1 ONSHORE BIODIVERSITY – SUPPORTING INFORMATION – ADDENDUM

This Addendum provides further information to supplement appendix 19-1: Onshore Biodiversity – Supporting Information of the Environmental Impact Assessment Report (EIAR volume 2C).

It has been prepared in response to a Request for Further Information (RFI) from An Coimisiún Pleanála (ACP) (formerly An Bord Pleanála (ABP)) regarding the planning application (case reference ABP-319799-24) for the Oriel Wind Farm Project (hereafter referred to as "the Project"), which stated:

"The applicant is requested to confirm whether any on-going or additional surveying has been carried out since the application was lodged and, if so, the applicant is invited to submit any further survey data results and update the planning application documentation, as appropriate."

This Addendum provides the following onshore biodiversity baseline information collected between the period September 2023 and July 2025:

- Habitats and flora:
  - Terrestrial (June 2024 and May 2025).
  - Freshwater aquatic (July 2025).
  - Invasive alien plants and animals (June 2024 and May 2025).
- Fauna:
  - Bats
    - Preliminary Ground Level Roost Assessment (June 2024 and May 2025).
    - Night-time bat walkover (NBW) surveys (May, July and September 2024).
    - Static bat activity (May to September 2024).
  - Badger (June 2024 (onshore route) and February 2025 (Joint bays 1 to 4).
  - Otter (July 2025)
  - Amphibians and reptiles (all surveys)
  - Birds
    - Breeding bird surveys (April to July 2025).
    - Intertidal bird surveys (September 2023 to March 2025).
    - Offshore cable corridor surveys (October 2023 to March 2025).

This baseline data supplements the baseline data presented in appendix 19-1: Onshore Biodiversity – Supporting Information (EIAR volume 2C) and is used to inform the updated assessment in chapter 19 Addendum: Onshore Biodiversity (EIAR volume 2C Addendum).

The section and subsection headings in this Addendum correspond to those used in appendix 19-1: Onshore Biodiversity – Supporting Information (EIAR volume 2C). The reader is directed to review the information presented in this Addendum alongside the baseline presented in the EIAR chapter.

1.1 Field study

1.1.1 Habitats and flora

Terrestrial

Surveys were conducted on 5 and 6 June 2024; and 20 and 21 May 2025. There are no changes to the methodology employed to carry out these surveys, as described in appendix 19-1: Onshore Biodiversity – Supporting Information (volume 2C).

Freshwater aquatic

Surveys were conducted on 14 and 15 July 2025. There is no change to the methodology employed to carry out this survey, as described in appendix 19-1: Onshore Biodiversity – Supporting Information (EIAR volume 2C).

1.1.2 Fauna

Bats

Preliminary ground level roost assessment

A preliminary ground-level roost assessment was carried out on 5 and 6 June 2024; and 20 and 21 May 2025. Surveys were conducted in line with updated guidance *Bat Surveys for Professional Ecologists: Good Practice Guidelines. 4th Edition* (Collins, 2023) (previously Collins, 2016), which was published in October 2023. The results of the assessment were used to grade trees in line with Collins (2023) as being PRF – I (Potential Roost Feature suitable for Individual bats) or PRF – M (Potential Roost Feature suitable for Multiple bats) features suitable for roosting bats.

Commuting and foraging habitats

Site walkovers were completed on the 5 and 6 June 2024; and 20 and 21 May 2025 to assess the potential suitability for bats, based on the presence of habitat features within the landscape. This assessment followed the BCT (Bat Conservation Trust) guidelines (Collins, 2023), which categorises the suitability of commuting and foraging habitats into negligible, low, moderate, and high, based on a combination of habitat features, connectivity, and professional judgement.

Night-time bat walkover and static survey

Night-time bat walkovers (NBW) were conducted on 15 May, 1 July and 4 September 2024. There is no change to the methodology employed to carry out these surveys, as described in appendix 19-1: Onshore Biodiversity – Supporting Information (EIAR volume 2C).

Badger

Badger surveys were conducted on 5 and 6 June 2024 (onshore substation site and the onshore cable route); and 18 February 2025 (joint bays 1 to 4 only, following an amendment to the location of the onshore cable route to address concerns raised by TII (see chapter 5 Addendum: Project Description (EIAR volume 2A Addendum)). There is no change to the methodology employed to carry out these surveys, as described in appendix 19-1: Onshore Biodiversity – Supporting Information (EIAR volume 2C).

Otter

Surveys for otter were carried out on 14 and 15 July 2025. There is no change to the methodology employed to carry out this survey, as described in appendix 19-1: Onshore Biodiversity – Supporting Information (EIAR volume 2C).

Limitations

There were some limitations to the otter surveys undertaken in July 2025 at the following locations due to access restrictions:

- Site A1 – survey was restricted to the lands downstream of the N33 due to dense and impenetrable vegetation which could not be fully searched;
- Site A2 – survey was restricted to the immediate vicinity of the bridge and 150 m downstream of same. Survey downstream of the bridge was undertaken bankside on the righthand bank (looking downstream). Due to steep banks and water depth, the river could not be surveyed from the channel. Dense vegetation immediately downstream of the bridge could not be fully searched;
- Site A3 – surveys were restricted to a distance of approximately 150 m downstream of the bridge. Water depth precluded survey from the river channel downstream of this point. Lands upstream of the bridge were not accessible;
- Site A9 and A10 – otter surveys were restricted to the immediate area of the works as access to upstream and downstream reaches were not possible; and
- A11 – survey undertaken approximately 70 m downstream of culvert on N33.

Other protected mammals

During all onshore biodiversity surveys of the Project, the potential was also noted for habitats of other protected terrestrial mammal species to occur including; hedgehog *Erinaceus europaeus*, pygmy shrew *Sorex minutus*, pine marten *Martes martes*, Irish stoat *Mustela erminea*, red squirrel *Sciurus vulgaris*, Irish hare *Lepus timidus hibernicus*, and red deer *Cervus elaphus*.

Birds

Onshore

Onshore bird survey

There are no changes to appendix 19-1: Onshore Biodiversity – Supporting Information.

Breeding bird survey

Breeding bird surveys were carried out monthly from April 2025 to July 2025 at the landfall, along the onshore cable route and at the onshore substation site. There is no change to the methodology employed to carry out these surveys, as described in appendix 19-1: Onshore Biodiversity – Supporting Information (EIAR volume 2C).

Intertidal

Intertidal bird surveys were carried out monthly from September 2023 to March 2025, focusing within a 300 m buffer of the landfall location. This 300 m extent has been based on a ‘rule of thumb’ as set out in Cutts *et al.* (2013) in the waterbird disturbance mitigation toolkit and was extended to 500 m in September 2023 to increase the focus area of surveys (see Figure 1A-5 to Figure 1A-7). There is no change to the remaining methodology employed to carry out this survey, as described in appendix 19-1: Onshore Biodiversity – Supporting Information (EIAR volume 2C).

Offshore vantage point surveys

The offshore vantage point surveys (cable corridor) were conducted bi-monthly from October 2023 to March 2025 from a single fixed Vantage Point (VP) at Dunany Point (see Figure 1A-7). This VP consisted of a 2 km viewshed (with a 180° viewing arc) covering an area of the offshore cable corridor located between the landfall location and the Offshore Ornithology Study Area / Boat-based and Aeriel Survey Area defined in chapter 11: Offshore Ornithology (EIAR volume 2B) (see Figure 1A-7). The VP’s 180° viewing arc was divided into six 30° survey sections, further subdivided into four 500 m distance bands from the surveyor(s) to facilitate detailed spatial recording of bird distribution and behaviour.

Surveyors arrived on site at least 30 minutes prior to the survey start time to minimise disturbance and allow birds to acclimate to their presence. Surveys were carried out twice monthly, with one high tide and one low tide covered each month. Surveys commenced 90 minutes prior to the tidal condition and concluded 90 minutes after the tidal condition, with a total of six hours of observation effort per month. Equipment used included binoculars (10x42 magnification) and a telescope (20-60x eyepiece).

Survey scans of the viewshed were conducted every 30 minutes with birds on the water surface/interacting with the water (e.g. feeding) being the primary focus. Additional snapshot counts of birds in flight were recorded once counts of birds on/interacting with the water's surface were counted. Species identification, abundance, behaviour (feeding, loafing, roosting, flying), and location within sectors and distance bands were recorded systematically every 30 minutes, resulting in six scans per survey.

Environmental variables such as wind direction, weather, sea state, and turbidity were recorded throughout surveys. Disturbances including vessel traffic and human presence were noted along with any observed effects on bird behaviour. Records of marine mammals were also maintained.

Amphibians and reptiles

During all onshore biodiversity surveys of the Project, the potential was also noted for amphibian and reptile habitats.

Invertebrates

Terrestrial

During walkover surveys of the Project and wider Zone of Influence (ZoI), the potential was also noted for habitats of protected invertebrate species to occur including marsh fritillary *Euphydryas aurinia* and small blue *Cupido minimus*. In the case of these two butterfly species, searches were made of suitable habitats for the larval food plants of marsh fritillary (devil's bit scabious *Succisa pratensis*), and small blue (kidney vetch *Anthyllis vulneraria*).

Freshwater aquatic

Surveys were conducted on 14 and 15 July 2025. There is no change to the methodology employed to carry out this survey, as described in appendix 19-1: Onshore Biodiversity – Supporting Information (EIAR volume 2C).

Fish

Surveys were conducted on 14 and 15 July 2025. There is no change to the methodology employed to carry out this survey, as described in appendix 19-1: Onshore Biodiversity – Supporting Information (EIAR volume 2C).

1.2 Baseline Environment

1.2.1 Desk Study

There are no changes to appendix 19-1: Onshore Biodiversity – Supporting Information.

1.2.2 Field Study

Habitats

Habitats detailed during the field study (June 2024, May 2025 and July 2025) and within the ZoI of the Project are illustrated in Figure 1A-2; which includes the relevant habitat codes from Fossitt (2000) for onshore habitats (terrestrial and freshwater). A summary of each habitat, where changes have occurred, is provided within this section.

Freshwater

FW2 Depositing/lowland rivers

Updated habitat description for depositing/lowland rivers recorded crossing and within the ZoI of the Project are provided in Table 1A-1 below. Surveys were undertaken at the eight sites as shown in Figure 1-5: Aquatic Ecology Sites of appendix 19-1: Onshore Biodiversity – Supporting Information (EIAR volume 2C) from watercourses detailed in Table 1A-1.

Table 1A-1: Freshwater habitat descriptions.

Site code/ name	Freshwater aquatic habitat results (July 2025)	Site photographs
A-1 / Rock 06 Stream	**Survey Results** This site comprised a small first order tributary of the River Dee which was accessed from the N33. Two pipes (approximately 30 cm diameter) underneath the N33 convey the stream from its source directly upstream. Two smaller pipes were also recorded discharging water to the stream. There was very shallow flow present within the pipes, with a maximum depth of <5 cm. Bankfull width was typically 2 m (wider near the culvert outlets), whereas wetted width was approximately 1.2 m. Water depth was 0.15 m. The hydromorphology of the stream was considerably degraded. A thick layer of silt was noted within the channel, and in unshaded sections the channel was chocked with vegetation (namely fool's watercress *Helosciadium nodiflorum*). The substrate comprised predominantly silt, with small amounts of sand (10%), coarse gravel (5%) and fine gravel (5%) recorded immediately downstream of the culvert pipe outlets. A high plume of silt was generated when the substrate was disturbed. The river habitat comprised approximately 95% pool and 5% run habitat, with the faster flowing run recorded immediately downstream of the culvert pipes. Velocity was slow, and became stagnant where the channel was choked with vegetation. Flow discharge was low. The channel has been historically channelised and straightened, with high bank heights recorded (left bank height was approximately 1.2 m, right bank height was approximately 2.2 m). Surrounding landuse comprised improved pasture, woodland and scrub. The riparian buffer comprised woodland/scrub on the left bank and scrub on the right bank. Bankside vegetation included willow, hawthorn, ash, elder, hazel, ivy (*Hedera helix*), nettles, great willowherb, herb robert, hogweed, reed canary grass (*Phalaris arundinaceae*), common reed (*Phragmites australis*), bindweed, brambles, hart's tongue fern, dock, and soft shield fern (*Polystichum setiferum*).	 **Left**: Site A-1 looking downstream. Channel not visible due to dense instream vegetation. **Right**: Site A-1 looking upstream. Small area of exposed substrate at culvert outlet. Photographs taken 15 July 2025.

Site code/ name	Freshwater aquatic habitat results (July 2025)	Site photographs
A-2 / River Dee at N33 bridge crossing	**Survey Results** This site is located on the main stem of the River Dee. The channel of the River Dee has been historically dredged as part of Arterial Drainage Schemes (ADS) and this is reflected in the high banks, widened and straightened profile and realtively deep flow that characterised this section of the river. The channel is an OPW ADS channel (reference code: C2(1)). Landuse in the area comprised tillage and scrub, with some industrial buildings located downstream. The river was surveyed for a distance (approximately 150 m) upstream of the N33 bridge, and at and immediately downstream of the bridge. Upstream of the N33 bridge, the river had uniform flow (100% deep glide habitat). Velocity was slow. The banks were high (approximately 3 m). Wetted and bankfull width were approximately 7 m. Dense stands of emergent macrophytes were recorded on the river margins with *Phalaris arundinacea*, *Schoenoplectus lacustris* and *Sparganium erectum* recorded. Diatom growth was noted on the stems of the emergent macrophytes. *Potomogeton* sp. was also noted growing in the channel. Due to water depth and moderate turbidity, the substrate was not visible. The riparian buffer on the left bank was approximately 1 m, comprising tall herb vegetation which transitioned into tillage. The buffer was wider on the right bank, and comprised tall herb and woody vegetation which also transitioned into tillage. No bank erosion was noted, but bank visibility was obscured by marginal vegetation and overhanging riparian vegetation. Riparian vegetation comprised nettles, great willow herb, cleavers, meadowsweet, sycamore, willow, apple, hawthorn, thistle and bindweed. At and immediately downstream of the N33 bridge, more diverse flow was recorded (50% run, 30% glide and 20% pool). Consequently, velocity was recorded as moderate-fast at this location. The substrate comprised boulder (5%), cobble (45%), coarse gravel (30%), fine gravel (10%), sand (5%) and silt (5%). Moderate-low siltation was noted, and a low silt plume formed when the substrate was disturbed. Turbidity was initially moderate, however, over a period of one hour, the turbidity in the river increased significantly, with the river turning brown and opaque (see image in right column). Shading was heavy due to overhanging vegetation and the N33 bridge. Significant bank and channel modificiations at the bridge were noted, with gabion mattresses that extended from the bank into the channel recorded under the bridge. A concrete structure (possible headwall, formerly	 **Left**: Site A-2 upstream of bridge, looking upstream. **Right**: Site A-2 upstream of bridge, looking downstream. Photographs taken 15 July 2025.

Site code/ name	Freshwater aquatic habitat results (July 2025)	Site photographs
	referred to as a deflector) was noted on the left bank downstream of the bridge. The moss *Fontinalis antipyretica* was recorded growing in the channel at this location. The riparian buffer immediately upstream and downstream of the bridge was wide (>20 m), and comprised mostly woody vegetation including birch, brambles, ivy, sycamore, hazel, rose, cotoneaster, dogwood and alder.	 **Left**: Site A-2 at bridge, looking upstream prior to turbidity increase. **Right**: Site A-2 at bridge, looking upstream after turbidity increase. Photographs taken 15 July 2025.

Site code/ name	Freshwater aquatic habitat results (July 2025)	Site photographs
A-3 / River Dee at Drumcar Bridge	**Survey Results** This survey site is located approximately 4.7 km downstream (by river) of site A-2 and is located on the mainstem of the River Dee. This section of the Dee also forms part of the OPW ADS (reference code: C2(1)). The river was surveyed in detail from the bridge to a distance of approximately 50 m downstream, however a 150 m reach downstream was also walked as part of the otter survey. Steep banks (1.7 – 3 m) and historic spoil mounds on the banks indicate historic alterations of the river channel. Rock armour was noted on the left bank downstream of the bridge and bridge piers were in the channel. Notwithstanding the historic alterations, the overall hydromorphology of the river at this location was improved compared with site A-2. Bankfull width of the River Dee was measured at approximately 12 m, whereas wetted width was measured at 10 m. The channel was considerably wider at the bridge (approximately 20 m). Flow was normal and velocity fast. Turbidity was low and no colour was noted. Visibility of the substrate was excellent. Within faster flowing riffle/run habitat, the substrate comprised boulder (5%), sand (5%), cobble (15%), coarse gravel (35%) and fine gravel (40%). Stands of water-crowfoot *Ranunculus* sp., were frequently recorded in the faster-flowing habitats within the channel, as well as the moss *Fontinalis antipyretica* which was abundant. Extensive filamentous algae and diatom growth was recorded on the substrate, particularly in slower flowing sections of the river. *Vaucheria* (1% cover) was also noted in the channel. Hemlock water-dropwort (*Oenanthe crocata*), water mint (*Mentha aquatica*), branched bur-reed (*Sparganium erectum*), reed canary grass *Phalaris arundinacea* and common club-rush *Schoenoplectus lacustris* were recorded growing in the margins. Water depth was estimated at 0.2 m within the faster flowing run habitat that dominated the survey reach. The large pool immediately downstream of the bridge was likely to exceed 1 m depth in places. Siltation was typically low, and when the substrate was kicked a low plume was generated. The dominant river habtiats were riffle/run (50%), glide (20%) and pool (30%). In-channel hydromorphological features included a vegetated mid-channel bar (colonised by *Phalaris arundinacea*), an unvegetated side bar (right bank) and exposed tree roots. Deep glide/pool habitat was recorded downstream of the survey reach, and rock armour was recorded on the right bank at this location. Upstream of the bridge, pool/glide habitat was recorded.	 **Top**: Site A-3 looking upstream. **Bottom**: Site A-3 looking downstream. Photographs taken 14 July 2025.

Site code/ name	Freshwater aquatic habitat results (July 2025)	Site photographs
	Sand martins and grey wagtail were recorded foraging immediately downstream of the bridge.	 **Left**: Site A-3 filamentous algae and diatom growth on substrate. **Right**: Site A-3 looking upstream from bridge. Photographs taken 14 July 2025.

Site code/ name	Freshwater aquatic habitat results (July 2025)	Site photographs
A-4 / Newhall 06 Stream	**Survey Results** The stream at this site comprises a small first order tributary of the Dillonstown Stream. This stream was surveyed in detail immediately downstream of the road crossing at this location. The river immediately upstream and parallel to the road (2023 survey location) was densely vegetated and difficult to access, however, a visual assessment from the bank top at this location was possible during the July 2025 survey. Surrounding landuse comprised tilage, improved pasture, scrub and residential (house and garden present on right bank top). Compared with the reach upstream of the road crossing, the reach downstream has a more natural hydromorphology. Nevertheless, there was evidence of modifications to the banks which were very steep (approximately 1.5 – 2 m) in places. Bank erosion on the left and right banks was noted. Both banks were undercut in places, and the right bank had partially collapsed. Unvegetated gravel/cobble side bars were recorded in the channel. Bankfull width was measured at 1.25 m whereas wetted width was measured at 1 m. Water depth was very shallow in riffle habitats (0.03 m) and maximum pool depth was 0.2 m. Siltation was heavy-moderate and a high plume of silt was generated when the substrate was disturbed. Turbidity was moderate, however visibility of the stream bed was excellent due to low flows. Velocity was slow. River habitat comprised 50% riffle and 50% pool. The substrate comprised 10% boulder, 30% cobble, 30% coarse gravel and 20% fine gravel and 10% sand. Riparian vegetation comprised unmanaged woodland and scrub, and was approximately 2 m in width (wider immediately downstream of the road). Hawthorn, apple, ash, holly, willow, nettles, willowherb, lords and ladies, meadowsweet, bramble, ivy, herb robert and common hogweed were recorded. Discarded waste was recorded within the riparian vegetation. Heavy shading was recorded at the survey site, and no instream vegetation was noted. Due to dense bramble scrub, the road crossing was not visible. Upstream of the road crossing, the river was straightened and overdeep, with steep, vertical banks. Fool's watercress growth was noted in the channel as well as heavy siltation. The riparian buffer on the left bank was narrow, and comrpised a strip of tall herb vegetation between the road and bank top. On the right bank, the riparian buffer comprised a treeline on the banktop. Species	 **Left**: Site A-4, downstream of road crossing, looking downstream. **Right**: Site A-4, downstream of road crossing, looking upstream. Photographs taken 14 July 2025.

Site code/ name	Freshwater aquatic habitat results (July 2025)	Site photographs
	recorded included great willowherb, hedge bindweed, ash, dock, cleavers, meadowsweet, hawthorn, nettle, bramble and common hogweed.	

Left: Site A-4, upstream of road crossing, looking downstream.
Right: Site A-4, upstream of road crossing, looking upstream.

Photographs taken 14 July 2025

Site code/ name	Freshwater aquatic habitat results (July 2025)	Site photographs
A-8 / Salterstown Stream downstream Site 6	**Survey Results** The stream at Site 8 is a small first order coastal stream. Bankfull width was approximately 3.2 m, and wetted width was approximately 1.7 m. Water depth was shallow in riffles (0.05 m). Maximum pool depth was 0.2 m. The stream was slightly wider at the bridge. The stream appears to have been historically straightened and deepened, with high banks recorded (1.5 – 1.2 m) and stone reinforcement on the right bank. Some moderate bank erosion was noted. The bridge itself was not deemed to be a barrier to fish migration. Siltation within the channel was heavy and a high silt plume was noted when the bed was disturbed. The substrate comprised boulder (10%), cobble (60%), coarse gravel (20%), fine gravel (5%) and sand (5%). Flow discharge was low on the day of survey, with slow velocity and low turbidity noted. River habitat comprised riffle (33.3%), pool (33.3%) and glide (33.3%) sequences. Shading was heavy, and trees leaning over the channel were recorded. Very little instream vegetation was recorded, with just a sparse cover of mosses on exposed boulders (<5%). Unvegetated side bars were noted in the channel. A hawthorn tree had fallen into the channel downstream of the bridge. Cattle access was noted upstream of the bridge. The invasive Japanese knotweed *Reynoutria japonica* was recorded on the right bank by the bridge. Riparian vegetation comprised sycamore, elm *Ulmus* sp., brambles, ivy, elder, nettles, soft shield fern *Polystichum setiferum*, ground elder *Aegopodium podagraria* and cleavers. The riparian buffer was a narrow treeline on both banks, with gardens recorded behind the treelines on both the left and right bank. Upstream of the bridge, the river habitat was similar, with less shading.	 **Left**: Site A-8, downstream of road crossing, looking upstream. **Right**: Site A-8, downstream of road crossing, looking downstream. Photographs taken 14 July 2025.

Photographs taken 14 July 2025

Site code/ name	Freshwater aquatic habitat results (July 2025)	Site photographs
A-9 / Port 06 Stream	**Survey Results** The stream was surveyed immediatley upstream of the L2240 road crossing at this location. This stream is a small, first order stream. It has been heavily modified, with evidence of channelisation and straightening along its length. The stream crosses under the local road through a pipe culvert. Bank height was approximately 0.5 m, and banks were vertical. The stream was approximately 1.5 m wide (wetted and bankfull width). Water depth was approximately 0.2 m. Two other tributaries enter the stream at this site (Ardballan Stream (north side of the road) and Wyanstown Stream (south side of the road)). The Ardballan Stream was dry on the day of the survey. Dense marginal vegetation comprising predominantly reed canary grass as well as flag iris *Iris pseudachorus* and small amounts of fool's watercress was recorded, which tunnelled the stream. The substrate comprised approximately 94% silt, and silt depth of approximately 0.4 m was recorded in the channel. The remaining substrate comprised a small amount of cobble (5%) and boulder (1%). Velocity was slow, and flow discharge was low. The river habitat consisted of 90% glide and 10% pool. Shading was heavy. The riparian buffer was between 2 and 3 m in width and was dominated by herbs and grasses including hedge bindweed, great willowherb, nettle, creeping thistle *Cirsium arvense*, meadowsweet, creeping buttercup, dock and Angelica *Angelica sylvestris*. Woody vegetation comprised elder, hawthorn and sycamore. The dominant landuse comprised rough pasture and tillage. Downstream of the road crossing, the Wyanstown Stream merges with the Port Stream. The river habitat is similar downstream, with deep silt, homogenous flow and dense marginal vegetation.	  **Left**: Site A-9, upstream of road crossing, looking upstream. Marginal and bankside vegetation obscure view of the stream channel. **Right**: Site A-9, upstream of road crossing, looking downstream towards culvert. Photographs taken 14 July 2025

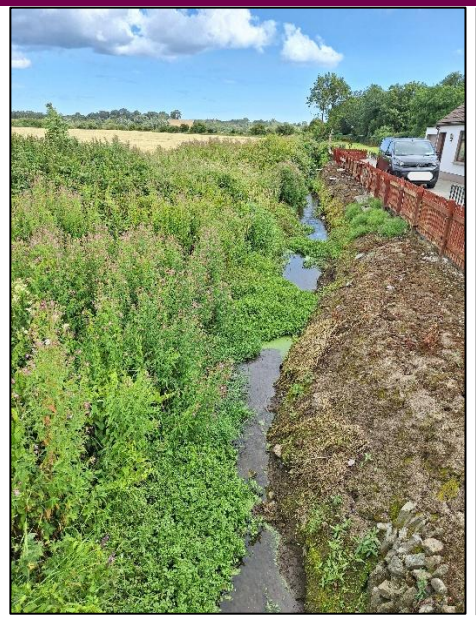
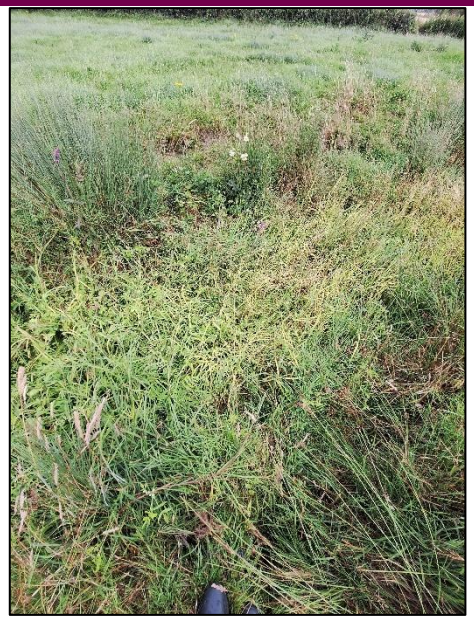
A-10 / Port 06 Stream upstream Site 9	**Survey Results** This site is located on a small first order stream, located approximately 760 m upstream of Site A-9. The stream was surveyed upstream of the L2240 bridge. The stream was channelised, straightened and choked with vegetation. Bankfull width was 3 m, whereas wetted width was approximately 1.5 m. Water depth was estimated at 0.45 m. Banks were steep and approximately 1 m in height. Evidence of poaching was noted on the banks. The substrate, where visible, comprised 100% silt. Flow discharge was low and velocity was stagnant. River habitat was 100% pool. Instream vegetation comprised water mint, duckweed *Lemna* sp., reed canary grass, water cress *Nasturtium* sp., fool's-water-cress, hard rush and sweet-grass *Glyceria* sp. A small amount of filamentous green algae was noted in the channel, with a larger amount recorded in a small drain flowing into the stream at the bridge.The riparian buffer was narrow. Riparian vegetation comprised rushes *Juncus* sp., gorse *Ulex europaeus*, bramble, creeping thiste, great willowherb, water mint, dock, cock's foot, marsh woundwort *Stachys palustris* and meadowsweet. Downstream of the L2240 bridge, more open water and glide habitat was recorded. Stands of emergent macrophytes (watercress) were noted in the channel. The right bank had been cleared of vegetation and comprised bare soil. The left bank comprised tall herbaceous vegetation and scrub. The substrate was heavily silted. Surrounding land use comprised rough pasture, tillage and suburban.	 **Left**: Site A-10, upstream of road crossing, looking upstream. **Right**: Site A-10, upstream of road crossing, looking downstream. Photographs taken 14 July 2025

Site code/ name	Freshwater aquatic habitat results (July 2025)	Site photographs





Left: Site A-10, downstream of road crossing, looking downstream.
Right: Site A-10, upstream of road crossing, dense in-channel vegetation.
Photographs taken 14 July 2025

Site code/ name	Freshwater aquatic habitat results (July 2025)	Site photographs
A-11 / Broadlough Stream	**Survey Results** The Broadlough stream at Site A-11 is a small first order tributary of the River Dee. The stream flows under the N33 through a pipe culvert. The survey site was located downstream of this culvert and extended into a small woodland. Landuse in the area comprised tillage, woodland and improved pasture. The stream has been modified into a drainage ditch.The stream has steep banks (approximately 1.6 to 1.8 m). Bankfull width and wetted width was measured at 1.8 m and 1.2 m respectively. Water depth was approximately 0.15 m, and a deep layer of silt (approximately 0.4 m) was noted within the channel. The substrate comprised 95% silt and 5% fine gravel. It was not possible to walk within the channel. Flow discharge was low, and velocity was stagnant. Shading was moderate, but increased to heavy towards the downstream end of the survey reach. River habitat comprised 100% pool. Instream vegetation was dense in unshaded sections of the channel, and comprised fool's water-cress. The third schedule invasive water fern *Azolla filiculoides,* which had been recorded at this site previously, was not recorded at the site during the survey. The riparian buffer comprised a treeline on the left bank and scrub and woodland on the right bank. Bankside vegetation comprised hawthorn, poplar, sycamore, ivy, ash, nettle, hoary willowherb *Epilobium parviflorum*, brambles, spear thistle *Cirsium vulgare,* bindweed and willow.	 **Left**: Site A-11, looking upstream. **Right**: Site A-11, looking downstream. Photographs taken 15 July 2025

Grassland

GA1 Improved agricultural grassland

The following species were additionally identified in varying abundances during field studies (June 2024 and May 2025); Lady's smock *Cardamine pratensis*, cow parsley *Anthriscus sylvestris*, cleavers *Galium aparine*, broad leaf dock *Rumex obtusifolius* and germander speedwell *Veronica chamaedrys*.

GS1 Dry neutral grassland

There are no changes to appendix 19-1: Onshore Biodiversity – Supporting Information.

GS2 Dry meadow and grassy verges

Within grassy verge habitat the following species was additionally identified in varying abundance during field studies (June 2024 and May 2025); creeping buttercup *Ranunculus repens*.

Within dry meadow habitat located east of the River Dee crossing at Drumcar, the following species were occasionally identified during field studies; germander speedwell, cow parsley, red clover *Trifolium pratense*, creeping buttercup, hawthorn (shrub) *Crataegus monogyna*, and bush vetch *Vicia sepium*. Giant hogweed *Heracleum mantegazzianum* was also noted at one location.

Along the N33 (revised location of joint bays 1 to 4), dry meadow and grassy verge habitat was identified occurring as a mosaic alongside scrub habitat. At joint bay 3, and east of joint bay 3, this habitat occurred to the rear of a dogwood *Cornus sanguinea* and hazel *Corylus avellana* dominated immature woodland strip (see WS2 description). This habitat is likely managed once a year and contained varying abundances of typical dry meadow/grassy verge species including creeping buttercup, creeping thistle *Cirsium arvense*, brambles *Rubus fruticosus* agg., broad-leaved dock, hard rush *Juncus inflexus*, soft rush *Juncus effusus*, creeping bent *Agrostis stolonifera*, vetchling *Lathyrus* sp., coltsfoot *Tussilago farfara*, greater willowherb *Epilobium hirsutum*, and common hogweed *Heracleum sphondylium*. Regrowth of trees were also present including willow *salix* sp., blackthorn *Prunus spinosa* and dogwood in addition to the presence of bramble, forming an open scrub field layer in areas.

Cultivated and built ground

BC1 Arable crops

The following species were occasionally identified during field studies (June 2024 and May 2025); fumitory *Fumaria officinalis* and common field-speedwell *Veronica persica*.

Coastland

CB1 Shingle and gravel banks

The Heritage Council's habitat classification system notes that CB1 Shingle and gravel banks habitat may correspond to Annex I habitat type '*perennial vegetation of stony banks (1220)*'. Perennial vegetation of stony banks occurs along the coast where shingle (cobbles and pebbles) and gravel have accumulated to form elevated ridges or banks above the high tide mark (Martin *et al.,* 2017). Typical assemblages include a wide range of vegetation and perennial species including *Crambe maritima* (sea kale)*, Honkenya peploides* (sea sandwort)*, Leymus arenarius* (lyme-grass)*, Lathyrus japonicus* (sea pea) and *Crithmum maritimum* (rock samphire). Martin *et al.,* (2017) also noted perennial species including *Rumex crispus* (curled dock), *Beta vulgaris* ssp. *maritima* (sea beet) and *Tripleurospermum maritimum* (sea mayweed).

The CB1 habitat identified at the landfall location (see Figure 1A-1) consists of an exposed seaward side with no vegetative colonisers and a leeward side which is not extensively vegetated, consisting only of two species, of rare occurrence, *Rumex crispus* (curled dock) and *Atriplex laciniata* (frosted orache). A small area of raised shingle was present above the HWM.

Figure 1A-1: CB1 Shingle and gravel banks; and CS3 Sedimentary sea cliffs identified at the landfall location.

CB1 habitat identified at the landfall location has been considered in the context of the typical physical parameters and vegetative community outlined by the Interpretation Manual of European Union Habitats (EC, 2013) and the criteria for assessment of the structure and function of perennial vegetation of stony banks (1220) (Martin *et al.,* 2017), see Table 1A-2.

Table 1A-2: Assessment of CB1 Shingle and gravel banks habitat in line with the monitoring criteria for assessment of the structure and function of perennial vegetation of stony banks [1220] (Martin *et al.,* 2017).

Fossitt (2000) Habitat Code	Notable species in Martin *et al*., (2017)	Regularly occurring species noted in Martin et al., (2017)	Species identified within CB1 Shingle and gravel banks habitat
CB1 Shingle and gravel banks	*Crambe maritima* *Glaucium flavum* *Lathyrus japonicus* *Mertensia maritima*	Pioneer community: *Beta vulgaris subsp. Maritima* *Crithmum maritimum* *Galium aparine* *Raphanus raphanistrum subsp. Maritimus* *Rumex crispus* *Silene uniflora* *Sonchus arvensis* *Tripleurospermum maritimum* Grassland community:	*Rumex crispus* *Atriplex laciniata*

Fossitt (2000) Habitat Code	Notable species in Martin *et al.*, (2017)	Regularly occurring species noted in Martin et al., (2017)	Species identified within CB1 Shingle and gravel banks habitat
		Agrostis capillaris *Agrostis stolonifera* *Arrhenatherum elatius* *Dactylis glomerata* *Poa humilis* *Elytrigia repens* *Festuca rubra* *Holcus lanatus* *Koeleria macrantha* *Luzula campestris* *Achillea millefolium* *Armeria maritima* *Cerastium fontanum* *Daucus carota* *Leontodon autumnalis* *Lotus corniculatus* *Plantago coronopus* *Plantago lanceolata* *Potentilla anserina* *Rumex acetosa* *Taraxacum officinale agg.,* *Galium verum* *Trifolium pratense* *Trifolium repens* <u>Scrub community:</u> *Lonicera periclymenum* *Prunus spinosa* *Rubus fruticosus agg.* *Ulex europaeus* *Calystegia sepium*	

Curled dock is a regularly occurring species of this habitat (1220), however, as curled dock and frosted orache are not listed as a notable species as part of the assessment, CB1 habitat is not considered to correspond to the species composition associated with *perennial vegetation of stony banks* (1220). Similarly, CB1 habitat is not considered to correspond to the species composition associated with *Annual vegetation of drift lines* (1210) (see Table 1A-3), due to curled dock and frosted orache (both <10%) not meeting the requirements for the species composition.

Table 1A-3: Assessment of CB1 Shingle and gravel banks habitat in line with the monitoring criteria for assessment of the structure and function of annual vegetation of drift lines [1210] (Martin *et al.,* 2017).

Fossitt (2000) Habitat Code	Criteria for assessment	Positive indicator species noted in Martin *et al.*, (2017)	Positive indicator species identified within CB1 Shingle and gravel banks habitat
CB1 Shingle and gravel banks	At least one species present in more than 40% of stops; and another species present in more than 20% of stops.	*Atriplex spp.* *Beta vulgaris ssp. Maritima* *Cakile maritima* *Galium aparine* *Honckenya peploides* *Polygonum oxyspermum* *Salsola kali* *Tripleurospermum maritimum*	*Rumex crispus* (<10%) *Atriplex laciniata* (<10%)

In addition to the existing measures outlined in section 19.8.2.3 of chapter 19: Onshore Biodiversity (EIAR volume 2C) and section 8.8.2 of chapter 8: Benthic Subtidal and Intertidal Ecology (EIAR volume 2B), the measures outlined in chapter 19 Addendum: Onshore Biodiversity will also be implemented.

The existing assessment completed within chapter 19: Onshore Biodiversity (EIAR volume 2C) considers the impact of fragmentation of habitats within the pNHA and concludes no significant effect. This conclusion remains valid considering the information outlined above.

CS3 Sedimentary sea cliffs

The Heritage Council's habitat classification system notes that CS3 Sedimentary sea cliffs habitat may correspond to Annex I habitat type *vegetated sea cliffs of the Atlantic and Baltic coasts* (1230). Vegetated sea cliffs of the Atlantic and Baltic coasts are steep slopes, the bases of which are occurring in the intertidal or subtidal zone that exhibit a complex pattern of floristic maritime assemblages due to coastal exposure, geology and geomorphology. They can consist of hard cliffs (at least 5 m high) and soft cliffs (at least 3 m high), with hard cliffs exhibiting a strong maritime influence and soft cliffs which are prone to sloping resulting in the presence of fast colonising pioneer species. The closest European site designated for the Annex I habitat *vegetated sea cliffs of the Atlantic and Baltic coasts [1230]* is Clogher Head SAC, located approx. 6.5 km south of the Project.

Typical vegetation assemblages include *Crithmum maritimum* (rock samphire), *Armeria maritima* (sea thrift), *Limonium spp.,* (sea lavender) *Brassica oleracea* (wild cabbage), *Silene maritima* (sea campion), *Cochlearia officinalis* (common scurvygrass), *Plantago maritima* (sea plantain), *Festuca rubra ssp. pruinosa* (red fescue), *Daucus spp.* (wild carrot), *Matricaria maritima* (sea mayweed), *Asplenium marinum* (sea spleenwort), *Spergularia rupicola* (rock Sea-spurrey), *Inula crithmoides* (rock samphire), *Sedum anglicum* (English stonecrop), *Rhodiola rosea* (roseroot), *Lavatera arborea* (tree mallow), *and Scilla verna* (spring squill) (EC, 2013). On soft coasts with active movement, complex assemblages of maritime and non-maritime vegetation occur.

The floristic assemblage of CS3 habitat at the landfall location (see Figure 1A-1) was dominated by *Festuca arundinacea* (tall fescue) with an abundance of *Festuca rubra* (red fescue). *Potentilla reptans* (creeping cinquefoil), *Equisetum telmateia* (great horsetail), *Plantago lanceolata* (ribwort plantain), *Cirsium arvense* (creeping thistle), and *Hedera helix* (ivy) were occasional, while *Daucus carota* (wild carrot), *Taraxacu*m agg. (dandelion), *Petasites hybridus* (butterbur) and *Anthyllis vulneraria* (kidney vetch) were rarely recorded. *Beta vulgaris* (sea beet) and *Lotus corniculatus* (bird's-foot trefoil) were also occasionally present.

CS3 habitat identified at the landfall location has been considered in the context of the typical physical parameters and vegetative community outlined by the Interpretation Manual of European Union Habitats (EC, 2013) and the criteria for assessment of the structure and function of Vegetated sea cliffs (1230) set out in the national survey and assessment of the conservation status of Irish sea cliffs (Barron *et al.,* 2011), see Table 1A-4.

Table 1A-4: Assessment of CS3 Sedimentary sea cliff habitat in line with the monitoring criteria for assessment of the structure and function of vegetated sea cliffs [1230] (Barron *et al.,* 2011).

Fossitt (2000) Habitat Code	Relevant vegetation zone found on Irish sea cliffs	Criteria for assessment	Positive indicator species noted in Barron *et al*., (2011)	Positive indicator species identified within CS3 Sedimentary sea cliff habitat at Dunany
CS3 Sedimentary sea cliff	Coastal grassland on soft cliffs	Positive indicator species ≥ 2	*Agrostis stolonifera* *Anthyllis vulneraria* *Arrhenatherum elatius* *Dactylis glomerata* *Daucus carota* *Elytrigia repens* *Festuca rubra* *Lotus corniculatus* *Tussilago farfara*	*Daucus carota* *Festuca rubra ssp.* *Lotus corniculatus*

Woodland and scrub

WN2 Oak-ash-hazel woodland

There are no changes to appendix 19-1: Onshore Biodiversity – Supporting Information.

WD1 (Mixed) broadleaved woodland

Within the small patch of woodland southwest of joint bay 11, the following species were rarely identified during field studies (June 2024 and May 2025); gorse *Ulex europaeus* and snowball bush (*Vibernum* sp.).

WD2 Mixed broadleaved/conifer woodland

There are no changes to appendix 19-1: Onshore Biodiversity – Supporting Information.

WS1 Scrub

There are no changes to appendix 19-1: Onshore Biodiversity – Supporting Information.

WS2 Immature woodland

Along the N33 (revised location of joint bays 1 to 4 (see chapter 5 Addendum: Project Description (EIAR volume 2A Addendum)), immature woodland was located parallel to the N33 along the immediate roadside verge, and to the south of WD1 (Mixed) broadleaved woodland (see Figure 1A-2). Immature woodland varied in structure and management compared to the WD1 mixed broadleaved woodland located along the northern most redline boundary.

Immature woodland was dominated by dogwood, elder *Sambucus nigra*, blackthorn, ash and privet *Ligustrum Ovalifolium* with a varying abundance of hazel, guelder rose *Viburnum opulus*, alder *Alnus glutinosa*, birch *Betula pendula*, willow (*Salix* sp.), and sycamore *Acer pseudoplatanus*. This section of immature woodland varied in width from 2 to10 m, was recently managed and cut back (top and side) with a varied height of approximately 2 to 5 m.

The features of WS2 Immature woodland associated with the N33 between the onshore substation, joint bays 1 to 4 and joint bay 8 are detailed in Table 1A-5.

Table 1A-5: Features of immature woodland habitat between the onshore substation, joint bays 1 to 4 and joint bay 8.

Joint bay reference	Habitat description within planning application boundary
Substation to JB-1	Hazel, alder, dogwood, blackthorn, birch.
JB-1 to JB-2	Hazel, dogwood, guelder rose, blackthorn, willow.
JB-2 to JB-3	Dogwood, blackthorn.
JB-3 to JB-4	Dogwood, guelder rose, grey willow *Salix cinerea,* hazel, privet.
L226 to JB-8	Sycamore, hazel, field maple *Acer campestre*, dogwood, alder, Norway maple *Acer platanoides*, grey willow, elder, Scots pine *Pinus sylvestris.*

WL1 Hedgerows

The following species were additionally identified in hedgerows associated with joint bays, see

Table **1A-6**.

Table 1A-6: Features of hedgerow associated with joint bays (9 to 29).

Joint bay reference	Habitat description within planning application boundary
JB-9	There are no changes to appendix 19-1: Onshore Biodiversity – Supporting Information.
JB-10	The following species were rarely identified during field studies; snowberry *Symphoricarpos albus* and holly *Ilex aquifolium*.
JB-11	There are no changes to appendix 19-1: Onshore Biodiversity – Supporting Information.
JB-12	The following species were rarely identified during field studies; holly and privet *Ligustrum vulgare*.
JB-13	There are no changes to appendix 19-1: Onshore Biodiversity – Supporting Information.
JB-14	There are no changes to appendix 19-1: Onshore Biodiversity – Supporting Information.
JB-15	The following species was rarely identified during field studies; hawthorn.
JB-16	The following species were rarely identified during field studies; holly, hawthorn and dogrose *Rosa canina*.
JB-17	The following species was rarely identified during field studies; gorse.
JB-18	There are no changes to appendix 19-1: Onshore Biodiversity – Supporting Information.
JB-19	There are no changes to appendix 19-1: Onshore Biodiversity – Supporting Information.

JB-21	The following species was rarely identified during field studies; dogrose.
JB-22	There are no changes to appendix 19-1: Onshore Biodiversity – Supporting Information.
JB-23	The following species were rarely identified during field studies; honeysuckle *Lonicera periclymenum* and horse chestnut *Aesculus hippocastanum*.
JB-24	The following species was rarely identified during field studies; dogrose.
JB-25	The following species was rarely identified during field studies; honeysuckle.
JB-26	The following species were rarely identified during field studies; ash *Fraxinus excelsior* and honeysuckle.
JB-27	There are no changes to appendix 19-1: Onshore Biodiversity – Supporting Information.
JB-28	There are no changes to appendix 19-1: Onshore Biodiversity – Supporting Information.
JB-29	There are no changes to appendix 19-1: Onshore Biodiversity – Supporting Information.

WL2 Treelines

There are no changes to appendix 19-1: Onshore Biodiversity – Supporting Information.

Protected flora/species of conservation concern

There are no changes to appendix 19-1: Onshore Biodiversity – Supporting Information.

Invasive plants and animals

One additional 'scheduled' invasive species was recorded within the ZoI of the Project during the 2025 survey. The species, location, and description of its occurrences is detailed in Table 1A-7 and shown in Figure 1A-2.

Table 1A-7: Locations of invasive plant and animal species recorded during the field study.

Map code	Species	Description and location (ITM)
IAPS-8	Giant hogweed *Heracleum mantegazzianum*	Single individual identified on the left bank of the River Dee at Drumcar. No signage, however, evidence of herbicide treatment (706515-791145).

Bat

Preliminary Ground Level Roost Assessment

The Preliminary Ground Level Roost Assessments identified 27 trees (noting BT15 – BT18 have fallen since the survey was undertaken in 2023) with features suitable for roosting bats (see Figure 1A-3)[1]. The visual assessment categorised the trees with potential to support bat roost features as ranging from PRF-I to PRF- M suitability (see Table 1A-8). Where no change has occurred since the 2023 ground level roost assessment, this is clearly stated. The 2024 ground level roost assessment identified five new trees with bat potential roosting features due to ivy coverage.

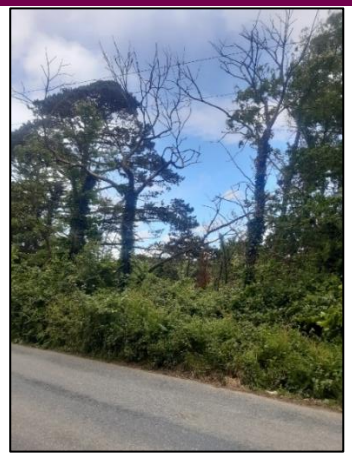
[1] As noted in section 1.1.2, these surveys were conducted in line with updated guidance Bat Surveys for Professional Ecologists: Good Practice Guidelines. 4th Edition (Collins, 2023) (previously Collins, 2016), which was published in October 2023. As a result of this, Figure 1A-3 depicts bat roost suitability (trees) as either PRF – I (Potential Roost Feature suitable for Individual bats) or PRF – M (Potential Roost Feature suitable for Multiple bats). This was previously referred to as “Bat Roost Low Suitability” or “Bat Roost Moderate Suitability” in Figure 1-2 of Appendix 19-1: Onshore Biodiversity – Supporting Information of the EIAR.

Table 1A-8: Features suitable for roosting bats identified during the Preliminary Ground Level Roost Assessment.

Map code	Tree species	Grid reference (ITM)	Feature location and description (2024)	Suitability (2024)	Feature location and description (2025)	Suitability (2025)
BT2	Scots Pine	706423 – 791136	No change since last survey in 2023.	**PRF-M** (will not be removed)	No change since last survey in 2024.	**PRF-M** (will not be removed)
BT3	Ash	706491 – 791157	No change since last survey in 2023	**PRF-M** (will not be removed)	No change since last survey in 2024.	**PRF-M** (will not be removed)
BT4	Ash	706499 – 791173	No change since last survey in 2023, however one new feature identified: • Small upward facing knothole, appears relatively shallow. Located on first branch approximately 2 m up main trunk, facing west into field. 	**PRF-I**	No change since last survey in 2024.	**PRF-I**
BT5	Ash	711604 – 789062	No change since last survey in 2023.	**PRF-I**	No change since last survey in 2024.	**PRF-I**
BT6	Hawthorn	711589 – 789066	No change since last survey in 2023.	**PRF-I**	No change since last survey in 2024.	**PRF-I**
BT7	Hawthorn	711586 – 789076	No change since last survey in 2023.	**PRF-I**	No change since last survey in 2024.	**PRF-I**
BT9	Ash	710889 – 789084	No change since last survey in 2023.	**PRF-I**	No change since last survey in 2024.	**PRF-I**
BT10	Ash	710880 – 789083	No change since last survey in 2023.	**PRF-I**	No change since last survey in 2024.	**PRF-I**

Map code	Tree species	Grid reference (ITM)	Feature location and description (2024)	Suitability (2024)	Feature location and description (2025)	Suitability (2025)
BT11	Ash	709814 – 789458	No change since last survey in 2023, with the addition of thick ivy in excess of 50 mm.	**PRF-I**	No change since last survey in 2024.	**PRF-I**
BT12	Ash	709824 – 789451	No change since last survey, with the addition of thick ivy in excess of 50 mm.	**PRF-I**	No change since last survey in 2024.	**PRF-I**
BT13	Ash	709832 – 789444	No change since last survey in 2023.	**PRF-I**	No change since last survey in 2024.	**PRF-I**

Map code	Tree species	Grid reference (ITM)	Feature location and description (2024)	Suitability (2024)	Feature location and description (2025)	Suitability (2025)
BT14	Sycamore	706627 – 791046	No change since last survey in 2023.	**PRF-I**	No change since last survey in 2024.	**PRF-I**
BT15	Maple	706617 – 791056	Tree has fallen since last survey in 2023.	**N/A**	-	**N/A**
BT16	Sycamore	706619 – 791065	Tree has fallen since last survey in 2023.	**N/A**	-	**N/A**
BT17	Maple	706628 – 791057	Tree has fallen since last survey in 2023.	**N/A**	-	**N/A**

Map code	Tree species	Grid reference (ITM)	Feature location and description (2024)	Suitability (2024)	Feature location and description (2025)	Suitability (2025)
						


BT18	Beech	706625 – 791059	Tree has fallen since last survey in 2023.	**N/A**	**-**	**N/A**
BT19	Silver fir	706534 – 791137	Most of the ivy covering the main trunk is now dead.	**PRF-I**	No change since last survey in 2024.	**PRF-I**

Map code	Tree species	Grid reference (ITM)	Feature location and description (2024)	Suitability (2024)	Feature location and description (2025)	Suitability (2025)
			Some roosting potential exists behind dead stems. 			
BT20	Scots pine	706559 – 791122	No change since last survey in 2023, with the addition of thick ivy.	**PRF-I**	No change since last survey in 2024.	**PRF-I**

Map code	Tree species	Grid reference (ITM)	Feature location and description (2024)	Suitability (2024)	Feature location and description (2025)	Suitability (2025)
BT21	Scots pine	706544 – 791122	No change since last survey, however bark peeling difficult to see due to thick ivy.	**PRF-I**	No change since last survey in 2024.	**PRF-I**

Map code	Tree species	Grid reference (ITM)	Feature location and description (2024)	Suitability (2024)	Feature location and description (2025)	Suitability (2025)
BT22	Sessile Oak	706484 – 791141	No change since last survey in 2023.	**PRF-I**	No change since last survey in 2024.	**PRF-I**
BT23	Ash	698158 – 791271	No change since last survey in 2023.	**PRF-I**	No change since last survey in 2024.	**PRF-I**
BT24	Ash	702843 – 791132	No change since last survey in 2023, however one new feature identified: • Knot hole from shed branches. Located on main trunk where it splits into north and south branches. Southeast facing, located at base of branches	**PRF-M** (will not be removed)	No change since last survey in 2024.	**PRF-M** (will not be removed)

Map code	Tree species	Grid reference (ITM)	Feature location and description (2024)	Suitability (2024)	Feature location and description (2025)	Suitability (2025)
			described above. Obscurred by ivy so can be difficult to see. 			
BT25	Ash	715012 – 790970	No change since last survey in 2023.	**PRF-M** (will not be removed)	No change since last survey in 2024.	**PRF-M** (will not be removed)
BT26	Ash	711548 – 789055	No change since last survey in 2023.	**PRF-I**	No change since last survey in 2024.	**PRF-I**
BT27	Ash	697944 – 790979	No change since last survey in 2023.	**PRF-I**	No change since last survey in 2024.	**PRF-I**
BT28	Ash	698156 – 791278	No change since last survey in 2023.	**PRF-I**	No change since last survey in 2024.	**PRF-I**

Map code	Tree species	Grid reference (ITM)	Feature location and description (2024)	Suitability (2024)	Feature location and description (2025)	Suitability (2025)
BT29	Sycamore	715018 - 790949	Partially detached ivy with stem diameter in excess of 50 mm with focus of ivy coverage on crown of tree. 	**PRF-I**	No change since last survey in 2024.	**PRF-I**
BT30	Sycamore	706649 - 791029	Partially detached ivy with stem diameter in excess of 50 mm. 	**PRF-I**	No change since last survey in 2024.	**PRF-I**

BT33	Ash	706580 - 791094	Partially detached ivy with stem diameter in excess of 50 mm.	**PRF-I**	No change since last survey in 2024.	**PRF-I**
BT34	Willow	699562 - 790956	South facing crack in main trunk located approximately 2.5 m from the ground where two branches depart from main trunk.	**-**	-	**PRF-I**

Commuting and foraging habitats

There are no changes to appendix 19-1: Onshore Biodiversity – Supporting Information.

Bat activity

The dates, timing, and weather conditions for the three bat activity transect surveys are detailed in Table 1A-9. A total of four species of bat (soprano pipistrelle, Leisler's bat, common pipistrelle and brown long-eared bat) were recorded using the onshore substation site and onshore cable route for foraging and/or commuting during the three combined transect activity bat surveys and the 20-night (2024) static deployment.

Table 1A-9: Dates, timings and weather conditions for bat activity transect surveys.

Date	Sunset / sunrise time	Start time of survey	End time of survey	Cloud cover (100%)	Precipitation	Wind (0 to 7)	Temperature (°C)
15/05/2024	21:22	21:22	00:12	20	0	1	18ºC
01/07/2024	22:00	22:00	00:56	100	0	3	16ºC
04/09/2024	20:08	20:08	22:37	60 to 70	Light precipitation	3	15ºC

Data from the bat activity transects indicated that the area of the onshore substation site and onshore cable route was most significant as a foraging and commuting resource for soprano pipistrelle (54.1% of passes) and common pipistrelles (30.5% of passes), with relatively few records of Leisler's bat (11.4% of passes), undetermined soprano/common pipistrelle species (3.9% of passes), and undetermined Myotis species (0.2% of passes) (Table 1A-10). Tabulated bat activity information recorded on field sheets is detailed in

Table 1A-11. Bat activity transects were completed both on foot as walkover surveys and using car-based driving transects. Results of these surveys are shown in Figure 1A-3.

Table 1A-10: Bat activity transect results.

Scientific name (common name)	Number of passes	% of total passes
Pipistrellus pygmaeus (soprano pipistrelle)	348	54.1
Nyctalus leisleri (Leisler's bat)	73	11.4
Pipistrellus pipistrellus (common pipistrelle)	196	30.5
Pipistrellus spp.	25	3.9
Myotis spp.	1	0.2
TOTAL	**643**	**100**

* Activity: C=Commuting; F=Foraging; HNS=Heard not seen; SNH=Seen not heard; S&H = Seen and heard; E=Emergence; R=Re entry; S=Swarming.

Data from the static bat detector along the River Dee at Drumcar over the 20 night period from 21 June to 15 September 2024 indicated that this area of the onshore cable route was most significant as a foraging and commuting resource for soprano pipistrelle (46.4% of passes), and Leisler's bat (26.9% of passes) followed by common pipistrelle (19.1% of passes) with relatively few records of undetermined pipistrelle species (6.8% of passes) myotis species (0.5% of passes), and brown long-eared bat species (0.5% of passes) (Table 1A-12). The location of the static bat detector is shown in Figure 1A-3 (see Map 2 of 4).

Table 1A-12: Static bat detector results – 2024.

Scientific name (common name)	Number of passes	% of total passes
Pipistrellus pygmaeus (soprano pipistrelle)	5144	46.4

Badger

Signs of badger activity were noted, including the presence of potential setts, foraging evidence, access runs, tracks and prints (Table 1A-13 and Table 1A-14). Note that figures illustrating the location of badger setts, and badger evidence have been supplied to ACP as a confidential appendix. Changes to badger sett evidence noted in the 2024 and 2025 surveys are shown in blue text.

Table 1A-13: Potential badger sett entrances.

Map code	Entrance aspect	Tunnel direction / wider than tall	Soil heap / entrance infilling (%)	Entrance status	Habitat type / entrance location	Notes
BS1	North	South / yes	Present / 60% detritus	Disused	Mixed broadleaved woodland / southeast of stream	-
BS2 - 1	Southwest	Northeast / yes	Present and unvegetated / 60% detritus	Disused	Mixed broadleaved woodland / southeast of stream – 20 m northeast of BS1-1	-
BS2 - 2	Southwest	Northeast / yes	Present and vegetated / <25% detritus	Disused	Mixed broadleaved woodland / 3 m west of BS2-1	Entrance aspect is upward facing to sky now as has collapsed. 2x tunnels, one north and one northeast
BS2 - 3	Southeast	Northeast / yes	Present and unvegetated / 25 to 50% detritus	Partially used	Mixed broadleaved Woodland / 6 m north of BS2-1 overlooking stream	Setts within the surrounding area are disused.
BS3 - 1	West	Southeast / yes	Present and vegetated / <25% detritus	Disused	Mixed broadleaved Woodland / overlooking stream	
BS3 - 2	Northeast	Southwest / yes	Present and unvegetated / <25% detritus	Disused	Mixed broadleaved woodland / under tree	Tree had fallen over the sett.
BS3 - 3	West	East / yes	Present and vegetated / 70% detritus	Disused	Mixed broadleaved woodland / overlooking stream	-
BS3 - 4	West	East / yes	Present and vegetated / 25 to 50% detritus	Disused	Mixed broadleaved woodland / overlooking stream	-
BS3 - 5	West	Southeast / yes	Present and unvegetated	Partially used	Mixed broadleaved woodland /	-

Map code	Entrance aspect	Tunnel direction / wider than tall	Soil heap / entrance infilling (%)	Entrance status	Habitat type / entrance location	Notes
			/ 25 to 50% detritus		overlooking stream	
BS4	West	South/ yes	Present and unvegetated / <25%detritus	Disused	Mixed broadleaved woodlands / under ferns	-
BS5	Could not be located. Several trees collapsed in this woodland likely covering this sett.					
BS6	West	North / northeast / yes	Present and vegetated / <25% detritus	Disused	Mixed broadleaved woodland / Under tree	Overlooking stream
BS7	Northeast	Southeast / yes	Present and unvegetated /	Disused	Grassy verge / hedegrow	-
BS8	Northwest	Southeast / yes	<75% detritus	Disused	Mixed broadleaved woodland / Hedgerow embankment	-

Table 1A-14: Description of badger evidence recorded.

Map code	Description
BE1	Snuffle hole
BE2	Snuffle hole
BE3	Snuffle hole

Otter

Evidence of otter (e.g. spraints, footprints, or feeding remains) was recorded, where present. The following evidence was recorded:

- A single otter spraint was found on a boulder immediately downstream of the N33 bridge at site A2;
- A single otter spraint was found on a boulder downstream at site A3;
- A single otter spraint was found on a boulder downstream at site A4; and
- A single otter spraint was found on a boulder downstream at site A8.

This widespread species is presumed to forage and/or commute along the downstream river network

Other protected mammals

There are no changes to appendix 19-1: Onshore Biodiversity – Supporting Information.

Birds

Onshore

Onshore bird survey

There are no changes to appendix 19-1: Onshore Biodiversity – Supporting Information.

Breeding bird survey

The onshore breeding bird surveys conducted in 2025 returned a total of 55 bird species records, 22 of which are Red (8 species) and Amber (14 species) listed birds of conservation concern (Gilbert *et al*., 2021). The survey results for the 22 Red and Amber listed birds of conservation concern are provided in Annex A, summarised in Table 1A-15 and shown in Figure 1A-4. In total, 41 species were observed showing behaviour which led them to being recorded as “possible” (8), “probable” (27) or “confirmed” (6) breeding.

Of the 55 bird species recorded, two were Annex I (Birds Directive) species, namely peregrine and little egret. A single individual of each species was recorded and while breeding is possible within the survey area, it is not considered an important breeding location for the peregrine and little egret.

Eight of the species listed were species of Special Conservation Interest (SCI), including black-headed gull, black-tailed godwit, grey heron, herring gull, lesser black-backed gull, oystercatcher, peregrine and ringed plover.

Table 1A-15: Breeding bird survey results – 2025.

Intertidal bird surveys

The results of the intertidal bird surveys are broken down into the following surveying seasons:

- Winter season 2023/24: September 2023 – March 2024;
- Breeding season 2024: April 2024 – August 2024; and
- Winter season 2024/25: September 2024 – March 2025.

The survey results for the intertidal bird surveys are summarised below and shown in Figure 1A-5, Figure 1A-6 and Figure 1A-7. The associated raw data from each survey is provided in Annex B.

Although not captured in the data presented below, anecdotal observations from walkers at Dunany Point indicate the presence of flocks of foraging brent geese in fields to the south, near Lurgan Boy Beach. Surveyors have investigated this area following these reports but have not yet identified the specific fields involved. It should be noted that these fields lie outside the survey area.

Winter season 2023/2024: September 2023 – March 2024

The monthly intertidal bird surveys conducted from September 2023 to March 2024 focused on Dunany South and surveyed all birds within a 500 m buffer of the landfall location. Results are shown in Table 1A-16 and Figure 1A-5, with the corresponding raw data included in Annex B.

These surveys returned a total of 47 bird species recorded, comprising 1,978 individuals. Of these observations, 605 were Red (seven species), 1,265 were Amber (21 species), and 106 were Green (18 species) listed birds of conservation concern Ireland (BOCCI) (Gilbert *et al*. 2021).

There was one observation of two female pheasants, which is not assigned to any of the BOCCI lists given that it is an introduced game species.

Seven of the bird species observed onsite were Annex I (Birds Directive) species, and 23 bird species observed onsite were SCI species. Results are summarized in Table 1A-16, along with their peak counts compared to national and international 1% population thresholds to assess the significance of the site for these species.

Table 1A-16: Peak counts for target species in winter season 2023/24

Whooper swan *Cygnus cygnus*								
N/R	1	N/R	N/R	N/R	N/R	N/R	150	340

As per the data the data presented in Table 1A-16, none of bird species recorded within the 500 m buffer of the landfall location during the September 2023 to March 2024 surveys exceeded national or international 1% population thresholds. The record that came closest to exceeding this was the 310 brent geese recorded in January 2024. However, these geese were observed flying through the area without stopping to forage. This suggests the site is functioning primarily as a transit route, most likely between Dundalk Bay SPA and the foraging fields located south of the Project.

Brent goose, black-headed gull, oystercatcher and herring gull were recorded consistently across all survey months, although their counts remained below their respective thresholds.

Breeding season 2024: April 2024 – August 2024

The monthly intertidal bird surveys conducted from April to August 2024 surveyed all birds within a 500 m buffer of the landfall location. Results are shown in Figure 1A-6 with the corresponding raw data in Annex B.

These surveys returned a total of 42 bird species recorded, comprising 492 individuals. Of these observations, 214 were Red (5 species) and 215 were Amber (22 species), and 58 were Green (14 species) listed BOCCI (Gilbert *et al*. 2021).

There was one observation of one calling pheasant, which is not assigned to any of the BOCCI lists as it is an introduced game species. Five of the bird species observed onsite were Annex I (Birds Directive) species, and 22 bird species observed onsite were SCI species.

These results are summarized in Table 1A-17, along with their peak counts compared to national and international 1% population thresholds to assess the significance of the site for these species.

Table 1A-17: Peak counts for target species in breeding season 2024.

Peak count for					1% threshold exceeded

3	N/R	3	5	4	74	1,380

As per the data presented in Table 1A-17, the only bird species recorded within the 500 m buffer of the landfall location from April to August 2024 which exceeded a population threshold was the Mediterranean gull. Mediterranean gull exceeded the national average with a peak count of one individual gull. There were no other records for Mediterranean gull during this time period. The national population for Mediterranean gull of five pairs, ten individuals, has come from the Seabird 2000 data (Mitchell *et al*., 2004), and the number of these gulls summering in Ireland in the last 25 years is believed to have increased, with BirdWatch Ireland stating: "*A recent colonist, the Mediterranean Gull arrived in Ireland in 1995 and first bred in the Republic in 1996 in Co. Wexford*[3]". None of the species recorded exceeded the international threshold.

Ringed plover, oystercatcher and herring gull were consistently present throughout the survey months however, no evidence of breeding onsite or in the immediate environs was recorded.

Sand martin *Riparia riparia* was recorded just outside the survey buffer and was not recorded within the survey buffer during the breeding season 2024. It was noted as possibly nesting in the sand cliffs approximately 530 m north of the transition joint bay.

Winter season 2024/25: September 2024 – March 2025

The monthly intertidal bird surveys conducted from September 2024 to March 2025 focused on Dunany South and surveyed all birds within a 500 m buffer of the landfall location. Results are shown in Figure 1A-7, with the corresponding raw data in Annex B.

These surveys returned a total of 52 bird species recorded, comprising 1,559 individuals. Of these observations, 459 were Red (9 species), 950 were Amber (21 species), and 145 were Green (21 species) listed BOCCI (Gilbert *et al*., 2021).

There were three observations of individual pheasants in March 2025, which are not assigned to any of the BOCCI lists as it is an introduced game species.

Results are summarised in Table 1A-18, along with their peak counts compared to national and international 1% population thresholds to assess the significance of the site for these species.

As per the data presented in Table 1A-18, four bird species recorded within the 500 m buffer of the landfall location from September 2024 to March 2025 exceeded the national 1% population thresholds, as follows:

- Herring gull showed a significant peak of 146 in November 2024, surpassing the national threshold of 130. This peak count is due to the observation of a flock of 82 herring gull flying south through the survey area without stopping to forage. The peak count for foraging/feeding herring gull within the study area for this date was 64, which is below the national threshold;
- Mediterranean gull also exceeded the national average with a peak count of four in November 2024. There were no other records for Mediterranean gull during this time period. As previously discussed, this national figure is from the Seabird 2000 census and the recent colonist is believed to be breeding in higher numbers than it was 25 years ago;
- One observation recorded a peak count of 81 red-throated diver feeding within the 500 m buffer in November 2024, exceeding the national threshold of 20; and
- One observation recorded a peak count of 56 red-breasted merganser loafing/roosting within the 500 m buffer in December 2024, exceeding the national threshold of 25.

None of the species recorded exceeded the international threshold. Oystercatcher were consistently present throughout the survey months. While not exceeding the national threshold, it should be noted that in November 2024, 112 golden plovers were recorded roosting within the adjacent field (see Figure 1A-6), with a further 43 approximately 80 m north of the survey buffer.

Offshore vantage point surveys

Results of the vantage point (VP) surveys are broken down into the following surveying seasons:

- Winter season 2023/24: October 2023 – March 2024;
- Breeding season 2024: April 2024 – August 2024; and
- Winter season 2024/25: September 2023 – March 2024.

The survey results for the offshore VP surveys are summarised in Table 1A-19 to Table 1A-24 below. The associated raw data from each survey is provided in Annex C. The location of the VP at Dunany Point and overview of the 180° viewing arc is shown in Figure 1A-7.

Winter season 2023/24: September 2023 – March 2024

Table 1A-19 summarises the peak counts of bird species recorded from the VP surveys conducted at Dunany Point South during high tide between October 2023 and March 2024. The table highlights species of conservation concern, including those listed under Annex I of the Birds Directive, BOCCI red and amber listed species, and SCI species. It also compares peak counts against national and international 1% population thresholds to evaluate the significance of the wider area for these bird species during high tide conditions.

Table 1A-19: Peak counts for target species in winter season 2023/24 at high tide.

Peak count for						1% threshold exceeded	
October 2023	November 2023	December 2023	January 2024	February 2024	March 2024	National	International

Shag *Gulosus aristotelis*							
4	3	13	1	2	1	74	1,320

Between September 2023 and March 2024, high tide VP surveys at Dunany Point South recorded four species exceeding national 1% population thresholds, as follows:

- Four eider, two males and two females, were recorded in March 2024 exceeding their national threshold. These four birds were recorded as loafing within the viewshed for approximately one hour. Eider were only recorded in one other month during this season, with only one individual recorded in February 2024.
- Herring gull exceeded the national threshold in two peak counts:
    - January 2024's peak count for herring gull was 352 individuals during the third scan, well above its national threshold of 130. No other scan during this survey exceeded the threshold. Of these 352 birds, one was recorded as flying, 252 were recorded as loafing and 99 were recorded as roosting. The largest flocks within this scan were 120 gulls loafing in arc E4 and 130 gulls loafing in F4. Both E4 and F4 are outside of the cable corridor route, see Table 1A-19.
    - February 2024's peak count for herring gull was 420 individuals during the sixth scan, well above its national threshold of 130. No other scan during this survey exceeded the threshold. 417 herring gull were recorded loafing in arc F3 and 3 herring gull were recorded loafing in arc A4. Both arc A4 and F3 are primarily outside of the cable corridor route, with only small slivers of these arcs within, see Figure 1A-7.
- Red-throated diver exceeded the national threshold in two peak counts:
    - November 2023's peak count for red-throated diver was 48 individuals during the first scan, well above its national threshold of 20. Scans two (30), four (25) and five (27) also exceeded the threshold. These birds were recorded as loafing, feeding or preening throughout the viewshed.
    - January 2024's peak count for red-throated diver was 27 individuals during the fifth scan, above its national threshold of 20. The fourth scan also exceeded this threshold with 27 individuals recorded. These birds were recorded as loafing, feeding or preening throughout the viewshed.
- Red-breasted merganser exceeded the national threshold in two peak counts:

- February 2024's peak count for red-breasted merganser was 67 individuals during the sixth scan, well above its national threshold of 25. The first (26), second (32), fourth (37) and fifth (35) scans also exceeded the threshold. These birds were recorded as loafing, roosting, feeding or preening throughout the viewshed.
- March 2024's peak count for red-breasted merganser was 46 individuals during the second scan, above its national threshold of 25. The first (33) and third (27) scans also exceeded the threshold. These birds were recorded as loafing, roosting, feeding or preening throughout the viewshed.

Table 1A-20 presents comparable data collected during low tide surveys over the same period and at the same location, allowing for assessment of bird usage patterns in relation to tidal cycles.

Table 1A-20: Peak counts for target species in winter season 2023/24 at low tide.

Peak count for					1% threshold exceeded

Between September 2023 and March 2024, low tide vantage point surveys at Dunany Point South recorded four species exceeding the national 1% population thresholds, as follows:

- Three eider, were recorded in March 2024, exceeding their national threshold. These three birds were recorded as loafing within the viewshed for circa half an hour.
- Herring gull exceeded the national threshold January 2024's peak count with 133 individuals recorded during the third scan, well above its national threshold of 130. No other scan during this survey exceeded the threshold. Of these 133 birds, two were recorded as flying/on passage in C4 and E1, one was loafing in arc C3, and 130 were recorded as feeding over a bait ball in A4. The majority of the A4 arc is located outside of the cable corridor route (see Table 1A-20).
- Mediterranean gull also exceeded the national average with a peak count of one individual bird in February 2024. There were no other records for Mediterranean gull during this time period. As previously discussed, this national figure is from the Seabird 2000 census and the recent colonist is believed to be breeding in higher numbers than it was 25 years ago.
- Red-breasted merganser exceeded the national threshold in January 2024's peak count with 25 individuals recorded during the sixth scan, meeting the 1% national threshold of 25. No other scan during this survey exceeded the threshold. These birds were recorded as feeding or loafing across B2 (2), B3 (2), C2 (4), C3 (2), C4 (10), D2 (1), D3 (2) and D4 (2).

Breeding season 2024: April 2024 – August 2024

Table 1A-21 summarises the peak counts of bird species recorded from the VP surveys conducted at Dunany Point South during high tide from April 2024 to August 2024. The table highlights species of conservation concern, including those listed under Annex I of the Birds Directive, BOCCI red and amber listed species, and SCIs. It also compares peak counts against national and international 1% population thresholds to evaluate the significance of the wider area for these bird species during high tide conditions.

Table 1A-21: Peak counts for target species in breeding season 2024 at high tide

Peak count for					1% threshold exceeded

Between April and August 2024, high tide vantage point surveys at Dunany Point South recorded peak bird counts for the breeding season. None of these peak counts exceeded the national or international 1% population thresholds.

Species which were regularly, occurring during every survey month during the breeding season in 2024, include cormorant, gannet, herring gull, oystercatcher, shag and sandwich tern (see Table 1A-21).

Table 1A-22 presents comparable data collected during low tide surveys over the same period and at the same location, allowing for assessment of bird usage patterns in relation to tidal cycles.

Between April and August 2024, low tide vantage point surveys at Dunany Point South recorded one species exceeding their national 1% population threshold. Red-breasted merganser exceeded the national threshold in July 2024 when 44 individuals were recorded during the first scan loafing/preening in F1. The third (38), fourth (25), fifth (28) and sixth (32) scans also exceeded the threshold. These birds were recorded as loafing, roosting, feeding or preening, throughout the viewshed (see Table 1A-22).

Winter season 2024/25: September 2024 – March 2025

Table 1A-23 summarises the peak counts of bird species recorded from the vantage point surveys conducted at Dunany Point South during high tide between September 2024 and March 2025. The table highlights species of conservation concern, including those listed under Annex I of the Birds Directive, BOCCI red and amber listed species, and SCIs. It also compares peak counts against national and international 1% population thresholds to evaluate the significance of the wider area for these bird species during high tide conditions.

Due to constraints such as weather, tidal conditions and day light availability, there were two high tide surveys completed in December 2024, which were followed by two low tide surveys in January 2025 to balance this.

Table 1A-23: Peak counts for target species in winter season 2024/25 at high tide.

Peak count for							1% threshold exceeded

N/R	N/R	1	N/R	N/R	N/R	N/R	95	1,400

Between September 2024 and March 2025, high tide vantage point surveys at Dunany Point South recorded only one species exceeding their national 1% population threshold. Red-throated diver exceeded this threshold twice, once during the first December 2024 survey and once during the second December 2024 survey (see Table 1A-23)

The first December 2024 survey recorded a peak count of 25 divers during the fifth scan. A flock of 14 birds loafing in B4 represented the greatest numbers within an arc section, followed by loafing or feeding birds in A3 (2), C3 (5), D2 (3) and E2 (1). The second December 2024 survey recorded a peak count of 34 divers during the second scan. A flock of 14 divers were recorded as flying through B4. One flying through A3, and the remainder recorded as loafing in A4 (4), B4 (3), C2 (5), C3 (5) and D2 (2).

Table 1A-24 presents comparable data collected during low tide surveys over the same period and at the same location, allowing for assessment of bird usage patterns in relation to tidal cycles.

Between September 2024 and March 2025, low tide vantage point surveys at Dunany Point South recorded two species exceeding national 1% population thresholds: Mediterranean gull and red-throated diver (see Table 1A-24).

Mediterranean gull exceeded the national average with a peak count of three birds in March 2024. There were no other records for Mediterranean gull during this time period. As previously discussed, this national figure is from the Seabird 2000 census and the recent colonist is believed to be breeding in higher numbers than it was 25 years ago.

Red-throated diver exceeded the national threshold in two peak counts: November and March. November 2024's peak count for red-throated diver was 38 individuals during the fourth scan, above its 1% national threshold of 20. These birds were recorded as loafing or feeding throughout the viewshed; A3 (1), B2 (8), B3 (2), B4 (2), C2 (17) and C3 (8). Scan five also exceeded the threshold, recording 36 birds. These birds were recorded as loafing, feeding or preening throughout the viewshed. These birds were recorded as loafing or feeding throughout the viewshed; B2 (4), C1 (1), C2 (16), D2 (13), E3 (1) and E4 (1).

March 2025's peak count for red-throated diver was 25 individuals during the fourth scan, above its 1% national threshold of 20. These birds were recorded as loafing or feeding throughout the viewshed; A3 (5), B4 (1), C3 (3), D4 (1) and F4 (15).

Terrestrial

There are no changes to appendix 19-1: Onshore Biodiversity – Supporting Information.

Freshwater aquatic

A total of eight sites were assessed for freshwater aquatic invertebrate potential during the 2025 survey. A review of desk study records indicates that the nearest record for white clawed crayfish is from the third order River Dee, approximately 18.5 km upstream of the onshore substation site and onshore cable route. Table 1A-25 summarises the freshwater aquatic invertebrate results for these sites.

Table 1A-25: Freshwater aquatic invertebrate survey results from 2025 field survey.

Site code / name	Freshwater aquatic invertebrate results	EPA assigned Q-value (closest monitoring station)
A-1 / Rock 06 Stream	**Survey Results** A two minute pond sweep revealed the stream was dominated by pollution tolerant species including Gammarus *Gammarus* sp. which was recorded as excessive within the sample. Flatworm (Platyhelminthes) was common. Meniscus midges Dixidae, water—striders Vellidae, New Zealand mud snail *Potamopyrgus antipodarum*, non-biting midges (Chironomidae), pond snail *Radix balthica*, were few. A single leech (Piscicolidae) was recorded. Dense instream vegetation would indicate nutrient enrichment and hydromorphological degradation. A bio-index assessment and Small Streams Risk Score (SSRS) were not calculated due to the absence of relatively fast flowing habitat in the stream. Dissolved oxygen was measured at 79.3% and 8.11 mg/l. Temperature was 13.9°C, pH was 7.37 and conductivity was relatively high at 743 µS/cm. Crayfish habitat suitability was rated as 'none' for adults due to the silty substrate with no gravels or boulders, very low depth of water and very dense vegetation choking the stream. There is a very slight potential that the habitat could support juvenile crayfish, however this is considered unlikely given the absence of adult habitat and absence of juvenile crayfish in the sweep sample collected.	Q4 (Good); Year= 2020; Station= 150 m d/s old Rly Br (LHS).
A-2 / River Dee at N33 bridge crossing	**Survey Results** A two minute kick sample and one minute hand search was carried out immediately downstream of the N33 bridge. A total of 23 taxa were recorded, with Group C (pollution tolerant) taxa forming most of the sample. Two Group A (pollution sensitive) taxa were present in few numbers – the flat-bodied mayfly *Ecdyonurus* sp. and mayfly *Ephemera danica*. Five Group B (less pollution sensitive) taxa were recorded as few, namely the cased caddis flies *Lepidostoma hirtum*, *Odontocerum albicorne*, Limnephilidae, Glossosomatidae and *Sericostoma personatum*. The Group C taxon *Gammarus* sp. was recorded as numerous in the sample. The caseless caddisfly Hydropsychidae, black fly Simuliidae, the snail *Bithynia tentaculata*, and the mayflies *Seratella ignita* and *Baetis rhodani/atlanticus* – all Group C (pollution tolerant) taxa - were recorded as common. The Group C taxa Lumbricidae/Lumbriculidae, riffle beetles (*Elmis aenea* and *Limnius volckmari*), caseless caddisfly *Rhyacophila dorsalis* and the cranefly *Antocha* sp. were recorded as few. The Group D (very pollution tolerant) taxon Sphaeridae was recorded as few. Finally, the Group E (most pollution tolerant) taxon Tubificinae was recorded as few. Based on the species composition in the sample, a Q-value of 3-4	Q3-4 (Moderate); Year= 2006; Station= DEE New Br u/s Drumgoolestown Br.

Site code / name	Freshwater aquatic invertebrate results	EPA assigned Q-value (closest monitoring station)
	(moderate status) was inferred. Dissolved oxygen was measured at 79.5% and 7.39 mg/l. Temperature was 18.4°C, pH was 8.06 and conductivity was 568 µS/cm. Crayfish habitat suitability was estimated to be 'very good' due to the presence of submerged and emergent macrophytes, coarse substrate (at the bridge), overhanging vegetation and suitable water depth.	
A-3 / River Dee at Drumcar Bridge	**Survey Results** A two minute kick sample and one minute hand search was carried out within riffle/run habitat downstream of the bridge at this location. The macroinvertebrate sample recorded 22 taxa in total, with Group C (pollution tolerant) taxa recorded as excessive within the sample. One Group A (pollution sensitive) taxon was present in few numbers – the flat-bodied mayfly *Ecdyonurus* sp.. Five Group B (less pollution sensitive) taxa were few, namely cased caddis flies (Limnephilidae, Hydroptilidae, Glossosomatidae and *Sericostoma personatum*) and the mayfly *Alainites muticus*. The Group C taxon *Baetis rhodani/atlanticus* was recorded as numerous within the sample. Hydropsychidae, *Gammarus* sp. and *Seratella ignita* (all Group C) were common. The remaining Group C taxa were all recorded as few (namely Chironomidae, *Elmis aenea, Limnius volckmari*, *Potamopygrus antipodorum*, Polycentropodidae, Simuliidae, *Bithynia tentaculata*, Planorbidae, *Anyclus fluviatilus*, Hydracarina). Sphaeridae (Group D) and Tubificinae (Group E) were also recorded as few. Based on the species composition in the sample, a Q-value of 3-4 (moderate status) was inferred. Dissolved oxygen was measured at 100.8% and 9.14 mg/l. Temperature was 19.8°C, pH was 8.36 and conductivity was 551 µS/cm. No crayfish were present in the kick-sample, and crayfish remains were not observed in any of the otter spraints observed at the site. Due to the presence of soft banks, overhanging vegetation, aquatic vegetation, submerged tree roots and heterogenous coarse substrate, a habitat rating of 'excellent' was assigned for crayfish.	4 (Good); Year= 2020; Station = Br. At Drumcar.
A-4 / Newhall 06 Stream	**Survey Results** A two minute kick sample and one minute hand search was carried out within riffle/run habitat downstream of the bridge at this location. The macroinvertebrate sample recorded 12 taxa in total, with Group C (pollution tolerant) taxa forming most of the sample. No Group A (pollution sensitive) taxa were recorded. Three Group B (less pollution sensitive) taxa were few and common, namely cased caddis flies of the family Glossosomatidae (one individual) and the species *Odontocerum albicorne,* respectively. The Group C taxon *Gammarus* sp. was recorded as numerous. The Group D (very pollution tolerant) taxon *Asellus aquaticus* was also numerous. The Group C taxa *Baetis rhodani/atlanticus*, Lumbricidae/Lumbriculidae, Hydracarina, Polycentropodidae and Chironomidae were all common. The remaining taxa were all recorded as few, namely, riffle beetles *Elmis aenea*, and Ceratopogonidae (single specimen) (all Group C) and Hirudinea (single specimen – Group D). A bio-index assessment was not appropriate in this small first order stream and therefore an SSRS was deemed more suitable. A score of 3.2 was calculated indicating that the stream is "At Risk". Dissolved oxygen was measured at 50.4% and 4.71 mg/l. Temperature was 15.3°C, pH was 7.75 and conductivity was 700 µS/cm. The moderate-high siltation, low dissolved oxygen, dominance of Group C pollution tolerant taxa, absence of Group A pollution sensitive taxa, and SSRS score indicate water quality issues. No crayfish were collected in the kick-sample. Based on the moderate-high siltation, presence of coarse substrate and overhanging vegetation, a crayfish habitat appraisal rating of 'poor' was assigned.	4 (Good); Year= 2020; Station = Br. At Drumcar

Site code / name	Freshwater aquatic invertebrate results	EPA assigned Q-value (closest monitoring station)
A-8 / Salterstown Stream downstream Site 6	**Survey Results** A two minute kick sample and one minute hand search was carried out within riffle/run habitat downstream of the bridge at this location. The macroinvertebrate sample recorded 13 taxa in total, with Group C taxa dominating the sample. No Group A taxa were recorded. One Group B (less pollution sensitive) taxon was recorded in small numbers, namely cased caddisflies in the family Limnephilidae. The Group C taxa *Gammarus* sp. and blackfly larvae (Simuliidae) were recorded as dominant. The Group C taxa *Baetis rhodani/atlanticus*, Platyhelminthes and *Dicranota* sp. were recorded as common. The remaining taxa, Chironomidae, *Elmis aenea*, Lumbricidae/Lumbriculidae, *Ancylus fluviatilus*, Hydracarina, Vellidae (all Group C) and *Asellus aquatics* (Group D) were all recorded as "few". Based on the species composition in the sample, a Q-value of 3 (poor status) was inferred, although given the small size of the stream, this score should be interpreted with caution. Nevertheless, the heavy siltation, low dissolved oxygen (64.2% and 6.04 mg/l), overall excessive numbers of Group C pollution tolerant taxa, low numbers and diversity of Group B taxa, and absence of Group A pollution sensitive taxa indicate water quality issues. Temperature was 16.8°C, pH was 7.40 and conductivity was 620 µS/cm. No crayfish were present within the kick sample. Suitable habitat in the form of tree roots, boulders and cobbles were recorded in the channel, however siltation was evident. Crayfish habitat was rated as 'good'.	No monitoring station connected to this stream, WFD status (2016 to 2021) is moderate based on modelling.
A-9 / Port 06 Stream	**Survey Results** Given the highly modified nature of the channel and absence of stony, fast flowing riffle/run habitat, a biotic index calculation was not considered appropriate at this site. However, a two minute pond sweep was collected to assess general macroinvertebrate biodiversity at the site. A total of 18 taxa were recorded. Limnephilidae (cased caddis fly) was recorded as common. Chironomidae were recorded as dominant. Vellidae, *Potamopygrus antipodarum* and Sphaeridae were recorded as common. The remaining species, namely the beetles Dytiscidae and Gyrinidae, Limoniidae, Hydracarina, Lumbricidae/Lumbriculidae, *Gammarus* sp., *Ancylus fluviatilus*, Planorbidae, *Asellus aquaticus*, Hirudinea, *Radix balthica*, and *Chironomus* sp. were recorded as "few". Dissolved oxygen was measured at 70.9% and 6.73 mg/l. Temperature was 15.6°C and conductivity was 684 µS/cm. Crayfish habitat was assigned a rating of 'poor-fair' due to the presence of soft banks and rooted aquatic vegetation, which could provide some limited habitat particularly for juveniles.	No monitoring station connected to this stream, WFD status (2016 to 2021) is moderate based on modelling.
A-10 / Port 06 Stream upstream Site 9	**Survey Results** A macroinvertebrate survey was not collected due to the overgrown channel vegetation, particularly extensive duckweed, which made bankside assessment extremely difficult. Given the proximity to Site A-9, it can be inferred that similar macroinvertebrate species are likely to occur at this site. Dissolved oxygen was measured at 29.4% and 2.68 mg/l. Temperature was 17.3°C, pH was 7.31 and conductivity was relatively high at 915 µS/cm. Crayfish habitat was assigned a rating of none-poor, due to the presence of detritus and rooted aquatic vegetation, which could provide some limited habitat particularly for juveniles.	No monitoring station connected to this stream, WFD status (2016 to 2021) is moderate based on modelling.

Site code / name	Freshwater aquatic invertebrate results	EPA assigned Q-value (closest monitoring station)
A-11 / Broadlough Stream	**Survey Results** A two minute pond sweep of the drain, where accessible, revealed low diversity. A total of five taxa were recorded. The macroinvertebrate community was dominated by *Gammarus* sp.. *Asellus aquaticus*, Chironomidae, *Radix balthica* and Platyhelminthes were recorded as few. An aquatic bio-index assessment and SSRS were not calculated due to the absence of fast flowing habitat and coarse substrate in the stream. Dissolved oxygen was measured at 70.8% and 6.69 mg/l. Temperature was 17.4°C, pH was 7.80 and conductivity was relatively high at 740 µS/cm. Crayfish habitat was assigned a rating of none-poor, due to the presence of detritus and rooted aquatic vegetation, which could provide some limited habitat particularly for juveniles.	Q4 (Good); Year= 2020; Station= 150 m d/s old Rly Br (LHS).

Fish

A total of eight sites were assessed for fisheries potential. The site code, watercourse name (EPA), and fish assessment results are detailed in Table 1A-26.

Table 1A-26: Fisheries assessment results.

Site code / name	Fisheries assessment results
A-1 / Rock 06 Stream	**Survey Results** Good spawning substrates were not present. Salmonid and lamprey spawning habitat was rated as 'None' due to high siltation, no riffle/ glide /pool habitat sequence present and no gravels. The stream has been modified into a drainage ditch with no habitat characteristics suitable for adult salmonid or lamprey spawning or refuge. For juvenile salmonids there was no coarse substrate and flow was slow. The substrate consisted of 100% silt and the channel choked with vegetation. These conditions are not representative of juvenile salmonid habitat and a rating of 'None' was assigned. Lamprey nursery habitat was assigned a rating of 'None-poor' due to the presence of a deep silt layer in the channel. It is considered unlikely that lamprey actually occur within the channel given the lack of suitable spawning habtiat. Habitat suitability of eel was considered to be none/poor.
A-2 / River Dee at N33 bridge crossing	**Survey Results** No spawning habitat for salmonids and lamprey was observed in the reach surveyed upstream of the N33 bridge. At and immediately downstream of the N33 bridge, spawning habitat was assessed as 'none-poor' due to the presence of some coarse gravels. Adult salmonid habitat was rated as 'good' due to the presence of deep glide and holding pools. Juvenile salmonid habitat was rated as 'Fair' due to the presence of suitable cover and coarse substrate at the bridge. A sandy/silt accumultion was noted downstream of the N33 bridge which may provide lamprey nursery habitat. Furthermore, given the presence of slow flowing water and rooted macrophytes upstream of the bridge, it is considered highly likely that suitable lamrpey nursery habitat exists in this reach. A rating of 'Good' was assigned. The habitat at the survey site was considered excellent for eel.
A-3 / River Dee at Drumcar Bridge	**Survey Results** Salmonid adult and spawning was rating as 'Very Good' – 'Excellent' due to the presence of cobble/gravel spawning habitat, resting pools for adults and low siltation within the gravels. Juvenile salmonid habitat was also rated as 'Excellent' due to the presence of areas of shallow, fast flowing water and coarse substrate. Cover was noted in the form of aquatic vegetation and overhanging vegetation. Lamprey spawning habtiat was rated as 'very good' – 'excellent' due to the presence of cobble/gravel spawning habitat, refuge habitat for adults and low siltation within the gravels. Lamprey nursery was rated as 'Very Good' due to the presence of deep silty deposits along the river margins, as well as a significant mound of sandy/silt located approximately 150 m of the bridge near the right bank. The habitat at the survey site was considered excellent for eel. Minnow *Phoxinus phoxinus* shoals were noted within the river channel.

Site code / name	Fisheries assessment results
A-4 / Newhall 06 Stream	**Survey Results** Salmonid and lamprey spawning habitat was assigned a rating of 'Poor'. Juvenile salmonid habitat was rated as ' Fair', due to the presence of coarse substrate, and cover in the form of overhanging vegetation. It should be noted that water quality at this stream (at risk) is likely to affect juvenile salmonids and lamprey should they occur in this stream. In addition, low DO and very low water levels within the stream is likely to significantly limit the presence of salmonids, eel and lamprey while these conditions persist. Lamprey nursery habitat potential was assigned a rating of 'None'. There were no silted areas of slow backwater within the survey reach. A three-spined stickleback (*Gasterosteus aculeatus*) was captured within the kick sample collected at the site. The habitat at the survey site was considered fair for eel. Given the presence of heterogenous substrate at the site, it is possible that when flows are higher, habitat suitabiliy for fish, particularly juvenile salmonids, would improve.
A-8 / Salterstown Stream downstream Site 6	**Survey Results** Salmonid spawning and adult habtiat for this stream was rated as 'Fair', due to the presece of cobble and gravel spawning habitat and resting pools for adults. The stream is more suited to brown trout as opposed to salmon due to it's small size. It is worth noting, however, that low dissolved oxygen levels, siltation and macroinvertebrate assessment indicate impaired water quality. Juvenile salmonid habitat was rated as 'Good' due to the presence of shallow, fast flowing water, cover in the form of overhanging vegetation and coarse substrate. Lamprey nursery habtiat within the stream was limited and no areas with deep silt/sandy deposits suitable for ammocetes was noted. A rating of 'None-Poor' was assigned. The habitat at the survey site was considered very good for eel.
A-9 / Port 06 Stream	**Survey Results** Salmonid and lamprey adult and spawning habitat was rated as 'None'. The stream was heavily silted, with no suitable spawning habitat. The substrate comprised predominantly deep silt. Juvenile salmonid habtiat was also assigned a rating of 'None' due to the slow flowing and silty nature of the stream. Lamprey nursery habitat was assigned a rating of 'None-Poor' due to the presence of a deep silt layer in the channel and slow flowing water. It is considered unlikely that lamprey actually occur within the channel given the lack of suitable spawning habtiat at the site. Furthermore, based on satellite imagery and the survey results at site A-10 (upstream of A-9), the river habitat upstream of A-9 is unlikely to support adult lamprey or contain suitable lamprey spawning habitat. Given the homogenous silty nature of the channel, the habitat at the survey site was considered 'Poor' for eel. A three-spined stickleback was captured within the marginal sweep sample collected at the site.
A-10 / Port 06 Stream upstream Site 9	**Survey Results** Salmonid and lamprey adult and spawning habitat was rated as 'None'. The stream was heavily vegetated and silted, with no suitable spawning habitat. The substrate comprised predominantly deep silt. Juvenile salmonid habtiat was also assigned a rating of 'None' due to the stagnant and silty nature of the stream. Lamprey nursery habitat was assigned a rating of none-poor due to the presence of a deep silt layer in the channel. It is considered unlikely that lamprey actually occur within the channel given the lack of suitable spawning habtiat. Furthermore, based on satellite imagery, the river habitat upstream of A-10 is unlikely to support adult lamprey or contain suitable lamprey spawning habitat. Although potentially suitable habitat exists for lamprey ammocetes, it's considered highly unlikely that they occur at the site. Given the homogenous silty nature of the channel, the habitat at the survey site was considered poor for eel.
A-11 / Broadlough Stream	**Survey Results** Salmonid and lamprey adult and spawning habitat was rated as 'None'. The stream was drain-like, vegetated and silted, with no suitable spawning habitat. The substrate was predominantly silt. Juvenile salmonid habtiat was also assigned a rating of 'None' due to the slow flowing and silty nature of the stream. Lamprey nursery habitat was assigned a rating of 'None-poor' due to the presence of a deep silt layer and slow-stagnant flow in the channel. It is considered unlikely that lamprey actually occur within the channel given the lack of suitable spawning habtiat. Given the homogenous silty nature of the channel, the habitat at the survey site was considered poor for eel. A three-spined stickleback was captured within the marginal sweep sample collected at the site.

1.3 Geographic frames of reference outlined by the NRA (2009)

There are no changes to appendix 19-1: Onshore Biodiversity – Supporting Information.

1122	2	29/05/2025	R. Robin	Green	1	FL: Recently FLedged young (nidicolous species) or downy young (nidifugous species). Careful consideration should be given to the likely provenance of any fledged juvenile capable of significant geographical movement. Evidence of dependency on adults (e.g. feeding) is helpful. Be cautious, even if the record comes from suitable habitat.

ID	Survey No.	Date	BTO Code & Species	BOCCI	No.	Activity (A = Agitated; B = Building nest; F = Flying; H = Breeding Habitat; P = Pair; S = Singing)
1272	2	29/05/2025	WR Wren	Green	1	FL: Recently FLedged young (nidicolous species) or downy young (nidifugous species). Careful consideration should be given to the likely provenance of any fledged juvenile capable of significant geographical movement. Evidence of dependency on adults (e.g. feeding) is helpful. Be cautious, even if the record comes from suitable habitat.

1958	4	23/07/2025	WP Woodpigeon	Green	1	FL: Recently FLedged young (nidicolous species) or downy young (nidifugous species). Careful consideration should be given to the likely provenance of any fledged juvenile capable of significant geographical movement. Evidence of dependency on adults (e.g. feeding) is helpful. Be cautious, even if the record comes from suitable habitat.

Annex 2C Table 2: Vantage Point (cable corridor) October 2023 – March 2025 VP data

Dirn.: 8 cardinal directions (eg **N**, **NE**, **E**…) of birds heading at first observation OR **V** if associating with observation base
Age (JNCC codes): **A**: Adult; **I**: Immature; **J**: Juvenile; **2**: 2nd calendar year; **3**: 3rd calendar year; **4**: 4th calendar year
Plum.: [**S**: Summer; **W**: Winter; **T**: Transitional], [**L**: Light; **I**: Intermediate; **D**: Dark]
Behv: **SU**: Surface feeding; **PL**: Plunge feeding; **DP**: Dip feeding; **FE**: Feeding (other); **SC**: Scavenging; **SF**: Scavenging at fishing vessel; **KL**: Kleptoparasitising; **CN**: Carrying nest material; **CF**: Carrying food; **PR**: Preening or bathing; **ED**: Escape diving from vessel; **EF**: Escape flight from vessel
Assoc.: Assign an association ID starting at 1 to group clusters of birds together that are recorded on separate rows (e.g. 2 adult and 1 juv GU)
Mammals: **SGR**: Grey seal; **SHB**: Harbour seal; **DBO**: Bottlenose dolphin; **PHR**: Harbour porpoise
