## **Annex A**

### **ADMS Results**

## 1. Introduction

This is an update to NIS Appendix L Air Quality submitted to An Bord Pleanála in October 2018 as part of the application for approval of the proposed N6 GCRR pursuant to Section 51 of the Roads Act 1993 (as amended). It forms part of the response to the request by ABP for further information in December 2023 where they requested GCC to “*Update the appropriate assessment screening document and the Natura Impact Statement including updated site conversation objectives*”. Where there have been any changes to the assessment and/or any updates since 2018, these have been set out in this updated Appendix L.

This report has been prepared to consider potential air quality impacts as they relate to European sites and is included as an appendix to the Natura Impact Statement for the proposed N6 Galway City Ring Road (GCRR) and the proposed development at Galway Racecourse, hereafter referred to as the Project.

The key changes to this report since the 2018 NIS involve updating:

- the description of the receiving environment and impact assessments to take account of changes, new developments, updated traffic surveys and traffic modelling outputs, etc.
- updated assessment through the application of the new TII Air Quality Standard
- new software to calculate transport emissions – REM tool
- to take account of new monitoring, new developments, updated modelling results etc.

The study considers the construction and operation phases of the Project. As this report is based on a completely new assessment based on new methodology, any errata or corrigenda identified during the oral hearing in 2020 for the proposed N6 GCRR are no longer relevant to the updated chapter.

## 2. Air quality standards and limit values

In December 2022, the Ambient Air Quality Standards Regulations 2022 came into force and transposed EU Directive 2008/50/EC on ambient air quality and cleaner air for Europe into Irish law. The purpose of the Air Quality Regulations is to:

- Establish limit values and alert thresholds for concentrations of certain pollutants
- Provide for the assessment of certain pollutants using methods and criteria common to other European member states
- Ensure that adequate information on certain pollutant concentrations is obtained and made publicly available
- Provide for the maintenance and improvement of ambient air quality where necessary

The limit values established under the Air Quality Regulations relevant to this assessment (pollutants of concern) are included in Table 1.

**Table 1 Limit Values in the Air Quality Regulations (Source: Ambient Air Quality Standards Regulations 2022)**

Pollutant	Limit Value for the Protection of:	Averaging Period	Limit value ( $\mu\text{g}/\text{m}^3$ )	Basis of Application of Limit Value
NO <sub>2</sub> (Nitrogen Dioxide)	Human Health	1-hour	200	$\leq 18$ exceedances p.a. (99.79%ile)
		Calendar year	40	Annual mean
NO <sub>x</sub> (Oxides of Nitrogen)	Vegetation	Calendar year	30	Annual mean
PM <sub>10</sub> (Particulate Matter)	Human Health	24-hours	50	$\leq 35$ exceedances p.a. (90%ile)
		Calendar year	40	Annual mean
PM <sub>2.5</sub> (Particulate Matter)	Human Health	Calendar year	25	Annual mean

On the 10 of December 2024, the EU Directive 2024/2881/EC came into force on ambient air quality and cleaner air for Europe. This Directive (2024/2881/EC) is an amendment and replacement of the preceding Directives 2004/107/EC and 2008/50/EC and must be implemented into law by each member state within two years. The 2024/2881/EC Directive sets new limit values for pollutants that EU Member States must comply with by 2026 and 2030. These limits are listed in Table 2. However, as the Government of Ireland is yet to transpose this into Irish Law, the current limit values as per the Air Quality Regulations 2022 apply to the air quality assessment of the Project.

**Table 2 Limit Values set by the EU Directive 2024/2881/EC which have yet to be transposed into Irish Law**

Pollutant	Limit Value for the Protection of:	Averaging Period	Limit Value ( $\mu\text{g}/\text{m}^3$ ) by 2026	Basis of Application of Limit Value	Limit Value ( $\mu\text{g}/\text{m}^3$ ) by 2030	Basis of Application of Limit Value
NO <sub>2</sub> (Nitrogen Dioxide)	Human Health	1-hour	200	$\leq 18$ exceedances p.a.	200	$\leq 3$ exceedances p.a.
		Calendar year	40	Annual mean	20	Annual mean
NO <sub>x</sub> (Oxides of Nitrogen)	Vegetation	Calendar year	30	Annual mean	30	Annual mean
PM <sub>10</sub> (Particulate Matter)	Human Health	24-hours	50	$\leq 35$ exceedances p.a.	45	$\leq 18$ exceedances p.a.
		Calendar year	40	Annual mean	20	Annual mean
PM <sub>2.5</sub> (Particulate Matter)	Human Health	Calendar year	25	Annual mean	10	Annual mean

The Ambient Air Quality Standards Regulations outline an annual critical level for NO<sub>x</sub> for the protection of vegetation and natural ecosystems in general. The CAFE Directive defines ‘Critical Levels’ as:

*‘a level fixed on the basis of scientific knowledge, above which direct adverse effects may occur on some receptors, such as trees, other plants or natural ecosystems but not on humans’.*

Critical load is defined by IAQM (2019) as:

*Deposition flux of an air pollutant below which significant harmful effects on sensitive ecosystems do not occur, according to present knowledge. Usually measured in units of kilograms per hectare per year (kg/ha/yr)*

The critical loads are obtained from the Air Pollution Information System (APIS) website (Centre for Ecology and Hydrology), refer to Table 3.

**Table 3 Critical Loads / Levels at Sensitive Designated Habitats (APIS 2022)**

	Nitrogen Deposition Critical Load (kgN/ha/yr)	Ammonia Critical Level ( $\mu\text{g}/\text{m}^3$ )
Maximum	30	3
Minimum	5	1

In accordance with TII Standard, sensitive designated habitats within 200m of the affected road network and all European sites within a 2km buffer of the Project are considered. There are three sensitive designated habitats located within 2km: Lough Corrib SAC, Galway Bay Complex SAC and Moycullen Bogs NHA. The Lough Corrib SAC is located immediately adjacent to the Project. The Moycullen Bogs NHA is located within 40m of the Project.

The Galway Bay Complex SAC is located more than 200m from the Project, however, it is located in proximity to a number of links where reductions in traffic volumes are predicted. Therefore, an assessment of the positive impact of such traffic reductions is presented.

With regards to larger dust particles that can give rise to nuisance dust, there are no statutory guidelines, at European or national level, regarding the maximum dust deposition levels, that may be generated during construction activities. However, Verein Deutscher Ingenieure (VDI) German Technical Instructions on Air Quality Control - TA Luft standard for dust deposition (VDI 2002) (non-hazardous dust) provides a guideline for the rate of dust deposition of 350 mg/m<sup>2</sup>/day averaged over one year. The EPA concurs that this guideline may be applied, although the EPA typically applies the guideline limit as a 30-day average.

This guidance value is applied to monitor dust impacts from the construction of the Project.

## 3. Air quality assessment

### 3.1 Construction phase

Dust emissions are likely to arise from the following activities:

- Site clearance including demolitions
- Utility diversions
- Foundation construction
- Site excavation

- Use of generators
- Stockpiling of excavated materials
- Handling of construction materials
- Construction traffic movements

### **Dust Emission Magnitude**

The IAQM (Institute of Air Quality Management) guidance<sup>1</sup> was used to assess the potential air quality impacts on ecological sensitive designated habitats during the construction phase.

Each dust generating activity has been assigned a dust emission magnitude as shown in Table 4.

**Table 4 Dust Emission Magnitude for Construction Activities**

Activity	Dust Emission Magnitude	Reasoning
Earthworks	Large	Total site area >110,000m <sup>2</sup>
Construction	Large	Onsite concrete batching
Track-out	Large	>50 HDV (>3.5t) outward movements in any one day
Demolition	Medium	Total building volume 12,000m <sup>3</sup> – 75,000m <sup>3</sup> , potentially dusty construction material, demolition activities 6-12m above ground level

### **Sensitivity of the Area**

The sensitivity of the area to ecological sensitive designated habitats has been assigned as high, due to the number of sensitive designated habitats within 200m distance from dust generating activities.

The overall sensitivity has been summarised as shown in Table 5.

**Table 5 Outcome of Defining Sensitivity of Area (Source: IAQM Guidance)**

Potential Impact	Risk			
	Earthworks	Construction	Track-out	Demolition
Ecological	High	High	High	High

Taking into consideration the dust emission magnitude and the sensitivity of the area, the risk of dust impacts is presented in Table 6.

**Table 6 Risk of Dust Impacts to Define Mitigation**

Potential Impact	Risk			
	Earthworks	Construction	Track-out	Demolition
Ecological	High	High	High	Medium

The impact risk is assigned, as shown in Table 6, prior to the implementation of mitigation measures. On this basis, the direct impact on air quality during the construction phase has the potential to be negative, significant, and short-term in proximity to the works.

<sup>1</sup> Assessment of dust from demolition and construction 2024 V2.2

Mitigation measures will be employed during the construction phase to minimise any off-site impacts, refer to the Construction Environmental Management Plan in Appendix C of this updated NIS for further details. Specifically, a 2m dust screen will be provided at the locations in the areas of the overlap of the proposed N6 GCRR and the Lough Corrib cSAC.

### 3.2 Operational phase

This section considers the potential effects of the Project on ecological sensitive designated habitats. All predicted concentrations include for maximum background concentrations. Results are presented below using TII REM tool. Refer to Appendix 1 for the results using the ADMS model. In general, the ADMS outputs are consistent with the TII REM tool in the immediate vicinity of the proposed Project, however, pollutant concentrations reduce at a greater rate with increased separation from the proposed Project with the ADMS model compared to TII REM tool.

#### 3.2.1 Opening Year – 2031

The predicted change in NOx concentrations due to the projected changes in operational phase AADT (2031) at the ecological sensitive designated habitats is presented in Table 7. Based on the significance criteria, within 50m of the Project a moderate adverse rating is predicted at Lough Corrib SAC with slight adverse effects predicted within 60m. Beyond 70m and beyond 40m at all Moycullen Bogs NHA receptor points, a neutral effect is predicted.

Predicted concentrations NOx including the implementation of the Project are in compliance with AQLV. Refer to Chapter 8, Biodiversity for an analysis of the potential implications for the ecological sensitive designated habitats.

**Table 7 Predicted NOx Concentrations at Various Distances from the Project - 2031**

Ecological Sensitive Designated Habitat	Distance to Project (m)	Do-Minimum Concentrations ( $\mu\text{g}/\text{m}^3$ ) (Background)	Do-Something Concentrations ( $\mu\text{g}/\text{m}^3$ ) (Including Background)	% Change in Concentration Relative to AQLV	% Do-Something Relative to AQLV	Impact Rating
Lough Corrib SAC	0	6.3	16.31	33.4	54.4	Moderate adverse

	180	1.9	2.01	0.4	6.7	Neutral
	190	1.9	1.99	0.3	6.6	Neutral
	200	1.9	1.97	0.2	6.6	Neutral

The predicted change in ammonia concentrations due to the projected changes in operational phase AADT (2031) at the ecological sensitive designated habitats is presented in Table 8 and compared to the maximum critical level of  $3\mu\text{g}/\text{m}^3$  as presented in Table 3. Based on the significance criteria, within 30m of the Project a substantial adverse rating is predicted at Lough Corrib SAC with a moderate adverse predicted within 90m. Moderate adverse effects are also predicted at 40m from the Moycullen Bogs NHA. Refer to Chapter 8 Biodiversity for an analysis of the potential implications for the ecological sensitive designated habitats.

**Table 8 Predicted Ammonia concentrations at Various Distances from the Project - 2031**

Ecological Sensitive Designated Habitat	Distance to Project (m)	Do-Minimum Concentrations ( $\mu\text{g}/\text{m}^3$ ) (background)	Do-Something Concentrations ( $\mu\text{g}/\text{m}^3$ ) (including background)	% Change in Concentration Relative to AQLV	% Do-Something relative to AQLV	Impact Rating

	200	1.1	1.11	0.3	37.0	Neutral

The predicted change in nitrogen deposition due to the projected changes in operational phase AADT (2031) at the ecological sensitive designated habitats is presented in Table 9 at various distances from the Project. Predicted deposition rates are compared to the maximum critical load of 30kgN/ha/yr as presented in Table 3. Total nitrogen deposition is predicted to comply with critical loads at all receptors in Lough Corrib SAC and Moycullen Bogs NHA in 2031.

**Table 9 Predicted Nitrogen Deposition - 2031**

	160	4.3	4.55	15.2
	170	4.3	4.48	14.9
	180	4.3	4.48	14.9

<b>Ecological Sensitive Designated Habitat</b>	<b>Distance to Project (m)</b>	<b>Do-Minimum Deposition (kgN/ha/yr) (background)</b>	<b>Do-Something Deposition (kgN/ha/yr) (including background)</b>	<b>% Total Deposition Relative to Maximum Critical Load</b>
	190	4.3	4.47	14.9
	200	4.3	4.39	14.6

Based on the significance criteria and as the total deposition is greater than 1% of the maximum (and minimum) critical load, the results are to be analysed by the biodiversity practitioner.

### 3.2.2 Design Year – 2046

The predicted change in NOx concentrations due to the projected changes in operational phase AADT (2046) at the ecological sensitive designated habitats is presented in Table 10. Based on the significance criteria, within 40m of the Project a moderate adverse rating is predicted at Lough Corrib SAC with slight adverse effects predicted within 60m. Beyond 70m a neutral effect is predicted. For all Moycullen Bogs NHA receptor points a neutral effect is predicted.

Predicted concentrations NOx including the implementation of the Project are in compliance with AQLV.

**Table 10 Predicted NOx Concentrations at Various Distances from the Project - 2046**

The predicted change in ammonia concentrations due to the projected changes in operational phase AADT (2046) at the ecological sensitive designated habitats is presented in Table 11 and compared to the maximum critical level of  $3\mu\text{g}/\text{m}^3$ . Based on the significance criteria, within 40m of the Project a substantial adverse rating is predicted at Lough Corrib SAC with a moderate adverse predicted within 100m. Moderate adverse effects are predicted within 50m of the Moycullen Bogs NHA.

**Table 11 Predicted Ammonia Concentrations at Various Distances from the Project - 2046**

Ecological Sensitive Designated Habitats	Distance to Project (m)	Do-Minimum Concentrations ( $\mu\text{g}/\text{m}^3$ ) (background)	Do-Something Concentrations ( $\mu\text{g}/\text{m}^3$ ) (including background)	% Change in Concentration Relative to AQLV	% Do-Something Relative to AQLV	Impact Rating

The predicted change in nitrogen deposition due to the projected changes in operational phase AADT (2046) at the ecological sensitive designated habitats is presented in Table 12 at various distances from the Project. Predicted deposition rates are compared to the maximum critical load of 30kgN/ha/yr (see Table 3). An exceedance of total nitrogen deposition is predicted within 10m of the proposed Project in 2046 at the Lough Corrib SAC. Total nitrogen deposition is predicted to comply with critical loads at all receptors in Moycullen Bogs NHA in 2046.

**Table 12 Predicted Nitrogen Deposition - 2046**

<b>Ecological Site</b>	<b>Distance to Project (m)</b>	<b>Do-Minimum Deposition (kgN/ha/yr) (background)</b>	<b>Do-Something Deposition (kgN/ha/yr) (including background)</b>	<b>% Total Deposition Relative to Maximum Critical Load</b>

	90	4.3	5.39	18.0
	100	4.3	5.14	17.1
	110	4.3	4.97	16.6

Ecological Site	Distance to Project (m)	Do-Minimum Deposition (kgN/ha/yr) (background)	Do-Something Deposition (kgN/ha/yr) (including background)	% Total Deposition Relative to Maximum Critical Load
	120	4.3	4.81	16.0
	130	4.3	4.72	15.7
	140	4.3	4.64	15.5
	150	4.3	4.55	15.2
	160	4.3	4.55	15.2
	170	4.3	4.55	15.2
	180	4.3	4.47	14.9
	190	4.3	4.47	14.9
	200	4.3	4.39	14.6

Based on the significance criteria and as the total deposition is greater than 1% of the maximum (and minimum) critical load, the results are to be analysed by the biodiversity practitioner.
