate* suitability, i.e. habitat connected to the wider landscape that could be used by bats for foraging and commuting and habitat connectivity (Collins, 2016). All other habitat was considered *Negligible* for commuting and foraging.

With regard to roosting bats, the majority of trees and hedgerows were assigned *Negligible* roosting potential due to the size and lack of PRFs i.e. *Negligible* habitat features on site likely to be used by roosting bats (Collins, 2016). Species present on site comprise a mixture of mature and immature conifer and broadleaf species primarily including hawthorn, hazel, and *willow spp.*

A small number of trees near the entrance hut and stone structure presented *Low* roosting potential due to the presence of limited PRFs which could support small numbers of roosting bats. All other habitat was considered negligible for roosting (Collins, 2016).

Nine structures within the Site were inspected for bat roosting suitability. Details of the inspection and dusk emergence surveys are presented below in Sections 4.2.2.1 and 4.2.3.

4.3.2 Roost Surveys

4.3.2.1 Daytime Roost Inspections

A search for roosts was undertaken within 200m plus the rotor radius (i.e. 235m) of the Proposed Development (NatureScot, 2021). The aim was to determine the presence of roosting bats and the need for further survey work or mitigation. The site was visited in April, May, June, July, September, and October 2023. A walkover was carried out and structures were assessed for their potential to support roosting bats (see **Appendix 1** for criteria in assessing roosting habitats).

Nine structures were identified and inspected as part of the roost survey effort. Eight structures were identified as PRFs. One further structure was flagged as a possible structure with bat roosting potential by a landowner during a conversation later in the season. Details of daytime inspections and dusk emergences carried out are shown in Table 4-3.

Summary of Roost Survey Results

The structures were subject to interior (where accessible) and exterior inspections to search for evidence of bats. Details of the inspection surveys are presented below. None of the structures are due to be removed as part of the Proposed Development.

Table 4-3 Emergence and Inspection Results.

Structure	Roost Survey	Date	Location (IG Ref.)	Survey Results
A) Dairy Shed	Inspection	13 th June 2023 and 3 rd October 2023	T 19601 44476	<i>Negligible</i> suitability - No evidence of bats or bat activity.
B) Storage shed	Inspection	13 th June 2023 and 3 rd October 2023	T 19621 44391	<i>Negligible</i> suitability - No evidence of bats or bat activity.
C) Storage shed	Inspection	13 th June 2023 and 3 rd October 2023	T 19690 44396	<i>Negligible</i> suitability - No evidence of bats or bat activity.
D) Storage shed	Inspection	3 rd October 2023	T 19608 44512	<i>Negligible</i> suitability - No evidence of bats or bat activity.
E) Derelict farmhouse	Inspection & Dusk Emergence	3 rd May 2023 and 13 th June 2023	T 19536 44411	<i>High</i> suitability - No bats seen emerging on the dusk emergence surveys on the 3 rd May 2023 and the 13 th June 2023. Scattered bat droppings were found in one of the rooms during the inspection.
F) Red brick ruin	Inspection	3 rd October 2023	T 18230 44113	<i>Negligible</i> suitability - No evidence of bats or bat activity.
G) Stables	Inspection	3 rd October 2023	T 20505 46096	<i>Low</i> suitability - No evidence of bats or bat activity.
H) Hay shed	Inspection	3 rd October 2023	T 20522 46051	<i>Negligible</i> suitability - No evidence of bats or bat activity.
I) Horse walker	Inspection	3 rd October 2023	T 20509 46053	<i>Negligible</i> suitability - No evidence of bats or bat activity.

A) Dairy Farm

The dairy farm and calving operation and associated infrastructure were located approximately 40 metres west of turbine T12. (IG Ref.: T 19601 44476). The structure consists of block and plaster walls,

metal internal rafters, corrugated sheet roofing. The internal areas have cow holding areas, for livestock management, and feeding/holding areas.

Buildings were open, bright, spacious, clean and well-lit with artificial lighting at night. Inspections around the external walls showed no gaps, or cracks in the structures. Lights illuminate the adjoining yards at night. No evidence of bats were found during the external inspection. The yard around the building was maintained in a neat and tidy manner. The combination of the high levels and regularity of lighting, high levels of human and cattle activity, and the physical features of the building led to the structure being assigned a *Negligible* roosting potential.

Plate 4-1 South facing aspect of Ballywater Dairy Farm (east side).

Plate 4-2 South facing aspect of Ballywater Dairy Farm (west side).

B, C & D) Storage Sheds

Three newly constructed structures, referred to as Storage Sheds B, C & D were located around structure A. The function of the sheds was machinery and feed storage. All of these structures were open on one side with high natural light shining through clear roof panels in the daytime with no areas of darkness. Lights also illuminate these buildings at night. Two of these structures had associated adjoining structures. Structure B (IG Ref.: T 19621 44391) is located approximately 130 metres south-west of T12 and 130 metres north of T13. Structure C (IG Ref.: T 19690 44396) is located approximately 65 metres south of turbine T12. Structure D is located approximately 105 metres west of turbine T12. The lighting conditions of these sheds, combined with the lack of potential roosting features within the structures led to them being assessed as having *Negligible* roosting potential.

E) Derelict Farmhouse

The two-story, derelict farmhouse, composed of red brick and stone, contained five chimneys and a slate roof. The building consisted of the original structure and an eastern and western block. The farmhouse is located in the centre of the site, adjacent to the main farm buildings (IG Ref: T 19548 44460). The structure is located approximately 70 m east of turbine T8. This structure was inspected on 13th June 2023. No bats were found in this building; however, evidence of scattered bat droppings were found in one of the rooms. This structure was assigned a *High* roosting potential due to its accessibility and suitability for bats. The shed was subject to dusk emergence surveys on the 3rd May 2023 and the 13th June 2023, as detailed in Section 4.4.1.

Plate 4-3 South facing aspect of the derelict farmhouse.

Plate 4-4 Collapsed wall on the south facing aspect of the derelict farmhouse.

Plate 4-5 Gaps in the slate roof, the soffit, and the boarded window.

Plate 4-6 Droppings found in the PRF.

F) Red brick ruin

A red brick ruin located in an agricultural field to the south-west of the main site entrance to the south side of the site was also assessed for bat roosting potential. This structure is a ruin composed of brickwork, plasterwork, and concrete. This structure has no roof, and open windows. The structure is located approximately 775 metres south-west of turbine T3, approximately 260 metres outside of the EIAR Site Boundary. This structure was inspected using an endoscope on 3rd October 2023. No signs

of bats or bat activity were found. This structure was assessed as having *Negligible* roosting potential due to its exposure to the elements and light.

Plate 4-7 East facing aspect of the PRF.

Plate 4-8 Inside of the north-east room of the PRF, showing gaps in the brickwork.

G) Stables

Horse stables (IG Ref.: T 20505 46096) are located approximately 330 metres north-west of turbine T21. The stables were subject to external and internal inspections on the 3rd October 2023. The stables are a concrete structure with corrugated metal roofing. Cracks in the concrete on the exterior of the structure and other crevices inside the stables were inspected with an endoscope. No signs of bats or bat activity were found. However, there were suitable PRFs that could host small numbers of roosting bats opportunistically. As such, the stables were assigned a *Low* roosting potential.

Plate 4-9 East facing aspect of the stables.

Plate 4-10 Cracks in the cement work being inspected with an endoscope.

Plate 4-11 Central, busier section of the stables.

Plate 4-12 Section of the stables with less activity (east side section).

H) Hay shed

The hay shed near the horse stables (IG Ref.: T 20522 46051) consisted of an open access one bay shed with three concrete walls, wooden rafters and corrugated metal walls and roof. The structure was bright with natural light and used in for hay and straw storage. Crevices were found between the block walls externally and the sheet metal wall for potential opportunistic roosting. No evidence of bat activity was identified. This structure was inspected on the 3rd October 2023 and was assigned a *Negligible* roosting potential.

Plate 4-13 North facing aspect of the hay shed.

Plate 4-14 Crevice between the wall and sheet metal

l) Horse walker

Access into the horse walker was not possible, so it was assessed externally. The exterior of the structure was inspected for evidence of bat activity and suitable roosting features. The roof of the horse walker had a large hole allowing natural illumination during the day. The internal mechanics and use of the structure results in noise and movement when in use. There were no visible features suitable for roosting bats. As such, the structure was assigned a *Negligible* roosting potential.

Plate 4-15 North-east facing aspect of the horse walker.

4.3.2.2 Potential Roosting Features - Trees

The EIAR site boundary is comprised of a network of hedgerows and treelines bordering the exterior of the site, sections of broadleaved woodland, and the local road network. The trees along the main site entrance to the south side of the site were assessed for roosting potential and were assigned *Negligible* to *Low* roosting potentials. No trees are planned to be felled according to the Proposed Development.

Woodland

The southern section of the site contains areas of immature woodland within the managed crop/grazing land providing shelter and foraging resources for bats. There are sections of immature woodland consisting of broadleaf tree species to the west of the site along some field and road margins that connect to a small waterbody. Woodland habitat was largely made up of immature trees with no roosting features. They were assigned *Negligible* roosting suitability. Hedgerows within the site were highly managed, and thus were assigned a *Negligible* roosting suitability. No trees within 235 m (roost search buffer) of the turbines showed potential roosting features.

Plate 4-16 Woodland habitat south of the dairy farm, and linear vegetation features going east.

Plate 4-17 Woodland in the foreground near T3, and a treeline in the background near T3 (South-East of the site).

Plate 4-18 Waterbody on site to the east of the site, with woodland on the western bank.

Plate 4-23 Dead tree with cracking, lifting bark, rotten cavities and rot holes.

4.3.3

Manual Activity Surveys

Manual bat activity surveys took place in the Spring, Summer, and Autumn of 2023. Bat activity was recorded on all surveys, with a total of 292 bat passes. Soprano pipistrelle (n=214) was the species recorded most frequently, followed by Leisler's bat (n=63), and Common pipistrelle (n=51). Brown long-eared bats were recorded infrequently, with only 5 passes recorded across all three surveys. *Myotis* spp. and *Nathusius'* pipistrelle were also rarely recorded with only two *Myotis* spp. bat passes and one *Nathusius'* pipistrelle bat pass recorded across all three surveys. The species composition recorded across all three surveys are shown in Plate 4-24. Despite the Site being 8.5 kilometres from the Article 17 *Nathusius'* pipistrelle range, it was noted that *Nathusius'* pipistrelle calls were recorded infrequently during the manual and static surveys.

Plate 4-24 Species composition recorded during manual activity surveys.

Dusk Emergence Surveys

One structure with *High* roosting potential was identified within the EIAR Site Boundary during the first survey at the site on 13th April 2023. The stables (IG Ref.: T 20505 46096) were assessed as having *Low* roosting potential. All other structures were subsequently assigned *Negligible* roosting potential. Table 4-4 details the survey effort in relation to dusk emergence surveys carried out on the derelict farmhouse assigned a *High* roosting potential.

On the 3rd May 2023, Common pipistrelle, Soprano pipistrelle, and Leisler's bats were recorded using the area surrounding the derelict farmhouse as a commuting corridor. There were also some Soprano pipistrelle recorded foraging nearby. There were no bats observed emerging from the PRF during this survey.

On the 13th June 2023, there was no bat activity observed by either surveyor during the dusk emergence survey.

Table 4-4 Manual activity surveys at PRFs in 2023.

PRF	IG Ref.	Date	Survey Type	Results
Derelict farmhouse	T 19536 44411	3 rd May 2023	Dusk Emergence	No bats seen emerging. Some commuting and foraging activity nearby.
		13 th June 2023	Dusk Emergence	No bats seen emerging. No bat activity recorded during the survey.

Manual Transect Surveys

Manual activity surveys also comprised driven transects at dusk. One standalone transect survey was conducted and two transect surveys followed dusk emergence surveys at PRFs and were aimed at assessing the use of linear features and other habitats by bats. Transects and results are shown in Figures 4-1 to 4-3 below. Table 4-5 shows total bat passes per species, per survey.

All activity noted by surveyors on the transect was foraging and commuting activity, along with some social calls. Most of the bat activity recorded during the driven transect surveys on the site were

recorded on the roads within the south side of the site. Higher levels of activity were recorded between turbine T10 and turbine T16. There was also noticeable activity between turbine T3 and the main entrance to the south side of the wind farm site, and between the two patches of woodland south of turbine T17.

Table 4-5 Static Detector Surveys: Species Composition Across All Deployments (Total Bat Passes).

Species	Spring	Summer	Autumn	Total
<i>Myotis spp.</i>	0	0	8	8
Leisler's bat	13	17	12	42
Nathusius' pipistrelle	2	0	2	4
Common pipistrelle	17	3	26	46
Soprano pipistrelle	74	22	30	126
Brown long-eared bat	1	0	0	1
Total Bat Passes	107	42	78	227

4.3.4 Ground-level Static Surveys

In total, 106,567 bat passes were recorded across all deployments. In general, Common pipistrelle (n=41,345) occurred most frequently, with Soprano pipistrelle (n=39,928) and Leisler's bat (n=23,613) also occurring frequently, while *Myotis spp.* (n=1,074), Brown long-eared bat (n=494) were less frequent. Nathusius' pipistrelle (n=113) were rare. Plate 4-25 presents bat species composition across all ground-level static detectors.

Plate 4-25 Pie chart displaying the bat species composition of the ground-level static surveys in 2023.

Bat activity was calculated as total bat passes per hour (bp/h) per season to account for any bias in survey effort, resulting from varying night lengths between seasons. Plate 4-26 and Table 4-6 presents these results for each species.

During 2023, bat activity in general was dominated by Common pipistrelle and Soprano pipistrelle. The third most commonly recorded species was Leisler's bat. The relative number of recordings for the other species recorded (*Myotis spp.*, Brown long-eared bat, and Nathusius' pipistrelle) were much lower.

The composition of bat species also differed by season. In spring, the most frequently recorded species was the Soprano pipistrelle, followed by the Common pipistrelle and Leisler's bat. In summer, the Common pipistrelle was the most common, with Leisler's bat second and Soprano pipistrelle third. During autumn, the Common pipistrelle remained the most recorded, followed by the Soprano pipistrelle and Leisler's bat. After these, the other three species/species groups were much less frequently recorded across all seasons. In every season, *Myotis* species were the fourth most common, the Brown long-eared bat was fifth, and Nathusius' pipistrelle was the least common. The bat activity composition for each season is shown in Plate 4-27.

The relative abundance of each species also varied. The Brown long-eared bat was most abundant in autumn and least in spring. The Soprano pipistrelle had the highest relative abundance in spring, with

similar levels in summer and autumn. The Common pipistrelle showed no significant change across seasons. Nathusius' pipistrelle had near-zero abundance in spring but was higher in summer and autumn. Leisler's bat was most abundant in summer and least in spring, while the Myotis species were most abundant in autumn and least in spring.

Plate 4-26 Bat activity rates (passes per detector hours) for each survey season.

Plate 4-27 Bat Activity Composition per Season.

Table 4-6 Static Detector Surveys: Species Composition Across All Deployments (Total Bat Passes Per Detector Hours in Each Season)

	Spring	Summer	Autumn
Total survey hours	2633.1	2636.5	1919.3
<i>Myotis</i> spp.	0.205	0.082	0.166
Leisler's bat	5.875	1.745	1.846
Nathusius' pipistrelle	0.008	0.016	0.026
Common pipistrelle	11.17	2.19	3.209
Soprano pipistrelle	11.836	1.621	2.339
Brown long-eared bat	0.058	0.054	0.104

The median bat activity per detector for each season, is shown in Plate 4-28 (identical y-axis limits) and Plate 4-29 (variable y-axis limits).

Plate 4-28 Median bat activity per detector across all nights in each season (plots with identical y-axis limits).

Plate 4-29 Median bat activity per detector across all nights in each season (plots with variable y-axis limits).

D06 (corresponding to turbine T16), had the highest median bat activity in any season, with very high median bat activity recorded in Spring. Median bat activity at this detector was low during Summer and Autumn. D09 (corresponding to T12) recorded the highest median bat activity in Summer. D02 (corresponding to T24) recorded the highest median bat activity in Autumn (closely followed by D09). The composition of Leisler's bat median activity within these plots seemed to increase in the summer. D10 (corresponding to T8) and D12 (corresponding to T3) had consistently low median bat activity across all three surveyed seasons. Bat species activity per day is shown for Spring, Summer and Autumn in Plates 4-30 to 4-34.

Plate 4-30 Bat Activity for Each Night in the Spring Survey Period.

Plate 4-31 Bat Activity for Each Night in the Summer Survey Period.

Plate 4-32 Bat Activity for Each Night in the Autumn Survey Period.

Plate 4-33 Bat activity for each night surveyed in 2023.

Plate 4-34 Nightly Bat Activity with Unsurveyed Nights Indicated with Red Dots.

5. DISCUSSION

5.1 Assessment of Bat Activity Levels

Ballywater Wind Farm site consists of predominantly agricultural lands which do not provide significant suitable roosting, commuting and foraging habitat for bats. While these habitats are not considered to provide high-quality habitat for bat species, habitats adjacent to and surrounding the site provide a mosaic of diverse habitat features such as water bodies, woodland and marsh which are likely to attract bats to the site.

The highest overall bat activity (looking at median and maximum activity for each species) was recorded at D06 (corresponding to turbine T16), with other detectors with high median bat activity being D01 (corresponding to turbine T22), D02 (corresponding to turbine T24), D04 (corresponding to turbine T20), and D09 (corresponding to turbine T12).

Details on activity assessment per detector are presented below. Table 5-1 shows the results of the site-level assessment. Activity was assessed as Low, Medium or High based on the methodology described in Section 2.2.5. The activity levels identified inform the impact assessment included in Chapter 6 of the EIAR, together with the results of the desktop study, habitat appraisal and roost assessment.

5.1.1 Adapted Site-specific Ranges

Low, Medium and High activity levels were assigned to median and maximum pass rates (bpph) identified during Spring, Summer and Autumn at the detectors deployed across the site as adapted from Mathews *et al.* (2016).

Leisler's bat

Leisler's bat activity was generally *Low* in all seasons, but with *High* activity peaks recorded. Median Leisler's bat activity in Spring was *Low* at all detectors besides D03, D04, D05, D09, D11, and D13 which all recorded *Moderate* median activity. High peak activity was recorded in Spring at all detectors, besides D01 and D07 (these recorded *Moderate* peak activity). Leisler's bat peak activity in Spring was noticeably higher at D03, D04, D05, and D12 when compared to the other detectors. In Summer, median activity for Leisler's bat was *Low* at all detectors besides D09, which recorded *Moderate* median activity. Leisler's bat peak activity was generally *Low* in Summer, with D01 and D06 recording *Moderate* peak activity and D05, D09, and D10 recording *High* peak activity. Median activity was *Low* for Leisler's bat at all detectors in Autumn. D01 and D05 recorded *High* peak Leisler's bat activity in Autumn, and D12 recorded *Low* peak activity, while all others recorded *Moderate* peak activity.

Leisler's bats are considered to be a species at high-risk of collision due to their higher altitude of flying, particularly at the height of wind turbine sweep areas. Ireland is considered a stronghold for the species, which is relatively rare in other areas of Europe: adaptive risk mitigation measures is particularly important for this species.

D01 = T22; D02 = T24; D03 = T18; D04 = T20; D05 = T14; D06 = T16; D07 = T16; D08 = T7; D09 = T12; D10 = T8; D11 = T9; D12 = T3; D13 = T17

Pipistrelle species

Median Common pipistrelle activity was generally *Low* across all seasons, with the only exceptions being D03, D04, and D05 in Spring, with D03 and D04 recording *Moderate* median activity and D05 recording *High* median activity. Peak Common pipistrelle activity was *High* at all detectors in Spring. In Summer, peak Common pipistrelle activity varied, with four detectors (D01, D02, D04, and D09) recording *High* activity, five detectors (D05, D06, D11, D12, and D13) recording *Moderate* peak activity and the remaining four detectors recording *Low* peak activity. Similarly, in the Autumn survey period, peak Common pipistrelle was *High* at five detectors (D01, D02, D05, D09, and D11), *Moderate* at five detectors (D03, D04, D06, D10, D13), and *Low* at the remaining three detectors. Detectors at which the peak Common pipistrelle activity was *High* across all three seasons were D01, D02, and D09. The highest recorded was at D03 in Spring, with one night recording 141.6 Common pipistrelle passes per hour.

A small number of Nathusius' pipistrelle passes was recorded. Median and maximum Nathusius' pipistrelle was low at every detector during every season with two exceptions: D02 recorded *Moderate* maximum activity in Autumn and D04 recorded *High* maximum activity in Summer. While Nathusius' pipistrelle activity was very low within the site, this is outside the known range for the species and thus makes the local population particularly vulnerable.

Woodland Species.

Most *Myotis* spp. activity was *Low* across the site for all seasons. Peak activity at D06 in Spring was the only instance where there was *High* activity recorded for *Myotis* species. In Spring, peak activity was *Moderate* at D01, D02, D07, and D09. In Summer, *Myotis* spp. peak activity was *Moderate* for D01, D08, and D13, and for D02, D06, and D13 in Autumn.

Brown long-eared bat activity was generally *Low* but regular throughout the site. A relatively high peak activity level for this species was recorded at D11 in Spring. *Moderate* peak activity for this species was recorded at D05 and D06 in Spring; at D01, D02, D04, D05, D06, D10, D11, and D13 in Summer; and at D01, D04, D05, D06, D07, D08, D10, D13 in Autumn. The detectors which recorded *Moderate* peak activity across all three survey seasons were D05 and D06, two detectors located near areas of broadleaved woodland.

Myotis spp. bats and brown long-eared bats are not considered to be at high risk of collision with wind turbines, as they tend to commute and forage at low altitudes in proximity of linear features and within woodland environments. The site provides suitable foraging and commuting habitat but has limited roosting potential, limited to the derelict farmhouse, and some broadleaved trees. Activity was higher in areas associated with woodland diversity.

D01 = T22; D02 = T24; D03 = T18; D04 = T20; D05 = T14; D06 = T16; D07 = T16; D08 = T7; D09 = T12; D10 = T8; D11 = 9;
D12 = T3; D13 = T17

Table 5-1 Assessment of bat activity median and maximum levels. Categorised into levels Low, Medium, and High.

Species	Season	Bat activity (bp/h)	D01	D02	D03	D04	D05	D06	D07	D08	D09	D10	D11	D12	D13

5.2

Importance of Bat Population Recorded at the Site

Ecological evaluation within this section follows a methodology that is set out in Chapter three of the 'Guidelines for Assessment of Ecological Impacts of National Roads Schemes' (NRA, 2009).

All bat species in Ireland are protected under the Bonn Convention (1992), Bern Convention (1982) and the EU Habitats Directive (92/43/EEC). Additionally, in Ireland bat species are afforded further protection under the Birds and Natural Habitats Regulations (2011) and the Wildlife Acts 1976, as amended. No active bat roosts were confirmed within the footprint of the Site. Bats as an Ecological Receptor have been assigned **Local Importance (Higher value)** on the basis that the habitats within the site are utilized by a regularly occurring bat population of Local Importance.

6. RISK AND IMPACT ASSESSMENT

This risk and impact assessment has been undertaken in accordance with NatureScot Guidance. As per the NatureScot Guidance, wind farms present four potential risks to bats: Collision mortality, barotrauma and other injuries:

- Loss or damage to commuting and foraging habitat
- Loss of, or damage to, roosts
- Displacement of individuals or populations

For each of these four risks, the detailed knowledge of bat distribution and activity within the EIAR Study Area has been utilized to predict the potential effects of the wind farm on bats.

6.1 Collision Mortality

6.1.1 Assessment of Site-Risk

The likely impact of a proposed development on bats is related to site-based risk factors, including habitat and development features. The site risk assessment, as per Table 3a of the NatureScot guidance, is provided in Table 6-1 below.

Table 6-1 Site-risk Level Determination for the Proposed Development Site (Adapted from NatureScot 2021).

Criteria	Site-specific Evaluation	Site Assessment
Habitat Risk	The habitats within the site provide potential suitable foraging habitat for bats and is connected to the wider landscape by blocks of woodland, rivers and mature hedgerows. However, it does not provide an extensive and diverse habitat mosaic of high quality for foraging bats or meet any of the criteria of a high-risk site as set out in Table 3a of NatureScot, 2021.	Moderate
Project Size	Following the criteria set out in NatureScot, 2021 the project is of Medium scale as it consists of 21 no. turbines, with turbine heights of 99 metres. There are no other wind energy developments within 5km.	Medium
Site Risk Assessment		Medium Site Risk (3)

The Site is located in an area of predominantly agricultural grassland and arable crops with areas of buildings and artificial surfaces, treelines, marshes, sand dunes, and small areas of woodland, and scrub. As per table 3a of the NatureScot Guidance (2021), it has a *Moderate* habitat risk score. As per Table 3a, the Proposed Development is a Medium project (22 turbines) with no other wind energy developments within 5km.

The cross tabulation of a Medium project on a Moderate risk site results in an overall risk score of **Medium** (NatureScot Table 3a).

6.1.2 Assessment of Collision Risk

The following high-risk species were recorded during the dedicated surveys:

- Leisler's bat,
- Common pipistrelle,
- Soprano pipistrelle,
- Nathusius' pipistrelle

The Overall Risk Assessment for high collision risk species is provided in the sections below. Overall Risk was determined, in accordance with Table 3b of NatureScot guidance (Appendix 3), by a cross-tabulation of the site risk level (i.e. Medium) and Ecobat bat activity outputs for each species. The assessment was carried out for both median and maximum Ecobat activity categories in order to provide insight into typical bat activity (i.e. median values) and activity peaks (i.e. maximum values). NatureScot recommends that the most appropriate activity level (i.e. median or maximum) be utilised to determine the overall risk assessment for a species.

As per NatureScot guidance there is no requirement to complete an Overall Risk Assessment for low-risk species. During the extensive suite of surveys undertaken that following low risk species were recorded:

- *Myotis* sp.,
- Brown long-eared bat.

Overall activity levels were low for the above species; therefore, no significant collision related effects are anticipated.

6.1.2.1 Leisler's bat

This site is within the current range of the Leisler's bat (NPWS, 2019). Leisler's bats are classed as a rarer species of a high population risk which have a high collision risk (Plate 3-2). Leisler's bats were recorded during activity surveys across the Site.

When assessed in the context of the identified site risk and in line with Table 3b (SNH, 2019), typical activity for Leisler's bat was found to be **Low-moderate** in Spring and **Low** for Summer and Autumn in 2023. Peak activity levels were **High** in Spring, **Low-moderate** in Summer, and **Moderate-high** in Autumn for Leisler's bat (See Table 5-2 below). Overall activity risk for Leisler's bat at typical activity levels in 2023 was found to be **Medium** in Spring and **Low** in Summer and Autumn. Peak activity risk assessments for Leisler's bat were **High** for Spring and **Medium** for Summer and Autumn (See Table 6-2 below).

Based on site visit and survey data, including driven transects, it is determined that the Typical Activity (i.e. Median) is reflective of the nature of the site, which is mainly agricultural lands and artificial surfaces, with low levels of bat activity recorded during the driven transects undertaken.

Thus, there is a **Low** overall risk level assigned to the local population of Leisler's bat.

Table 6-2 Leisler's Bat - Overall Risk Assessment

Survey Period	Site Risk	Typical Activity (Median)	Typical Risk Assessment (as per Table 3b SNH 2019)	Activity Peaks (Maximum)	Peak Risk Assessment (as per Table 3b SNH 2019)
Spring	Medium (3)	Low-moderate (2)	Typical Risk is Medium (6)	High (5)	Peak Risk is High (15)
Summer		Low (1)	Typical Risk is Low (3)	Low-moderate (2)	Peak Risk is Medium (6)
Autumn		Low (1)	Typical Risk is Low (3)	Moderate-high (4)	Peak Risk is Medium (12)

6.1.2.2 Soprano pipistrelle

This site is within the current range of the Soprano pipistrelle bat (NPWS, 2019). Soprano pipistrelles are classed as a common species of a medium population risk which have a high potential collision risk (Plate 3-2). Soprano pipistrelles were recorded during activity surveys across the Site.

When assessed in the context of the identified site risk and in line with Table 3b (SNH, 2019), overall activity risk for Soprano pipistrelle in 2023 was found to be **Medium** at moderate typical activity levels in Spring and **Low** in Summer and Autumn. Peak activity levels were **High** in Spring and **Low-moderate** in Summer and Autumn for Soprano pipistrelle, resulting in a peak risk assessment of **High** for Spring and **Medium** for Summer and Autumn (See Table 6-3 below).

Based on site visit and survey data, including driven transects, it is determined that the Typical Activity (i.e. Median) is reflective of the nature of the site for Summer and Autumn, which is mainly agricultural lands and artificial surfaces, with low levels of bat activity recorded during the driven transects undertaken in these survey periods. However, the data observed during the driven transect in Spring implies the activity levels for Soprano pipistrelles to be more aligned with a **Moderate-high** activity classification.

Thus, there is **Medium** collision risk level assigned to the local population of Soprano pipistrelle in Spring, and a **Low** collision risk level assigned to the population in Summer and Autumn.

Table 6-3 Soprano Pipistrelle - Overall Risk Assessment

Survey Period	Site Risk	Typical Activity (Median)	Typical Risk Assessment (as per Table 3b SNH 2019)	Activity Peaks (Maximum)	Peak Risk Assessment (as per Table 3b SNH 2019)
Spring	Medium (3)	Low-Moderate (2)	Typical Risk is Medium (6)	High (5)	Peak Risk is High (15)
Summer		Low (1)	Typical Risk is Low (3)	Low-moderate (2)	Peak Risk is Medium (6)
Autumn		Low (1)	Typical Risk is Low (3)	Low-moderate (2)	Peak Risk is Medium (6)

Detector locations with High median Soprano pipistrelle activity levels

A summary of bat activity results, as shown in **Appendix 3** provides key metrics for Soprano pipistrelle recorded, per detector, per survey period. Detector D06 registered High median Soprano pipistrelle activity levels in Spring. This detector corresponds to turbine T16. No other detectors recorded High levels of median Soprano pipistrelle activity across any other season. Given that high median activity levels were recorded near turbine T16, an adaptive monitoring and mitigation strategy has been devised for the Proposed Development in line with the case study example provided in Appendix 5 of the NatureScot Guidance. Further details on proposed curtailment can be found in section 7 below.

6.1.2.3 Common pipistrelle

This site is within the current range of the Common pipistrelle bat (NPWS, 2019). Common pipistrelle are classed as a common species of a medium population risk which have a high collision risk (Plate 3-2). Common pipistrelle were recorded during activity surveys across the Site.

When assessed in the context of the identified site risk and in line with Table 3b (SNH, 2019), overall activity risk for Common pipistrelle in 2023 was found to be **Medium** at typical activity levels in Spring, and **Low** in Summer and Autumn. Peak activity levels ranged from **Moderate** to **High** across the three

survey seasons for Common pipistrelle (See Table 6-4 below), resulting in peak risk assessments for this local population of **High** in Spring, and **Medium** in Summer and Autumn.

Based on site visit and survey data, including driven transects, it is determined that the Typical Activity (i.e. Median) is reflective of the nature of the site, which is mainly agricultural lands and artificial surfaces, with low levels of bat activity recorded during the walked transects undertaken.

Thus, there is **Medium** collision risk level assigned to the local population of Common pipistrelle in Spring, and a **Low** overall risk level assigned to the local population of Common pipistrelle in Summer and Autumn.

Table 6-4 Common Pipistrelle - Overall Risk Assessment

Survey Period	Site Risk	Typical Activity (Median)	Typical Risk Assessment (as per Table 3b SNH 2019)	Activity Peaks (Maximum)	Peak Risk Assessment (as per Table 3b SNH 2019)
Spring	Medium (3)	Low-moderate (2)	Typical Risk is Medium (6)	High (5)	Peak Risk is High (15)
Summer		Low (1)	Typical Risk is Low (3)	Moderate (3)	Peak Risk is Medium (9)
Autumn		Low (1)	Typical Risk is Low (3)	Moderate-high (4)	Peak Risk is Medium (12)

Detector locations with High median Common pipistrelle activity levels

A summary of bat activity results, as shown in **Appendix 3**, provides key metrics for Common pipistrelle recorded, per detector, per survey period. Detector D06 registered **High** median Common pipistrelle activity levels in Spring. This detector corresponds to turbine T16. No other detectors recorded High levels of median Common pipistrelle activity across any other season. Given that high median activity levels were recorded near turbine T16, an adaptive monitoring and mitigation strategy has been devised for the Proposed Development in line with the case study example provided in Appendix 5 of the NatureScot Guidance. Further details on proposed curtailment can be found in section 7 below.

6.1.3

Collision Risk Summary

Site-level collision risk for high collision risk bat species was typically **Low**, with Common pipistrelle and Soprano pipistrelle being assigned a **Medium** site level collision risk in Spring. Overall bat activity levels were typical of the nature of the site, which is mainly agricultural lands and artificial surfaces, with small patches of broadleaved woodland.

However, following per detector analysis, detector D06 showed high median activity levels in Spring for Common and Soprano pipistrelle (Table 5-1). Taking a precautionary approach and given the potential for high collision risk was recorded at median activity levels at detector D06 an adaptive monitoring and mitigation strategy has been devised for the Proposed Development, in line with the case study example provided in Appendix 5 of the NatureScot (2021) Guidance and based on the site-specific data. This will involve curtailment during periods with high Common and Soprano pipistrelle activity (i.e. Spring at T16), with simultaneous activity monitoring taking place. Turbines will be curtailed during the weather conditions most suitable for bat activity at the site, see Section 7.1 "Curtailment" below. Proposed curtailment and monitoring is outlined in Section 7 below.

Table 6-5 High Median Bat Activity Per Detector

Survey Period	Nights Recorded	Detector ID	Corresponding Turbine	Median Bat Activity	Median Bat Activity Level	Max Bat Activity	Max Bat Activity Level
SOPRANO PIPISTRELLE							
Spring	42	D06	T16	18.3	High	65.6	High
COMMON PIPISTRELLE							
Spring	42	D06	T16	29.6	High	149.1	High

6.1.3.1 Dog-led Collision Monitoring Results

Dog-led collision monitoring surveys were conducted to monitor any potential bat related fatalities at the site, and to provide an estimate of potential turbine collision related mortality associated with the Proposed Development.

Surveys were undertaken between October 2023 and September 2024 and included carcass searches, searcher efficiency trials and scavenger activity trials. Throughout the surveys, ten bat carcasses were identified. Details of these bat records are shown below in Table 6-6. Further details can be found in Appendix 6-7, Carcass Search Report. Further details and mitigation recommendations based on the carcass search results can be found in Chapter 6 of the EIAR.

Table 6-6 Bat carcasses found during carcass searches performed since October 2023.

Turbine	Date	Species	Distance from Turbine (m)
T14	8th May 2024	<i>Pipistrellus pipistrellus</i>	25
T9	11th June 2024	<i>Pipistrellus pipistrellus</i>	15
T24	17th July 2024	<i>Pipistrellus pipistrellus</i>	21
T23	7th August 2024	<i>Nyctalus leisleri</i>	37

T15	4th September 2024	<i>Pipistrellus spp.</i>	18
T23	5th September 2024	<i>Pipistrellus spp.</i>	22
T23	5th September 2024	<i>Pipistrellus pygmaeus</i>	21

6.2 Loss or Damage to Commuting and Foraging Habitat

The Proposed Development consists of existing wind farm infrastructure. No change in habitats within the site is anticipated as a result of the extension of life application. Given the extensive area of habitat

that will remain undisturbed throughout the site, no significant effects with regard to loss of commuting and foraging habitat are anticipated.

6.3 **Loss of, or Damage to Roosts**

The Proposed Development consists of existing wind farm infrastructure. No change in habitats within the site is anticipated as a result of the extension of life application. No potential for significant effect with regard to the loss of, or damage to, roosting habitat as a result of the Proposed Development.

6.4 **Displacement of Individuals or Populations**

The Site is an operational windfarm predominantly located in agricultural lands. There will be no net loss of linear landscape features for commuting and foraging bats and there will be no loss of any roosting site of ecological significance. The habitats on the site will remain suitable for bats and no displacement of individuals or populations is anticipated as a result of the continued operation.

7. **BEST PRACTICE AND MITIGATION MEASURES**

This section describes the best practice and site-specific mitigation measures that are in place to avoid and reduce the potential for significant effects on local bat populations.

7.1 **Standard Best Practice Measures**

7.1.1 **Noise Restrictions**

The extension of life planning application for Ballywater Wind Farm will not result in any changes to the infrastructure. Existing agricultural practices within the site will continue. No change in existing noise levels are anticipated as a result of the Wind Farm Activities and farming practises taking place.

7.1.2 **Lighting Restrictions**

No additional artificial lighting is proposed as part of the Proposed Development. Therefore, no significant effects on bats is anticipated. Should lighting be required in future within the site, the lighting shall be designed in accordance with the Institute of Lighting Professionals Guidance Note 08/23 Bats and artificial lighting at night and Dark Sky Ireland Lighting Recommendations.

No significant effects of lighting on bats are anticipated; however, if in the course of this monitoring, any potential for significant effects on bats is identified, specific measures will be implemented to avoid any such impacts.

7.1.3 **Blade Feathering**

NIEA Guidelines also recommend that, in addition to buffers applied to habitat features, all wind turbines are subject to 'feathering' of turbine blades when wind speeds are below the cut-in speed of the subject turbine. This means that the turbine blades are pitched at 90 degrees or parallel to the wind to reduce their rotation speed to below two revolutions per minute while idling. This measure has been shown to significantly reduce bat fatalities (by up to 50%) in some studies (NIEA, 2021).

In accordance with NIEA Guidelines, blade feathering will be implemented as a standard across all proposed turbines when wind speeds are below the cut-in speed of the turbine.

7.2

Bat Mitigation and Monitoring Plan

Overall risk levels for high collision risk bat species ranged from **Low** to **Medium**. This risk level is reflective of the nature of the site, which is mainly agricultural grasslands and arable crops, with areas of buildings and artificial surfaces, marshes, sand dunes, scrub, woodland, and treelines, with low to moderate levels of bat activity recorded during the walked and driven transects undertaken.

However, taking a precautionary approach and given that high collision risk was recorded at median and peak activity levels, an adaptive monitoring and mitigation strategy has been devised for the Proposed Development in line with the case study example provided in Appendix 5 of the NatureScot (2021) Guidance and based on the site-specific data.

7.2.1

Curtailment

Curtailment involves raising the cut-in speed with associated loss of power generation in combination with reducing the blade rotation (blade feathering) below the cut-in speed.

Overall risk levels for high collision risk bat species ranged from **Low** to **Medium**. This risk level is reflective of the nature of the site, which is mainly agricultural grasslands and arable crops, with areas of buildings and artificial surfaces, marshes, sand dunes, scrub, woodland, and treelines, with low to moderate levels of bat activity recorded during the walked and driven transects undertaken.

However, following per detector Ecobat analysis, detector D06 (i.e. Turbine 16), recorded high median activity levels in Spring (Table 5-1). Taking a precautionary approach and given the potential for high collision risk was recorded at median activity levels at this detector, an adaptive monitoring and mitigation strategy has been devised for the Proposed Development. The strategy is in line with the case study example provided in Appendix 5 of the NatureScot Guidance and has been informed by the extensive suite of site-specific survey data. Curtailment will be implemented during periods with high median bat activity (i.e. Spring at T16), with simultaneous activity monitoring taking place. Turbines will be curtailed during the weather conditions most suitable for bat activity at the site.

Recent research used to inform NatureScot guidance has found that 90% of all bat activity can occur on sites when temperature exceeded 11.5°C and windspeed was below 5m/s. In addition, the bat activity is generally recorded 30 minutes after sunset and 40 minutes prior to sunrise. These conditions are largely consistent with the high seasonal activity peaks recorded at the Proposed Development site. Therefore, a software module will be programmed into the SCADA system controlling the turbines to curtail turbines when all these criteria are met. Curtailment is achieved by opening the blade pitch into the fully-feathered position, which reduces blade rotation speed to <1rpm.

The effectiveness of curtailment will be monitored in order to determine (a) whether it is working effectively (i.e. whether bat mortality is detected, thereby confirming its effectiveness), and (b) whether the curtailment regime can be refined such that turbine down-time can be minimised whilst ensuring that it remains effective at preventing casualties.

A summary of the proposed seasonal curtailment is provided in Table 7-1 below.

Table 7-1 Turbine Specific Curtailment Strategy for High-risk Species.

Turbine No.	Proposed Curtailment Period		
	Spring (April to May)	Summer (June to mid-August)	Autumn (mid-August to October)
Turbine 16	Yes	No	No

7.2.2

Operational Monitoring

To continually assess the effects of the ongoing Wind Farm site activities on bat activity, at least 3 years of post-consent monitoring is proposed. Post-consent monitoring will include static detector surveys, manual activity surveys and corpse searching to record any bat fatalities resulting from collision.

The results of post-consent monitoring will be utilised to assess any potential changes in bat activity patterns and to monitor the implementation of the mitigation and curtailment strategy. At the end of each year, the efficacy of the mitigation and curtailment monitoring plan will be reviewed, and any identified efficiencies incorporated into the programme. This approach allows for an evidence-based review of the potential for bat fatalities at the Site, and to ensure that the necessary measures are implemented for the protection of bat species locally. The effectiveness of any mitigation/curtailment needs to be monitored in order to determine (a) whether it is working effectively (i.e. the level of bat mortality is incidental), and (b) whether the curtailment regime can be refined such that turbine down-time can be minimised whilst ensuring that it remains effective at preventing casualties.

The below subsections provide additional detail on the proposed survey effort, timing, and mitigation/curtailment.

Monitoring Year 1

Bat activity surveys

The post-construction surveys will be carried out as per the pre-construction survey effort. Static monitoring will take place at each turbine during the bat activity season (between April and October) (NatureScot, 2021, NIEA, 2021). Full spectrum recording detectors will be utilised for the same duration as during pre-application surveys and at the same density (NatureScot, 2021). As described in Section 3.5 above, the assessment of bat activity levels will include the use of 'Ecobat' (or similar alternative), a web-based interface, allowing uploaded activity data to be contrasted with a comparable reference range, allowing objective and robust interpretation. Walked survey transects will also be conducted.

Key weather parameters and other factors that are known to influence collision risk will be monitored and shall include:

- Windspeed in m/s (measured at nacelle height)
- Temperature (°C)
- Precipitation (mm/hr)

Carcass searches

Carcass searches, to monitor and record bat fatalities, shall be conducted at each turbine in accordance with NIEA Guidance. This shall include searcher efficiency trials and an assessment of scavenger removal rates to determine the appropriate correction factor to be applied in relation to determining an

accurate estimate of collision mortality. Surveys should cover all activity seasons and the use of a trained dog detection team will be carried out to ensure maximum efficiency.

Monitoring Years 2 & 3

Monitoring surveys shall continue in Year 2 and 3, and where a curtailment requirement has been identified, the success of the curtailment strategy shall be assessed in line with the baseline data collected in the preceding year(s). The performance of any curtailment programme in terms of its ability to respond to the changes in bat abundance based on temperature and wind speed shall be analysed to confirm it is neither significantly over- nor under- curtailment during different periods of bat activity.

At the end of each year, the efficacy of any mitigation/curtailment programme shall be reviewed, and any identified efficiencies incorporated into the programme. The requirement for continued post-consent monitoring will also be considered. Should no bat fatalities be recorded in Year 1, curtailment (where applicable) in Year 2 and Year 3 could be reduced/re-evaluated or removed with monitoring continuing to inform this strategy. A monitoring programme will be submitted to, and agreed with, the relevant planning authority. Any subsequent changes will be agreed with Wexford County Council.

7.3

Residual Impacts

Not Significant Effect

Taking into consideration the sensitive design of the project, the proposed best practice and adaptive mitigation measures; significant residual effects on bats with regard to 1) Collision mortality, barotrauma and other injuries, 2) Loss or damage to commuting and foraging habitat, 3) Loss of, or damage to, roosts and 4) Displacement of individuals or populations are not anticipated.

Cumulative effects

The Proposed Development was considered in combination with other plans, existing and approved projects and planning applications pending a decision, in the surrounding area that could result in cumulative impacts on bats. This included a review of online Planning Registers and served to identify past, present and future plans and projects, their activities and their predicted environmental effects. The plans and projects considered are listed in Chapter 2 of the EIAR: Background of the Proposed Development.

Following the detailed assessment provided in the preceding sections, it is concluded that, the Proposed Development will not result in any residual adverse effects on bats, when considered on its own. Therefore, no potential for the Proposed Development to contribute to any cumulative adverse effects on any bat populations when considered in-combination with other plans and projects.

In the review of the projects that was undertaken, no connection, that could potentially result in additional or cumulative impacts was identified. Neither was any potential for different (new) impacts resulting from the combination of the various projects and plans in association with the Proposed Development.

Taking into consideration the reported residual impacts from other plans and projects in the area and the predicted impacts with the current proposal, no residual cumulative impacts have been identified regarding bats.

8.

CONCLUSION

This report provides a full and comprehensive assessment of the potential for impact on bat populations at the site of the Proposed Development. The surveys and assessment provided in this report are in accordance with NatureScot guidance. Following consideration of the residual effects (post mitigation) it is noted that the Proposed Development will not result in any significant effects on bats.

Provided that the Proposed Development is maintained and operated in accordance with the design, best practice and mitigation that is described within this report, significant effects on bats are not anticipated at any geographic scale.

APPENDIX 1

BAT HABITAT SUITABILITY ASSESSMENT

Bat Survey Report

Appendix 1 – Habitat Suitability Assessment

HABITAT SUITABILITY ASSESSMENT

Guidelines for assessing the potential suitability of a site for bats, based on the presence of habitat features (taken from Collins, 2016)

Suitability	Roosting Habitats	Commuting and Foraging Habitats
Negligible	Negligible habitat features on site likely to be used by roosting bats.	Negligible habitat features on site likely to be used by commuting or foraging bats.
Low	A structure with one or more potential roost sites that could be used by individual bats opportunistically. However, these potential roost sites do not provide enough space, shelter, protection, appropriate conditions¹ and/or suitable surrounding habitat to be used on a regular basis or by larger numbers of bats, i.e. unlikely to be suitable for maternity or hibernation². A tree of sufficient size and age to contain potential roost features but with none seen from the ground or features seen with only very limited roosting potential³.	Habitat that could be used by small numbers of commuting bats such as a gappy hedgerow or unvegetated stream, but isolated, i.e. not very well connected to the surrounding landscape by other habitats. Suitable, but isolated habitat that could be used by small numbers of foraging bats such as a lone tree (not in a parkland situation) or a patch of scrub.
Moderate	A structure or tree with one or more potential roost sites that could be used by bats due to their size, shelter, protection, conditions and surrounding habitat but unlikely to support a roost of high conservation status (with respect to roost type only – the assessments in this table are made irrespective of species conservation status, which is established after presence is confirmed).	Continuous habitat connected to the wider landscape that could be used by bats for commuting such as lines of trees and scrub or linked back gardens. Habitat that is connected to the wider landscape that could be used by bats for foraging such as trees, scrub, grassland or water.
High	A structure or tree with one or potential roost sites that are obviously suitable for use by larger numbers of bats on a more regular basis and potentially for longer periods of time due to their size, shelter, protection, conditions and surrounding habitat.	Continuous, high-quality habitat that is well connected to the wider landscape that is likely to be used regularly by commuting bats such as river valleys, streams, hedgerows, lines of trees and woodland edge. High-quality habitat that is well connected to the wider landscape that is likely to be used regularly by foraging bats such as broadleaved woodland, tree-lined watercourses and grazed parkland. Site is close to and connected to known roosts.

¹ For example, in terms of temperature, humidity, height above ground, light levels or levels of disturbance.

² Larger numbers of Common pipistrelle may be present during autumn and winter in large buildings in highly urbanised areas, based on evidence from the Netherlands (Korsten *et al.* 2015).

³ Categorisation aligns with BS 8596:2015 Surveying for bats in trees and woodland (BSI, 2015).

APPENDIX 2

SITE RISK ASSESSMENT

Bat Survey Report

Appendix 2 – Site Risk
Assessment (Table 3a,
SNH)

SITE RISK ASSESSMENT

Table 3a: Stage 1 - Initial site risk assessment

Site Risk Level (1-5)*		Project Size		
Habitat Risk		Small	Medium	Large
	Low	1	2	3
	Moderate	2	3	4
	High	3	4	5

Key: Green (1-2) - low/lowest site risk; Amber (3) - medium site risk; Red (4-5) - high/highest site risk.

* Some sites could conceivably be assessed as being of no (0) risk to bats. This assessment is only likely to be valid in more extreme environments, such as above the known altitudinal range of bats, or outside the known geographical distribution of any resident British species.

Habitat Risk	Description
Low	Small number of potential roost features, of low quality. Low quality foraging habitat that could be used by small numbers of foraging bats. Isolated site not connected to the wider landscape by prominent linear features.
Moderate	Buildings, trees or other structures with moderate-high potential as roost sites on or near the site. Habitat could be used extensively by foraging bats. Site is connected to the wider landscape by linear features such as scrub, tree lines and streams.
High	Numerous suitable buildings, trees (particularly mature ancient woodland) or other structures with moderate-high potential as roost sites on or near the site, and/or confirmed roosts present close to or on the site. Extensive and diverse habitat mosaic of high quality for foraging bats. Site is connected to the wider landscape by a network of strong linear features such as rivers, blocks of woodland and mature hedgerows. At/near edge of range and/or on an important flyway. Close to key roost and/or swarming site.

Project Size	Description
Small	Small scale development (≤ 10 turbines). No other wind energy developments within 10km. Comprising turbines < 50m in height.
Medium	Larger developments (between 10 and 40 turbines). May have some other wind developments within 5km. Comprising turbines 50-100m in height.
Large	Largest developments (> 40 turbines) with other wind energy developments within 5km. Comprising turbines > 100m in height.

APPENDIX 3

OVERALL SITE RISK ASSESSMENT

Bat Survey Report

Appendix 3 – Overall Risk
Assessment (Table 3b,
SNH)

Table 3b: Stage 2 - Overall risk assessment

Site risk level (from Table 3a)	Ecobat activity category (or equivalent justified categorisation)					
	Nil (0)	Low (1)	Low-moderate (2)	Moderate (3)	Moderate-high (4)	High (5)
Lowest (1)	0	1	2	3	4	5
Low (2)	0	2	4	6	8	10
Med (3)	0	3	6	9	12	15
High (4)	0	4	8	12	16	20
Highest (5)	0	5	10	15	20	25

The scores in the table are a product of multiplying site risk level and the Ecobat activity category (or equivalent). The activity categories equate to those given in Table 1 for high collision risk species. Nil (0) means no bat activity was recorded across the whole site, but caution is needed here, because although the values given in this column are "0", at sites where pre-construction surveys found no bat activity, there remains the possibility that new turbines could attract some bat species, thereby altering the level of risk that applies in reality.

Overall assessment:

Low (green) 0-4
Medium (amber) 5-12
High (red) 15-25

It is important to have an understanding of both "typical" and unusually high levels of bat activity at a site so that potentially important peaks in activity are not overlooked. It is therefore recommended that both the highest Ecobat activity category and the most frequent activity category (i.e. the median) are assessed separately in Table 3b and presented in the overall risk assessment. A judgement can then be made on which is the most relevant. It should be noted that presenting mean activity levels can be highly misleading where the data are highly skewed, as is frequently the case with bat activity at wind turbines (Lintott & Mathews, 2018).

APPENDIX 6-6

**Collision Monitoring Report
(October 2023 -September
2024)**

1.

INTRODUCTION

MKO was commissioned to complete dog-lead collision monitoring surveys as part of an application to extend the operational life of the existing Ballywater Wind Farm, Co. Wexford. The surveys were conducted to monitor any potential bird or bat related fatalities at the site, and to provide an estimate of potential collision related mortality associated with the wind farm.

This report provides details of the surveys undertaken, including survey design, methods and results. Surveys were undertaken between October 2023 and September 2024 and include carcass searches, searcher efficiency trials and scavenger activity trials on site. Any recommendations that may inform additional mitigation measures during the operational phase of the wind farm are prescribed below. In this report, the “site” is defined as the existing Ballywater Wind Farm.

The Proposed Development is described in full in Chapter 4 of this EIAR.

1.1

Background

Traditionally, carcass searches were carried out by human observers by means of walking transects and visually identifying the carcasses. Their effectiveness, however, was affected by a variety of variables, such as: size, colour and decomposition of the carcass, topography, weather conditions, vegetation type and density in the environment, and finally observer competency in detecting the carcasses. Hence, according to earlier studies, human searches are frequently carried out with low efficiency rates, which causes a significant bias in mortality estimates.

According to Bernardino *et al.* (2012), the employment of dogs and their olfactory capabilities may boost carcass detection rates. Numerous studies have shown and proven that dogs have a superior ability to detect bird and bat carcasses in respect to humans, particularly with small carcasses or when the carcasses are located in dense vegetation (Arnett 2006, Horman 2001, Mathews F.M. 2013, Paula 2011, Reed 2011, Rafael Barrientosa 2018).

While the guidelines provide recommendations in relation to methodologies, dog-lead searches require flexibility while conducting surveys: “*the dog and handler must adapt their survey technique to the current site conditions*”, Bennet (2015). Additionally, the usage of transects should only be used as a guide, with freedom to stray from it if necessary. Bennet also states that a trained dog should be able to pick up the target smells prior to the survey starting, highlighting the importance of allowing the dog the opportunity to “follow the nose” and look for the desired odours somewhat independently. Dog teams are deployed to carry out searches at turbines bases starting at dawn each morning to reduce the possibility of carcasses being removed by scavengers.

It should be emphasized that the dog’s ability to find carcass odour can be significantly influenced by wind conditions, as the scent travels with the wind. Hence, each search should ideally start downwind on the outer edge of the search area, and the transect walked horizontally across the wind while also moving upwind. Bennet (2015) lists a number of environmental variables that affect search efficiency rates, which can be seen in Table 1.1.

Table 1-1 Factors influencing a dog's ability to detect carcasses.

Consideration	Issue	Management
Relationship between dog and handler	Handler must be able to monitor the dogs performance to determine interest and likely success on a day-by-day, and hour-by-hour basis	Handlers should be appropriately experienced with dog training and behaviour
	Handler must recognise when the dog has detected a scent to enable them to go off transect	Dog and handler should live together and have a strong relationship outside of work. Regularly use roadkill to stimulate success and monitor performance
Wind speed: Still	On days with no wind there is nothing to carry the scent of the carcass to the dog and detection will be more difficult	Identify days as low wind Reduce the distance between transects to allow the dog to cover more ground and be closer to the source of the scent
Wind speed: Low-Medium	Ideal scenting conditions for dogs	Maximum spacing between transects
Wind speed: High	Dogs will become overloaded with scents from much further than the survey area	Reduce spacing between transects on downwind side of turbine. Allow the dog freedom to follow scents off transects
Wind speed: Extreme	It is more difficult for dogs to locate sources of scents in extreme wind conditions	Allow the dog freedom to follow scents. Maintain constant spacing along transects. Encourage the dog more frequently. Use roadkill to simulate success and monitor performance
Temperature: Cold (<8°C approximately)	Scents are reduced in cold conditions	Reduce the distance between transects to allow the dog to cover more ground and be closer to the source of the scent
Temperature Mildly cool to warm (<30°C approximately)	As scents warm up, they become more readily detected	Maintain recommended transect distances (dependent upon wind and precipitation)
Topography: flat	Scents are readily carried from one side of the survey area to the other	Maximum transect spacing
Topography:	Undulating Scents may be not be uniformly detected across the site	Ensure transects encompass depressions as well as rises
Topography: Steep	Steep sites may reduce exposure to scents depending upon the interaction with the wind	Ensure transects are crossing the direction of wind from the survey area
Vegetation: low (<5cm)	Detection is based on vision and scent	Maximum transect spacing
Vegetation: medium to tall grass	Dogs may be below the optimum scenting area and vegetation may reduce the exposure of the scent to wind	Ensure the dog has the freedom to "hop/bounce" through the survey area to reach the scents above the vegetation height
Vegetation: dense heath land	Vegetation may reduce the exposure of the scent to wind Scented vegetation (i.e. flowers) may increase the time to find target scents	Ensure dogs are adequately target trained to eliminate confounding scents. Reduce transects to cover more terrain
Vegetation: Trees/Scrub	Reduction in wind speed	Reduce distance between transects
Target Species	Large carcasses are more readily detected than small carcasses	Ensure dogs are adequately target trained to eliminate confounding scents
	Carcasses from species not of interest (i.e. lambs, rabbits) can provide additional scents	

1.2

Statement of Authority

Collision Monitoring Surveys were undertaken by MKO Conservation Detection Dog Handlers Cathal Bergin (BSc.) and Jessica Sara Barbara (BSc., MSc.). They were assisted by Dr. Caroline Finlay (PhD) of Conservation Detection Dogs Northern Ireland. All surveyors are LANTRA accredited handlers with relevant expertise in undertaking the ecological surveys utilised to inform this assessment.

The dogs employed in the surveys were Cain (black Labrador), Clay (fox-red Labrador), Kizzy (Sprocker), Kynren (Springer Spaniel), Mac (Springer Spaniel), Monty (Springer Spaniel), Niffler (Cocker Spaniel), Rufus (Springer Spaniel), Taio (Springer Spaniel), and Ziba (German Shorthaired Pointer) and have been specially trained in the detection of bird and bat carcasses.

The Collision Monitoring Report was prepared by Jessica Sara Barbara and reviewed by Cathal Bergin, Aoife Joyce (BSc., MSc.) and John Hynes (BSc., MSc. MCIEEM). Cathal has over 4 years' experience in ecological consultancy and 2 years conservation detection dog handler experience. Aoife has over 5 years' experience in advanced bat survey techniques and ecological impact assessments. John is a full member of the Chartered Institute of Ecology and Environmental Management (CIEEM) and has over 10 years' professional ecological consultancy experience.

2.

PROJECT DESCRIPTION

The site is situated south of Courtown (Grid Ref: SG 12144 01882) in Co. Wexford, as shown in Figure 2-1. The wind farm site includes 21 turbines and is served by a network of access roads, used both by landowners to access their agricultural lands, and for the operational phase maintenance of the existing wind farm. The dominant habitat onsite is agricultural grassland and arable crop with accompanying smaller areas of inland marshes, dunes, hedgerows and tree lines. As has been detailed in Chapter 1 and Chapter 4 of this EIAR, no construction works or ground works are required as part of the existing Ballywater Wind Farm, as the proposal seeks to extend the operational life of the existing wind farm. The full description of the wind farm is provided in Chapter 4 of this EIAR.

The site comprises the existing windfarm infrastructure, including turbines and associated hardstand areas and the wind farm access roads, which are classified as *Buildings and artificial surfaces (BL3)*. Outside of the existing wind farm infrastructure, the lands within the EIAR site boundary are dominated by agricultural fields, comprised of *Improved agricultural grassland (GA1)* and *Arable crops (BC1)*. Field boundaries are typically delineated by *Hedgerows (WL1)*, smaller areas of *Earthbank (BL2)*, *Stone walls and other stonework (BL1)*, while the internal access tracks were often lined with strips of *Dry meadows and grassy verges (GS2)* and *Scrub (WS1)*. Marsh and sand dune habitats can be found on the periphery of the Site along the eastern coastal boundary.

Habitats around the turbine bases within the designated survey radius was comprised primarily of *Improved Agricultural Grassland (GA1)*, *Arable Crop (BC1)*, *Buildings and Artificial Surfaces (BL3)*, *Dry meadows and grassy verges (GS2)* and *Scrub (WS1)* along with *Hedgerows (WL1)*.

3.

METHODS

3.1

Collision Monitoring

3.1.1

Search Area

At the time of surveys/scope design there was no standardised boundary surrounding a wind turbine for the detection of bird and bat fatal collisions. The search distance from turbine bases was calculated using a variety of techniques. Recommendations on search areas are listed below.

- Atienza (2011) states *“the ground search area has to be at least 10% more than the rotor diameter”*.
- According to Edkins (2014) *“search width should be equal to the maximum rotor tip height”*.
- Rodrigues (2015) advises a search area with *“a radius equal to the total height of the wind turbine, as bats that collide can be blown away from the turbine by strong winds”*, but due to the impracticality of a 250mx250m search area *“it is advisable to search a smaller area (not less than 50m radius)”*.
- Smallwood (2020) suggests a 50m search area surrounding turbine bases.
- Young (2003) demonstrates how that the majority of bird strikes on wind turbines occur 63 meters or less from the turbine base. And that the chance of carcasses being found outside of this area has recently increased due to the steadily rising turbine height.

At Ballywater Wind Farm, given that the maximum turbine rotor tip height is 99m, a survey search area of a 50m circumference centred on each turbine base was considered appropriate. To record coverage of each search area around turbines (unless otherwise noted due to impeding factors), the dog and handler movement is tracked using Garmin K5 tracking collars and Alpha 200i devices. All carcasses found within the search area, regardless of species, are recorded.

Collision Monitoring Surveys were designed to identify and establish the number and species of bird and bat fatalities suspected to have been brought on by collision with wind turbines. For carcasses where the cause of death was uncertain, the fatality was, according to Johnson *et al.* (2003), assigned to the wind farm. Furthermore, when species identification is questionable, like the case of decaying remains or feather spots, samples can be submitted for DNA analysis.

Surveys were undertaken monthly at the site between October 2023 and September 2024. Monthly searches allowed for results to be gathered for bird and bat casualties year-round. Dog-lead searches for bird and bat carcasses were conducted by a dog and trainer team, as outlined in Table 3-1 below. The search methodology and trials used to inform carcass detection probability are described below.

3.1.2

Dog-lead Searches

Searches were conducted through dog-lead surveys, broadly following the methodologies recommended by Bennet (2015).

Before each survey, meteorological data (temperature and wind speed) and ground cover details (habitat) were recorded. When a bird or bat carcass was discovered, the GPS location, a photograph, the distance from the turbine, ITM and the date and time were recorded. The carcass condition was assessed as:

- intact (carcass that is completely intact or not badly decomposed);
- scavenged (evidence that the carcass was fed upon by a predator);
- or feather spot (ten or more feathers indicating predation or scavenging or two or more primary feathers must be present to consider the carcass a casualty).

Carcass searching work was calibrated to account for the ability of the search dog to find bird and bat carcasses and likelihood of scavenging by predators. This ensured a more accurate estimation of the total number of potential collision victims.

3.2

Scavenger Removal Trials

The scavenger removal trials are conducted monthly by leaving a carcass (facing a camera trap) in plots located within the search radius, on a variety of habitats, for a minimum of 21 days, or until scavenger(s) removed the carcasses, before retrieving them. A total of two camera traps were placed on site per month during the duration of the survey with locations being moved each month. Browning Strike Force Trail Camera model BTC-5PX-1080 along with 64GB SD cards were chosen for use. Low numbers of carcasses are placed at a time on a site to avoid scavenger swarming, this is when high number of carcasses on site attract higher than usual numbers of scavengers. A determination on carcass removal was made when no body parts containing flesh or bone or >10 disarticulated feathers could be found. Scavenger removal rate was then determined by the amount of scavenging that occurred in the intervening period.

3.3

Searcher Efficiency

To ensure a more accurate estimation of the total number of fatalities, dog-lead searches were calibrated to account for the dog's ability to find bird and bat carcasses (searcher efficiency) and the likelihood of carcasses not being found due to scavenging by animals (scavenger removal).

The searcher efficiency trials were carried out at a randomly chosen time during the survey cycle by planting a mixture of bird and bat carcasses within the site and allowing the dog team to search for them. Searcher efficiency was then based on the percentage retrieval success. One worker left carcasses within the various habitats proportional to habitat representativity in the search area, and the dog and trainer team searched for them in the following hours. This time period aided in hiding any scent of the worker laying the carcasses, and allowed a double-blind test to be conducted where the detection team is unaware of the carcasses location in order to simulate as accurately as possible a survey without handler's bias.

3.4

Collision Rates

Collision-related mortality at the wind farm was estimated using the GenEst software package (version 1.4.9; Dalthorp *et al.*, 2023). The results of carcasses found during collision monitoring surveys was input into a model, along with information on the wind farm and survey, such as the number of turbines, the area surveyed and the survey effort. This generated an estimate of mortality at the wind farm, which was then corrected for searcher efficiency, scavenger removal and detection probability, based on the results of the trials.

4.

RESULTS

4.1

Collision Monitoring

4.1.1

Dog-lead Carcass Searches

Throughout the Collision Monitoring Surveys undertaken from October 2023 to September 2024, one hundred and three fatalities were discovered. As outlined in Section 3.1, for carcasses where the cause of death was uncertain, the fatality was assigned to the wind farm (Johnson, 2003). The results of the carcass found are outlined in Table 4-1 below. Further detailed results are outlined in Appendix 1.

4.2

Scavenger Removal Trial

Scavenger removal trials conducted over the duration of the survey cycle sought to gain an insight into scavenger activity levels on site. Results from the scavenger removal trials, represented in Table 4.2, show that predation time varies on the site. It should be noted that in one of the scavenger removal trials the camera trap was not triggered for the predation event although the carcass was gone upon retrieval. In these cases, maximum days before predation were attributed. The median number of days a carcass persisted on site for was **14.64 days** when including the one event not captured on camera, suggesting medium predation. Predators recorded were predominantly foxes, but hooded crows were also recorded.

Table 4.2 Scavenger Removal Trial Results

Turbine	Carcass	Date and time laid	Date and time scavenged/recovered	Total time before predation (days)	Predator
9	Small mouse	25/10/2023 10:22	29/10/2023 09:37	3.97	Hooded crow
11	Small mouse	25/10/2023 09:06	08/11/2023 07:13	13.92	Fox

22	Small mouse	16/11/2023 10:47	16/11/2023 15:00	0.18	Hooded crow

4.3

Searcher Efficiency Trial

During surveys on the 26/02/2024, fourteen carcasses were randomly placed throughout the site without the dog team being aware of location or number of carcasses placed. Of the fourteen carcasses laid for the dog searcher efficiency trial one blackbird was predated on. Of the other 13 carcasses, 12 were found by the dog team, thus the efficiency rate for Ballywater Wind Farm was 92% with the exclusion of the predated carcass. Details shown in Table 4-3.

Table 4-3 Efficiency Trial Results

Collision Rates

Collision-related mortality at the wind farm was estimated using the GenEst software package (version 1.4.9; Dalthorp *et al.*, 2023). The results of carcasses found during collision monitoring surveys was input into a model, along with information on the wind farm and survey, such as 1) the number of turbines, 2) the area surveyed and 3) the survey effort. This generated an estimate of mortality at the wind farm, which was then corrected for 4) searcher efficiency, 5) scavenger removal and 6) detection probability, based on the results of the trials.

Results

Results for Ballywater Wind Farm, with 1) 21 turbines (42 megawatts). The search area at each turbine base comprised a 2) 50m circle and 3) 100% of the search area was surveyed. Surveys were conducted by trained dogs Cain, Clay, Taio, Kizzy, Kynren, Mac, Niffler, Monty, Rufus and Ziba, with handlers Jessica Sara, Caroline Finlay and Cathal Bergin (LANTRA Qualified).

- 4) Searcher efficiency was 92% (median = 0.92 [CI 0.68-0.99])
- 5) The median number of days a carcass persisted was 10.13 days,
- 6) Detection probability was 0.39 [CI 0.26-0.52])

Birds

The model estimates with 90% confidence that between **171 and 369 bird fatalities** occurred over the study period at the wind farm (estimated mortality = 235.75 birds [confidence intervals 170.59-368.82]. This scales to 11.23 [CI 8.12-17.56] birds per turbine per year or 5.61 [CI 4.06-8.78] birds per megawatt hour.

Bats

The model estimates with 90% confidence that between **17 and 47 bat fatalities** occurred over the study period at the wind farm (estimated mortality = 27.13 bats [confidence intervals 16.54-47.45]. This scales to 1.29 [CI 0.79-2.26] bats per turbine per year or 0.65 [CI 0.39-1.13] bats per megawatt hour.

5.

DISCUSSION AND CONCLUSION

Fatalities recorded at the site were frequent during the surveys carried out between October 2023 and September 2024. In total, 93 bird and 10 bat fatalities were recorded over a 1-year period. Bird species recorded included *corvid spp.*, *gull spp.* (amber), *swan spp.* (amber), egret, buzzard, kestrel (red) and duck species, which are a mix of Green, Amber and Red listed in Birds of Conservation Concern in Ireland. Bat species include Leisler's bat, common and soprano pipistrelle which are common and widespread across Ireland.

GenEst results provided above estimated that no more than 369 bird and 47 bat fatalities could occur over a 12-month period on the entire windfarm site.

Continued post-consent monitoring is recommended and proposed at the site.

APPENDIX 10-1

GLOSSARY OF TERMS

APPENDIX 10.1 - GLOSSARY OF ACOUSTIC TERMINOLOGY

A – Weighting	The “A” suffix denotes the fact that the sound levels have been “A-weighted” in order to account for the non-linear nature of human hearing.
Background Noise	The noise level rarely fallen below in any given location over any given time period, often classed according to day time, evening or night time periods. The $L_{A90,10min}$ is the parameter that is used to define the background noise level in this instance. L_{A90} is the sound level that is exceeded for 90% of the sample period. It is typically used as a descriptor for background noise.
dB (decibel)	The unit normally employed to measure the magnitude of sound. It is defined as 20 times the logarithm of the ratio between the RMS pressure of the sound field and the reference pressure of 20 micro-pascals (20 μ Pa).
dB(A)	An ‘A-weighted decibel’ – a measure of the overall noise level of sound across the audible frequency range (20 Hz – 20 kHz) with A-frequency weighting (i.e. A – Weighting) to compensate for the varying sensitivity of the human ear to sound at different frequencies.
Hub Height Wind Speed	The wind speed at the centre of the turbine rotor.
Hertz (Hz)	The unit of sound frequency in cycles per second.
$L_{Aeq,T}$	This is the equivalent continuous sound level. It is a type of average and is used to describe a fluctuating noise in terms of a single noise level over the sample period (T). The closer the L_{Aeq} value is to either the L_{AF10} or L_{AF90} value indicates the relative impact of the intermittent sources and their contribution. The relative spread between the values determines the impact of intermittent sources such as traffic on the background.
L_{AF90}	Refers to those A-weighted noise levels in the lower 90 percentile of the sampling interval; it is the level which is exceeded for 90% of the measurement period. It will therefore exclude the intermittent features of traffic and is used to estimate a background level. Measured using the “Fast” time weighting.
L_{den}	Refers to the L_{Aeq} noise levels over a whole day, but with a penalty of 10 dB(A) for night-time noise (23:00-07:00) and 5 dB(A) for evening noise (19:00-23:00), also known as the day evening night noise indicator.
Low Frequency Noise	LFN - noise which is dominated by frequency components towards the lower end of the frequency spectrum.
Noise	Sound that evokes a feeling of displeasure in the environment in which it is heard, and is therefore unwelcomed by the receiver
Noise Sensitive Location (NSL)	Any dwelling house, hotel or hostel, health building, educational establishment, place of worship or entertainment, or any other facility or other area of high amenity which for its proper enjoyment requires the absence of noise at nuisance levels.

octave band	A frequency interval, the upper limit of which is twice that of the lower limit. For example, the 1,000Hz octave band contains acoustical energy between 707Hz and 1,414Hz. The centre frequencies used for the designation of octave bands are defined in ISO and ANSI standards.
Pascal (Pa)	Pascal is a unit of pressure and so sound pressures are measured in Pascals.
Sound Power Level (LW)	The sound power level radiated by a source is defined as: $L_W = 10 \log_{10} \left(\frac{W}{W_0} \right) \text{ dB}$ where W is the acoustic power of the source in Watts (W) and W₀ is a reference sound power chosen in air to be 10⁻¹² W.
Sound Pressure Level (Lp)	The sound pressure level at a point is defined: $L_P = 20 \log_{10} \left(\frac{P}{P_0} \right) \text{ dB}$ where P is the sound pressure and P₀ is a reference pressure for propagation of sound in air and has a value of 2x10⁻⁵Pa.
Tonal	Sounds which cover a range of only a few Hz which contains a clearly audible tone i.e. distinguishable, discrete or continuous noise (whine, hiss, screech, or hum etc.) are referred to as being 'tonal'.
10 Minute Average Wind Speed (m/s)	The wind speed measured by an anemometer at a specified height above ground level, averaged over a 10-minute period.
Wind Shear	The increase of wind speed with height above ground.

1.0 NOISE

1.1 Introduction

1.1.1 *Statement of Authority*

This Report has been prepared by Mr Brendan O'Reilly of Noise and Vibration Consultants Ltd. Mr. O'Reilly has a Masters degree on noise and vibration from Liverpool University and has over 35 years experience in noise and vibration control (and many years experience in preparation of noise impact statements) and is a member of a number of professional organisations. Mr. O'Reilly was a co- author and project partner (as a senior noise consultant) in 'ENVIRONMENTAL QUALITY OBJECTIVES Noise in Quiet Areas' administered by the Environmental Protection Agency on behalf of the Department of the Environment, Heritage and Local Government (as a first step towards implementation of the EC Directive relating to the Assessment and Management of Environmental Noise (EU, 2002).

Noise & Vibration Consultants have considerable experience in the assessment of noise impact and have compiled studies for in excess of 60 planned wind farm developments throughout Ireland ranging in size from 1 to 40 turbines.

1.1.2 *Introduction*

A wind farm development, consisting of twenty one wind ENERCON turbines each of hub height 64m with maximum power output of 2MW, has been consented and has been fully operational for a number of years at Ballywater, Courtown, Co. Wexford. The Ballywater wind farm was permitted by planning permission 20010458. The developer commissioned Noise and Vibration Consultants Ltd to undertake a noise survey to assess compliance with the planning permit.

1.1.3 *Noise Limits*

The noise limits for residential properties are given in Condition 19 of the planning permission Condition 19 states:

Noise levels from the proposed development when measured at the nearest inhabited house shall not exceed 40dBA (15 minute Leq) at wind speed of 5m/s and 45dBA (15 minute Leq) at a wind speed in excess of 10m/s. Measurements shall be made in accordance with ISO Recommendations R1996/1 'Acoustics-Description and Measurement of Environmental Noise, Part 1: Basic qualities

and procedures, In the event that the reviews show that any turbine may have a detrimental impact, mitigating measures shall be proposed and submitted for agreement of the Planning Authority.

1.2 Acoustic Terminology

Sound is simply the pressure oscillations that reach our ears. These are characterised by their amplitude, measured in decibels (dB), and their frequency, measured in Hertz (Hz). Noise is unwanted or undesirable sound, it does not accumulate in the environment and is normally localised. Environmental noise is normally assessed in terms of A-weighted decibels, dB (A), when the 'A weighted' filter in the measuring device elicits a response which provides a good correlation with the human ear. The criteria for environmental noise control are of annoyance or nuisance rather than damage. In general a noise level is liable to provoke a complaint whenever its level exceeds by a certain margin the pre-existing noise level or when it attains an absolute level. A change in noise level of 3 dB (A) is 'barely perceptible'; while an increase in noise level of 10 dB (A) is perceived as a twofold increase in loudness. A noise level in excess of 85 dB (A) gives a significant risk of hearing damage.

1.3 Wind Farm Environment

The wind farm is located in a rural agriculture area close to the sea. In a rural area such as this and where most wind farms (in areas of high mean wind speeds) are located the background noise and total noise is predominately dominated by wind speed effects on vegetation and obstacles. Other noise sources in the locality is farming activity, low level traffic flow, birds and waves from the sea at locations close to the shore.

1.4 Noise Monitoring for Baseline and Operational

To establish the noise levels from the wind turbines some baseline monitoring data was required in addition to monitoring the operational wind farm. The baseline noise monitoring was obtained during periods of the wind farm shut down over a range of wind speeds.

Noise monitoring locations

Figure 1 – As Constructed Turbine Locations and Noise Monitoring Locations

Figure 2 – As Constructed Turbine Locations and Noise Monitoring Locations

The noise monitors were set up 16th June prior to a 6 day planned shutdown of the wind farm and the monitoring was extended to 22nd July '15 for a total of 5 weeks during which time enough data was not obtained over a sufficient range of wind speeds. Mean wind speeds never exceeded 9m/s for sufficient time to derive a best-fit plot. It became evident from weather forecasts that wind speeds of up to 12m/s were unlikely for a significant period into the future. The second period of noise monitoring with periods of wind farm shut down was set up based on weather forecasts commenced on 21st October and extended to 20th November '15. During this second phase of monitoring wind speeds above 12m/s were achieved bringing the cumulative noise monitoring periods to 9 weeks (see Appendix 1 for monitoring data.)

Most of the nearest houses to the development are located southwest to northwest of the wind farm so to obtain down wind conditions easterly wind direction was required. Easterly winds generally do not exceed 8 to 9m/s.

A 10m portable wind mast was set up on the wind farm site approximately 300m due west of T05 and upwind of the prevailing winds so that the wake effects of the wind farm would be negligible.

A rain gauge was located 10m from the portable wind mast. Wind speed and direction data for baseline and operational noise survey is given in Appendix 2. The six monitoring locations were as given in Figure 1 and 2 with photos in Appendix 3.

The six noise monitoring locations were as follows:

Locations H03

The measurement location H03 was located approximately 30m from ho3 and facing towards the wind farm

Location H04

The measurement location representing H04 was located immediately across the road in the field approximately 30m nearer the wind farm.

Location H10

The measurement location representing H10 was directly across the road in a field facing directly towards the wind farm.

Location H16

The measurement location representing H16 was in the field on the boundary of H16 site with part of the wind farm to the northeast and southwest.

Location H20

The measurement location representing H20 was on the site boundary at the back of the house facing the wind farm to the east.

Location H31

The measurement location representing H31 was located in field as marked on map with clear view of turbines.

1.5 Noise Monitoring Methodology and Noise Limits

The methodology carried out in this report is in the main compliant with:

Department of Environment, Heritage and Local Government 'Wind Energy Development Guidelines 2006'.

ISO 1996-1:2003 Description, Measurement and Assessment of Environmental Noise: Part 1: Basic Quantities and Assessment Procedures.

The Assessment and Rating of Noise from Wind Farms (ETSU-R-97) –the UK energy Technology Support Unit.

A Good Practice Guide to the Application of ETSU-R-97 for the Assessment and Rating of Wind Turbine Noise, Institute of Acoustics, May 2013.

'Supplementary Guidance Note 5: Post Completion Measurements, July 2014'- this is a supplementary guidance to A Good Practice Guide.

The Wind Energy Development Guidelines and best practice recommends measurements using the L90 descriptor and 10 minute intervals. The planning permission which takes precedence states that the noise level shall not exceed 40dBA (15 minute Leq) at a wind speed of 5m/s and 45dBA (15 minute Leq) at a wind speed in excess of 10m/s. The L90 descriptor is recommended since it is the only descriptor which allows reliable wind turbine measurements to be made without corruption from relatively loud transitory noise events from other sources. The relationship between Leq and L90 for wind turbines is accepted as $Leq = L90 + 2$ or $L90 = Leq - 2$. Therefore the noise limits with measurements as L90 become equal to fixed limits of:

- 40dB(A) 15 minute Leq at 5m/s becomes 38dB(A) L90 at 5m/s
- 45dB(A) 15 minute Leq at 10m/s and above becomes 43dB(A) L90 at above 10m/s and above

It is usually necessary to carry out around 1 month of monitoring to obtain the necessary range of data points for wind speed and directions when using 10 minute intervals. However planning

states 15 minute intervals (1 months monitoring at 10 minute intervals would equate to the same amount of data points as 1.5 months at 15 minute intervals).

The noise limits apply to turbine noise only, and not the total measured noise level around the site. The noise limits apply only to noise from the development which is the subject of the planning consent as the operator has no control over noise from any other developments. To assess the wind turbine noise levels it is necessary to determine the level of any other noise in the area, as it varies with wind speed, so that it can be subtracted from the total measured noise level at each wind speed. To determine application of noise limits it is standard practice to consider downwind conditions because of the propagation effects. Downwind conditions can generally be defined for each location as conditions in which the angle between the wind direction and the direct line from any turbine to the measurement location considered is no greater than ± 45 degrees. For large or extended wind farms it is normal to only consider the turbines primarily contributing to the receptor noise levels. Because of the layout of this wind farm with respect to houses many receptors are considered as downwind at no greater than ± 90 degrees. The angle of downwind is given for each receptor. All wind speeds are referenced to 10m height and synchronised to noise levels measurements.

The following conditions were adhered to in undertaking the surveys:

- Measurement of operational noise levels using 15-minute intervals was undertaken during varied wind speeds using noise instruments which comply with Type 1 standard in IEC 651-1: 1979.
- Concurrent measurements of average wind speed / direction and noise levels were recorded at 15-minute intervals – the wind data was taken from a temporary 10m height wind mast which was sited up wind of wind turbines (up wind of prevailing S to SW winds).
- Monitoring locations were selected representing some of the nearest receptors surrounding the development.

1.6 Instrumentation used in Noise Survey

The following instrumentation was used in the operational noise survey measurements:

- Five Larson Davis 812 Precision Integrating Sound Level Analyser/Data logger with 900B Pre-amplifier and 1/2" Pre-polarised Microphone.
- One Larson Davis 831 Precision Integrating Sound Level Analyser/Data logger and 1/2" Pre-polarised Microphone.
- Microphones mounted on tripods at a height of 1.2 metres above ground level and fitted with double skin windscreens based on that specified in W/13/00386/REP 'Noise Measurements in Windy Conditions'
- Calibration type: Larson Davis Precision Acoustic Calibrator Model CAL200.
- Rain gauge type: Davis Instruments Vantage pro2 weather station with rainfall data in Appendix 4.

Details on Calibration and Calibration Certification of Noise Systems

The noise monitors were calibrated before and after each noise survey and the drift of calibration was less than 0.2dB. All instruments have been calibrated with pre-amp and microphone, with certificates in Appendix 5.

1.7 Noise Data and Processing for Wind Turbine Noise

The wind turbine SCADA data was synchronised with wind speed, direction and noise monitoring times. Periods when all turbines were not fully operational and when wind farm was shut-down were filtered out along with periods of heavy rainfall which was likely to impact on noise levels. Periods of atypical (bird song or farm activity) levels were also filtered. To eliminate periods when aforementioned activity or movement around dwellings were at a minimum, the data for analysis was filtered into night-time data from 23.00 to 07.00hrs. The Supplementary Guidance Note 5: Post Completion measurements issued by the Institute of Acoustics (July'14), suggests that it may be useful to filter out all data except that measured between 2300 to 0400hrs to avoid competing noise, however to obtain sufficient data to compile graphs over the range of wind speeds it was decided to use a longer period of 23.00 to 07.00hrs.

The background noise levels were obtained from periods of shut-down (see Appendix 6) during the 9 week monitoring period and this data was filtered out from the 'operational' noise data.

The downwind turbine noise to the nearest houses H3, H4 and H10 exist for north, east and south east wind conditions. These conditions do not occur frequently and when they do, the wind speeds rarely go above a mean wind speed of 8-9m/s.

The downwind turbine noise to houses in the direction of H31 exists in north east, east and south east wind conditions. These conditions occur more frequently than east wind and obtaining wind speeds above 10m/s becomes an easier task.

The downwind turbine noise towards H16, prevail for west, south west and south winds. These conditions are frequent and are the dominant prevailing wind conditions.

The data for analysis was filtered to hours between 2300 and 07.00hrs and the following wind directions were assessed at each location:

- For H3 downwind, the data was filtered corresponding to less than 180 degrees (+/- 90 degrees).
- For H4 downwind, the data was filtered corresponding to above 315 degrees and less than 135 degrees.
- For H10 downwind, the data was filtered into data that corresponded to greater than 270 degrees.
- For H16 downwind, the data was filtered corresponding to less than 90 degrees (+/- 45 degrees).
- For H16 downwind, the data was also filtered corresponding to less than 180 degrees and less than 270 degrees (+/- 45 degrees). At this house location there were turbines northeast and also in opposite direction – southwest direction from the measurement location.
- For H20 downwind, the data was filtered corresponding to less than 180 degrees (+/- 90 degrees).

- For H31 downwind, the data was filtered corresponding to above 45 degrees and less than 180 degrees.

The prevailing 'operational' L90 noise level has been calculated based on the methodology contained in a Good Practice Guide to the Application of ETSU-R-97 for the Assessment and Rating of Wind Turbine Noise (SGN 4 & 5). The mean 15 minute wind speeds were taken from a 10m mast on site (upwind of prevailing wind). The wind speeds were then calculated to hub height wind speed using a wind shear of 0.2 and then recalculated to 10m height using a roughness length of 0.05m (methodology as given in Guidance Note 1 (d) and in Appendix 7). After filtering of the noise data the wind speed data was plotted against the measured noise levels. The methodology uses a polynomial regression line calculated through the background (L90) noise data for each 15 minute period to give the prevailing background noise data. A 2nd, 3rd or 4th order polynomial regression line is then plotted through the L90 noise data. The choice of order of polynomial regression line is based upon whichever order of curve gives the *best-fit* to the measured data. A similar methodology was used when analysing the captured 'background' L90 noise data and wind speeds (data with no turbines operational).

The final graphs plotted against wind speed shows two data sets; one for 'operational' downwind noise (i.e. with turbines operating) and one for the background / baseline noise data. The calculated wind turbine noise is then determined by subtracting the best-fit baseline noise data from the downwind operational noise.

A plot of the downwind noise data across the range of wind speed with planning noise limits included is given in Figures 2 to 9 inclusive. An analysis and calculations of the wind turbine noise levels in down-wind conditions at each location is given in Table 1.

1.8 Assessment / Commentary

In Table 1, the turbines noise levels are determined by subtracting the background (L90) levels from the operational (L90) measured levels. The term ΔL is used to denote the difference between the recorded wind turbine noise levels and the recommended limit. A negative value indicates that the wind turbine noise level is within the noise limit. It should be noted, however, that where the shut-down noise approaches the operational noise, the level of shut-down noise has an increasing effect on the calculated turbine noise such that when the difference between the two is 3db or less, it is inappropriate to use a correction with any degree of accuracy. The term 0 is also used where the background noise approaches and exceeds the operational noise. Where the background noise is greater than the operational noise then compliance is likely to be demonstrated (the operational noise being background + turbines).

The ENERCON turbines of 64m hub height achieve maximum sound power levels at a standardised wind speed of 9m/s. Accordingly the noise levels from the wind turbines at a wind speed of 9m/s will represent maximum sound power noise levels. In Table 1 the noise levels at 9m/s is within compliance for all locations including Location H20 where the background is marginally above the operational which makes compliance likely. Down wind was carried out for two directions for H16 as wind turbines are in directly opposite directions from this location.

At 5m/s, the total noise (operational noise which includes background noise) is below the noise limits at all locations and in compliance with planning.

1.9 Conclusion

During the noise survey period the noise levels from the wind farm was compliant with the planning noise limits at 5m/s and at 10m/s and above. Furthermore the wind turbines operating on site attain maximum sound power level at wind speeds of 9m/s.

1.0 INTRODUCTION

AWN completed a background noise survey at strategic locations surrounding the existing Ballywater Wind Farm Co. Wexford. The noise survey was undertaken to inform the environmental noise impact assessment for the proposed continued operation of the Wind Farm. This note has been prepared to provide details of the assessment methodology and result of the derived background noise levels at the relevant Noise Monitoring Locations (NMLs).

2.0 BACKGROUND NOISE SURVEY

The noise survey and subsequent data analysis was carried out in accordance with best practice following the guidance contained in the Institute of Acoustics publication *A Good Practice Guide to the Application of ETSU-R-97 for the Assessment and Rating of Wind Turbine Noise* (May 2013), (IOA GPG).

2.1 Selection of Measurement Locations and Methodology

The intent of the survey was to measure background noise at representative locations for typical noise sensitive locations surrounding the development. As the wind farm was operational, the survey locations were identified with consideration of the potential turbine noise contribution from the existing Ballywater turbines and supported by reviewing aerial images and street side images where available on websites e.g., Google Earth and Bing Maps. The suitability of any location to be representative of, or a 'proxy' for, other locations, was determined through on-site observations and review of predicted turbine noise levels and the measured background noise data.

The assessment methodology in the EIAR is in accordance with the Institute of Acoustics document *A Good Practice Guide to the Application of ETSU-R-97 for the Assessment and Rating of Wind Turbine Noise* (2013) hereafter referred to as the IOA GPG.

The following text summaries the guidance from the IOA GPG for the selection of background noise survey locations:

- The selection of suitable noise monitoring locations for background noise surveys is not straightforward and only general guidance can be given as it is not possible to be prescriptive.
- Often there are practical constraints on where equipment can be placed, and a considerable degree of experience-based judgement is required when selecting these positions.
- Any contribution to background noise levels of noise from an existing wind farm must be excluded when assigning background noise and setting noise criteria for wind turbine noise.
- No general guidance can therefore be given on the number of measurement locations as this will be site-specific.

A robust assessment of the noise impacts of the wind farm necessitates a detailed survey of the background noise at noise sensitive locations (NSLs) in the vicinity of the wind farm. As mentioned in section 2.2.2 of the IOA GPG: *'Any contribution to background noise levels of noise from an existing wind farm must be excluded when assigning background noise and setting noise limits for a new development.'* There are a number of ways of achieving this, as described in section 5.2 of IOA GPG:

5.2.2 *Where a new wind farm is proposed and a receptor is also within the area acoustically affected by an already operational wind farm, then noise from the existing wind farm must not be allowed to influence the background noise measurements for the proposed development.*

5.2.3 *In the presence of an existing wind farm, suitable background noise levels can be derived by one of the following methods:*

- *switching off the existing wind farm during the background noise level survey (with associated significant cost implications);*
- *accounting for the contribution of the existing wind farm in the measurement data e.g. directional filtering (only including ground data when it is not influenced by the existing turbines e.g. upwind of the receptor, but mindful of other extraneous noise sources e.g. motorways) or subtracting a prediction of noise from the existing wind farm from the measured noise levels;*
- *utilising an agreed proxy location removed from the area acoustically affected by the existing wind farm/s; or*
- *utilising background noise level data as presented within the Environmental Statement/s for the original wind farm/s (the suitability of the background noise level data should be established).*

With the exception of switching off the turbines (site shutdown), all of the above methods are proposed to assist the noise impact assessment.

Three locations were selected in a desktop exercise, on the basis of being outside the 35 dB L_{A90} noise contour and other typical criteria for selecting background noise survey measurement locations in order to serve as a proxy location for NSL closer to the turbines. The noise environment at the locations selected must be typical of the noise environment at other nearby locations. Another location (NML4) was identified close to the turbines in an attempt capture the operational noise.

A total of four background noise monitoring locations were recommended in addition to 6 no. alternative locations. Following a period of time agreements were made between the client representative and landowners to install noise monitors at four locations.

2.1 Measurement Locations

Location	Coordinates (ITM)		Location with respect to dwelling
	Easting	Northing	
NML1	717,809	645,103	40 m to NW of dwelling
NML2	719,760	646,911	18 m to W of dwelling
NML3	722,100	646,810	57 m to S of dwelling
NML4	720,342	645,472	32 m to SW of dwelling

Table 2 Coordinates of Noise Monitoring Equipment

Figure 1 shows the locations each of the monitoring location in the context of the surrounding area.

Figure 1 Location of NMLs, showing 2 km buffer from turbines

2.2 Measurement Periods

The periods of noise measurements used in the background noise monitoring assessment are outlined in Table 3. The survey was deemed completed when an

adequate number of datasets had been measured as recommended in the IOA GPG to determine a suitable representation of the typical background noise.

Location	Start Date	End Date
NML1	11:10 on 01 February 2024	10:08 on 04 March 2024
NML2	11:50 on 01 February 2024	11:49 on 15 March 2024
NML3	13:10 on 01 February 2024	05:55 on 12 March 2024
NML4	15:10 on 01 February 2024	17:21 on 10 March 2024

Table 3 Measurement periods of Noise Monitoring Equipment

Before and after the survey the measurement apparatus was check calibrated using a Brüel & Kjær type 4231 Sound Level Calibrator where appropriate. Instruments were calibrated on each interim visit and any drift noted. All calibration drifts were less than ± 0.4 dB and within acceptable tolerances outlined in the IOA GPG.

2.3 Instrumentation

The following instrumentation was used at the various locations:

Location	Equipment	Serial Number	Calibration Date	Max Calibration Drit over Survey Period
NML1	Rion NL-52	564808	Sept 2023	+0.4
NML2	Rion NL-52	164427	May 2022	0.0
NML3	Rion NL-52	186671	May 2022	+0.1
NML4	Rion NL-52	976162	Sept 2022	0.0

Table 4 Noise Monitoring Instrumentation

2.3 Rainfall Data

Rain fall was monitored and logged using two Texas Instruments TR-525 data loggers that were installed at Locations NML1 and NML2 over the duration of the survey.

2.4 Measurement of Wind Data

Average wind speed and direction data from each turbine in 10-minute intervals was measured at the turbine hubs and provided to AWN.

These wind speeds were then corrected to the 'standardised' 10 m wind speed in accordance with the IOA GPG. The 'standardised' wind speed is the industry standard for referencing for wind speeds with respect to wind turbines.

Figure 2 presents the distributions of wind speed and wind direction standardised to 10 metre height over the survey period detailed in Table 4.

Figure 2 Distributions of Wind Speeds and Directions Over the Survey Period

3.0 RESULTS

3.1 Data Analysis

The following sections present a summary of the methodology carried out on the noise monitoring data to derive the background noise curves at each NML.

3.1.1 Assessment Periods

The results presented in the following sections refer to the noise data collated during 'quiet periods' of the day and night as defined in the IOA GPG. These periods are defined in Table 5.

Period Description	Period Definition
Daytime (Amenity Hours)	ETSU-R-97 defines the amenity hours as: 18.00 to 23.00 Monday to Friday; 13.00 to 23.00 on Saturdays; and, 07.00 to 23.00 on Sundays.
Night	ETSU-R-97 defines the night-time hours as 23.00 to 07.00 every day

Table 5 Daytime and Night Periods

The data sets have been assessed separately for both daytime and night-time periods and analysed with respect to the methods outlined in the IOA GPG.

3.1.2 Noise from Existing Turbines

As discussed above in Section 2.1, any contribution to the measured noise levels from existing wind turbines must be excluded when deriving background noise levels and setting noise limits for wind turbine noise.

Table 6 summarises important information relevant to this aspect of the methodology.

Location	Nearest turbine to measurement location	Analysis details
NML1	T03 is 1325 m to SE	Background noise represented by upwind sectors S, SW and NW.
NML2	T21 is 1412 m to SW	Background noise represented by upwind sectors W, NW and N.
NML3	T22 is 1579 m to SW	- Downwind is represented by sectors SE, S, and W (SW not included to minimise potential influence of wind turbines) - Upwind is represented by N sector. - Measured levels affected by sea wave noise: upwind levels higher than downwind levels. - Predicted wind turbine noise levels more than 10 dB below measured downwind levels. - Therefore, downwind levels considered representative of background noise.
NML4	T24 is 415m to E	Measured levels affected by sea wave noise. Estimate of background noise levels obtained by using NW sector and subtracting predicted turbine noise levels.

Table 6 Location-specific methodology details

3.1.3 Atypical Noise Data

The data sets have been filtered to remove issues such as periods affected by rainfall, dawn chorus and the influence of other atypical noise sources. An example of atypical sources would be short, isolated periods of raised noise levels attributable to local sources, agricultural activity, boiler flues, operation of gardening equipment etc. This approach is in line with the guidance contained in the IOA GPG.

3.2 Wind Shear

Wind shear is defined as the increase of wind speed with height above ground. The issue of wind shear has been considered in this assessment and followed relevant

guidance as outlined in the IOA GPG. It is standard procedure to reference noise data to standardised 10 metre height wind speed.

In this instance, the wind speed measurements were made at 64 m hub height. The measured hub height wind speeds were then corrected to standardised 10 metre height wind speed.

The Calculated hub height wind speeds have been standardised to 10 m height using the following equation:

$$\text{Roughness Length Shear Profile: } U_1 = U_2 \times \left[\frac{\ln(H_1/z)}{\ln(H_2/z)} \right]$$

Where:

H ₁	The height of the wind speed to be calculated (10m)
H ₂	The height of the measured or calculated HH wind speed.
U ₁	The wind speed to be calculated.
U ₂	The measured or calculated HH wind speed.
Z	The roughness length.

Note: A roughness length of 0.05m is used to standardise hub height wind speeds to 10m height in the IEC 61400-11:2003 standard, regardless of what the actual roughness length seen on a site may have been. This 'normalisation' procedure was adopted for comparability between test results for different turbines.

Any reference to wind speed in this chapter should be understood to be the standardised 10m height wind speed reference unless otherwise stated.

3.3 Derived Background Noise Levels

Appendix B presents the preliminary regression analysis for daytime and night-time periods from each NML from which the background noise levels have been derived.

The derived background noise levels dB L_{A90,10min} for daytime are presented in Table 7.

Locations	Period	Background Noise Levels dB L _{A90} at standardised 10m height wind speed m/s for 64.0 m Hub Height							
		3	4	5	6	7	8	9	10
NML1	Day	26.3	26.7	28.8	31.9	35.7	39.7	43.4	46.5
NML2	Day	29.8	30.3	31.6	33.8	36.4	39.2	42.0	44.5
NML3	Day	29.2	29.8	31.7	34.4	37.4	40.3	42.5	43.7
NML4 Upwind	Day	29.9	31.9	34.2	36.5	38.7	40.3	41.3	41.2

Table 7 Derived Background Noise Levels at Assessment Hub Height – Daytime

The derived background noise levels dB L_{A90,10min} for night-time are presented in Table 8. In the case of NML4, the data collected did not allow a robust analysis.

Locations	Period	Background Noise Levels dB L _{A90} at standardised 10m height wind speed m/s for 64.0 m Hub Height							
		3	4	5	6	7	8	9	10
NML1	Night	22.7	22.6	25.3	29.8	35.5	41.4	--	--
NML2	Night	22.8	25.1	27.8	30.8	34.0	37.3	40.8	--
NML3	Night	24.2	25.9	28.5	31.8	35.3	38.8	41.9	44.3
NML4	Night	--	--	--	--	--	--	--	--

Table 8 Derived Background Noise Levels at Assessment Hub Height – Night-time

APPENDIX A GLOSSARY OF TERMS

Background noise	The noise level rarely fallen below in any given location over any given time period, often classed according to day time, evening or night-time periods.
dB	Abbreviation for 'decibel'.
dB(A)	Abbreviation for the decibel level of a sound that has been A-weighted.
Dawn Chorus	Noise due to birds which can occur at sunrise.
Decibel	The unit normally employed to measure the magnitude of sound.
Directivity	The property of a sound source that causes more sound to be radiated in one direction than another.
L_{A90}	The noise level exceeded 90% of the time during a measurement period, often used for the measurement of background noise.
Level	The general term used to describe a sound once it has been converted into decibels.
Sound level meter	An instrument for measuring sound pressure level.

APPENDIX B REGRESSION ANALYSES

The following graphs present the 'upwind' data sets for each location. In each case, the daytime data is presented first and the night-time data below.

NML 1 Daytime - Upwind (Southwest, West and Northwest):

Ballywater Wind Farm - NML-1 Upwind

NML 1 Night-time - Upwind Southwest, West and Northwest):

Ballywater Wind Farm - NML-1 Upwind

NML 2 Daytime - Upwind (West, Northwest and North):

Ballywater Wind Farm - NML-2 Upwind**NML 2 Night-time - Upwind (West, Northwest and North):****Ballywater Wind Farm - NML-2 Upwind**

NML 3 Daytime – Downwind (West, South and Southeast):**Ballywater Wind Farm - NML-3 Downwind****NML 3 Night-time – Downwind (West, South and Southeast):****Ballywater Wind Farm - NML-3 Downwind**

NML 3 Daytime – Upwind (North):**NML 3 Night-time – Upwind (North):**

NML 4 Night-time – Downwind (Northeast, East):**Ballywater Wind Farm - NML-4 Downwind****NML 4 Daytime – Downwind (Northeast, East):****Ballywater Wind Farm - NML-4 Downwind**

NML 4 Day (all periods¹) – Upwind (Northwest)**Ballywater Wind Farm - NML-4 Upwind****NML 4 Night (all periods) – Upwind Northwest**

In the case of NML4, the data collected did not allow a robust analysis.

APPENDIX 10-4

NOISE MODEL PARAMETERS

APPENDIX 10.4 – NOISE MODEL PARAMETERS

Prediction calculations for turbine noise have been conducted in accordance with ISO 9613: *Acoustics – Attenuation of sound outdoors, Part 2: General method of calculation*, 1996. Guidance in terms of the calculation settings has been obtained from the *Institute of Acoustics (IOA) Good Practice Guide to the Application of ETSU-R-97 for the Assessment and Rating of Wind Turbine Noise* (2013) (IOA GPG) and its associated supplementary guidance notes. The following are the main aspects that have been considered in terms of the noise predictions presented in this instance.

Ground Effect:

Ground effect is the result of sound reflected by the ground interfering with the sound propagating directly from source to receiver. The prediction of ground effects is inherently complex and depend on source height receiver height propagation height between the source and receiver and the ground conditions.

The ground conditions are described according to a variable defined as G, which varies between 0.0 for hard ground (including paving, ice concrete) and 1.0 for soft ground (includes ground covered by grass trees or other vegetation).

Noise predictions have been carried out using a source height corresponding to the hub height of the proposed turbines, a receiver height of 4 m and a ground effect factor of $G = 0.5$.

Geometrical Divergence

This term relates to the spherical spreading in the free-field from a point sound source resulting in an attenuation depending on distance according to the following equation:

$$A_{geo} = 10 \log(d) - 11 \text{ dB}$$

where d = distance from the source

A wind turbine may be considered as a point source beyond a distance corresponding to one rotor diameter.

Atmospheric Adsorption

Sound propagation through the atmosphere is attenuated by the conversion of the sound energy into heat. This attenuation is dependent on the temperature and relative humidity of the air through which the sound is travelling and is frequency dependent with increasing attenuation towards higher frequencies.

In accordance with the guidance set out in the IOA GPG for calculations, a temperature of 10°C and a relative humidity of 70% have been used, which give relatively low levels of atmosphere attenuation and corresponding worst case noise predictions.

Topographic Screening

Flat topography was used for all noise prediction calculation.

APPENDIX 10-5

**ENERCON SOUND POWER LEVEL
E70 E4 TURBINE DATA DOC**

The sound power level of the ENERCON E-70 E4 with 2000 kW rated power and 71 m rotor diameter is given as follows:

Hub height	<u>calculated</u> sound power level an tonality for 10 m/s in 10 m height
65 m	102,0 dB(A) 0 - 1 dB
85 m	102,0 dB(A) 0 - 1 dB
98 m	102,0 dB(A) 0 - 1 dB
114 m	102,0 dB(A) 0 - 1 dB

1. ENERCON turbines with their variable operational control guarantee that a given sound power level is being kept over the entire life of the turbine.
2. ENERCON guarantees that there is no tonality for all hub heights over the whole power range.
3. The sound power level for the reference wind speed of 10 m/s in 10 m height refers to the sound power level for 95% of the rated power according to FGW guidelines.
4. The design of the ENERCON turbines (no fast rotating parts – therefore no mechanical wear) guarantees that no increase of machinery noise will occur during the entire life of the turbines.
5. At the future time official measurements of the sound power level will be carried out according to the latest guidelines (FGW guidelines - technical guidelines to determine sound power levels of wind energy converters, Fördergesellschaft Windenergie e.V., based on IEC guidelines 61400-11 ed. 2 and DIN 45681 for the evaluation of tonality). According to the guidelines a measurement accuracy of $\pm 1\text{dB(A)}$ will be assumed.
